##### **10.2.1.2.1 Supported Task: N/A**

##### **10.2.1.2.2 Lateral Task: SNSHA 3**

##### **10.2.1.2.3 Supporting Task: N/A**

#### **10.2.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

##### **Military**

1. Partial joint staff integration. (C2.3.1.1)
2. Partial multinational integration. (C2.3.1.2)

**Civil**

1. Correct interdepartmental/interagency relationships. (C3.1.1.3)

**10.2.2 Functional Needs Analysis****10.2.2.1 Capability and Deficiency Assessment Summary**

Table 10.2-1 discusses the only capability that exists to perform the task to the designated standard. CJCS/joint staff promulgates and establishes joint Service baseline standards, criteria, and metrics for CBRN/TIM medical protective countermeasures.

**Current Capability and Deficiency**

Protection policies, standards, measures, criteria, and metrics exist for specific medical CBRND countermeasures and their application by the force. Standards, measures, criteria, and metrics, however, are established during the research and development process for each specific medical CBRND countermeasure. Deficiencies include the lack of a single set of overarching medical CBRND countermeasure standards, measures, criteria, and metrics for CBRND assets. The overall current assessment is “red.”

**Projected Near/Mid-Term Capability and Deficiency**

No change projected for this task.

**Projected Far-Term Capability and Deficiency**

No change projected for this task.

Table 10.2-1. SNSHLD 2: Capability and Deficiency Assessment

Capability: CJCS— Medical	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10	M11	M12	M13	M14	M15	M16	M17	M18	M19	M20	M21	M22	M23	M24	M25	M26

	FAA Measure	Scale
M1	Policies outline the management, eligibility, and administration of medical CBRN/TIM protective countermeasures.	<p><b>G:</b> Doctrine, policies, standards, and TTPs provide specific guidance and requirements for the management, eligibility, and administration of medical protective countermeasures for all eligible populations, including U.S. military members, MWAs, eligible civilians, and non-U.S. force personnel.</p> <p><b>Y:</b> Doctrine, policies, standards, and TTPs adequately address the management, eligibility, and administration of medical protective countermeasures by U.S. military members.</p> <p><b>R:</b> Doctrine, policies, standards, and TTPs are inadequate or nonexistent for the management, eligibility, and administration of medical protective countermeasures by U.S. forces.</p>
M2	Standards and supporting criteria address medical CBRN/TIM protective countermeasures for all threat biological agents.	<p><b>G:</b> An overarching single set of specific standards and criteria address CBRN/TIM protective countermeasures for all threat biological agents, address all force members (including MWAs, eligible civilians, and non-U.S. force members), meet Food and Drug Administration (FDA) criteria for approval, and are applied.</p> <p><b>Y:</b> Standards and supporting criteria are established for specific high-threat biological agents, meet FDA criteria for approval, and address all U.S. force members, including eligible civilians and MWAs.</p> <p><b>R:</b> Standards and supporting criteria are nonexistent or established for specific biological agent countermeasures based upon known achievable, do not address all threat biological agents, meet FDA criteria for investigational new drug (IND) approval only and address U.S. military members only.</p>
M3	Standards and supporting criteria address medical CBRN/TIM protective countermeasures against the effects of radiological exposures.	<p><b>G:</b> An overarching single set of specific standards and criteria address CBRN/TIM protective countermeasures for radiological exposure, address all force members (including MWAs, eligible civilians, and non-U.S. force members), meet FDA criteria for approval, and are applied.</p> <p><b>Y:</b> Specific standards and criteria addressing CBRN/TIM protective countermeasures for the radiological exposure are defined for specific medical countermeasures, meet FDA criteria for approval, and address all U.S. force members, including eligible civilians and MWAs.</p> <p><b>R:</b> Standards and supporting criteria are nonexistent or established for specific CBRN/TIM protective countermeasures for radiological exposure, are based upon known achievable, do not address preexposure and presymptomatic exposures, meet FDA criteria for IND approval only, and address U.S. military members only.</p>

M4	Standards and supporting criteria address medical CBRN/TIM protective countermeasures for all threat chemical warfare agents.	<p><b>G:</b> An overarching single set of specific standards and criteria address CBRN/TIM protective countermeasures for all threat chemical agents, address all force members (including MWAs, eligible civilians, and non-U.S. force members), meet FDA criteria for approval, and are applied.</p> <p><b>Y:</b> Standards and supporting criteria are established for specific high-threat chemical agents, meet FDA criteria for approval, and address all U.S. force members, including eligible civilians and MWAs.</p> <p><b>R:</b> Standards and supporting criteria are nonexistent or established for specific chemical agent countermeasures based upon known achievable, do not address all threat chemical agents, meet FDA criteria for IND approval only, and address U.S. military members only.</p>
M5	Standards and supporting criteria address medical CBRN/TIM protective countermeasures for all high-threat toxic industrial chemical (TIC) agents.	<p><b>G:</b> An overarching single set of specific standards and criteria address CBRN/TIM protective countermeasures for all threat TIC agents, address all force members (including MWAs, eligible civilians, and non-U.S. force members), meet FDA criteria for approval, and are applied.</p> <p><b>Y:</b> Standards and supporting criteria are established for specific high-threat TIC agents, meet FDA criteria for approval, and address all U.S. force members, including eligible civilians and MWAs.</p> <p><b>R:</b> Standards and supporting criteria are nonexistent or established for specific TIC agent countermeasures based upon known achievable, do not address all threat TIC agents, meet FDA criteria for IND approval only, and address U.S. military members only.</p>
M6	Standards and supporting criteria address medical CBRN/TIM protective countermeasures for all high-threat toxic industrial biological (TIB) agents.	<p><b>G:</b> An overarching single set of specific standards and criteria address CBRN/TIM protective countermeasures for all high-threat TIB agents, address all force members (including MWAs, eligible civilians, and non-U.S. force members), meet FDA criteria for approval, and are applied.</p> <p><b>Y:</b> Standards and supporting criteria are established for specific high-threat TIB agents, meet FDA criteria for approval, and address all U.S. force members, including eligible civilians and MWAs.</p> <p><b>R:</b> Standards and supporting criteria are nonexistent or established for specific TIB agent countermeasures based upon known achievable, do not address all high-threat TIB agents, meet FDA criteria for IND approval only, and address U.S. military members only.</p>
M7	Standards and supporting criteria for medical CBRN/TIM protective countermeasures consider prominent endemic diseases for threat areas.	<p><b>G:</b> An overarching single set of specific standards and criteria address CBRN/TIM protective countermeasures for all prominent endemic diseases for threat areas, address all force members (including MWAs, eligible civilians, and non-U.S. force members), meet FDA criteria for approval, and are applied.</p> <p><b>Y:</b> Standards and supporting criteria for CBRN/TIM protective countermeasures are established for prominent endemic diseases for specific threat areas, meet FDA criteria for approval, and address all U.S. force members, including eligible civilians and MWAs.</p> <p><b>R:</b> CBRN/TIM protective countermeasure standards and supporting criteria are nonexistent or established for specific prominent endemic diseases within a select threat area, do not address all prominent endemic disease agents, meet FDA criteria for IND approval only, and address U.S. military members only.</p>

M8	Standards and supporting criteria address differing population groups (e.g., military forces, eligible civilians supporting the mission, eligible civilians not supporting the mission, and MWAs).	<p><b>G:</b> Medical CBRN countermeasures and standards address all eligible populations groups (including military personnel, eligible civilians, MWAs, and non-U.S. force members), meet FDA criteria for approval, and are applied.</p> <p><b>Y:</b> Medical CBRN countermeasure standards and criteria address U.S. military personnel, MWD, and eligible civilians directly supporting the mission; and meet FDA criteria for approval.</p> <p><b>R:</b> Medical CBRN countermeasure standards and criteria address U.S. military members only, and meet FDA criteria for IND approval only.</p>
M9	Standards and supporting criteria define and address presymptomatic low-dose exposures and cumulative long-term effects.	<p><b>G:</b> An overarching single set of standards and criteria define and address presymptomatic low-dose exposures and cumulative long-term effects for all threat biological agents, address all eligible population members (including U.S. military, MWAs, eligible civilians, and non-U.S. force members), meet FDA criteria for approval, and are applied.</p> <p><b>Y:</b> Medical CBRN countermeasure standards and criteria address and define presymptomatic low-dose exposures and cumulative long-term effects for specific CBRN agents, meet FDA criteria for approval, and address all U.S. force members, including eligible civilians and MWAs.</p> <p><b>R:</b> Medical CBRN countermeasure standards and criteria do not or inadequately address and define presymptomatic low-dose exposures and cumulative long-term effects, meet FDA criteria for IND approval only, and address U.S. military members only.</p>
M10	Metrics specify the required efficacy of medical CBRN/TIM protective countermeasures for biological agents by identified population groups.	<p><b>G:</b> An overarching single set of metrics establish minimal level of efficacy of CBRN/TIM protective countermeasures for all threat biological agents, address all eligible population members (including U.S. military, MWAs, eligible civilians, and non-U.S. force members), meet FDA criteria for approval, and are applied.</p> <p><b>Y:</b> Medical CBRND countermeasure minimal efficacy metrics are established for specific high-threat biological agents, meet FDA criteria for approval, and address all U.S. force members, including eligible civilians and MWAs.</p> <p><b>R:</b> Efficacy metrics are nonexistent or established for specific biological agent countermeasures based upon known achievable, do not address all threat biological agents, meet FDA criteria for IND approval only, and address U.S. military members only.</p>
M11	Metrics specify the required efficacy of medical CBRN/TIM protective countermeasures against effects of radiological exposures by identified population groups.	<p><b>G:</b> An overarching single set of metrics establish minimal level of efficacy of CBRN/TIM protective countermeasures for radiological exposures, meet FDA criteria for approval, address all eligible population members (including U.S. military, MWAs, eligible civilians, and non-U.S. force members), and are applied.</p> <p><b>Y:</b> Medical CBRND countermeasure minimal efficacy metrics are established for specific radiological exposures, meet FDA criteria for approval, and address all U.S. force members, including eligible civilians and MWAs.</p> <p><b>R:</b> Efficacy metrics are nonexistent or established for specific radiological countermeasures based upon known achievable, do not address all threat biological agents, meet FDA criteria for IND approval only, and address U.S. military members only.</p>

M12	Metrics specify the required efficacy of medical CBRN/TIM protective countermeasures against chemical warfare agents by identified population groups.	<p><b>G:</b> An overarching single set of metrics establish minimal level of efficacy of CBRN/TIM protective countermeasures for chemical agents, address all eligible population members (including U.S. military, MWAs, eligible civilians, and non-U.S. force members), meet FDA criteria for approval, and are applied.</p> <p><b>Y:</b> Medical CBRND countermeasure minimal efficacy metrics are established for specific chemical agents, meet FDA criteria for approval, and address all U.S. force members, including eligible civilians and MWAs.</p> <p><b>R:</b> Efficacy metrics are nonexistent or established for specific chemical agent countermeasures based upon known achievable, do not address all threat chemical agents, meet FDA criteria for IND approval only, and address U.S. military members only.</p>
M13	Metrics specify the required efficacy of medical CBRN/TIM protective countermeasures against high-threat TIC agents by identified population groups.	<p><b>G:</b> An overarching single set of metrics establish minimal level of efficacy of CBRN/TIM protective countermeasures for all high-threat TIC agents, address all eligible population members (including U.S. military, MWAs, eligible civilians, and non-U.S. force members), meet FDA criteria for approval, and are applied.</p> <p><b>Y:</b> Medical CBRND countermeasure minimal efficacy metrics are established for specific high-threat TIC agents, meet FDA criteria for approval, and address all U.S. force members, including eligible civilians and MWAs.</p> <p><b>R:</b> Efficacy metrics are nonexistent or established for specific TIC agent countermeasures based upon known achievable, do not address all threat TIC agents, meet FDA criteria for IND approval only, and address U.S. military members only.</p>
M14	Metrics specify the required efficacy of medical CBRN/TIM protective countermeasures against high-threat toxic industrial biological agents by identified population groups.	<p><b>G:</b> An overarching single set of metrics establish minimal level of efficacy of CBRN/TIM protective countermeasures for all high-threat TIB agents, address all eligible population members (including U.S. military, MWAs, eligible civilians, and non-U.S. force members), meet FDA criteria for approval, and are applied.</p> <p><b>Y:</b> Medical CBRND countermeasure minimal efficacy metrics are established for specific high-threat TIB agents, meet FDA criteria for approval, and address all U.S. force members, including eligible civilians and MWAs.</p> <p><b>R:</b> Efficacy metrics are nonexistent or established for specific TIB agent countermeasures based upon known achievable, do not address all threat TIB agents, meet FDA criteria for IND approval only, and address U.S. military members only.</p>
M15	Metrics establish the period of time for attainment of required level of afforded prophylactic protection.	<p><b>G:</b> An overarching single set of metrics establish the maximum period of time for the attainment of the required level of afforded prophylactic protection by CBRN/TIM protective countermeasures, address all eligible population members (including U.S. military, MWAs, eligible civilians, and non-U.S. force members), meet FDA criteria for approval, and are applied.</p> <p><b>Y:</b> Medical CBRND countermeasure metrics for attainment of a required level of afforded prophylactic protection are established for specific agents, meet FDA criteria for approval, and address all U.S. force members, including eligible civilians and MWAs.</p> <p><b>R:</b> Prophylactic protection-level attainment metrics are nonexistent or established for specific threat agent countermeasures based upon known achievable, do not address all threat agents, meet FDA criteria for IND approval only, and address U.S. military members only.</p>

M16	Metrics specify the maximum number of applications required to attain required level of afforded protection.	<p><b>G:</b> An overarching single set of metrics establish the maximum number of applications to attain the required level of afforded protection by CBRN/TIM protective countermeasures, address all eligible population members (including U.S. military, MWAs, eligible civilians, and non-U.S. force members), meet FDA criteria for approval, and are applied.</p> <p><b>Y:</b> Medical CBRND countermeasure metrics for the number of applications to attain a required level of afforded protection are established for specific agents, meet FDA criteria for approval, and address all U.S. force members, including eligible civilians and MWAs.</p> <p><b>R:</b> Protection-level attainment metrics for the maximum number of required applications are nonexistent or established for specific threat agent countermeasures based upon known achievable, do not address all threat agents, meet FDA criteria for IND approval only, and address U.S. military members only.</p>
M17	Metrics specify the required level of afforded protection.	<p><b>G:</b> An overarching single set of metrics establish the required level of afforded protection by CBRN/TIM protective countermeasures, address all eligible population members (including U.S. military, MWAs, eligible civilians, and non-U.S. force members), meet FDA criteria for approval, and are applied.</p> <p><b>Y:</b> Medical CBRND countermeasure metrics for the required level of afforded protection are established for specific agents, meet FDA criteria for approval, and address all U.S. force members, including eligible civilians and MWAs.</p> <p><b>R:</b> Protection-level metric requirements are nonexistent or established for specific threat agent countermeasures based upon known achievable, do not address all threat agents, meet FDA criteria for IND approval only, and address U.S. military members only.</p>
M18	Metrics specify the maximum percentage of population experiencing adverse reactions.	<p><b>G:</b> An overarching single set of metrics establish the maximum percentage of each eligible population experiencing adverse reactions to CBRN/TIM protective countermeasures, address all eligible populations (including U.S. military, MWAs, eligible civilians, and non-U.S. force members), meet FDA criteria for approval, and are applied.</p> <p><b>Y:</b> Medical CBRND countermeasure metrics for the maximum percentage of the target population experiencing adverse reactions are established for specific agents, meet FDA criteria for approval, and address all U.S. force members, including eligible civilians and MWAs.</p> <p><b>R:</b> Adverse reaction percentage metric requirements for targeted populations are nonexistent or established for specific threat agent countermeasures based upon known achievable, do not address all threat agents, meet FDA criteria for IND approval only, and address U.S. military population only.</p>
M19	Metrics specify the maximum percentage of population experiencing long-term effects.	<p><b>G:</b> An overarching single set of metrics establish the maximum percentage of each eligible population experiencing long-term effects from CBRN/TIM protective countermeasures, address all eligible populations (including U.S. military, MWAs, eligible civilians, and non-U.S. force members), meet FDA criteria for approval, and are applied.</p> <p><b>Y:</b> Medical CBRND countermeasure metrics for the maximum percentage of the target population experiencing long-term effects are established for specific agents, meet FDA criteria for approval, and address all U.S. force members, including eligible civilians and MWAs.</p> <p><b>R:</b> Long-term effects percentage metric requirements for targeted populations are nonexistent or established for specific threat agent countermeasures based upon known achievable, do not address all threat agents, meet FDA criteria for IND approval only, and address U.S. military population only.</p>

M20	Metrics specify presymptomatic low-dose exposure levels by CBRN/TIM agent.	<p><b>G:</b> An overarching single set of medical CBRND metrics specify presymptomatic low-dose exposure levels, by CBRN/TIM agent, for each eligible population, address all eligible populations (including U.S. military, MWAs, eligible civilians, and non-U.S. force members), meet FDA criteria for approval, and are applied.</p> <p><b>Y:</b> Medical CBRND metrics identify presymptomatic low-dose exposure levels for specific agents, meet FDA criteria for approval, and address all U.S. force members, including eligible civilians and MWAs.</p> <p><b>R:</b> Presymptomatic low-dose exposure level metric requirements for targeted populations are nonexistent or established for specific threat agent countermeasures based upon readily measured and observed, do not address all threat agents, meet FDA criteria for IND approval only, and address U.S. military population only.</p>
M21	Metrics specify maximum allowable presymptomatic cumulative low-dose exposure limit for operational period by CBRN/TIM agent.	<p><b>G:</b> An overarching single set of medical CBRND metrics specify the maximum allowable presymptomatic cumulative low-dose exposure levels, by CBRN/TIM agent, for each eligible population for a realistic operational period (operational period covers the time period beginning with predeployment and ending following return to home location), address all eligible populations (including U.S. military, MWAs, eligible civilians, and non-U.S. force members), meet FDA criteria for approval, and are applied.</p> <p><b>Y:</b> Medical CBRND metrics identify the maximum allowable presymptomatic cumulative low-dose exposure levels for specific agents over a defined operational period, meet FDA criteria for approval, and address all U.S. force members, including eligible civilians and MWAs.</p> <p><b>R:</b> Maximum allowable presymptomatic cumulative low-dose exposure level metric requirements for targeted populations over a selected operational period are nonexistent, are suggested, or are established for specific threat agent countermeasures based upon readily measured and observed, do not address all threat agents, meet FDA criteria for IND approval only, and address U.S. military population only.</p>
M22	Metrics specify maximum allowable lifetime presymptomatic cumulative exposure limit by CBRN/TIM agent.	<p><b>G:</b> An overarching single set of medical CBRND metrics specify the maximum allowable lifetime presymptomatic cumulative low-dose exposure levels, by CBRN/TIM agent for each eligible population, address all eligible populations (including U.S. military, MWAs, eligible civilians, and non-U.S. force members), meet FDA criteria for approval, and are applied.</p> <p><b>Y:</b> Medical CBRND metrics identify the maximum allowable presymptomatic lifetime cumulative low-dose exposure levels for specific agents, meet FDA criteria for approval, and address all U.S. force members, including eligible civilians and MWAs.</p> <p><b>R:</b> Maximum allowable presymptomatic cumulative lifetime low-dose exposure level metric requirements for targeted populations are nonexistent, are suggested, or are established for specific threat agent countermeasures based upon readily measured and observed, do not address all threat agents, meet FDA criteria for IND approval only, and address U.S. military population only.</p>
M23	Metrics specify administration method for countermeasure (e.g., oral, injection, epidermal application, nasal, respiratory, etc.).	<p><b>G:</b> An overarching single set of metrics establish the administration methods for CBRN/TIM protective countermeasures, address all eligible population members (including U.S. military, MWAs, eligible civilians, and non-U.S. force members), meet FDA criteria for approval, and are applied.</p> <p><b>Y:</b> Medical CBRND countermeasure administration method metrics are established for specific agents, meet FDA criteria for approval, and address U.S. force members, including eligible civilians and MWAs.</p> <p><b>R:</b> Medical CBRND countermeasure administration method metrics are nonexistent, do not address all threat agents, and are not approved by the FDA for administration to other than U.S. forces.</p>

M24	Metrics specify the duration of effectiveness once required level of afforded prophylactic protection is attained.	<p><b>G:</b> An overarching single set of medical CBRND metrics specify the duration of effectiveness upon attainment of the required level of afforded prophylactic protection, address all eligible populations (including U.S. military, MWAs, eligible civilians, and non-U.S. force members), meet FDA criteria for approval, and are applied.</p> <p><b>Y:</b> Medical CBRND metrics specify the duration of effectiveness upon attainment of the required level of afforded prophylactic protection for specific agents, meet FDA criteria for approval, and address all U.S. force members, including eligible civilians and MWAs.</p> <p><b>R:</b> Duration of effectiveness upon attainment of required level of afforded prophylactic protection metric requirements for targeted populations are nonexistent or established for specific threat agent countermeasures based upon known achievable, do not address all threat agents, meet FDA criteria for IND approval only, and address U.S. military population only.</p>
M 25	Metrics specify the minimum period for readministration to retain required level of afforded protection once attained (e.g., annually, weekly, daily, etc.).	<p><b>G:</b> An overarching single set of medical CBRND metrics specify the minimum period for readministration to maintain the required level of afforded prophylactic protection - once attained, address all eligible populations (including U.S. military, MWAs, eligible civilians, and non-U.S. force members), meet FDA criteria for approval, and are applied.</p> <p><b>Y:</b> Medical CBRND metrics specify the period of readministration for protection maintenance upon attainment of the required level of afforded prophylactic protection for specific agents, meet FDA criteria for approval, and address all U.S. force members, including eligible civilians and MWAs.</p> <p><b>R:</b> Metric requirements for readministration frequency for maintenance of the required level of afforded prophylactic protection for targeted populations are nonexistent or established for specific threat agent countermeasures based upon known achievable, do not address all threat agents, meet FDA criteria for IND approval only, and address U.S. military population only.</p>
M26	Metrics specify the limitations upon administration (e.g., gender, age, medical condition, etc.).	<p><b>G:</b> Medical CBRN countermeasures metrics specify limitations for administration within all eligible populations groups (including military personnel, eligible civilians, MWAs, and non-U.S. force members) to include limitations for gender, age, medical condition, allergies, and other potentially limiting factors.</p> <p><b>Y:</b> Medical CBRN countermeasure metrics address limitations upon administration to U.S. military personnel.</p> <p><b>R:</b> Metric requirements addressing limitations upon administration are nonexistent or established for specific threat agent countermeasures based upon known achievable, do not address all threat agents, meet FDA criteria for IND approval only, and address U.S. military population only.</p>

<sup>1</sup> DOTLPF currently exists to support the issuance and administration of medical CBRN/TIM protective countermeasures by the force. However, DOTLPF does not adequately impose concise standards, supporting criteria, and metrics for the RD&E of medical CBRN/TIM protective countermeasures adequately protecting the force throughout the deployment cycle. DOTLPF does not address presymptomatic medical CBRN/TIM protective countermeasures by other than U.S. forces (includes MWAs, civilians, non-U.S. forces, etc.).

<sup>2</sup> Doctrine, policies, standards, and TTPs adequately address the management, eligibility, and administration of medical CBRN/TIM protective countermeasures by the force. Policies do not address the administration of medical CBRN/TIM protective countermeasures by or to other than U.S. forces (includes MWAs, civilians, non-U.S. forces, etc.).

<sup>3</sup> Standards and supporting criteria are established for specific biological agent countermeasures during the research and development process. However, the standards and criteria are often dependent upon the known achievable rather than a required level of protection. Standards and supporting criteria do not address all threat biological agents. Nor do standards and supporting criteria consider presymptomatic medical CBRN/TIM countermeasures by other than U.S. forces (includes MWAs, civilians, non-U.S. forces, etc.).

<sup>4</sup> Standards and supporting criteria are established during the research and development process for a specific countermeasure. However, current standards and supporting criteria do not address presymptomatic medical CBRN/TIM protective countermeasures by other than U.S. forces (includes MWAs, civilians, non-U.S. forces, etc.).

<sup>5</sup> Standards and supporting criteria are established during the research and development process. Medical CBRN/TIM countermeasures standards and supporting criteria do not exist for all threat chemical warfare agents. Further, standards and supporting criteria do not address presymptomatic medical CBRN/TIM protective countermeasures by other than U.S. forces (includes MWAs, civilians, non-U.S. forces, etc.).

<sup>6</sup> Medical CBRN/TIM countermeasures standards and supporting criteria do not exist for all high-threat TIC agents. TICs are a relatively recent consideration as a potential threat. Therefore, TICs are not currently addressed for presymptomatic medical CBRN/TIM protective countermeasures for the force. Further, standards and supporting criteria do not address presymptomatic medical CBRN/TIM protective countermeasures by other than U.S. forces (includes MWAs, civilians, non-U.S. forces, etc.).

<sup>7</sup> Medical CBRN/TIM countermeasures standards and supporting criteria do not exist for all high-threat TIB agents. TIB is a relatively recent consideration as a potential threat. Therefore, TIBs are not currently addressed for presymptomatic medical CBRN/TIM protective countermeasures for the force. Further, standards and supporting criteria do not address presymptomatic medical CBRN/TIM protective countermeasures by other than U.S. forces (includes MWAs, civilians, non-U.S. forces, etc.).

<sup>8</sup> Medical CBRN/TIM countermeasures standards and supporting criteria do not consider prominent endemic diseases for threat areas. Endemic disease prevention is considered a non-CBRN/TIM task. Standards and supporting criteria do not address presymptomatic medical CBRN/TIM protective countermeasures by other than U.S. forces (includes MWAs, civilians, non-U.S. forces, etc.).

<sup>9</sup> Medical CBRN/TIM countermeasures standards and criteria are designed for the force. Differing populations beyond the force profile are not considered. These absent populations include other than U.S. forces (includes MWAs, civilians, non-U.S. forces, etc.).

<sup>10</sup> Standards and supporting criteria do not define and address presymptomatic low-dose exposures and cumulative long-term effects.

<sup>11</sup> Metrics are established for specific biological agent countermeasures during the research and development process. However, the metrics are often dependent upon the known achievable rather than a required level of protection. Metrics do not address all threat biological agents. Nor do metrics consider presymptomatic medical CBRN/TIM countermeasures by other than U.S. forces (includes MWAs, civilians, non-U.S. forces, etc.).

<sup>12</sup> Metrics are established during the research and development process for a specific countermeasure. However, current metrics do not address presymptomatic medical CBRN/TIM protective countermeasures by other than U.S. forces (includes MWAs, civilians, non-U.S. forces, etc.).

<sup>13</sup> Metrics are established during the research and development process for a specific countermeasure. Medical CBRN/TIM countermeasures metrics do not exist for all threat chemical warfare agents. Further, metrics do not address presymptomatic medical CBRN/TIM protective countermeasures by other than U.S. forces (includes MWAs, civilians, non-U.S. forces, etc.).

<sup>14</sup> Medical CBRN/TIM countermeasures metrics do not exist for all high-threat TIC agents. TICs are a relatively recent consideration as a potential threat. Therefore, TICs are not currently addressed for presymptomatic medical CBRN/TIM protective countermeasures for the force. Further, metrics do not address presymptomatic medical CBRN/TIM protective countermeasures by other than U.S. forces (includes MWAs, civilians, non-U.S. forces, etc.).

<sup>15</sup> Medical CBRN/TIM countermeasures standards and supporting criteria do not exist for all high-threat TIB agents. TIB is a relatively recent consideration as a potential threat. Therefore, TIBs are not currently addressed for presymptomatic medical CBRN/TIM protective countermeasures for the force. Further, standards and supporting criteria do not address presymptomatic medical CBRN/TIM protective countermeasures by other than U.S. forces (includes MWAs, civilians, non-U.S. forces, etc.).

<sup>16</sup> Metrics are established during the research and development process for a specific countermeasure. However, the metrics are often dependent upon the known achievable rather than a required level of protection. The metrics must meet FDA criteria for approval. The metrics do not address presymptomatic medical CBRN/TIM protective countermeasures by other than U.S. forces (includes MWAs, civilians, non-U.S. forces, etc.).

<sup>17</sup> Metrics do not define and address presymptomatic low-dose exposures and cumulative long-term effects. Metrics are established during the research and development process for a specific countermeasure. However, the metrics are often dependent upon the known achievable rather than a required level of protection. Additionally, the application of a countermeasure is dependent upon detection and characterization of the agent for selection of the applicable countermeasure. The metrics do not address presymptomatic medical CBRN/TIM protective countermeasures by other than U.S. forces (includes MWAs, civilians, non-U.S. forces, etc.).

<sup>18</sup> Metrics do not define and address presymptomatic low-dose exposures and cumulative long-term effects.

<sup>19</sup> Metrics are established during the research and development process for a specific countermeasure. The metrics do not address presymptomatic medical CBRN/TIM protective countermeasures by other than U.S. forces (includes MWAs, civilians, non-U.S. forces, etc.). which may be different due to age and physical conditioning.

### 10.2.3 Functional Solution Analysis

#### 10.2.3.1 DOTLPF Assessment Summary

The deficiencies can be addressed with non-materiel solutions. Non-materiel solutions include development of an overarching set of standards, measures, criteria, and metrics for medical CBRND countermeasures against all threat CBRN/TIM agents. This overarching set should address other protected populations such as MWAs, eligible civilians, and non-U.S. forces and account for presymptomatic low-dose CBRN/TIM exposures and their potential cumulative long-term effects. Further, the determined set of standards, measures, criteria, and metrics must be based upon the true protection requirements of their targeted populations and not the known or believed achievable. Integration of these joint medical CBRND countermeasure standards, measures, criteria, and metrics into doctrine, policy, procedures, and TTPs provides the basis for development, acquisition, fielding, and employment of medical CBRND countermeasures.

1. **Deficiency:** Standards and supporting criteria do not address all threat biological agents  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application standards and criteria for protection against all threat biological agents.  
*Leadership:* Enforce compliance with established standards and criteria (see “Doctrine”).
2. **Deficiency:** Medical CBRN/TIM countermeasures standards and supporting criteria do not exist for all threat chemical warfare agents.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application standards and criteria for protection against all threat chemical warfare agents.  
*Leadership:* Enforce compliance with established metrics (see “Doctrine”) for standards and criteria.
3. **Deficiency:** Medical CBRN/TIM countermeasures metrics do not exist for all high-threat TIC agents.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application standards and criteria of metrics for standards and criteria for protection against all high-threat TIC agents. *Leadership:* Enforce compliance with established standards and criteria (see “Doctrine”).
4. **Deficiency:** TICs are not currently addressed for presymptomatic medical CBRN/TIM protective countermeasures for the force.  
**Non-Materiel Solutions:** *Doctrine:* Address presymptomatic medical CBRN/TIM protective countermeasures against TIB agents in doctrine, policy, and procedures.
5. **Deficiency:** Medical CBRN/TIM countermeasures standards and supporting criteria do not exist for all high-threat TIB agents.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards and criteria for all high-threat TIB agents. *Leadership:* Enforce compliance with established metrics (see “Doctrine”) for standards and criteria.

- 6. Deficiency:** The application of a countermeasure is dependent upon detection and characterization of the agent for selection of the applicable countermeasure.  
**Non-Materiel Solutions:** *Doctrine:* Development of doctrine and processes for the development of multivalent countermeasures, including protection for other than U.S. force members (e.g., eligible civilians, non-U.S. forces, MWAs, etc.).
- 7. Deficiency:** Metrics do not define and address presymptomatic low-dose exposures and cumulative long-term effects.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of metrics for low-dose exposure limits and cumulative long-term low-dose exposures. *Leadership:* Enforce compliance with established metrics (see “Doctrine”) for standards and criteria.
- 8. Deficiency:** Standards, supporting criteria, and metrics are often dependent upon the known achievable rather than a required level of protection.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures emphasis upon required levels of CBRN/TIM protection for development of standards, criteria, and metrics. *Leadership:* Enforce doctrine.
- 9. Deficiency:** Standards, supporting criteria, and metrics do not address administration of medical CBRN/TIM protective countermeasures to other than U.S. forces (includes MWAs, civilians, non-U.S. forces, etc.).  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures requirement to address the administration of medical CBRN/TIM protective countermeasures by other than U.S. forces (e.g., civilians, non-U.S. forces, MWAs, etc.). *Leadership:* Ensure standards, criteria, and metrics address the administration of medical CBRN/TIM protective countermeasures by other than U.S. forces (e.g., civilians, non-U.S. forces, MWAs, etc.).
- 10. Deficiency:** DOTLPPF does not adequately impose concise standards, supporting criteria, and metrics for the RD&E of medical CBRN/TIM protective countermeasures adequately protecting the force throughout the deployment cycle.  
**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, and procedures requirement for CBRN/TIM protective standards, criteria, and metric protecting the force through the deployment cycle. *Organization:* Establish organizational incentives to address CBRN/TIM protective standards, criteria, and metrics providing protection of the force throughout the deployment cycle. *Leadership:* Ensure standards, criteria, and metrics for CBRN/TIM medical prophylaxis RD&E are concise and adequately protect the force throughout the deployment cycle.
- 11. Deficiency:** DOTLPPF does not address presymptomatic medical CBRN/TIM protective countermeasures by other than U.S. forces (includes MWAs, civilians, non-U.S. forces, etc.).  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures requirement to address the administration, provision, and application of medical CBRN/TIM protective countermeasures by other than U.S. forces (e.g., civilians, non-U.S. forces, MWAs, etc.). *Organization:* Address organizational issues (e.g., who provides the equipment, support forces to train and equip, etc.) related to the provision of CBRN/TIM

protection to MWAs, eligible civilians, and non-U.S. forces. *Training:* Include MWAs and eligible civilians in CBRND training, exercises, and evaluations. Identify training requirements and responsibilities for non-U.S. forces. *Leadership:* Leadership awareness of criticality of MWD resources and increased dependence of military operations upon civilians. *Personnel:* Requirement eligible civilians supporting the mission meet minimum standards for safe use of CBRND resources.

#### **10.2.3.2 IMA Assessment Summary**

N/A

**10.3 Task SNSHLD 3: Establish standards, criteria, and procedures for training, equipping, and protecting force members and eligible civilians supporting the mission from threat CBRN/TIM agents****10.3.1 Functional Area Analysis****10.3.1.1 Definition**

To reduce the impact of CBRN/TIM releases or collateral release other than attack (ROTA) on U.S., allied, friendly, or nonaligned military forces and eligible civilians supporting the mission and military operations. Supports assistance to nations provided under military assistance and the family of engagement plans to eliminate weapons of mass destruction (WMD) vulnerabilities. Specifies common and interoperable standards addressing protection activities and resources. These include preparing forces (military and supporting eligible civilians) to survive and operate in threat CBRN/TIM environments and provision of clear and understandable procedures. The standards establish and define “eligible civilians supporting the mission,” and specify that these civilians shall possess equivalent protection afforded their military counterparts performing similar functions. The standards and procedures address the following:

- Training (formal and unit level) of personnel to survive and perform sustained operations within a CBRN/TIM environment.
- Equipping of units, personnel, and identified civilians for sustained operations within a toxic environment.
- Outlining protective equipment, medical measures, and other programs supporting survivability.
- Development of Shield professional resources.
- Specifying the conduct and evaluation of assessment exercises focused upon CBRN/TIM operations readiness.

**10.3.1.2 Derivation**

*Joint Enabling Concept for CBRN Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (SN 3.4.4, SN 4.3.4, SN 5.1.1, SN 6.1, SN 7.5, SN 9, SN 9.1.3, SN 9.2.1).*

**10.3.1.2.1 Supported Task: N/A****10.3.1.2.2 Lateral Task: SNSHA 3****10.3.1.2.3 Supporting Task: N/A****10.3.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Partially completed mission preparation. (C2.1.3)
2. Marginal to strong forces assigned. (C2.2.1)
3. Some interoperability. (C2.2.6)
4. Partial joint staff integration. (C2.3.1.1)
5. Partial multinational integration. (C2.3.1.2)

**Civil**

1. Correct interdepartmental/interagency relationships. (C3.1.1.3)

**10.3.2 Functional Needs Analysis****10.3.2.1 Capability and Deficiency Assessment Summary**

Table 10.3-1 discusses the only capability that currently exists to perform the task to the designated standard. CJCS/joint staff Medical promulgates and establishes joint Service baseline and comprehensive program, maximizing protection afforded by medical CBRN/TIM protective countermeasures, both short and long term, and does not adversely affect health and well-being.

**Current Capability and Deficiency**

Standards, criteria, and procedures are adequate for establishing and defining the military force, training of the military force for implementation of CBRND protective measures, and the provision of CBRN/TIM-protective IPE to the military force. Deficiencies include inadequate standards, criteria, and procedures to support sustained operations within a CBRN/TIM environment. Overall current assessment is “red.”

**Projected Near/Mid-Term Capability and Deficiency**

No change projected for this task.

**Projected Far-Term Capability and Deficiency**

No change projected for this task.

Table 10.3-1. SNSHLD 3: Capability and Deficiency Assessment

Capability: CJCS—Medical	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10
Current Overall Capability <sup>1</sup>	Y <sup>2</sup>	Y <sup>3</sup>	R <sup>4</sup>	R <sup>5</sup>	R <sup>4</sup>	Y <sup>6</sup>	R <sup>7</sup>	R <sup>8</sup>	R <sup>9</sup>	Y <sup>10</sup>
Near/Mid-Term Overall Capability	Y	Y	R	R	R	Y	R	R	R	Y
Far-Term Overall Capability	Y	Y	R	R	R	Y	R	R	R	Y

	FAA Measure	Scale
M1	Standards establish and define the force to include eligible civilians supporting the mission and military operations.	<p><b>G:</b> Standards establish and define, clearly and concisely, the force, including the defining and inclusion of eligible civilians supporting the mission/military operations.</p> <p><b>Y:</b> Standards are adequate for defining and establishing the military force, but does not adequately define eligible civilians supporting the mission/military operations and include them as a member of the force.</p> <p><b>R:</b> Standards do not or inadequately define the military force.</p>
M2	Standards address development of Shield professional resources.	<p><b>G:</b> Standards exist for Shield resources and provide for the continuing development of Shield professional resources within the joint and Service communities.</p> <p><b>Y:</b> Standards exist for Shield resources but do not adequately provide for the development of Shield professional resources within the joint and Service communities.</p> <p><b>R:</b> Standards do not exist for Shield resources and do not provide or are inadequate for the development of Shield professional resources within the joint and Service communities.</p>
M3	Standards address training personnel to operate in CBRN/TIM hazards.	<p><b>G:</b> Standards address the training and evaluation of all at-risk members (military members, eligible civilians, MWD, and non-U.S. force members) for the attainment and assessment of the skills, knowledge, and abilities to operate within CBRN/TIM hazards, including sustained operations.</p> <p><b>Y:</b> Standards are adequate for U.S. forces (military members, eligible civilians supporting the mission/operations, and MWD) to operate in CBRN/TIM hazards.</p> <p><b>R:</b> Standards are inadequate or do not address the training of all at-risk members and sustained operations within a CBRN/TIM environment.</p>
M4	Standards address equipping units and personnel for survival and sustained operations within a CBRN/TIM environment.	<p><b>G:</b> Standards provide clear and detailed guidance and requirements addressing the equipage of units and at-risk members for survival and sustained operations within a toxic and persistent CBRN/TIM environment.</p> <p><b>Y:</b> Standards are adequate and address the equipage of U.S. military units and personnel (including MWAs) for sustained operations within a CBRN/TIM environment.</p> <p><b>R:</b> Standards are inadequate or do not address the equipage of units and at-risk members to survive and operate within a sustained CBRN/TIM environment.</p>
M5	Force personnel are trained to operate in CBRN/TIM hazards.	<p><b>G:</b> Standards address the training and evaluation of all at-risk members (military members, eligible civilians, MWD, and non-U.S. force members) for the attainment and assessment of the skills, knowledge, and abilities to operate within CBRN/TIM hazards, including sustained operations.</p> <p><b>Y:</b> Standards are adequate for U.S. forces (military members, eligible civilians supporting the mission/operations, and MWD) to operate in CBRN/TIM hazards.</p> <p><b>R:</b> Standards are inadequate or do not address the training of all at-risk members and sustained operations within a CBRN/TIM environment.</p>

M6	Medical prophylaxis standards are established for personnel that might operate in a CBRN/TIM environment.	<b>G:</b> Medical CBRND countermeasure standards exist for all threat CBRN agents and encompass all eligible at-risk populations. <b>Y:</b> Medical CBRND countermeasure standards exist for selected high-threat CBRN agents for U.S. military members. <b>R:</b> Medical CBRND countermeasure standards are not established.
M7	Protective equipment is available for force personnel.	<b>G:</b> CBRND protective equipment is available for all at-risk force members, including nonmilitary members, and IPE is issued prior to entry into the Area of Responsibility (AOR). <b>Y:</b> CBRND protective equipment is available and IPE is issued to deploying military and MWAs prior to arrival within the AOR. <b>R:</b> CBRND protective equipment is not available for all force members (including eligible nonmilitary personnel and MWAs) prior to arrival within the AOR.
M8	All base/facility/units conduct annual CBRND exercises.	<b>G:</b> Annual CBRND exercises fully involve all personnel and activities, address sustained operations within a toxic CBRN/TIM environment, and involve all personnel and activities as integral participants. <b>Y:</b> Annual CBRND exercises fully involve direct mission personnel (military and eligible civilians directly supporting the mission) and MWAs, and address sustained operations within a toxic CBRN/TIM environment. <b>R:</b> Annual CBRND exercises are not conducted or do not address sustained operations within a CBRN/TIM environment, and do not fully integrate eligible at-risk civilians as participants.
M9	CBRND exercises fully integrate civilians supporting the mission.	<b>G:</b> CBRND exercises fully integrate all eligible civilians supporting the mission as exercise participants and are evaluated for their ability to perform their tasks in a toxic CBRN/TIM environment. <b>Y:</b> CBRND exercises integrate more than 50% of civilians supporting the mission as exercise participants and evaluate their ability to perform their tasks in a toxic CBRN/TIM environment. <b>R:</b> CBRND exercises integrate less than 50% of civilians supporting the mission as exercise participants and/or does not adequately evaluate their ability to perform their tasks in a toxic CBRN/TIM environment.
M10	DoD-level exercise evaluation criteria, including timing, type, content, and scoring.	<b>G:</b> Distinct DoD and joint exercise plans and evaluation requirements exist for sustained operations within a toxic CBRN/TIM environment. Service specific exercises and evaluations are developed based upon the DoD and joint plans and evaluation requirements. <b>Y:</b> DoD and joint exercise plans and evaluation requirements exist and include CBRN/TIM operations as components. Operations within a toxic CBRN/TIM environment are addressed in Service exercises and evaluations. <b>R:</b> DoD, joint, and Service-specific exercise plans and evaluation requirements are inadequate, do not exist, or do not address CBRN/TIM operations.

<sup>1</sup> DOTLPF exists for military forces. However, civilian personnel and operations supporting the mission are not adequately addressed. Sustained operations within a CBRN/TIM hazard is not adequately addressed in current DOTLPF.

<sup>2</sup> Standards are adequate for defining and establish the military force. However, the definition of eligible civilians supporting the mission/military operations and their inclusion as a member of the force is inadequate.

<sup>3</sup> Standards are inadequate for the development of Shield professional resources within the joint community and Services.

<sup>4</sup> Standards are adequate for training personnel to prepare for the implementation of protective measures upon notification of a CBRN/TIM hazard. However, training and evaluation for sustained operations within a CBRN/TIM hazard is inadequate. MWAs and nonmilitary personnel are not trained and considered for CBRN/TIM operations.

<sup>5</sup> Standards are inadequate for equipping units and personnel to survive and sustain operations within a CBRN/TIM environment. MWAs and nonmilitary personnel are not trained and considered for CBRN/TIM operations.

<sup>6</sup> Medical prophylaxis standards exist for a number of CBRN agents. The availability of medical countermeasures is dependent upon knowledge of the threat and logistical limitations. Medical prophylaxis standards are absent for many threat agents. Additionally, standards are threat agent specific and vary between prophylaxes. MWAs and nonmilitary personnel are not considered for CBRN/TIM prophylaxis.

<sup>7</sup> Adequate protective equipment is available for deploying force personnel. However, this equipment may not be issued to force members until arrival in the AOR. Additionally, no protective equipment is available for MWAs. Protective equipment for nonmilitary personnel is an issue.

<sup>8</sup> Base, facilities, and units are required to conduct CBRND exercises. However, these exercises do not fully involve all personnel and activities. Nor do they address sustained operations within a contaminated environment. Nonmilitary personnel, although potentially at risk, are not integrated as participants.

<sup>9</sup> Nonmilitary personnel, although potentially at risk, are not integrated as participants in CBRND exercises.

<sup>10</sup> Joint exercise plans include evaluation criteria, timing, type, content, and scoring. However, these are not the foundation for development of Service-specific exercise and evaluations. Additionally, there is a need for distinct CBRN/TIM-specific exercise/evaluations focusing upon sustained operations.

### 10.3.3 Functional Solution Analysis

#### 10.3.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies associated with standards, criteria, and procedures for training, equipping, and protecting the force from threat CBRN/TIM agents. The deficiencies can be addressed by non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section. Non-materiel solutions include defining and integrating eligible civilians supporting the mission/military operations into CBRND standards, criteria, doctrine, policy, and procedures for training, equipping, and protection. Similar integration of MWAs, particularly MWD, is identified as a deficiency. A full solution set supporting sustained operations within a CBRN/TIM environment includes the establishment in doctrine, policy, and procedures of sustained operations standards and the supporting training, equipping, exercising, and evaluation to prepare and enable the force. Analysis to determine standards for development of Shield professional resources and to equip forces for sustained operations within a CBRN/TIM environment; and RD&E for standards for prophylactic protection against threat agents for targeted populations are specified in the DOTLPF Assessment Summary.

1. **Deficiency:** The definition of eligible civilians supporting the mission/military operations and their inclusion as a member of the force is inadequate.

**Non-Materiel Solutions:** *Doctrine:* Define eligible civilians supporting the mission/military operations for CBRND and establish their inclusion in the force within doctrine, policy, procedures, and TTPs. *Organization:* Identify organizational services dependent upon civilians for mission/military operations success. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians supporting the mission/military operations and conduct CBRND training, exercised, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians supporting the mission/military operations. *Personnel:* Personnel meeting the definition of eligible civilians supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment.

2. **Deficiency:** Standards are inadequate for the development of Shield professional resources within the joint community and Services.

**Non-Materiel Solutions:** *Doctrine:* Doctrine, policies, and procedures for the development of Shield professional resources. *Organization:* Organizational structure facilitating and supporting development and application of Shield professional resources. *Training:* Establish training structure for the career development of Shield professional resources. *Leadership:* Ensure recognition of value of resource and provide management for development and application of Shield professional resource. *Personnel:* Personnel possessing the intellectual and physiological aptitudes to acquire, maintain, and apply the requisite knowledge, skills, abilities, and competencies of a career Shield professional resource. *Facilities:* Develop infrastructure and support for the development and support of Shield professional resources.

3. **Deficiency:** Standards are inadequate for equipping units and personnel to survive and sustain operations within a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the standards for sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force against the standards for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing skills to manage forces in these circumstances, and willingness to implement necessary changes and activities to prepare the force.

4. **Deficiency:** Training and evaluation for sustained operations within a CBRN/TIM hazard is inadequate.

**Non-Materiel Solutions:** *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing skills to manage forces in these circumstances, and willingness to implement and pursue necessary changes and activities to prepare the force

5. **Deficiency:** The availability of medical countermeasures is dependent upon knowledge of the threat and logistical limitations.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine and processes for development of multivalent countermeasures, including protection for other than U.S. force members (e.g., eligible civilians, non-U.S. forces, MWAs, etc.).

6. **Deficiency:** There is a lack of doctrine for risk management of forces operating in radiologically contaminated environments. Current guidance is based on cold-war assumptions and does not reflect modern threats and mission priorities.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policies, and procedures that address appropriate operationally oriented command dose levels for low-level radiation exposure based on mission priority across the range of military operations. *Training:* Train leaders and personnel on operationally oriented low-level radiation exposure control standards and procedures

7. **Deficiency:** There is a lack of doctrine and data supporting risk management of forces exposed to low-level chemical contamination.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policies, and procedures that address appropriate operationally oriented exposure limits and how to keep personnel from exceeding those limits using available detection and monitoring equipment and techniques. *Training:* Train leaders and personnel on operationally oriented low-level chemical exposure control standards and procedures.

8. **Deficiency:** Standards are threat agent specific and vary between prophylaxes.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of baseline standards for prophylactic CBRND protection against all threat agents. *Leadership:* Enforce compliance with established standards (see Footnote 20 above) for prophylactic CBRND protection.

- 9. Deficiency:** MWAs and nonmilitary personnel are not considered for CBRN/TIM prophylaxis and CBRN/TIM operations.

**Non-Materiel Solutions:** *Doctrine:* Doctrine, policy, and procedures addressing MWAs and nonmilitary personnel during CBRND operations and the provision of CBRND protection, including prophylaxis. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and nonmilitary personnel and conduct CBRND training, exercised, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWD and nonmilitary personnel.

- 10. Deficiency:** Base-, facility-, unit-level exercises do not fully involve all personnel and activities.

**Non-Materiel Solutions:** *Doctrine:* Doctrine, policy, and procedures requiring comprehensive participation and integration of all potentially affected personnel and activities in CBRND exercises. *Organization:* All affected entities are aware of and participate in comprehensive exercises. *Training:* All personnel (military and nonmilitary), as well as MWAs, are trained in CBRND and in the accomplishment of related tasks, as appropriate. *Leadership:* Recognition of the value of comprehensive exercises to enhance readiness, survival, and promote interaction between activities.

- 11. Deficiency:** Base-, facility-, unit-level exercises do not address sustained operations within a contaminated environment.

**Non-Materiel Solutions:** *Doctrine:* Incorporate sustained operations within a CBRN/TIM environment into doctrine, policy, and procedures. *Organization:* Ensure resources, taskings, and staff are in place or available to perform sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing skills to manage forces in these circumstances, and willingness to implement necessary changes and activities to prepare the force.

- 12. Deficiency:** Nonmilitary personnel, although potentially at risk, are not integrated as participants in CBRND exercises.

**Non-Materiel Solutions:** *Doctrine:* Address CBRND of nonmilitary personnel in doctrine, policy, and procedures; and include CBRND preparatory activities such as training and exercises. *Organization:* Identify organizational services performed by nonmilitary personnel. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for nonmilitary personnel and conduct CBRND training, exercised, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of nonmilitary personnel.

- 13. Deficiency:** Joint exercise plans are not the foundation for development of Service-specific exercise and evaluations.

**Non-Materiel Solutions:** *Doctrine:* Reinforce existing doctrine and policy for development of Service-specific exercises and evaluations based upon joint exercise plans. *Leadership:* Ensure joint exercise plans are used in the development of Service-specific exercises and evaluations.

**14. Deficiency:** There is a need for distinct CBRN/TIM-specific exercise/evaluations focusing upon sustained operations.

**Non-Materiel Solutions:** *Doctrine:* Incorporate sustained operations within a CBRN/TIM environment into doctrine, policy, and procedures and require specific exercising and evaluations for these operations. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing skills to manage forces in these circumstances, and willingness to implement necessary changes and activities to prepare the force.

**15. Deficiency:** Civilian personnel and operations supporting the mission are not adequately addressed.

**Non-Materiel Solutions:** *Doctrine:* Doctrine, policy, and procedures addressing civilian personnel and operations for CBRND. *Organization:* Identify organizational services and activities supporting the mission performed by civilian personnel and operations. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for civilian personnel and operations supporting the mission; and conduct CBRND training, exercised, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of civilian personnel and operations supporting the mission. *Personnel:* Civilian personnel and operations supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment.

**16. Deficiency:** Sustained operations within a CBRN/TIM hazard is not adequately addressed in current DOTLPF.

**Non-Materiel Solutions:** *Doctrine:* Address sustained operations within a CBRN/TIM environment into doctrine, policy, and procedures. *Organization:* Ensure resources, taskings, and staff are in place or available to perform sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing skills to manage forces in these circumstances, and willingness to implement necessary changes and activities to prepare the force.

#### 10.3.3.2 IMA Assessment Summary

N/A

## **10.4 Task SNSHLD 4: Establish standards, criteria, and procedures for training, equipping, and protecting eligible civilians not supporting the mission from threat CBRN/TIM agents**

### **10.4.1 Functional Area Analysis**

#### **10.4.1.1 Definition**

To reduce the impact of CBRN/TIM releases or collateral ROTA on U.S. and allied-, friendly-, or nonaligned-nation eligible civilians. Supports assistance to nations provided under military assistance and the family of engagement plans to eliminate WMD vulnerabilities. These eligible civilians may include

- detained civilians and evacuees,
- military dependents,
- indigenous or third-nation national labor pool, and
- other defined and identified civilians not addressed by SNSHLD 3.

Specifies common and interoperable standards addressing protection activities and resources. These include preparing non-mission support civilians (where possible) to survive in threat CBRN/TIM environments and providing clear and understandable procedures. The standards establish and define “civilians not supporting the mission” and specify the minimal level of protection enabling survival. The standards and procedures recognize the wide variance in body types, ages, and physical capabilities of the identified civilian populace. The standards and procedures address

- training of civilians to survive within a CBRN/TIM environment;
- equipping of identified civilians for survival operations within a toxic environment;
- outlining protective equipment, medical measures, and other programs supporting survivability; and
- specifying the conduct and evaluation of assessment exercises focused upon CBRN/TIM operations readiness that include these civilians where possible.

#### **10.4.1.2 Derivation**

*Joint Enabling Concept for CBRN/TIM Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (SN 3.4.4, SN 4.3.4, SN 5.1.1, SN 6.1, SN 7.5, SN 9, SN 9.1.3, SN 9.2.1).*

##### **10.4.1.2.1 Supported Task: N/A**

##### **10.4.1.2.2 Lateral Task: SNSHA 3**

##### **10.4.1.2.3 Supporting Task: N/A**

**10.4.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Partially completed mission preparation. (C2.1.3)
2. Marginal to strong forces assigned. (C2.2.1)
3. Some interoperability. (C2.2.6)
4. Partial joint staff integration. (C2.3.1.1)
5. Partial multinational integration. (C2.3.1.2)

**Civil**

1. Correct interdepartmental/interagency relationships. (C3.1.1.3)

**10.4.2 Functional Needs Analysis****10.4.2.1 Capability and Deficiency Assessment Summary**

Table 10.4-1 discusses the only capability that currently exists to perform the task to the designated standard. CJCS/joint staff promulgates, defines, and establishes a comprehensive program of CBRN/TIM defense for eligible non-mission support civilians including prophylaxis, training, equipment, processes, exercising and evaluation, and DOTLPF.

**Current Capability and Deficiency**

Procedures exist in Noncombatant Evacuation Operations plans for the selected provisioning of non-mission support civilians (primarily military dependents at high-threat area (HTA) fixed-site locations) with minimal protective equipment that is generally drawn from mission stocks or obtained via commercial off-the-shelf (COTS) sources. The Guardian Program is reviewing and assessing selected COTS assets for installation populace. The primary focus is currently upon first responders and is expected to expand to other personnel. Deficiencies include inadequate standards, criteria, and procedures for CBRND of non-mission support civilians. The overall current assessment is “red.”

**Projected Near/Mid-Term Capability and Deficiency**

The determination and procurement of selected COTS protective material will continue under the Guardian Program. However, types and quantities are under review and consideration. No other change is projected for this task.

**Projected Far-Term Capability and Deficiency**

No change is projected for this task.

Table 10.4-1. SNSHLD 4: Capability and Deficiency Assessment

Capability: CJCS—Joint Staff	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10

M1	Standards establish and define eligible civilians not supporting the mission and military operations.	<p><b>G:</b> Standards define and identify requirements for the protection of eligible civilians not supporting the mission and military operations for CBRND.</p> <p><b>Y:</b> Eligible civilians not supporting the mission and military operations are defined and generally addressed in CBRND standards.</p> <p><b>R:</b> Eligible civilians not supporting the mission and military operations are inadequately or not addressed and defined in CBRND standards.</p>
M2	Standards address training non-mission support civilians to operate in CBRN/TIM hazards.	<p><b>G:</b> CBRND training standards exist for eligible non-mission support civilians and establish specific requirements.</p> <p><b>Y:</b> CBRND training standards provide general requirements for CBRND training of eligible non-mission support civilians.</p> <p><b>R:</b> CBRND standards do not exist or are inadequate for CBRND training of eligible non-mission support civilians.</p>
M3	Standards address equipping non-mission support civilians for survival within a CBRN/TIM environment.	<p><b>G:</b> CBRND provisioning standards establish specific requirements for the provisioning of at-risk eligible non-mission support civilians with CBRND protective equipment and are address in CBRND planning.</p> <p><b>Y:</b> Plans establish requirements and exist for the provisioning of eligible non-mission support civilians with CBRND protective equipment and is primarily limited to Outside the Continental United States (OCONUS) HTAs.</p> <p><b>R:</b> Plans do not exist or do not establish CBRND requirements for the provisioning of eligible non-mission support civilians.</p>
M4	Standards and procedures address protection equipment for the full range of body types, ages, and physical capabilities inherent to the non-mission support civilian populace.	<p><b>G:</b> CBRND standards and procedures provide specific guidance and requirements for the provisioning of protective equipment to eligible non-mission support civilians and fully address the complete range of body types, ages, and physical capabilities within the population.</p> <p><b>Y:</b> CBRND standards and procedures are limited and general or address only the predominant characteristics of at-risk eligible non-mission support civilian populations.</p> <p><b>R:</b> Standards and procedures do not or inadequately address the full range of body types, ages, and physical capabilities within the at-risk eligible non-mission support civilian populace.</p>
M5	Standards established for medical prophylaxis for non-mission support civilians that might encounter a CBRN/TIM environment.	<p><b>G:</b> CBRND standards are established and address the characteristics (e.g., age, gender, medical condition, etc.) inherent within an eligible non-mission support civilian population.</p> <p><b>Y:</b> Force CBRND prophylactic standards are applied to a segment of an eligible at-risk non-mission support civilian population when determined essential by authorized medical authorities. Standard medical practices, modified as necessary by medical authorities, are applied when possible to protect other segments of the population.</p> <p><b>R:</b> CBRND prophylactic standards do not exist or cannot be applied for the protection of eligible non-mission support civilians.</p>

M6	Protective equipment available for non-mission support civilians for the full range of body types, ages, and physical capabilities inherent to the non-mission support civilian populace.	<p><b>G:</b> CBRND protective equipment is authorized and available for provisioning and survival of all members of an eligible at-risk non-mission support civilian population.</p> <p><b>Y:</b> CBRND protective equipment is available and provided for segments of an eligible at-risk non-mission support civilian population.</p> <p><b>R:</b> Authorized and available CBRND protective equipment is not existent or is inadequate for the protection of eligible at-risk non-mission support civilians.</p>
M7	Non-mission support civilians routinely at base/facility/unit are trained to operate in CBRN/TIM hazards.	<p><b>G:</b> Recurrent CBRND training is provided to eligible at-risk non-mission support civilians and is sufficient in depth and scope to promote survivability in a CBRN/TIM environment.</p> <p><b>Y:</b> Familiarization CBRND training is provided to eligible at-risk non-mission civilians upon entry into an OCONUS HTA and is limited in scope and/or depth.</p> <p><b>R:</b> CBRND training and/or training requirements of eligible at-risk civilians are inadequate or nonexistent for survival in a CBRN/TIM environment.</p>
M8	All base/facility/units conduct annual CBRND exercises.	<p><b>G:</b> Annual CBRND exercises address sustained operations within a toxic CBRN/TIM environment, and involve all personnel (military and civilian) and activities as integral participants.</p> <p><b>Y:</b> Annual CBRND exercises involve limited segments of an eligible at-risk non-mission support population and address sustained operations within a toxic CBRN/TIM environment.</p> <p><b>R:</b> Annual CBRND exercises are not conducted or do not address sustained operations within a CBRN/TIM environment, and do not generally integrate eligible at-risk non-mission civilians as participants.</p>
M9	CBRND exercises fully integrate civilians not supporting the mission.	<p><b>G:</b> CBRND exercise criteria establish and requires the integration of at-risk non-mission civilians as participants.</p> <p><b>Y:</b> CBRND exercise criteria provides for limited integration of at-risk non-mission civilians as participants.</p> <p><b>R:</b> CBRND exercises and exercise criteria do not generally integrate eligible at-risk non-mission civilians as participants.</p>
M10	DoD-level exercise evaluation criteria exist, including timing, type, content, and scoring.	<p><b>G:</b> Distinct DoD and joint exercise plans and evaluation requirements exist for sustained operations within a toxic CBRN/TIM environment. Service-specific exercises and evaluations are developed based upon the DoD and joint plans and evaluation requirements.</p> <p><b>Y:</b> DoD and joint exercise plans and evaluation requirements exist and include CBRN/TIM operations as components. Operations within a toxic CBRN/TIM environment are addressed in Service exercises and evaluations.</p> <p><b>R:</b> DoD, joint, and Service-specific exercise plans and evaluation requirements are inadequate, do not exist, or do not address CBRN/TIM operations.</p>

<sup>1</sup> DOTLPF exists for military forces. However, civilian personnel and operations are not adequately addressed.

<sup>2</sup> Standards are inadequate. Eligible civilians not supporting the mission and military operations are not defined and adequately addressed.

<sup>3</sup> Training of non-mission support civilians to operate in CBRN/TIM hazards are not addressed in standards.

<sup>4</sup> Noncombatant Evacuation Operations plans for selected areas include the provisioning of non-mission support civilians with minimal protective equipment; generally drawn from mission stocks or obtained through COTS. However, existing standards detailing eligibility, type of equipment, training, and other CBRN/TIM survival areas are inadequate or nonexistent.

<sup>5</sup> Standards and procedures addressing protection equipment for the range of body types, ages, and physical capabilities inherent within a potential protection population are inadequate or nonexistent. COTS protective equipment is being addressed as part of the Guardian Program and may provide some protective resources for protected populations.

<sup>6</sup> Standards for medical prophylaxis are developed for the force. They are inadequate or fail to address other potential protected populations.

<sup>7</sup> Military-provided protective equipment does not adequately address the range of body types, ages, and physical capabilities inherent within a civilian populace. COTS protective equipment is being addressed as part of the Guardian Program and may provide some protective resources for protected populations.

<sup>8</sup> Training is nonexistent or haphazard at best. Doctrine, policy, standards, procedures, and TTPs do not adequately address training of civilian personnel.

<sup>9</sup> Base, facilities, and units are required to conduct CBRND exercises. However, these exercises do not fully involve all personnel and activities. Nor do they address sustained operations within a contaminated environment. Nonmilitary personnel, although potentially at risk, are not integrated as participants.

<sup>10</sup> Non-mission support civilians are not generally integrated into CBRND exercises.

<sup>11</sup> Joint exercise plans include evaluation criteria, timing, type, content, and scoring. However, these are not the foundation for development of Service-specific exercise and evaluations. Additionally, there is a need for distinct CBRN/TIM-specific exercise/evaluations focusing upon sustained operations and the integration of civilian personnel.

### 10.4.3 Functional Solution Analysis

#### 10.4.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies associated with standards, criteria, and procedures for training, equipping, and protecting eligible civilians not supporting the mission/military operations from threat CBRN/TIM agents. The deficiencies can be addressed by non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section. Non-materiel solutions include defining and integrating eligible civilians not supporting the mission/military operations into CBRND standards, criteria, doctrine, policy, and procedures for training, equipping, and protection. Analysis and RD&E to determine standards for equipping eligible civilians not supporting the mission/military operations for survival in a CBRN/TIM environment and includes supporting training, exercising, and evaluation criteria and programs are specified in the DOTLPF Assessment Summary. Standards, criteria, doctrine, policy, and procedures for CBRND protection of eligible civilians not supporting the mission/military operations do not address the application of presymptomatic prophylaxis and do not adequately address protection for the range of body types, ages, and physical capabilities inherent within a civilian population. Nor is the potential for CBRND for sustained CBRN/TIM environments.

- 1. Deficiency:** Eligible civilians not supporting the mission and military operations are not defined and adequately addressed.

**Non-Materiel Solutions:** *Doctrine:* Define eligible civilians not support the mission/military operations for CBRND and address in doctrine, policy, procedures, and TTPs. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians not support the mission/military operations and conduct CBRN/TIM training, exercises, and evaluations, where appropriate. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians not supporting the mission/military operations.
- 2. Deficiency:** Training of non-mission support civilians to operate in CBRN/TIM hazards is not addressed in standards.

**Non-Materiel Solutions:** *Doctrine:* Establish CBRND training, exercise, and evaluation standards and criteria for eligible civilians not supporting the mission/military operations. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians not support the mission/military operations and conduct CBRN/TIM training, exercises, and evaluations, where appropriate. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians not supporting the mission/military operations.
- 3. Deficiency:** Existing standards detailing eligibility, type of equipment, training, and other CBRN/TIM survival areas are inadequate or nonexistent.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards for protection of eligible civilians not supporting the mission/military operations. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians not support the mission/military operations and

conduct CBRN/TIM training, exercises, and evaluations, where appropriate. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians not supporting the mission/military operations.

4. **Deficiency:** Standards and procedures addressing protection equipment for the range of body types, ages, and physical capabilities inherent within a potential protection population are inadequate or nonexistent.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards for protection of eligible civilians not supporting the mission/military operations addressing the variation within a potential protected population. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians not support the mission/military operations and conduct CBRN/TIM training, exercises, and evaluations, where appropriate. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians not supporting the mission/military operations.

5. **Deficiency:** Standards are inadequate or fail to address other potential protected populations.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards for protection of eligible civilians not supporting the mission/military operations addressing the variation within a potential protected population.

6. **Deficiency:** Military-provided protective equipment does not adequately address the range of body types, ages, and physical capabilities inherent within a civilian populace.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards for protection of eligible civilians not supporting the mission/military operations addressing the variation within a potential protected population. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians not support the mission/military operations and conduct CBRN/TIM training, exercises, and evaluations, where appropriate.

7. **Deficiency:** Doctrine, policy, standards, procedures, and TTPs do not adequately address training of civilian personnel.

**Non-Materiel Solutions:** *Doctrine:* Establish CBRND training, exercise, and evaluation standards and criteria for eligible civilians not supporting the mission/military operations. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians not support the mission/military operations and conduct CBRN/TIM training, exercises, and evaluations, where appropriate. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians not supporting the mission/military operations.

8. **Deficiency:** CBRND exercises do not fully involve all personnel and activities.

**Non-Materiel Solutions:** *Doctrine:* Doctrine, policy, and procedures requiring comprehensive participation and integration of all potentially affected personnel and activities in CBRND exercises. *Organization:* All affected entities are aware of and participate in comprehensive exercises. *Training:* All personnel (military and nonmilitary) are trained in appropriate CBRND protective measures. *Leadership:* Recognition of the value

of comprehensive exercises to enhance readiness, survival, and promote interaction between activities.

- 9. Deficiency:** CBRND exercises do not address sustained operations within a contaminated environment.

**Non-Materiel Solutions:** *Doctrine:* Incorporate sustained operations within a CBRN/TIM environment into doctrine, policy, and procedures. *Organization:* Ensure resources, taskings, and staff are in place or available to support civilians during sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate capabilities and activities for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality for potential sustained operations within a CBRN/TIM environment, raining providing skills to manage operations in these circumstances, and willingness to implement necessary changes and activities to prepare for sustained CBRND operations.

- 10. Deficiency:** Nonmilitary personnel, although potentially at risk, are not integrated as participants in CBRND exercises.

**Non-Materiel Solutions:** *Doctrine:* Address CBRND of nonmilitary personnel in doctrine, policy, and procedures; and include CBRND preparatory activities such as training and exercises. *Organization:* Identify organization services required to support eligible civilians not supporting the mission/military operations. *Training:* Establish CBRND training, exercise, and evaluation standards, criteria, and programs for eligible civilians not supporting the mission/military operations. *Leadership:* Implement and manage CBRND training, equipping, protection, and exercising of eligible civilians not supporting the mission/military operations.

- 11. Deficiency:** DoD-level exercise evaluation criteria are not the foundation for development of Service-specific exercise and evaluations.

**Non-Materiel Solutions:** *Doctrine:* Reinforce existing doctrine and policy for development of Service-specific exercises and evaluations based upon joint exercise plans. *Leadership:* Ensure joint exercise plans are used in the development of Service-specific exercises and evaluations.

- 12. Deficiency:** There is a need for distinct CBRN/TIM-specific exercise/evaluations focusing upon sustained operations and the integration of civilian personnel.

**Non-Materiel Solutions:** *Doctrine:* Incorporate sustained operations within a CBRN/TIM environment, integrating eligible civilians not supporting the mission/military operations, into doctrine, policy, and procedures and require specific exercising and evaluations for these operations. *Training:* Train, exercise, and evaluate for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality for potential sustained operations within a CBRN/TIM environment, raining providing skills to manage operations in these circumstances, and willingness to implement necessary changes and activities to prepare for sustained CBRND operations.

- 13. Deficiency:** Civilian personnel and operations are not adequately addressed in DOTLPPF.

**Non-Materiel Solutions:** *Doctrine:* Doctrine, policy, and procedures addressing civilian personnel and operations for CBRND. *Organization:* Identify organization services and

activities necessary to support survivability of civilian personnel within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for civilian personnel and operations not supporting the mission/military operations; and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilian personnel not supporting the mission/military operations.

#### **10.4.3.2 IMA Assessment Summary**

N/A

**10.5 Task SNSHLD 5: Establish standards, criteria, and procedures for training, equipping, and protecting MWAs from threat CBRN/TIM agents****10.5.1 Functional Area Analysis****10.5.1.1 Definition**

To reduce the impact of CBRN/TIM releases or collateral ROTA on U.S. and allied-, friendly-, or nonaligned-nation MWAs. Standards and procedures address common and interoperable requirements and criteria for training (formal and unit level) of handlers and MWAs, particularly military working dogs (MWDs), to survive within a CBRN/TIM environment. The standards establish and define MWAs and specify the minimal level of protection required for MWDs and military working equines (MWEs). The standards for MWE further identify the circumstances in which protection is afforded against CBRN/TIM agents. The standards address the equipping of MWA-using units, handlers, and MWAs with MWA protective systems (individual and collective) for sustained survival within a CBRN/TIM environment. These include protective measures (materiel and nonmateriel) supporting operational requirements and affording MWA protection against expected threats. Standards and procedures outline protective equipment, medical/veterinary measures, and other programs supporting survivability, and specify the conduct and evaluation of assessment exercises that are focused upon CBRND operations to ensure readiness.

**10.5.1.2 Derivation**

*Joint Enabling Concept for CBRN/TIM Operations, Protection Joint Functional Concept, UJTL (SN 3.4.4, SN 4.3.4, SN 5.1.1, SN 6.1, SN 7.5, SN 9, SN 9.1.3, SN 9.2.1).*

**10.5.1.2.1 Supported Task: N/A****10.5.1.2.2 Lateral Task: SNSHA 3****10.5.1.2.3 Supporting Task: N/A****10.5.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Partially completed mission preparation. (C2.1.3)
2. Marginal to strong forces assigned. (C2.2.1)
3. Some interoperability. (C2.2.6)

4. Partial joint staff integration. (C2.3.1.1)
5. Partial multinational integration. (C2.3.1.2)

### **Civil**

1. Correct interdepartmental/interagency relationship. (C3.1.1.3)

## **10.5.2 Functional Needs Analysis**

### **10.5.2.1 Capability and Deficiency Assessment Summary**

Table 10.5-1 discusses the absence of standards, criteria, and procedures for training, equipping, and protecting MWAs from threat CBRN/TIM agents. CJCS/joint staff promulgates and establishes comprehensive program of CBRN/TIM defense for MWAs including prophylaxis, training, equipment, processes, exercising and evaluation, and DOTLPF.

#### **Current Capability and Deficiency**

No capability. Deficiencies include the lack of CBRND protection of MWAs, particularly MWD. The overall current capability is “red.”

#### **Projected Near/Mid-Term Capability and Deficiency**

No change is projected for this task.

#### **Projected Far-Term Capability and Deficiency**

No change is projected for this task.

Table 10.5-1. SNSHLD 5: Capability and Deficiency Assessment

Capability: CJCS—Joint Staff	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10	M11	M12
Current Overall Capability <sup>1</sup>	R <sup>2</sup>	R <sup>2</sup>	R <sup>3</sup>	R <sup>3</sup>	R <sup>2</sup>	R <sup>4</sup>	R <sup>5</sup>	R <sup>6</sup>	R <sup>7</sup>	R <sup>8</sup>	R <sup>9</sup>	Y <sup>10</sup>

Far-Term Overall Capability	R	R	R	R	R	R	R	R	R	R	R	Y

	FAA Measure	Scale
M1	Standards establish and define MWAs.	<b>G:</b> Standards define and specify CBRND requirements for all MWAs. <b>Y:</b> Standards define and specify CBRND requirements for predominant MWAs. <b>R:</b> CBRND standards are nonexistent or inadequately address MWAs.
M2	Standards address training MWA handlers and MWAs to survive CBRN/TIM hazards.	<b>G:</b> CBRND training standards detail requirements enabling survival of all MWAs. <b>Y:</b> CBRND training standards specify requirements enabling survival of predominant MWAs. <b>R:</b> CBRND training standards are nonexistent or inadequately address MWAs.
M3	Standards and procedures address equipping MWAs for survival within a CBRN/TIM environment.	<b>G:</b> CBRND standards address equipping all MWAs for survival. <b>Y:</b> CBRND standards and procedures specify equipment promoting survival of predominant MWAs. <b>R:</b> CBRND equipment standards and procedures are nonexistent or inadequately address survival of MWAs.
M4	Standards and procedures specifically address MWD protection and survival within a CBRN/TIM environment.	<b>G:</b> CBRND standards and procedures specify requirements and provide detailed guidance enabling survival of MWDs. <b>Y:</b> CBRND standards and procedures provide general guidance and requirements for survival of MWDs. <b>R:</b> CBRND standards and procedures do not address or are inadequate for survival of MWDs.
M5	Standards established for medical prophylaxis for MWAs that might encounter a CBRN/TIM environment.	<b>G:</b> CBRND medical prophylaxis standards for MWAs provide a minimum protection equivalent to protection afforded handlers. <b>Y:</b> CBRND medical prophylaxis standards for MWAs are limited and/or do not provide the equivalent level of protection as handlers. <b>R:</b> CBRND medical prophylaxis standards for MWAs are nonexistent or are inadequate.
M6	Protective equipment is available for MWAs.	<b>G:</b> CBRND protective equipment is available, allocated, and provides protection equivalent to handlers. <b>Y:</b> CBRND protective equipment for MWAs is allocated and limited to selected circumstances of protection (e.g., collective protection [COLPRO] for kenneling or IPE when away from COLPRO). <b>R:</b> CBRND protective equipment for MWAs is nonexistent or is inadequate.
M7	All MWA handlers and MWAs are trained to operate in CBRN/TIM hazards.	<b>G:</b> All MWAs and handlers are trained to promote survival in a toxic CBRN/TIM environment. <b>Y:</b> Predominant species MWAs and handlers are trained to promote survival in a toxic CBRN/TIM environment. <b>R:</b> MWA training for CBRND is nonexistent or inadequate.

M8	All base/facility/units conduct annual CBRND exercises.	<b>G:</b> Annual CBRND exercises address sustained operations within a toxic CBRN/TIM environment and involve all personnel (military and civilian), MWAs, and activities as integral participants. <b>Y:</b> Annual CBRND exercises provide for limited MWA participation and address sustained operations within a toxic CBRN/TIM environment. <b>R:</b> Annual CBRND exercises are not conducted or do not address sustained operations within a CBRN/TIM environment, and do not realistically integrate MWAs.
M9	CBRND exercises fully integrate MWA handlers and MWAs.	<b>G:</b> CBRND exercises fully and realistically integrate MWAs and handlers. <b>Y:</b> CBRND exercises provide for limited integration of MWAs and handlers. <b>R:</b> CBRND exercises do not integrate or inadequately involve MWA handlers and MWAs.
M10	DoD-level policy exists for CBRN/TIM protection of MWAs.	<b>G:</b> DoD-level policies, procedures, and requirements for CBRND establish baseline minimums for MWA protection promoting survivability and continued resource application when and as appropriate. <b>Y:</b> DoD-level policies, procedures, and requirements for MWA CRND provide adequate guidance for protection of predominant MWAs. <b>R:</b> DoD-level policies, procedures, and requirements for CBRND of MWAs are nonexistent or inadequate.
M11	DoD-level training standards exist for CBRN/TIM protection for MWAs.	<b>G:</b> DoD-level CBRND training standards detail requirements enabling survival of all MWAs. <b>Y:</b> DoD-level CBRND training standards specify requirements enabling survival of predominant MWAs. <b>R:</b> DoD-level CBRND training standards are nonexistent or inadequately address MWAs.
M12	DoD-level exercise evaluation criteria exist, including timing, type, content, and scoring.	<b>G:</b> Distinct DoD and joint exercise plans and evaluation requirements exist for sustained operations within a toxic CBRN/TIM environment. Service-specific exercises and evaluations are developed based upon the DoD and joint plans and evaluation requirements. <b>Y:</b> DoD and joint exercise plans and evaluation requirements exist and include CBRN/TIM operations as components. Operations within a toxic CBRN/TIM environment are addressed in Service exercises and evaluations. <b>R:</b> DoD, joint, and Service-specific exercise plans and evaluation requirements are inadequate, do not exist, or do not address CBRN/TIM operations.

<sup>1</sup> There is not effective DOTLPF in place to conduct this task.

<sup>2</sup> CBRN/TIM defense standards do not adequately address, or are nonexistent, for MWAs.

<sup>3</sup> CBRN/TIM defense standards and procedures do not adequately address, or are nonexistent, for MWAs.

<sup>4</sup> Protective equipment does not exist for MWAs.

<sup>5</sup> MWAs are not equipped and trained to operate in, or survive, CBRN/TIM hazards.

<sup>6</sup> Base, facilities, and units are required to conduct CBRND exercises. However, these exercises do not fully involve all personnel and activities. Nor do they address sustained operations within a contaminated environment. MWAs (particularly MWDs), although potentially at risk, are not integrated as participants.

<sup>7</sup> MWAs are not equipped and trained to operate in, or survive, CBRN/TIM hazards.

<sup>8</sup> DoD-level policies do not adequately address, or are nonexistent, for CBRN/TIM protection of MWAs.

<sup>9</sup> DoD-level training standards do not adequately address, or are nonexistent, for CBRN/TIM protection of MWAs.

<sup>10</sup> Joint exercise plans include evaluation criteria, timing, type, content, and scoring. However, these are not the foundation for development of Service-specific exercises and evaluations. Additionally, there is a need for distinct CBRN/TIM-specific exercises/evaluations focusing upon sustained operations and the integration of MWAs.

### 10.5.3 Functional Solution Analysis

#### 10.5.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies associated with standards, criteria, and procedures for training, equipping, and protecting MWAs from threat CBRN/TIM agents. The deficiencies can be addressed by non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section. Non-materiel solutions focus upon the establishment and operation of a CBRND programmatic area for MWAs with emphasis upon MWDs. CBRND standards, criteria, doctrine, policy, procedures, and TTPs fail to address the protection and survival of these assets. CBRND protective assets (including presymptomatic prophylaxis, individual protection, and collective protection) are not available or programmed. CBRND training, exercising, and evaluation do not include the protection of MWAs. The inability to ensure survivability of MWAs, particularly MWD, until relocated outside of the hazard area, to collective protection, or the hazard is resolved—not to continue operations within the hazard—is the core deficiency.

1. **Deficiency:** CBRN/TIM defense standards and procedures do not adequately address, or are nonexistent, for MWAs, particularly MWDs.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, standards, and procedures CBRND protection of MWAs, particularly MWDs.

2. **Deficiency:** Protective equipment does not exist for MWAs.

**Non-Materiel Solutions:** *Doctrine:* Develop plan for acquisition of CBRND protective equipment for MWDs.

3. **Deficiency:** MWAs are not equipped and trained to operate in, or survive, CBRN/TIM hazards.

**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of MWAs and training for CBRN/TIM environment survival. *Organization:* Ensure organizational consideration for maintenance and support of MWA CBRND protective equipment, measures, and activities. *Training:* Institutional and unit training of handlers and MWAs for CBRND measures and activities is required. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for MWA survivability. *Facilities:* Develop supporting infrastructure for MWA CBRND (e.g., logistics, veterinary surveillance, etc.).

4. **Deficiency:** CBRND exercises do not fully involve all personnel and activities.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures requiring comprehensive participation and integration of all potentially affected personnel, MWAs, and activities in CBRND exercises. *Organization:* Ensure that all affected entities are aware of and participate in comprehensive CBRND exercises. *Training:* Ensure that all personnel (military and nonmilitary) and MWAs are trained in appropriate CBRND protective measures. *Leadership:* Ensure recognition of the value of comprehensive exercises including MWAs to enhance readiness, survival, and promote interaction between activities.

5. **Deficiency:** CBRND exercises do not address sustained operations within a contaminated environment.

**Non-Materiel Solutions:** *Doctrine:* Incorporate sustained operations within a CBRN/TIM environment into doctrine, policy, and procedures. *Organization:* Ensure resources, taskings, and staff are in place or available to support MWAs during sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate capabilities and protective activities for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality for potential sustained operations within a CBRN/TIM environment, impact upon MWA availability, and training providing skills to manage operations in these circumstances, and willingness to implement necessary changes and activities to prepare for sustained CBRND operations.

6. **Deficiency:** MWAs (particularly MWDs), although potentially at risk, are not integrated as participants in CBRND exercises addressing sustained operations within a contaminated environment.

**Non-Materiel Solutions:** *Doctrine:* Address CBRND of MWAs, with emphasis on MWDs, in doctrine, policy, and procedures and include CBRND preparatory activities such as training and exercises. *Organization:* Identify organization services required to support MWAs, with emphasis on MWDs, during sustained operations within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation standards, criteria, and programs for MWAs, with emphasis on MWDs. *Leadership:* Implement and manage CBRND training, equipping, protection, and exercising of MWAs, with emphasis on MWDs.

7. **Deficiency:** DoD-level policies do not adequately address, or are nonexistent, for CBRN/TIM protection of MWAs.

**Non-Materiel Solutions:** *Doctrine:* Establish in DoD-level doctrine, policies, and guidance CBRND protective measures and activities for MWAs. *Leadership:* Awareness of criticality of MWAs for mission support and the conduct of operations and the need for MWD CBRND protective equipment, measures, and activities.

8. **Deficiency:** DoD-level exercise evaluation criteria are not the foundation for development of Service-specific exercise and evaluations.

**Non-Materiel Solutions:** *Doctrine:* Reinforce existing doctrine and policy for development of Service-specific exercises and evaluations based upon joint exercise plans and include MWA CBRND measures and activities. *Leadership:* Ensure joint exercise plans are used in the development of Service-specific exercises and evaluations.

9. **Deficiency:** There is a need for distinct CBRN/TIM-specific exercise/evaluations focusing upon sustained operations and the integration of MWAs.

**Non-Materiel Solutions:** *Doctrine:* Incorporate sustained operations within a CBRN/TIM environment, integrating MWAs, into doctrine, policy, and procedures and require specific exercising and evaluations for these operations. *Training:* Train, exercise, and evaluate for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality for potential sustained operations within a CBRN/TIM environment, impact upon MWA availability, and training providing skills to manage operations in these circumstances and

willingness to implement necessary changes and activities to prepare for sustained CBRND operations.

**10. Deficiency:** There is not effective DOTLPF in place to conduct this task.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing MWAs and operations for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of MWAs within a CBRN/TIM environment.

*Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and MWA operations and conduct CBRND training, exercises, and evaluations.

*Leadership:* Implement and manage CBRND training, equipping, and protection of MWAs.

*Facilities:* Develop supporting infrastructure for MWA CBRND (e.g., logistics, veterinary surveillance, etc.).

#### **10.5.3.2 IMA Assessment Summary**

N/A

**10.6 Task SNSHLD 6: Establish standards, criteria, and procedures for training, equipping, and protecting all classes of supplies from contamination by threat CBRN/TIM agents****10.6.1 Functional Area Analysis****10.6.1.1 Definition**

To reduce the impact of CBRN/TIM releases or collateral ROTA on U.S. and allied-, friendly-, or nonaligned-nation military equipment and supplies. Specifies common and interoperable standards addressing protection activities and resources for all classes of supplies. These include preparing forces to protect and apply equipment and supplies within threat CBRN/TIM environments and the provision of clear and understandable procedures. Resource protection includes the application of tailored protection to distinct equipment. The standards and procedures address

- training (formal and unit level) of personnel to apply CBRN/TIM protection to equipment and supplies to prevent contamination,
- equipping of units and identified equipment for operations within a CBRN/TIM environment, and
- specifying the conduct and evaluation of assessment exercises focused upon CBRND operations readiness.

**10.6.1.2 Derivation**

*Joint Enabling Concept for CBRN/TIM Operations, Protection Joint Functional Concept, UJTL (SN 1.1.6, SN 1.2.3, SN 3.3.6, SN 3.4.4, SN 4.3.3, SN 5.2.3, SN 6.1, SN 7.5, SN 9, SN 9.1.2, SN 9.2.1, SN 9.2.2).*

**10.6.1.2.1 Supported Task: N/A****10.6.1.2.2 Lateral Task: SNSHA 3****10.6.1.2.3 Supporting Task: N/A****10.6.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Partially completed mission preparation. (C2.1.3)

2. Marginal to strong forces assigned. (C2.2.1)
3. Some interoperability. (C2.2.6)
4. Partial joint staff integration. (C2.3.1.1)
5. Partial multinational integration. (C2.3.1.2)

### **Civil**

1. Correct interdepartmental/interagency relationships. (C3.1.1.3)

## **10.6.2 Functional Needs Analysis**

### **10.6.2.1 Capability and Deficiency Assessment Summary**

Table 10.6-1 discusses the only capability that exists to perform the task to the designated standard. CJCS/joint staff promulgates and establishes the program of CBRN/TIM defense measures for equipment and supplies including coverings, training, coatings, materials, processes, exercising and evaluation, and DOTLPF.

### **Current Capability and Deficiency**

Protection policies, standards, and criteria exist for CBRND protection of equipment and supplies but are generally limited to the housing of materiel in structures, two protective coatings designed for combat vehicles, the application of layers of plastic wrap for cargo in transit, and limited specific-purpose packagings. Deficiencies include inadequate or nonexistent interoperable standards, criteria, and procedures for the protection of all classes of supply. Overall current capability is “red.”

### **Projected Near/Mid-Term Capability and Deficiency**

No change projected for this task.

### **Projected Far-Term Capability and Deficiency**

No change projected for this task.

Table 10.6-1. SNSHLD 6: Capability and Deficiency Assessment

Capability: CJCS—Joint Staff	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10	M11	M12	M13

	FAA Measure	Scale
M1	Standards and procedures in place for protection of equipment and supplies from CBRN/TIM contamination.	<p><b>G:</b> Established and applied standards and procedures provide clear and detailed guidance and requirements addressing the protection of equipment and supplies against contamination during sustained operations within a persistent CBRN/TIM environment.</p> <p><b>Y:</b> Standards and procedures are adequate and address the protection of critical equipment and supplies against contamination during sustained operations within a CBRN/TIM environment.</p> <p><b>R:</b> Standards and procedures are inadequate or nonexistent for the protection of equipment and supplies against CBRN/TIM contamination.</p>
M2	Common and interoperable standards exist for handling exposed and contaminated equipment and supplies.	<p><b>G:</b> Overarching single set of standards specify common and interoperable requirements and measures for the marking and handling of exposed and/or contaminated equipment and supplies and details required protective measures for tasked personnel and units.</p> <p><b>Y:</b> General joint standards establish common guidelines for the marking and handling of exposed and/or contaminated equipment and supplies and identifies protective measures for tasked personnel and units.</p> <p><b>R:</b> Common and interoperable standards are inadequate or nonexistent for the marking and handling of exposed and/or contaminated equipment and supplies, and to identify protective measures for tasked personnel and units.</p>
M3	Common and interoperable standards exist for safe application involved in protection of equipment and supplies.	<p><b>G:</b> Overarching single set of standards specify common and interoperable requirements and measures for the safe use of exposed and/or contaminated equipment and supplies and details required protective measures for applying personnel and units.</p> <p><b>Y:</b> General joint standards establish common guidelines for the safe use of exposed and/or contaminated equipment and supplies and identifies protective measures for applying personnel and units.</p> <p><b>R:</b> Common and interoperable standards are inadequate or nonexistent for the safe use of exposed and/or contaminated equipment and supplies, and to identify protective measures for applying personnel and units.</p>
M4	Common and interoperable standards exist for transporting exposed and contaminated equipment and supplies.	<p><b>G:</b> Overarching single set of standards specify common and interoperable requirements and measures for the safe transport of exposed and/or contaminated equipment and supplies and details required protective measures for transporting personnel, transport resources, and units.</p> <p><b>Y:</b> General joint standards establish common guidelines for the safe transport of exposed and/or contaminated equipment and supplies and identifies protective measures for transporting personnel, transport resources, and units.</p> <p><b>R:</b> Common and interoperable standards are inadequate or nonexistent for the safe transport of exposed and/or contaminated equipment and supplies, and to identify protective measures for transporting personnel, transport resources, and units.</p>

M5	Standards address training units and personnel to protect equipment and supplies from CBRN/TIM hazards.	<p><b>G:</b> Training standards address the protection of all equipment and supplies, including assets not stored within facilities and tents, against contamination during sustained operations within a persistent CBRN/TIM environment.</p> <p><b>Y:</b> Training standards address the protection of critical equipment and supplies, including assets not stored within facilities and tents, against contamination during sustained operations within a CBRN/TIM environment.</p> <p><b>R:</b> Training standards are nonexistent or limited and/or inadequate for the protection of equipment and supplies, including assets not stored within facilities and tents, against CBRN/TIM contamination.</p>
M6	Standards and procedures address equipping distinct assets with tailored protection for a CBRN/TIM environment.	<p><b>G:</b> Overarching single set of standards specify common and interoperable requirements and measures for the identification and evaluation of at-risk assets (e.g., palletized cargo, aircraft support equipment, etc.) for mandatory equipment with tailored protection (e.g., asset-specific coverings, etc.) and the provision of procedures for their application against CBRN/TIM contamination.</p> <p><b>Y:</b> Common guidelines are established for the provision of tailored protection of critical assets against CBRN/TIM contamination.</p> <p><b>R:</b> Common and interoperable standards are inadequate or nonexistent for the provision of tailored CBRN/TIM protection of distinct assets.</p>
M7	Standards and procedures established for CBRN/TIM protective packing, containerizing, packaging, covering, and coating for equipment and supplies that might encounter contamination within a CBRN/TIM environment.	<p><b>G:</b> Standards and procedures address the application of CBRN protective barrier movement and storage materials (e.g., packaging, coverings, coatings, etc.) to all equipment and supplies, including assets not generally stored within facilities and tents, against potential contamination during sustained operations within a persistent CBRN/TIM environment.</p> <p><b>Y:</b> Standards and procedures address the use of CBRN protective barrier movement and storage materials to critical equipment and supplies, including assets not stored within facilities and tents, against potential contamination during sustained operations within a CBRN/TIM environment.</p> <p><b>R:</b> Standards and procedures are nonexistent or limited and/or inadequate for the protection of equipment and supplies, including assets not stored within facilities and tents, against CBRN/TIM contamination.</p>
M8	Protective packing, containers, packaging, covering, and coatings available for all equipment and supplies.	<p><b>G:</b> CBRN protective barrier movement and storage materials (e.g., packaging, coverings, coatings, etc.) are stockpiled and readily available for the protection of all equipment and supplies potentially subject to exposure/contamination throughout sustained operations within a CBRN/TIM environment.</p> <p><b>Y:</b> CBRN protective barrier movement and storage materials (e.g., packaging, coverings, coatings, etc.) are available for the protection of critical assets throughout sustained operations within a CBRN/TIM environment.</p> <p><b>R:</b> CBRN protective barrier movement and storage materials (e.g., packaging, coverings, coatings, etc.) are inadequate or nonexistent to protect equipment and supplies against contamination within a CBRN/TIM environment.</p>
M9	All force personnel are trained to operate in CBRN/TIM hazards using contaminated and uncontaminated assets.	<p><b>G:</b> Overarching single set of training standards specify common and interoperable requirements for the safe handling and application of contaminated and uncontaminated equipment/supplies during sustained operations within a CBRN/TIM environment.</p> <p><b>Y:</b> General joint training standards establish common guidelines for the safe use of uncontaminated and/or contaminated equipment and supplies within a CBRN/TIM environment and identifies protective measures for applying personnel and units.</p> <p><b>R:</b> Common and interoperable training standards are inadequate or nonexistent for the safe use of uncontaminated and/or contaminated equipment and supplies within a CBRN/TIM environment.</p>

M10	All base/facility/units conduct annual CBRND exercises.	<p><b>G:</b> Annual CBRND exercises fully integrate all personnel and activities and address sustained operations within a CBRN/TIM environment and includes the protection and, when appropriate, application of contaminated or exposed material involving all classes of equipment and material.</p> <p><b>Y:</b> Annual CBRND exercises fully involve military and direct mission civilian support personnel/functions and address sustained operations within a toxic CBRN/TIM environment, to include the protection and application of exposed/contaminated critical equipment and material.</p> <p><b>R:</b> Annual CBRND exercises are not conducted or do not address sustained operations within a CBRN/TIM environment, and do not generally integrate the protection and application of exposed/contaminated equipment and material.</p>
M11	DoD-level policies exist for CBRN/TIM protection of equipment and supplies.	<p><b>G:</b> DoD-level policies, procedures, and requirements for CBRND establish baseline minimums for the protection of equipment and supplies, including assets which may not be sheltered, against exposure/contamination during sustained operations within a toxic CBRN/TIM environment.</p> <p><b>Y:</b> DoD-level policies, procedures, and requirements for protection of equipment and supplies provide adequate guidance for the critical assets against exposure/contamination during sustained operations within a toxic CBRN/TIM environment.</p> <p><b>R:</b> DoD-level policies, procedures, and requirements for CBRND of equipment and supplies are nonexistent or inadequate.</p>
M12	DoD-level training standards exist for CBRN/TIM protection of equipment and supplies.	<p><b>G:</b> DoD-level CBRND training standards detail requirements and measures for protection of all equipment and supplies against CBRN/TIM exposure/contamination.</p> <p><b>Y:</b> DoD-level CBRND training standards specify requirements and measures for protection of critical equipment and supplies against CBRN/TIM exposure/contamination.</p> <p><b>R:</b> DoD-level CBRND training standards are nonexistent or inadequately address the protection of equipment and supplies against CBRN/TIM exposure/contamination.</p>
M13	DoD-level exercise evaluation criteria, including timing, type, content, and scoring.	<p><b>G:</b> Distinct DoD and joint exercise plans and evaluation requirements exist for sustained operations within a toxic CBRN/TIM environment and incorporates the protection and, when appropriate, application of contaminated or exposed material involving all classes of equipment and material. Service-specific exercises and evaluations are developed based upon the DoD and joint plans and evaluation requirements.</p> <p><b>Y:</b> DoD and joint exercise plans and evaluation requirements exist and include CBRN/TIM operations as components. Exercise criteria includes exposed and/or contaminated equipment and/or supplies. Operations within a toxic CBRN/TIM environment are addressed in Service exercises and evaluations.</p> <p><b>R:</b> DoD, joint, and Service-specific exercise plans and evaluation requirements are inadequate, do not exist, or do not address CBRN/TIM operations, to include exposed/contaminated equipment and supplies.</p>

<sup>1</sup> There is not effective DOTLPF in place to conduct task.

<sup>2</sup> Standards and procedures are inadequate for protection of equipment and supplies from CBRN/TIM contamination. CBRN/TIM protective coverings are limited in coverage and quantities. CBRN/TIM protective coatings are limited to two. CBRN/TIM protective packagings are limited or not identified. Standards and procedures applying commonly available materials for CBRN/TIM protection are limited or nonexistent.

<sup>3</sup> Common and interoperable standards are inadequate or nonexistent for handling exposed and contaminated equipment and supplies other than decontamination.

<sup>4</sup> Equipment and supplies protection is generally seen as placed under coverings (e.g., buildings, tents, tarps, etc.). However, standards do not address open stored material. Units and personnel training is limited, generally a short briefing on covering, and not adequate to preclude unnecessary loss of assets.

<sup>5</sup> Tailored protection (e.g., customized coverings for palletized cargo or certain types of equipment) are not addressed in standards and procedures.

<sup>6</sup> Equipment and supplies protection is generally seen as placed under coverings (e.g., buildings, tents, tarps, etc.). However, standards do not address open stored material. CBRN/TIM protective coverings are limited in coverage and quantities. CBRN/TIM protective coatings are limited to two. CBRN/TIM protective packagings are limited or not identified. Standards and procedures applying commonly available materials for CBRN/TIM protection are limited or nonexistent.

<sup>7</sup> CBRN/TIM protective packing, containers, packaging, coverings, and coatings are generally not identified, not in sufficient quantities when identified, and not readily available. However, CBRN/TIM protective packing, containers, and packaging generally do not exist. Coatings are limited to two, and one covering exists.

<sup>8</sup> Base, facilities, and units are required to conduct CBRND exercises. However, these exercises do not fully involve all personnel and activities. Nor do they address sustained operations within a contaminated environment. The protection of all classes of equipment and material are not generally exercised to include post-contamination activities such as decontamination, food safety, etc.

<sup>9</sup> DoD-level policies do not adequately address, or are nonexistent, for CBRN/TIM protection of all classes of equipment and supplies.

<sup>10</sup> DoD-level training standards do not adequately address, or are nonexistent, for CBRN/TIM protection of equipment and supplies beyond expedient covering and decontamination.

<sup>11</sup> Joint exercise plans include evaluation criteria, timing, type, content, and scoring. However, these are not the foundation for development of Service-specific exercise and evaluations. Additionally, there is a need for distinct CBRN/TIM-specific exercise/evaluations focusing upon sustained operations and protection of equipment and supplies.

### 10.6.3 Functional Solution Analysis

#### 10.6.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies associated with policies, standards, and criteria for CBRND protection of all classes of supply. The deficiencies can be addressed with non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section. Non-materiel solutions include research, development, test, evaluation and acquisition (RDTE&A) to address protection of equipment and supplies from CBRN/TIM contamination. Establish in doctrine, policy, procedures, and TTPs the solutions, standards, criteria, and information identified by RDTE&A efforts for joint application, planning, training, and integration into CBRND exercises and evaluations.

- 1. Deficiency:** Standards and procedures are inadequate for protection of equipment and supplies from CBRN/TIM contamination.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, standards, and procedures CBRND protection of all classes of supplies, to include the use of CBRND protective packagings, coverings, and coatings.
- 2. Deficiency:** Common and interoperable standards are inadequate or nonexistent for handling exposed and contaminated equipment and supplies other than decontamination.  
**Non-Materiel Solutions:** *Doctrine:* Promulgate, establish, and enforce the application of overarching joint standards for handling exposed and contaminated equipment and supplies through other than decontamination (i.e., continued use to support operations in selected circumstances, segregation and marking, etc.). *Training:* Include CBRND protection of materiel task performance within a CBRN/TIM environment as an essential requirement element of formal and unit training. *Leadership:* Leadership awareness of measures to protect all classes of supplies from CBRN/TIM contamination and joint standards for handling exposed and contaminated equipment and supplies.
- 3. Deficiency:** Standards do not address open stored material.  
**Non-Materiel Solutions:** *Doctrine:* Promulgate and establish doctrine, policy, standards, and procedures addressing the protection of materiel stored in the open.
- 4. Deficiency:** Units and personnel training is limited, generally a short briefing on covering, and not adequate to preclude unnecessary loss of assets.  
**Non-Materiel Solutions:** *Training:* Train, exercise, and evaluate the force against the standards (see Footnotes 1, 2, and 5 above) for protection of materiel, identification of contaminated materiel, and the handling of CBRN/TIM-contaminated resources. *Leadership:* Enforce compliance with established standards (see “Doctrine”) for CBRN/TIM protective measures and activities for all classes of materiel.
- 5. Deficiency:** Tailored protection (e.g., customized coverings for palletized cargo or certain types of equipment) are not addressed in standards and procedures.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policies, procedures, and standards addressing the application of tailored CBRND protective coverings for specific resources and applications. *Training:* Train, exercise, and evaluate the force for application of tailored CBRND protective coverings. *Leadership:* Implement and manage the provision of tailored protective coverings for selected materiel, training of force, and the appropriate application of the CBRND protective coverings.

6. **Deficiency:** CBRN/TIM protective coverings are limited in coverage and quantities.

**Non-Materiel Solutions:** *Doctrine:* Develop RDTE&A plan for protection of equipment and supplies against CBRN/TIM contamination.

7. **Deficiency:** CBRN/TIM protective packing, containers, packaging, coverings, and coatings are generally not identified, not in sufficient quantities when identified, and not readily available.

**Non-Materiel Solutions:** *Doctrine:* Integrate protective measures, assets, and activities for CBRND of all classes of supplies into doctrine, policy, and procedures. *Leadership:* Implement, manage, and enforce the application of CBRND protective measures, assets, and activities for all classes of supplies. Also, awareness of need for materiel protection.

8. **Deficiency:** CBRND exercises do not fully involve all personnel and activities.

**Non-Materiel Solutions:** *Doctrine:* Doctrine, policy, and procedures requiring comprehensive participation and integration of all potentially affected personnel, all classes of supplies, and activities in CBRND exercises. *Organization:* All affected entities are aware of and participate in comprehensive CBRND exercises. *Training:* All personnel (military and nonmilitary) are trained in protection of materiel under their responsibility and appropriate CBRND protective measures and materiel. *Leadership:* Recognition of the value of comprehensive exercises to enhance readiness, survival, and promote interaction between activities.

9. **Deficiency:** CBRND exercises do not address sustained operations within a contaminated environment.

**Non-Materiel Solutions:** *Doctrine:* Incorporate sustained operations within a CBRN/TIM environment into doctrine, policy, and procedures, to include the protection of materiel from contamination and the application of contaminated material to support operations.

*Organization:* Ensure resources, taskings, and trained personnel are in place or available to support protection of material during sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate capabilities and protective activities for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality for potential sustained operations within a CBRN/TIM environment, training providing skills to manage operations in these circumstances, and willingness to implement necessary changes and activities to prepare for sustained CBRND operations.

10. **Deficiency:** The protection of all classes of equipment and material are not generally exercised to include post-contamination activities such as decontamination, food safety, etc.

**Non-Materiel Solutions:** *Doctrine:* Address CBRND protection of equipment material in doctrine, policy, and procedures; and include CBRND preparatory activities such as training

and exercises. *Organization:* Identify organizational resources required to provide CBRND protection of equipment and supplies. *Training:* Establish CBRND training, exercise, and evaluation standards, criteria, and programs for protection of equipment and supplies. *Leadership:* Implement and manage CBRND training, equipping, protective measures, and exercising.

- 11. Deficiency:** DoD-level policies do not adequately address, or are nonexistent, for CBRN/TIM protection of all classes of equipment and supplies.

**Non-Materiel Solutions:** *Doctrine:* Review and enhance DoD-level doctrine, policies, and guidance on CBRND protective measures to prevent contamination, and the operational application of contaminated assets of, all classes of supplies. *Leadership:* Develop recognition and awareness of need to preclude contamination where possible and discourse on operational application of contaminated material, especially for operations in austere environments at extremes of LOC or operations otherwise logistically constrained.

- 12. Deficiency:** DoD-level exercise evaluation criteria are not the foundation for development of Service-specific exercise and evaluations.

**Non-Materiel Solutions:** *Doctrine:* Reinforce existing doctrine and policy for development of Service-specific exercises and evaluations based upon joint exercise plans. *Leadership:* Ensure joint exercise plans are used in the development of Service-specific exercises and evaluations.

- 13. Deficiency:** There is a need for distinct CBRN/TIM-specific exercise/evaluations focusing upon sustained operations and protection of equipment and supplies.

**Non-Materiel Solutions:** *Doctrine:* Incorporate sustained operations within a CBRN/TIM environment, protection of equipment and supplies, into doctrine, policy and procedures and require specific exercising and evaluation for these operations. *Training:* Train, exercise, and evaluate for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality for potential sustained operations within a CBRN/TIM environment, impact upon availability of equipment and supplies, and training providing skills to manage operations in these circumstances, and willingness to implement necessary changes and activities to prepare for sustained CBRND operations.

- 14. Deficiency:** There is not effective DOTLPF in place to conduct task.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing protection of material and supplies from CBRN/TIM contamination and the operational application of contaminated resources. *Organization:* Identify organization services and activities necessary to provide CBRND protection of equipment and supplies. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for protection of all classes of supply; and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, protective measures, and exercising.

#### 10.6.3.2 IMA Assessment Summary

N/A

**10.7 Task SNSHLD 7: Establish standards, criteria, and procedures for hazardous or contaminated materials and samples marking, packing, storage, handling, and transportation****10.7.1 Functional Area Analysis****10.7.1.1 Definition**

To reduce the potential for secondary contamination/release of hazardous or contaminated materials and samples to U.S., allied, friendly, or nonaligned military forces and civilians, MWAs, and equipment, supplies, and facilities. Policy and standards address requirements and criteria for training (formal and unit level) of personnel to package, mark, handle, transport, and store hazardous or contaminated materials and samples. Addresses common and interoperable standards and procedures specifying protection activities and resources for hazardous or contaminated materials and samples. The standards and procedures address

- equipping and preparing forces to apply containment packing and packaging/containers;
- applying required CBRN/TIM protective equipment and measures for handling, transporting, and storing;
- specifying the conduct and evaluation of assessment exercises to ensure readiness; and
- transporting CBRN/TIM-exposed or -contaminated material across U.S., host nation, third-country, or international airspace, territory, or waters.

**10.7.1.2 Derivation**

*Joint Enabling Concept for CBRN/TIM Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (SN 1.1.6, SN 1.2.3, SN 3.3.6, SN 3.4.4, SN 4.3.3, SN 5.2.3, SN 6.1, SN 7.5, SN 9, SN 9.1.2, SN 9.2.1, SN 9.2.2).*

**10.7.1.2.1 Supported Task: N/A****10.7.1.2.2 Lateral Task: SNSHA 3****10.7.1.2.3 Supporting Task: N/A****10.7.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Partially completed mission preparation. (C2.1.3)

2. Marginal to strong forces assigned. (C2.2.1)
3. Some interoperability. (C2.2.6)
4. Partial joint staff integration. (C2.3.1.1)
5. Partial multinational integration. (C2.3.1.2)
6. Sufficient deployed supplies. (C2.8.2)
7. Slow pipeline responsiveness. (C2.8.3.1)
8. Limited prepositioned materiel. (C2.8.4)

### **Civil**

1. Correct interdepartmental/interagency relationships. (C3.1.1.3)
2. Limited foreign government support (C3.1.2.3)

## **10.7.2 Functional Needs Analysis**

### **10.7.2.1 Capability and Deficiency Assessment Summary**

Table 10.7-1 discusses the only capability that exists to perform the task to the designated standard. CJCS/joint staff promulgates, establishes, and implements standards, criteria, and joint training for the safe management of hazardous or contaminated materials. Includes marking, packing, storing, handling, transporting, and other related activities.

### **Current Capability and Deficiency**

International standards and procedures exist for hazardous or contaminated material and samples. These often form the basis for internal national codes. Primary duty personnel in selected specialties (e.g., epidemiology, hazardous materials, laboratory, and others) are generally trained in international and U.S. national standards and procedures as outlined in DoD and Service directives and guidelines. Deficiencies include training of augmentation/additional duty personnel, preparatory activities, and availability of packing/containers/packaging. Overall current assessment is “green.”

### **Projected Near/Mid-Term Capability and Deficiency**

No change is projected for this task.

### **Projected Far-Term Capability and Deficiency**

No change is projected for this task.

Table 10.7-1. SNSHLD 7: Capability and Deficiency Assessment

	FAA Measure	Scale
M1	International standards and procedures exist for packaging and containment of hazardous or contaminated material and samples.	<p><b>G:</b> Internationally accepted standards and procedures exist for the packaging and containment of hazardous or infectious materials crossing international borders and are applicable to CBRN-exposed/contaminated material.</p> <p><b>Y:</b> Internationally accepted standards and procedures exist for the packaging and containment of selected CBRN-exposed/contaminated material and are restricted to specifically identified international border movements.</p> <p><b>R:</b> Internationally accepted standards are nonexistent or inadequate for packaging and containment for international movement of CBRN-exposed/contaminated material.</p>
M2	International standards and procedures exist for marking and identification of hazardous or contaminated material and samples.	<p><b>G:</b> Internationally accepted standards and procedures exist for the marking and identification of hazardous or infectious materials crossing international borders and are applicable to CBRN-exposed/contaminated material.</p> <p><b>Y:</b> Internationally accepted standards and procedures exist for the marking and identification of selected CBRN-exposed/contaminated material and are restricted to specifically identified international border movements.</p> <p><b>R:</b> Internationally accepted standards are nonexistent or inadequate for marking and identification for the international movement of CBRN-exposed/contaminated material.</p>
M3	International standards and procedures exist for storage of hazardous or contaminated material and samples.	<p><b>G:</b> Internationally accepted standards and procedures exist for the storage of hazardous or infectious materials during crossing of international borders and are applicable to CBRN-exposed/contaminated material. These standards and procedures frequently form the basis of internal national codes which are applicable for storage within a nation.</p> <p><b>Y:</b> Internationally accepted standards and procedures exist for the storage of selected CBRN-exposed/contaminated material and are restricted to specifically identified international border movements. These standards and procedures may form the basis of internal national codes applicable to storage within a nation.</p> <p><b>R:</b> Internationally accepted standards are nonexistent or inadequate for storage during the international movement of CBRN-exposed/contaminated material and are not generally applied to internal national codes applicable for storage within a nation.</p>

M4	International standards and procedures exist for transport of hazardous or contaminated material and samples including across international boundaries.	<b>G:</b> Internationally accepted standards and procedures exist for the transport of hazardous or infectious materials crossing international borders and are applicable to CBRN-exposed/contaminated material. <b>Y:</b> Internationally accepted standards and procedures exist for the transport of selected CBRN-exposed/contaminated material and are restricted to specifically identified international border movements. <b>R:</b> Internationally accepted standards are nonexistent or inadequate for the international movement of CBRN-exposed/contaminated material across international boundaries.
M5	DoD-level training standards exist for packaging and containment of hazardous or contaminated material and samples.	<b>G:</b> DoD-level CBRND training standards detail requirements and measures for the packaging and containment of CBRN/TIM hazardous or contaminated material and samples. <b>Y:</b> DoD-level CBRND training standards provide general requirements and measures for the packaging and containment of CBRN/TIM hazardous or contaminated material/samples. <b>R:</b> DoD-level CBRND training standards are nonexistent or inadequately address the packaging and containment of CBRN/TIM hazardous or contaminated material and samples.
M6	DoD-level training standards exist for marking and identification of hazardous and contaminated material and samples.	<b>G:</b> DoD-level CBRND training standards detail requirements for the marking and identification of CBRN/TIM hazardous or contaminated material and samples. <b>Y:</b> DoD-level CBRND training standards general requirements exist for the marking and identification of CBRN/TIM hazardous or contaminated material/samples. <b>R:</b> DoD-level CBRND training standards are nonexistent or inadequately address the marking and identification of CBRN/TIM hazardous or contaminated material and samples.
M7	DoD-level training standards exist for storage of hazardous and contaminated material and samples.	<b>G:</b> DoD-level CBRND training standards detail requirements for the safe storage of CBRN/TIM hazardous or contaminated material and samples. <b>Y:</b> DoD-level CBRND training standards general requirements exist for the safe storage of CBRN/TIM hazardous or contaminated material/samples. <b>R:</b> DoD-level CBRND training standards are nonexistent or inadequately address the safe storage of CBRN/TIM hazardous or contaminated material and samples.
M8	DoD-level training standards exist for transport of hazardous or contaminated material and samples.	<b>G:</b> DoD-level CBRND training standards detail requirements for the safe transport of CBRN/TIM hazardous or contaminated material and samples. <b>Y:</b> DoD-level CBRND training standards general requirements exist for the safe transport of CBRN/TIM hazardous or contaminated material/samples. <b>R:</b> DoD-level CBRND training standards are nonexistent or inadequately address the safe transport of CBRN/TIM hazardous or contaminated material and samples.
M9	DoD-level exercise evaluation criteria exist, including timing, type, content, and scoring.	<b>G:</b> Distinct DoD and joint exercise plans and evaluation requirements exist for sustained operations within a toxic CBRN/TIM environment and incorporates the preparation and movement of CBRN/TIM hazardous or contaminated material and samples. Service-specific exercises and evaluations are developed based upon the DoD and joint exercise plans and evaluation requirements. <b>Y:</b> DoD and joint exercise plans and evaluation general requirements exist and include CBRN operations as components. Service-specific exercises and evaluations do not fully and sequentially address the entire process involving the preparation, storage, handling, and movement of CBRN/TIM hazardous or contaminated material and samples. <b>R:</b> DoD, joint, and Service-specific exercise plans and evaluation requirements are inadequate, do not exist, or do not address CBRN/TIM operations.

M10	Standards and procedures in place for packaging and containment of hazardous or contaminated material and samples.	<p><b>G:</b> DoD/joint standards and procedures detail requirements for the packaging and containment of hazardous or contaminated material and samples. Service-specific standards and procedures incorporate the DoD/joint standards.</p> <p><b>Y:</b> DoD/joint standards and procedures provide general guidance for the packaging and containment of hazardous or contaminated material and samples. Service-specific standards and procedures may vary, but not in critical aspects, from the DoD/joint standards and procedures.</p> <p><b>R:</b> Standards and procedures are inadequate or nonexistent for the packaging and containment of hazardous or contaminated material and samples.</p>
M11	Common and interoperable standards for handling hazardous or contaminated material and samples exist.	<p><b>G:</b> DoD/joint standards and procedures detail common and interoperable requirements for the safe handling of hazardous or contaminated material and samples. Service-specific standards and procedures incorporate the DoD/joint standards.</p> <p><b>Y:</b> DoD/joint standards and procedures provide common general guidance for the safe handling of hazardous or contaminated material and samples. Service-specific standards and procedures may vary, but not in critical aspects, from the DoD/joint standards and procedures.</p> <p><b>R:</b> Common standards and procedures are inadequate or nonexistent for the safe handling of hazardous or contaminated material and samples.</p>
M12	Common and interoperable standards for safe storage of hazardous or contaminated material and samples exist.	<p><b>G:</b> DoD/joint standards and procedures detail common and interoperable requirements for the safe storage of hazardous or contaminated material and samples. Service-specific standards and procedures incorporate the DoD/joint standards.</p> <p><b>Y:</b> DoD/joint standards and procedures provide common general guidance for the safe storage of hazardous or contaminated material and samples. Service-specific standards and procedures may vary, but not in critical aspects, from the DoD/joint standards and procedures.</p> <p><b>R:</b> Common standards and procedures are inadequate or nonexistent for the safe storage of hazardous or contaminated material and samples.</p>
M13	Common and interoperable standards for transporting hazardous or contaminated material and samples exist.	<p><b>G:</b> DoD/joint standards and procedures detail common and interoperable requirements for the safe transport of hazardous or contaminated material and samples. Service-specific standards and procedures incorporate the DoD/joint standards.</p> <p><b>Y:</b> DoD/joint standards and procedures provide common general guidance for the safe transport of hazardous or contaminated material and samples. Service-specific standards and procedures may vary, but not in critical aspects, from the DoD/joint standards and procedures.</p> <p><b>R:</b> Common standards and procedures are inadequate or nonexistent for the safe transport of hazardous or contaminated material and samples.</p>
M14	Standards address training units and personnel to pack, containerize/package, mark, handle, and transport hazardous or contaminated material or samples.	<p><b>G:</b> Training standards address the application of protective barrier materials and assets, identification and marking, and the safe handling and transport of hazardous or contaminated material/samples.</p> <p><b>Y:</b> Training standards generally address the application of protective barrier materials and assets, identification and marking, and the safe handling and transport of hazardous or contaminated material/samples.</p> <p><b>R:</b> Training standards are nonexistent or inadequately address the application of protective barrier materials and assets, identification and marking, and the safe handling and transport of hazardous or contaminated material and samples.</p>

M15	Standards and procedures address equipping units and personnel packing, storing, handling, or transporting hazardous or contaminated material or samples with CBRN/TIM protective equipment.	<p><b>G:</b> Overarching single set of standards specify common and interoperable requirements and measures for the protection of personnel and activities performing the preparation, storage, handling, and transport of hazardous or contaminated material/samples.</p> <p><b>Y:</b> Common guidelines are established for the provision of protection of personnel and activities performing logistical functions associated with hazardous or contaminated material/samples.</p> <p><b>R:</b> Common and interoperable standards are inadequate or nonexistent for the provision of protection of personnel and activities associated with functions involving the preparation, storage, handling, and transport of hazardous or contaminated material/samples.</p>
M16	All applicable personnel trained to pack, containerize/package, store, transport, mark, and identify hazardous or contaminated material and samples.	<p><b>G:</b> Training standards address the application of protective barrier materials and assets, identification and marking, and the safe handling and transport of hazardous or contaminated material/samples by all applicable personnel (primary and augmentation).</p> <p><b>Y:</b> Training standards address the application of protective barrier materials and assets, identification and marking, and the safe handling and transport of hazardous or contaminated material/samples by personnel with these as routine responsibilities.</p> <p><b>R:</b> Training standards are nonexistent or inadequately address the application of protective barrier materials and assets, identification and marking, and the safe handling and transport of hazardous or contaminated material and samples by personnel subject to perform these tasks.</p>
M17	All applicable personnel equipped with protective equipment to pack, containerize/package, handle, and transport hazardous and contaminated material and samples.	<p><b>G:</b> All personnel subject to perform tasks associated with the preparation, storage, handling, and/or transport of hazardous and contaminated material and samples are appropriately equipped.</p> <p><b>Y:</b> Designated personnel with routine responsibilities to perform preparation, storage, handling, and/or transport of hazardous and contaminated material and samples are appropriately equipped.</p> <p><b>R:</b> Protective equipment assets are inadequate or nonexistent for the provision of protection of personnel possessing routine functions involving the preparation, storage, handling, and transport of hazardous or contaminated material/samples.</p>
M18	Protective packing, containers, and packaging available for hazardous or contaminated material and samples.	<p><b>G:</b> CBRN protective barrier movement and storage materials (e.g., packaging, containers, etc.) are readily available for the movement of hazardous or contaminated material and samples.</p> <p><b>Y:</b> CBRN protective barrier movement and storage materials (e.g., packaging, containers, etc.) are available for the movement of selected material and samples.</p> <p><b>R:</b> CBRN protective barrier movement and storage material is nonexistent or not available to support the movement of hazardous or contaminated material and samples.</p>
M19	All base/facility/unit conduct annual CBRND exercises.	<p><b>G:</b> Annual CBRND exercises fully integrate all personnel and activities and address sustained operations within a CBRN/TIM environment and includes the preparation, storage, handling, and transport of hazardous or contaminated material and samples by all applicable personnel.</p> <p><b>Y:</b> Annual CBRND exercises fully involve military and direct mission civilian support personnel/functions and address operations within a toxic CBRN/TIM environment, to include aspects of the preparation, storage, handling, and transport of hazardous or contaminated material and samples by personnel possessing routine, nonemergency functions involving these activities.</p> <p><b>R:</b> Annual CBRND exercises are not conducted or do not address operations within a CBRN/TIM environment and do not generally integrate the preparation, storage, handling, or transport of hazardous or contaminated material and samples.</p>

<sup>1</sup> Effective DOTLPF is in place for the conduct of this task by primary duty personnel whose duties include the performance of the task. DOTLPF is inadequate for augmentation or additional duty personnel tasked to accomplish these functions. Nor is general knowledge DOTLPF for recognition of a potential hazard using international markings provided to the general force.

<sup>2</sup> Current international standards address only fully contained (packaged) hazardous materials and samples. There is a lack of standards for shipping contaminated items that cannot be completely encapsulated to contain the associated hazards. No international standards have been established providing acceptable threshold levels of contamination. Without established maximum contamination allowances, diplomatic clearances for overflight and landings may be denied for the air transport of contaminated and formerly contaminated aircraft and cargo. Without overflight and landing clearances, the air shipment of contaminated or formerly contaminated cargo will be significantly impeded. Internationally accepted standards exist for the packaging, handling, movement, and marking of hazardous or infectious materials crossing international borders. These are promulgated under the auspices of the United Nations. Air transported material is governed by the International Civil Aviation Organization Technical Instructions (ICAO TI) on the Safe Transport of Dangerous Goods by air augmenting Annex 18 to the Convention on International Civil Aviation. Maritime transported materials are governed by the International Maritime Dangerous Goods (IDMG) Code mandated by Chapter 7 of the International Convention for the Safety of Life at Sea (SOLAS). Note: Not all chapters of the IDMG are mandatory. Infectious material is governed under the World Health Organization (WHO) promulgated International Health Regulations of 1969 (as amended). Codes and standards are also promulgated by the International Atomic Energy Agency (IAEA). The primary two documents are the Code of Conduct on the Safety and Security of Radioactive Sources and the International Atomic Energy Regulations for the Safe Transport of Radioactive Materials. All the international standards provide instructions on the handling and marking of hazardous and infectious material. However, additional requirements may be imposed by individual countries upon material identified, destined, transshipped, within or pass through/over their borders.

<sup>3</sup> International standards address the movement of material across international boundaries. Storage requirements generally address storage within transport means. Storage requirements are generally within the purview of the host country and its standards. Many countries, however, do use the international standards and recommendations as a basis for their internal codes.

<sup>4</sup> Training standards exist for primary duty personnel performing cargo movement activities. However, primary packaging and containment of contaminated material and samples is the responsibility of the initiating activity (e.g., Technical Escort Unit [TEU], medical facility, CBRN/TIM survey and sampling, field lab, etc.). The correct marking and identification is dependent upon notification and initial marking/identification actions by the preparing activity. These personnel may, or may not, be trained in required packaging, containment, marking, and identification of collected material and samples.

<sup>5</sup> Training standards exist for primary duty personnel performing cargo movement activities. However, primary packaging and containment of contaminated material and samples is the responsibility of the initiating activity (e.g., TEU, medical facility, CBRN/TIM survey and sampling, field lab, etc.). The correct marking and identification is dependent upon notification and initial marking/identification actions by the preparing activity. These personnel may or may not be trained in required packaging, containment, marking, and identification of collected material and samples. There are no established procedures or training standards to address the interior contamination of airlift aircraft in the event of agent release. Interior decontamination capabilities are inadequate. Therefore, training standards to address this deficient area are also inadequate.

<sup>6</sup> Joint exercise plans include evaluation criteria, timing, type, content, and scoring. However, these are not the foundation for development of Service-specific exercise and evaluations. Additionally, there is a need for distinct CBRN/TIM-specific exercise/evaluations that include the packing, marking, and movement of hazardous/infections material and samples.

<sup>7</sup> Standards and procedures existing under Department of Transportation, Occupational Safety and Health Administration (OSHA), and Centers for Disease Control (CDC) regulations and requirements. DoD standards and procedures incorporate these requirements. However, the standards and procedures are generally known and applied by primary duty personnel. Implementation by Services is guided by Service directives and guidelines developed from DoD requirements. Service directives and guidelines are unique to the Service, although based upon a common foundation.

<sup>8</sup> Standards and procedures detailed by Department of Transportation, OSHA, and CDC regulations and requirements. DoD standards and procedures incorporate these requirements. However, only primary duty personnel performing these functions are trained, knowledgeable, and able to apply the standards. Training by Services is guided by Service directives and guidelines developed from DoD and Service requirements. Primary duty personnel whose field does not include these tasks in their specialty description may not be trained to perform these functions. Training to recognize a potential hazard through identification of international markings is not provided to the general force. Training of augmentation and additional duty personnel to accomplish these tasks is generally minimal and inadequate.

<sup>9</sup> Standards and procedures detailed by Department of Transportation, OSHA, and CDC regulations and requirements. DoD standards and procedures incorporate these requirements. However, the standards and procedures are generally known and applied by primary duty personnel. Equipping is dependent upon known requirements.

<sup>10</sup> Personnel in a field possessing a task for this function in their specialty description may not be trained and equipped to accomplish the task.

<sup>11</sup> Protective packing, containers, and packaging for hazardous or contaminated material and samples is generally available to those whose primary function includes the preparation and storage of this material.

<sup>12</sup> Base, facilities, and units are required to conduct CBRND exercises. However, these exercises do not generally include activities necessitating the packing, marking, storage, and movement of hazardous or contaminated material and samples.

### 10.7.3 Functional Solution Analysis

#### 10.7.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies associated with policies, standards, and criteria for hazardous or contaminated material and samples marking, packing, storage, handling, and transportation. The deficiencies can be addressed by non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section. Non-materiel solutions include addressing in doctrine, policy, and procedures the training of personnel performing augmentation or direct support functions (e.g., preparation, storing, moving, handling, transporting, etc.) of hazardous, contaminated, or infectious material and incorporating standards into institutional and unit training, exercises, and evaluations for all personnel and activities performing these tasks and functions (regardless of whether primary responsibility or support). The inclusion in doctrine, policy, procedures, and TTPs recognition training and knowledge of all force personnel of international markings identifying hazardous, contaminated, or infectious material provides early identification of hazards and appropriate actions.

- 1. Deficiency:** Non–primary duty personnel may, or may not, be trained in required packaging, containment, marking, and identification of collected material and samples.  
**Non-Materiel Solutions:** *Training:* Personnel performing augmentation or direct support functions (e.g., storing, moving, handling, transporting, etc.) of hazardous, contaminated, or infectious material require training commensurate with their responsibilities. *Leadership:* Ensure all personnel identified in “Training” are trained and knowledgeable.
- 2. Deficiency:** The correct marking and identification is dependent upon notification and initial marking/identification actions by the preparing activity.  
**Non-Materiel Solutions:** *Doctrine:* Enforce existing doctrine, policies, and procedures for marking and identification actions by preparing activities. *Training:* Personnel performing preparation, storage, movement, handling, transport, etc., of hazardous, contaminated, or infectious material are fully trained and evaluated for correct marking and identification of these materials. *Leadership:* Ensure compliance with standards, procedures, and requirements for the preparation, storage, movement, handling, transport, and other associated actions for hazardous, contaminated, or infectious material, including marking and identification.
- 3. Deficiency:** DoD-level training standards do not exist for non–primary duty personnel performing hazardous/contaminated cargo movement and transport activities.  
**Non-Materiel Solutions:** *Doctrine:* Adjust existing doctrine, policies, and procedures to require all personnel and activities performing tasks and functions, regardless of whether primary responsibility or support, associated with the preparation, storage, movement, handling, transport, and other tasks associated with hazardous, contaminated, or infectious material are trained to standards. *Training:* Incorporate standards into institutional and unit training, exercises, and evaluations for all personnel and activities performing tasks and functions, regardless of whether primary responsibility or support, associated with the preparation, storage, movement, handling, transport, and other tasks associated with

hazardous, contaminated, or infectious material. *Leadership*: Enforcement of standards and management of training to ensure readiness of all personnel and activities to safely perform their tasks and functions, regardless of whether primary responsibility or support, associated with the preparation, storage, movement, handling, transport, and other tasks associated with hazardous, contaminated, or infectious material.

4. **Deficiency**: DoD-exercise evaluation criteria are not the foundation for development of Service-specific exercise and evaluations.

**Non-Materiel Solutions**: *Doctrine*: Reinforce existing doctrine and policy for development of Service-specific exercises and evaluations based upon joint exercise plans and include the preparation, storage, movement, handling, transport, and other tasks associated with hazardous, contaminated, or infectious material. *Leadership*: Ensure joint exercise plans are used in the development of Service-specific exercises and evaluations.

5. **Deficiency**: There is a need for distinct CBRN/TIM-specific exercise/evaluations that include the packing, containerization/packaging, marking, handling, and transporting of hazardous or contaminated material or samples

**Non-Materiel Solutions**: *Doctrine*: Incorporate the preparation, storage, movement, handling, transport, and other tasks associated with hazardous, contaminated, or infectious material into exercises and evaluations criteria and requirements. *Training*: Train, exercise, and evaluate the preparation, storage, movement, handling, transport, and other tasks associated with hazardous, contaminated, or infectious material. *Leadership*: Recognize criticality for the safe preparation (including marking and identification), storage, movement, handling, transport, and other tasks associated with hazardous, contaminated, or infectious material.

6. **Deficiency**: Common and interoperable standards for safe packaging, containment, handling, and storage of hazardous or contaminated material and samples are generally known and applied by primary duty personnel only.

**Non-Materiel Solutions**: *Training*: Ensure all personnel, regardless of whether primary responsibility or support, performing preparation, storage, movement, handling, transport, etc., of hazardous, contaminated, or infectious material, are fully trained and evaluated for application of common and interoperable standards for the safe packaging, containment, handling, storage, and transport of hazardous or contaminated material and samples including marking and identification of these materials. *Leadership*: Recognize criticality for the safe preparation (including marking and identification), storage, movement, handling, transport, and other tasks associated with hazardous, contaminated, or infectious material and ensure personnel identified in “Training” are trained and comply with requirements.

7. **Deficiency**: Personnel in a field possessing a task to pack, containerize/package, handle, and transport hazardous and contaminated material and samples in their specialty description may not be trained and equipped to accomplish the task.

**Non-Materiel Solutions**: *Training*: Train, exercise, and evaluate all personnel and activities performing tasks and functions, regardless of whether primary responsibility or support, associated with the preparation, storage, movement, handling, transport, and other tasks associated with hazardous, contaminated, or infectious material, are trained to standards.

*Leadership:* Recognize criticality for the safe preparation (including marking and identification), storage, movement, handling, transport, and other tasks associated with hazardous, contaminated, or infectious material and ensure personnel are properly equipped, adequately trained, and fully comply with requirements.

8. **Deficiency:** Base/facility annual CBRND exercises do not generally include activities necessitating the packing, marking, storage, and movement of hazardous or contaminated material and samples.

**Non-Materiel Solutions:** *Doctrine:* Incorporate the safe preparation, storage, movement, handling, transport, and other tasks associated with hazardous, contaminated, or infectious materials into CBRND exercises and evaluations criteria and requirements. *Organization:* Ensure resources, taskings, and staff are in place or available to support the safe preparation, storage, movement, handling, transport, and other organization assigned tasks associated with hazardous, contaminated, or infectious materials. *Training:* Train, exercise, and evaluate capabilities and activities for the safe preparation, storage, movement, handling, transport, and other organization assigned tasks associated with hazardous, contaminated, or infectious materials. *Leadership:* Recognize criticality for the safe preparation (including marking and identification), storage, movement, handling, transport, and other tasks associated with hazardous, contaminated, or infectious material and ensure personnel are properly equipped, adequately trained, fully comply with requirements, and are prepared and ready to perform the tasks and activities.

9. **Deficiency:** DOTLPF is inadequate for augmentation or additional duty personnel tasked to accomplish these functions.

**Non-Materiel Solutions:** *Doctrine:* Adjust existing doctrine, policies, and procedures to require all personnel and activities performing tasks and functions, regardless of whether primary responsibility or support, associated with the preparation, storage, movement, handling, transport, and other tasks associated with hazardous, contaminated, or infectious material are trained to standards. *Organization:* Ensure resources, taskings, and staff are in place or available to support the safe preparation, storage, movement, handling, transport, and other organization assigned tasks associated with hazardous, contaminated, or infectious materials. *Training:* Incorporate standards into institutional and unit training, exercises, and evaluations for all personnel and activities performing tasks and functions, regardless of whether primary responsibility or support, associated with the preparation, storage, movement, handling, transport, and other tasks associated with hazardous, contaminated, or infectious material. *Leadership:* Recognize criticality for the safe preparation (including marking and identification), storage, movement, handling, transport, and other tasks associated with hazardous, contaminated, or infectious material and ensure personnel are properly equipped, adequately trained, fully comply with requirements, and are prepared and ready to perform the tasks and activities.

10. **Deficiency:** General knowledge DOTLPF for recognition of a potential hazard using international markings is not provided to the general force.

**Non-Materiel Solutions:** *Training:* Establish recognition training of all force personnel of international markings identifying hazardous, contaminated, or infectious material.

*Leadership:* Ensure all subordinate personnel are trained, knowledgeable, and are able to

correctly interpret international markings identifying hazardous, contaminated, or infectious material.

**11. Deficiency:** Absence of international standards for maximum allowable levels of contamination for transportation of contaminated cargo through sovereign airspace could result in the denial of overflight and landing clearance to contaminated aircraft and cargo.

**Non-Materiel Solutions:** *Doctrine:* Revise current doctrine to emphasize the risk to intertheater movement of aircraft and cargo posed by exposure to chemical and biological warfare agents. Stress the importance of contamination avoidance to the preservation of intertheater airlift capabilities. *Training:* Incorporate advanced CBRN contamination avoidance and control measures into joint and Service air mobility education and training courses. *Leadership:* Ensure that key decision makers and personnel in positions of leadership are aware of the ramification of aircraft and equipment contamination and protective measures to mitigate the risk to air mobility operations.

#### **10.7.3.2 IMA Summary**

N/A

## **10.8 Task SNSHLD 8: Establish standards, criteria, and procedures for safe handling and safely transporting CBRN/TIM-exposed or -contaminated casualties and MWAs**

### **10.8.1 Functional Area Analysis**

#### **10.8.1.1 Definition**

To ensure the efficient and consistent application of standards for safe handling and transport of exposed or contaminated casualties following a CBRN/TIM release. This task includes

- standards and procedures for the provision of protective equipment to casualties (including casualties unable to wear IPE);
- prevention of secondary contamination of attending personnel, support equipment, and transport assets;
- common procedures for handling and transporting CBRN/TIM-exposed or -contaminated personnel and MWAs; and
- transport of exposed or contaminated casualties and MWAs across U.S., host nation, third-country, or international airspace, territory, or waters.

#### **10.8.1.2 Derivation**

*Joint Enabling Concept for CBRN/TIM Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (SN 1.1.5, SN 1.2.3, SN 2.2.1, SN 4.3.3, SN 4.3.4, SN 8.1.6, SN 9, SN 9.2.2).*

##### **10.8.1.2.1 Supported Task: N/A**

##### **10.8.1.2.2 Lateral Task: SNSHA 3**

##### **10.8.1.2.3 Supporting Task: N/A**

#### **10.8.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

##### **Military**

1. Some interoperability. (C2.2.6)
2. Partial joint staff integration. (C2.3.1.1)
3. Partial multinational integration. (C2.3.1.2)
4. Sufficient deployed supplies. (C2.8.2)

5. Sufficient continental United States (CONUS) resupply. (C2.8.3)
6. Slow pipeline responsiveness. (C2.8.3.1)
7. Limited prepositioned materiel. (C2.8.4)

### **Civil**

1. Correct interdepartmental/interagency relationships (C3.1.1.3)
2. Limited foreign government support (C3.1.2.3)

## **10.8.2 Functional Needs Analysis**

### **10.8.2.1 Capability and Deficiency Assessment Summary**

Table 10.8-1 discusses the only capability that exists to perform the task to the designated standard. CJCS/joint staff institutes and provides joint Service oversight of DOTMLPF program for the safe handling and transport of exposed or contaminated casualties and MWAs providing for the enhanced survivability of exposed and contaminated casualties as well as MWAs.

### **Current Capability and Deficiency**

International standards specify international requirements for the movement of contaminated (infectious) individuals/animals across international borders. However, U.S. national standards addressing the transport of CBRN/TIM-exposed and -contaminated casualties within the United States do not exist. Training guidelines for selected groups do exist for the handling of exposed and contaminated casualties and are generally performed at the unit level. Existing guidance for the protection of exposed and contaminated casualties specifies the application of either CPS or standard IPE for CBRND protection. Deficiencies include the lack of CBRND standards, criteria, doctrine, policy, procedures, TTPs for the protection of casualties unable to wear standard IPE and CPS is not available or applicable (such as movement from COLPRO-equipped medical facility for evacuation). Standards, criteria, and procedures do not adequately address the handling and transport of CBRN/TIM-exposed or -contaminated MWA casualties. The overall current capability is assessed as “red.”

### **Projected Near/Mid-Term Capability and Deficiency**

No change projected for this task.

### **Projected Far-Term Capability and Deficiency**

No change projected for this task.

**Table 10.8-1. SNSHLD 8: Capability and Deficiency Assessment**

Capability: CJCS—Joint Staff	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10	M11	M12	M13	M14	M15	M16

<b>Far-Term Overall Capability</b>	Y	R	R	R	Y	Y	R	R	Y	R	Y	R	Y	G	R	R

	FA A Measure	Scale
M1	International standards exist for transport of exposed or contaminated casualties (human and MWAs).	<b>G:</b> Internationally accepted standards and procedures exist for the transport of exposed or contaminated casualties across international borders and are applicable to CBRN/TIM casualties. <b>Y:</b> Internationally accepted standards and procedures exist for the transport of selected CBRN-exposed/contaminated casualties and are restricted to specifically identified international border movements. <b>R:</b> Internationally accepted standards are nonexistent or inadequate for the international movement of CBRN-exposed/contaminated material across international borders.
M2	National standards and procedures exist for transport of exposed and contaminated casualties and MWAs, including across state boundaries.	<b>G:</b> Mandated national standards and procedures exist for the transport of exposed or contaminated casualties across state borders, are applicable to CBRN/TIM casualties, and are applied without variance and additional restrictive requirements across all states. <b>Y:</b> National standards and procedures exist for the transport of exposed or contaminated casualties across state borders, are applicable to CBRN/TIM casualties, and are applied with minor additional restrictive requirements across all states. <b>R:</b> National standards and procedures applicable to CBRN-exposed or -contaminated casualties are inadequate, nonexistent, are applied with significant additional restrictive requirements by the states, or widely vary between states.
M3	DoD-level training standards exist for handling of exposed or contaminated casualties and MWAs.	<b>G:</b> DoD-level CBRND training standards detail requirements and measures for the safe handling of exposed and contaminated casualties, including MWAs. <b>Y:</b> DoD-level training standards provide general requirements and measures for the safe handling of exposed and contaminated casualties, including MWAs. <b>R:</b> DoD-level CBRND training standards are nonexistent or inadequately address the safe handling of exposed and contaminated casualties, including MWAs.
M4	DoD-level training standards exist for transport of exposed or contaminated casualties and MWAs.	<b>G:</b> DoD-level CBRND training standards detail requirements for the safe transport of CBRN-exposed or -contaminated casualties, including MWAs. <b>Y:</b> DoD-level CBRND training standards provide general requirements for the safe transport of CBRN-exposed or -contaminated casualties, including MWAs. <b>R:</b> DoD-level CBRND training standards are nonexistent or inadequately address the safe transport of CBRN-exposed or -contaminated casualties, including MWAs.

M5	DoD-level exercise evaluation criteria exist, including timing, type, content, and scoring.	<p><b>G:</b> Distinct DoD and joint exercise plans and evaluation requirements exist for sustained operations within a toxic CBRN/TIM environment and incorporates as a distinct critical area of evaluation the handling and movement of CBRN-exposed or -contaminated casualties, including MWAs. Service-specific exercises and evaluations are developed based upon the DoD and joint exercise plans and evaluation requirements.</p> <p><b>Y:</b> DoD and joint exercise plans and evaluation general requirements exist and include CBRN operations as components. Service-specific exercises and evaluations do not fully and sequentially address the entire process of handling and movement of CBRN-exposed or -contaminated casualties, including MWAs.</p> <p><b>R:</b> DoD, joint, and Service-specific exercise plans and evaluation requirements are inadequate, do not exist, or do not fully address CBRN operations and the handling/movement of CBRN-exposed or -contaminated casualties.</p>
M6	Standards and procedures in place for protection of exposed or contaminated casualties and MWAs.	<p><b>G:</b> DoD/joint standards and procedures detail common and interoperable requirements for the protection of exposed or contaminated casualties and MWAs, including those medically unable to wear IPE. Service-specific standards and procedures incorporate the DoD/joint standards.</p> <p><b>Y:</b> DoD/joint standards and procedures provide common general guidance for the protection of exposed or contaminated casualties and MWAs, including those medically unable to wear IPE. Service-specific standards and procedures may vary, but not in critical aspects, from the DoD/joint standards and procedures.</p> <p><b>R:</b> Common standards and procedures are inadequate or nonexistent for the safe handling of exposed or contaminated casualties and MWAs, including those medically unable to wear IPE.</p>
M7	Common and interoperable standards exist for handling exposed or contaminated casualties and MWAs.	<p><b>G:</b> DoD/joint standards and procedures detail common and interoperable requirements for the safe handling of exposed or contaminated casualties and MWAs, including those medically unable to wear IPE. Service-specific standards and procedures incorporate the DoD/joint standards.</p> <p><b>Y:</b> DoD/joint standards and procedures provide common general guidance for the safe handling of exposed or contaminated casualties and MWAs, including those medically unable to wear IPE. Service-specific standards and procedures may vary, but not in critical aspects, from the DoD/joint standards and procedures.</p> <p><b>R:</b> Common standards and procedures are inadequate or nonexistent for the safe handling of exposed or contaminated casualties and MWAs, including those medically unable to wear IPE.</p>
M8	Common and interoperable standards exist for transporting exposed or contaminated casualties and MWAs.	<p><b>G:</b> DoD/joint standards and procedures detail common and interoperable requirements for the safe transport of exposed or contaminated casualties and MWAs. Service-specific standards and procedures incorporate the DoD/joint standards.</p> <p><b>Y:</b> DoD/joint standards and procedures provide common general guidance for the safe transport of exposed or contaminated casualties and MWAs. Service-specific standards and procedures may vary, but not in critical aspects, from the DoD/joint standards and procedures.</p> <p><b>R:</b> Common standards and procedures are inadequate or nonexistent for the safe transport of exposed or contaminated casualties and MWAs.</p>
M9	Standards address training units and personnel to protect, handle, and transport exposed or contaminated casualties and MWAs.	<p><b>G:</b> Training standards address the application of protective assets and the safe handling and transport of exposed or contaminated casualties/MWAs, including those medically unable to wear IPE.</p> <p><b>Y:</b> Training standards generally address the application of protective assets and the safe handling and transport of exposed or contaminated casualties/MWAs, including those medically unable to wear IPE.</p> <p><b>R:</b> Training standards are nonexistent or inadequately address the application of protective assets and the safe handling and transport of exposed or contaminated casualties and MWAs, including those medically unable to wear IPE.</p>

M10	Standards and procedures address training units and personnel to protect themselves, support equipment, and transportation assets against secondary exposure/contamination.	<p><b>G:</b> Training standards address the application of protective barrier materials, assets, procedures, and detection equipment to protect personnel, equipment, and transport assets against secondary exposure/contamination from exposed or contaminated casualties and MWAs.</p> <p><b>Y:</b> Training standards generally address the application of protective barrier materials, assets, procedures, and detection equipment to protect personnel, equipment, and transport assets against secondary exposure/contamination from exposed or contaminated casualties and MWAs.</p> <p><b>R:</b> Training standards are nonexistent or inadequately address the application of protective barrier materials, assets, procedures, and detection equipment to protect personnel, equipment, and transport assets against secondary exposure/contamination from exposed or contaminated casualties and MWAs.</p>
M11	Standards and procedures address equipping units and personnel handling or transporting exposed and contaminated casualties and MWAs with CBRN/TIM protective equipment.	<p><b>G:</b> Overarching single set of standards specify common and interoperable requirements and measures for the protection of personnel and activities performing the handling and transport of exposed or contaminated casualties/MWAs.</p> <p><b>Y:</b> Common guidelines are established for the provision of protection of personnel and activities performing handling and transport functions associated with exposed or contaminated casualties/MWAs.</p> <p><b>R:</b> Common and interoperable standards are inadequate or nonexistent for the provision of protection of personnel and activities associated with functions involving the handling and transport of exposed or contaminated casualties/MWAs.</p>
M12	Standards and procedures address protection of exposed and contaminated casualties and MWAs, including those unable to wear IPE.	<p><b>G:</b> Overarching single set of standards specify common and interoperable requirements and measures for the protection of exposed or contaminated casualties/MWAs, including those medically unable to wear standard IPE.</p> <p><b>Y:</b> Common guidelines are established for the provision of protection of exposed or contaminated casualties/MWAs, including those medically unable to wear standard IPE.</p> <p><b>R:</b> Common and interoperable standards are inadequate or nonexistent for the provision of protection to exposed or contaminated casualties/MWAs, including those medically unable to wear standard IPE.</p>
M13	All applicable personnel are trained to safely handle and transport exposed or contaminated casualties and MWAs.	<p><b>G:</b> Training standards address the application of protective equipment assets and the safe handling and transport of exposed or contaminated casualties/MWAs by all applicable personnel (primary and augmentation).</p> <p><b>Y:</b> Training standards address the application of protective equipment assets and the safe handling and transport of exposed or contaminated casualties/MWAs by personnel with these as designated responsibilities.</p> <p><b>R:</b> Training standards are nonexistent or inadequately address the application of protective equipment assets and the safe handling and transport of exposed or contaminated casualties and MWAs by personnel subject to perform these tasks.</p>
M14	All applicable personnel are equipped with protective equipment to safely handle and transport exposed or contaminated casualties and MWAs.	<p><b>G:</b> All personnel subject to perform tasks associated with the handling and/or transport of exposed and contaminated casualties and MWAs are appropriately equipped.</p> <p><b>Y:</b> Designated personnel with designated responsibilities to perform handling and/or transport of exposed and contaminated casualties and MWAs are appropriately equipped.</p> <p><b>R:</b> Protective equipment assets are inadequate or nonexistent for the provision of protection of personnel possessing routine functions involving the handling and transport of exposed or contaminated casualties/MWAs.</p>
M15	Protective equipment is available for exposed and contaminated casualties and MWAs, including those medically unable to wear IPE.	<p><b>G:</b> CBRN protective equipment for exposed and contaminated casualties/MWAs, to include those medically unable to wear IPE, are readily available and provide protection for an extended period.</p> <p><b>Y:</b> CBRN protective equipment assets for exposed contaminated casualties/MWAs, to include those medically unable to wear IPE, are available.</p> <p><b>R:</b> CBRN protective equipment is nonexistent or not available to support exposed and/or contaminated casualties and/or MWAs, including those medically unable to wear IPE.</p>

M16	All base/facility/units conduct annual CBRND exercises to include distinct CBRN/TIM-specific exercise/evaluations encompassing mass CBRN/TIM casualty transport, medical reception and triage, and treatment.	<p><b>G:</b> Annual CBRND exercises fully integrate all personnel and activities and address sustained operations within a CBRN/TIM environment and includes the handling and transport of exposed or contaminated casualties and MWAs by all applicable personnel.</p> <p><b>Y:</b> Annual CBRND exercises fully involve military and direct mission civilian support personnel/functions and address operations within a toxic CBRN/TIM environment, to include aspects of the handling and transport of exposed or contaminated casualties and MWAs by personnel possessing routine non-emergency functions involving these activities.</p> <p><b>R:</b> Annual CBRND exercises are not conducted or do not address operations within a CBRN/TIM environment and do not generally integrate the handling and transport of exposed or contaminated casualties and MWAs.</p>
-----	---	---

<sup>1</sup> DOTLPF is inadequate for the transport of exposed/contaminated casualties by air. DOTLPF is also nonexistent for the protection and care of casualties unable to wear IPE and MWAs.

<sup>2</sup> International standards exist for the transport of contaminated individuals across international borders. These are promulgated under the auspices of the World Health Organization (WHO)—promulgated International Health Regulations of 1969 (as amended) specifies international requirements.

<sup>3</sup> National standards and procedures addressing the transport of exposed and contaminated casualties within the United States do not exist.

<sup>4</sup> Training standards are not promulgated at the joint level addressing training standards for the handling of exposed and contaminated casualties and MWAs. Guidelines do exist for the performance of these functions. However, training is generally inadequate and, although limited formal training may be provided for selected groups, usually performed at the unit level. MWAs are not equipped or prepared against CBRN/TIM agents.

<sup>5</sup> DoD training standards do not exist for the transport of exposed and contaminated casualties. Unit-level training is limited to the movement of casualties to the medical facility and is predominantly reliant upon tactical ground transport. Air transport (tactical rotary wing) is a last resort due to concerns about asset contamination. Tactical and strategic fixed wing air transport is not considered an acceptable means of transport. MWAs are not equipped or prepared against CBRN/TIM agents.

<sup>6</sup> Joint exercise plans include evaluation criteria, timing, type, content, and scoring. However, these are not the foundation for development of Service-specific exercise and evaluations. Additionally, there is a need for distinct CBRN/TIM-specific exercise/evaluations that include mass CBRN/TIM casualty transport, medical reception and triage, and treatment.

<sup>7</sup> Existing guidance specifies the application of either CPS or standard IPE to protect exposed and contaminated casualties against further contamination until decontaminated. However, these standards do not address casualties who cannot be adequately protected by standard IPE (due to injuries or medical requirements) and CPS is not available. MWAs are not equipped or prepared against CBRN/TIM agents.

<sup>8</sup> Common and interoperable standards are not promulgated by DoD addressing training for handling exposed and contaminated casualties and MWAs. Guidelines do exist for the performance of these functions. However, training is generally inadequate and, although limited formal training may be provided for selected groups by the Services, usually performed at the unit level. MWAs are not equipped or prepared against CBRN/TIM agents.

<sup>9</sup> Common and interoperable standards do not exist for the transport of exposed and contaminated casualties. Unit-level training is limited to the movement of casualties to the medical facility and is predominantly reliant upon tactical ground transport. Air transport (tactical rotary wing) is a last resort due to concerns about asset contamination. Tactical and strategic fixed wing air transport is not considered an acceptable means of transport. Prior decontamination of exposed/contaminated casualties is the only identified means for protecting transportation assets against secondary contamination. The predominant means is decontamination of the asset following secondary exposure/contamination. Existing standards and procedures provide adequate protection of personnel against secondary exposure/contamination. Standards and procedures require the application of protective equipment and measures if the potential exists for contamination/exposure. MWAs are not equipped or prepared against CBRN/TIM agents. Protection of support equipment, particularly medical equipment necessary for casualty treatment, is inadequate.

<sup>10</sup> Standards do address general training requirement for the transport of casualties to medical care, although not CBRN/TIM-specific. Similarly, the general standard to protect casualties is an existing requirement, though it too is not CBRN/TIM-specific. Standards do exist for the handling and protection of exposed and contaminated casualties by medical and selected specialized activities. Casualties who cannot be adequately protected by standard IPE (due to injuries or medical requirements) are not addressed. MWAs are not equipped or prepared against CBRN/TIM agents.

<sup>11</sup> MWAs are not equipped or prepared against CBRN/TIM agents. Existing standards and procedures provide adequate protection of personnel against secondary exposure/contamination. Standards and procedures require the application of protective equipment and measures if the potential exists for contamination/exposure. However, air transport resources are inadequately equipped and prepared to transport exposed and contaminated casualties and MWAs.

<sup>12</sup> MWAs are not equipped or prepared against CBRN/TIM agents. Exposed and contaminated casualties (human and MWA) unable to wear IPE are not adequately addressed in standards and procedures. Protective equipment is not available for these casualties. Casualties able to wear standard IPE are required to apply the equipment outside of CPS. However, medical units are not provided stocks of standard IPE for use by patients. Medical policy is the patient's unit is responsible for providing the equipment to the medical unit for use by the patient. Operationally involved units may be delayed, at best, in providing equipment.

<sup>13</sup> Existing standards and procedures provide adequate protection of personnel against secondary exposure/contamination. Standards and procedures require the application of protective equipment and measures if the potential exists for contamination/exposure. MWAs are not equipped or prepared against CBRN/TIM agents.

<sup>14</sup> Base, facilities, and units are required to conduct CBRND exercises. There is a need for distinct CBRN/TIM-specific exercise/evaluations that include mass CBRN/TIM casualty transport, medical reception and triage, and treatment.

### 10.8.3 Functional Solution Analysis

#### 10.8.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies associated with policies, standards, and criteria for the safe handling and transport of CBRN/TIM-exposed or -contaminated human and MWA casualties. The deficiencies can be addressed with non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section. Non-materiel solutions includes the development of CBRND protective equipment for MWD and casualties unable to wear standard IPE; addressing in doctrine, policy, and procedures standards and criteria for both institutional and unit-level training on the safe handling and transport of CBRN/TIM-exposed or -contaminated human and MWA casualties; establishment of doctrine, policy, procedures, and TTPs for the safe transport of CBRN/TIM-exposed or -contaminated human and MWA casualties; and the incorporation of exercise and evaluation standards and criteria into CBRND doctrine, policy, procedures, and TTPs for the safe handling and transport of these casualties.

- 1. Deficiency:** National standards and procedures addressing the transport of exposed and contaminated casualties within the United States do not exist.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, standards, and procedures for the safe transport (air, ground, and sea) of exposed and contaminated casualties. *Training:* Include standards and procedures for the safe transport (air, ground, and sea) of exposed and contaminated casualties as an essential element of formal and unit training.
- 2. Deficiency:** Training standards are not promulgated at the joint level addressing training standards for the handling of exposed and contaminated casualties.  
**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures the application of institutional and unit training standards for the handling of exposed and contaminated MWA casualties. *Training:* Establish training, exercise, and evaluation standards for the safe handling of exposed and contaminated MWA casualties. *Leadership:* Implement and manage training and equipping of functions and activities handling exposed and contaminated MWA casualties.
- 3. Deficiency:** Training standards are not promulgated at the joint level addressing training standards for the handling of exposed and contaminated casualties and MWAs.  
**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures the application of institutional and unit training standards for the handling of exposed and contaminated casualties/MWAs. *Training:* Establish training, exercise, and evaluation standards for the safe handling of exposed and contaminated casualties and/or MWAs by applicable units and personnel. *Leadership:* Implement and manage training and equipping of functions and activities handling exposed and contaminated casualties/MWAs.
- 4. Deficiency:** Training is generally inadequate and, although limited formal training may be provided for selected groups, is usually performed at the unit level.  
**Non-Materiel Solutions:** *Training:* Establish and implement training, exercise, and evaluation standards for the safe handling of exposed and contaminated casualties/MWAs

5. **Deficiency:** DoD training standards do not exist for the transport of exposed and contaminated casualties.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures the application of institutional and unit training standards for the handling of exposed and contaminated casualties, including prevention of secondary exposure/contamination. *Training:* Establish training, exercise, and evaluation standards for the safe handling and protection of exposed and contaminated casualties, including prevention of secondary exposure/contamination. *Leadership:* Establish and implement training, exercise, and evaluation standards for the safe handling of exposed and contaminated casualties, including prevention of secondary exposure/contamination.

6. **Deficiency:** DoD training standards do not exist for the transport of exposed and contaminated casualties.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures the application of institutional and unit training standards for the handling of exposed and contaminated MWA casualties, including prevention of secondary exposure/contamination. *Training:* Establish training, exercise, and evaluation standards for the safe handling and protection of exposed and contaminated MWA casualties, including prevention of secondary exposure/contamination. *Leadership:* Establish and implement training, exercise, and evaluation standards for the safe handling of exposed and contaminated MWA casualties, including prevention of secondary exposure/contamination.

7. **Deficiency:** DoD-level exercise evaluation criteria are not the foundation for development of Service-specific exercise and evaluations.

**Non-Materiel Solutions:** *Doctrine:* Reinforce existing doctrine and policy for the development of Service-specific exercises and evaluations based upon joint exercise plan and include the safe handling, transport, and management of contaminated casualties/MWAs. *Leadership:* Ensure joint exercise plans are used in the development of Service-specific exercises and evaluations.

8. **Deficiency:** There is a need for installation, facility, and unit-level distinct CBRN/TIM-specific exercise/evaluations that include mass CBRN/TIM casualty transport, medical reception and triage, and treatment.

**Non-Materiel Solutions:** *Doctrine:* Incorporate the safe handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties/MWAs into doctrine, policy and procedures and requires specific exercising and evaluation for these operations and activities that includes all activities and functions conducting these functions including nonmedical activities and functions. *Organization:* Ensure resources, taskings, and trained personnel are in place or available to support the handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties/MWAs by all activities and functions conducting these functions including nonmedical activities and functions. *Training:* Train, exercise, and evaluate the handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties/MWAs by all activities and functions conducting these functions including nonmedical activities and functions, including the prevention of secondary exposure/contamination. *Leadership:*

Implement and manage training, equipping, protective measures, and exercising for the safe handling, transport, medical reception and triage, and treatment of contaminated casualties/MWAs by all activities and functions conducting these functions including nonmedical activities and functions.

**9. Deficiency:** MWAs are not equipped or prepared against CBRN/TIM agents.

**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, standards, and procedures for CBRND protection of MWAs and contaminated MWA casualties, including prevention of secondary exposure/contamination. *Organization:* Organizational considerations for the safe handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties/MWAs by all activities and functions conducting these functions including nonmedical activities and functions, including the prevention of secondary exposure/contamination. *Training:* Institutional and unit-level training for CBRND protection of MWAs including MWA casualties and encompasses the prevention of secondary exposure/contamination. *Leadership:* Awareness and planning for CBRND protective requirements for MWAs and contaminated MWA casualty survivability. *Facilities:* Supporting infrastructure for MWD CBRND and contaminated MWD casualties (e.g., logistics, veterinary services, etc.).

**10. Deficiency:** Standards do not address casualties who cannot be adequately protected by standard IPE (due to injuries or medical requirements) and CPS is not available.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures the application of CBRND standards for the protection of casualties who cannot be adequately protected by standard IPE, including prevention of secondary exposure/contamination. *Organization:* Organizational considerations for the protection of casualties who cannot be adequately protected by standard IPE, including prevention of secondary exposure/contamination. Includes ensuring resources, taskings, and trained personnel are in place or available. *Training:* Establish training, exercise, and evaluation standards/criteria involving exposed and contaminated casualties. *Leadership:* Recognize criticality for the protection of casualties who cannot be adequately protected by standard IPE, training providing skills to manage operations of these types, and willingness to implement necessary changes and activities to prepare to perform and support protective operations/activities.

**11. Deficiency:** Standards do not address MWA casualties who cannot be adequately protected by standard IPE (due to injuries or medical requirements) and CPS is not available.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures the application of CBRND standards for the protection of MWA casualties who cannot be adequately protected by standard IPE, including prevention of secondary exposure/contamination. *Organization:* Organizational considerations for the protection of MWA casualties who cannot be adequately protected by standard IPE, including prevention of secondary exposure/contamination. Includes ensuring resources, taskings, and trained personnel are in place or available. *Training:* Establish training, exercise, and evaluation standards/criteria involving exposed and contaminated MWA casualties. *Leadership:* Recognize criticality for the protection of MWA casualties who cannot be adequately protected by standard IPE, training providing skills to manage operations of these types, and

willingness to implement necessary changes and activities to prepare to perform and support protective operations/activities.

- 12. Deficiency:** Common and interoperable standards are not promulgated by DoD addressing training for handling exposed and contaminated casualties.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures the application of institutional and unit training standards for the handling of exposed and contaminated casualties. *Training:* Establish training, exercise, and evaluation standards for the safe handling of exposed and contaminated casualties. *Leadership:* Implement and manage training and equipping of functions and activities handling exposed and contaminated casualties.

- 13. Deficiency:** Common and interoperable standards are not promulgated by DoD addressing training for handling exposed and contaminated MWA casualties.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures the application of institutional and unit training standards for the handling of exposed and contaminated MWA casualties. *Training:* Establish training, exercise, and evaluation standards for the safe handling of exposed and contaminated MWA casualties. *Leadership:* Implement and manage training and equipping of functions and activities handling exposed and contaminated MWA casualties.

- 14. Deficiency:** Training is generally inadequate and, although limited formal training may be provided for selected groups by the Services, usually performed at the unit level for the handling of exposed and contaminated casualties.

**Non-Materiel Solutions:** *Doctrine:* Incorporate institutional and unit-level training standards and criteria addressing the safe handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties into doctrine, policy and procedures and require specific exercising and evaluation for these operations and activities that encompasses all activities and functions conducting these functions including nonmedical activities and functions. *Training:* Train, exercise, and evaluate the handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties by all activities and functions conducting these functions including nonmedical activities and functions, including the prevention of secondary exposure/contamination *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties by all activities and functions conducting these functions including nonmedical activities and functions.

- 15. Deficiency:** Training is generally inadequate and, although limited formal training may be provided for selected groups by the Services, usually performed at the unit level for the handling of exposed and contaminated MWA casualties.

**Non-Materiel Solutions:** *Doctrine:* Incorporate institutional and unit-level training standards and criteria addressing the safe handling, transport, protective measures, medical reception and triage, and treatment of contaminated MWA casualties into doctrine, policy and procedures and require specific exercising and evaluation for these operations and activities that encompasses all activities and functions conducting these functions including

nonmedical activities and functions. *Training:* Train, exercise, and evaluate the handling, transport, protective measures, medical reception and triage, and treatment of contaminated MWA casualties by all activities and functions conducting these functions including nonmedical activities and functions, including the prevention of secondary exposure/contamination. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe handling, transport, protective measures, medical reception and triage, and treatment of contaminated MWA casualties by all activities and functions conducting these functions including nonmedical activities and functions.

- 16. Deficiency:** Protection of support equipment, particularly medical equipment necessary for casualty treatment, is inadequate.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures protective measures against secondary contamination or exposure from CBRN/TIM-contaminated casualties of support equipment including medical/veterinary equipment. *Organization:* Identify organizational services, resources, taskings, and activities to provide protection of equipment and personnel from secondary exposure/contamination to CBRN/TIM agents and to provide for the safe handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties. *Training:* Train, exercise, and evaluate the handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties by all activities and functions conducting these functions, including nonmedical activities and functions and the prevention of secondary exposure/contamination to support equipment and personnel. *Leadership:* Implement and manage training, equipping, protective measures, and exercising the prevention of secondary exposure of resources while performing handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties. *Facilities:* Supporting infrastructure for the safe handling, transport, provision of protective measures, medical reception and triage, and treatment of contaminated casualties, including the prevention of secondary exposure/contamination to support equipment and personnel.

- 17. Deficiency:** Protection of support equipment, particularly medical equipment necessary for casualty treatment, is inadequate.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures protective measures against secondary contamination or exposure from CBRN/TIM-contaminated MWA casualties of support equipment including medical/veterinary equipment. *Organization:* Identify organizational services, resources, taskings, and activities to provide protection of equipment and personnel from secondary exposure/contamination to CBRN/TIM agents and to provide for the safe handling, transport, protective measures, medical reception and triage, and treatment of contaminated MWA casualties. *Training:* Train, exercise, and evaluate the handling, transport, protective measures, medical reception and triage, and treatment of contaminated MWAs by all activities and functions conducting these functions, including nonmedical activities and functions and the prevention of secondary exposure/contamination to support equipment and personnel. *Leadership:* Implement and manage training, equipping, protective measures, and exercising the prevention of secondary exposure of resources while performing handling, transport, protective measures, medical reception and triage, and treatment of contaminated MWA casualties. *Facilities:* Supporting infrastructure for the safe handling, transport, provision of

protective measures, medical reception and triage, and treatment of contaminated casualties/MWAs, including the prevention of secondary exposure/contamination to support equipment and personnel.

- 18. Deficiency:** Air transport resources are inadequately equipped and prepared to transport exposed and contaminated casualties.

**Non-Materiel Solutions:** *Doctrine:* Promulgate and implement doctrine, policy, standards, and procedures for the safe transport by air of exposed and contaminated casualties, including the prevention of secondary exposure/contamination of the airframe and aircrew. *Organization:* Organizational resources, taskings, and trained personnel are in place or available to support the safe air transport of exposed and contaminated casualties, including the prevention of secondary exposure/contamination of the airframe and aircrew. *Training:* Institutional and unit-level training for application of standards for the safe transport by air of exposed and contaminated casualties. Exercising and evaluations to assess capabilities and prepare for the conduct of safe transport by air of exposed and contaminated casualties. Training, exercising, and evaluation include measures to prevent secondary exposure/contamination of the airframe and aircrew. *Leadership:* Recognize criticality for the protection of air transport resources from secondary contamination/exposure to CBRN/TIM agents while providing safe air transport of exposed and contaminated casualties. *Facilities:* Supporting infrastructure for the safe air transport of contaminated casualties, including the prevention of secondary exposure/contamination to airframe and aircrew.

- 19. Deficiency:** Air transport resources are inadequately equipped and prepared to transport exposed and contaminated MWA casualties.

**Non-Materiel Solutions:** *Doctrine:* Promulgate and implement doctrine, policy, standards, and procedures for the safe transport by air of exposed and contaminated MWA casualties, including the prevention of secondary exposure/contamination of the airframe and aircrew. *Organization:* Organizational resources, taskings, and trained personnel are in place or available to support the safe air transport of exposed and contaminated MWA casualties, including the prevention of secondary exposure/contamination of the airframe and aircrew. *Training:* Institutional and unit-level training for application of standards for the safe transport by air of exposed and contaminated MWA casualties. Exercising and evaluations to assess capabilities and prepare for the conduct of safe transport by air of exposed and contaminated MWA casualties. Training, exercising, and evaluation include measures to prevent secondary exposure/contamination of the airframe and aircrew. *Leadership:* Recognize criticality for the protection of air transport resources from secondary contamination/exposure to CBRN/TIM agents while providing safe air transport of exposed and contaminated MWA casualties. *Facilities:* Supporting infrastructure for the safe air transport of contaminated MWA casualties, including the prevention of secondary exposure/contamination to airframe and aircrew.

- 20. Deficiency:** DOTLPP is inadequate for the transport of exposed/contaminated casualties by air.

**Non-Materiel Solutions:** *Doctrine:* Doctrine, policy, and procedures addressing the safe transport of exposed and contaminated casualties by air. *Organization:* Organizational

structures, resources, taskings, and trained staff to enable and support the safe transport of exposed and contaminated casualties by air. *Training*: Institutional and unit-level training for the safe transport by air, of exposed and contaminated casualties. Exercises and evaluations to assess capabilities and prepare for the conduct of safe transport of exposed and contaminated casualties. *Leadership*: Recognize criticality of air transport of exposed and contaminated casualties for survivability and treatment. *Facilities*: Supporting infrastructure for the safe air transport of contaminated casualties.

- 21. Deficiency:** DOTLPPF is inadequate for the transport of exposed/contaminated MWA casualties by air.

**Non-Materiel Solutions:** *Doctrine*: Develop doctrine, policy, and procedures addressing the safe transport of exposed and contaminated MWA casualties by air. *Organization*: Develop organizational structures, resources, taskings, and trained staff to enable and support the safe transport of exposed and contaminated MWA casualties by air. *Training*: Establish institutional and unit-level training for the safe transport by air of exposed and contaminated MWA casualties, including exercising and evaluations to assess capabilities and prepare for the conduct of safe transport of exposed and contaminated MWA casualties. *Leadership*: Recognize criticality of air transport of exposed and contaminated MWA casualties for survivability and treatment. *Facilities*: Develop supporting infrastructure for the safe air transport of contaminated MWA casualties.

- 22. Deficiency:** DOTLPPF is nonexistent for the protection and care of casualties unable to wear IPE.

**Non-Materiel Solutions:** *Doctrine*: Promulgate doctrine, policy, and procedures the application of CBRND standards for the protection of casualties who cannot be adequately protected by standard IPE, including prevention of secondary exposure/contamination. *Organization*: Ensure organizational considerations for the protection of casualties who cannot be adequately protected by standard IPE, including prevention of secondary exposure/contamination. Includes ensuring resources, taskings, and trained personnel are in place or available. *Training*: Establish training, exercise, and evaluation standards/criteria involving exposed and contaminated casualties who cannot be adequately protected by standard IPE. *Leadership*: Recognize criticality for the protection of casualties who cannot be adequately protected by standard IPE, training providing skills to manage operations of these types, and willingness to implement necessary changes and activities to prepare to perform and support protective operations/activities. *Facilities*: Develop supporting infrastructure (e.g., consumables, transport COLPRO, power production, etc.) to enable survival of exposed and contaminated casualties who cannot be adequately protected by standard IPE.

- 23. Deficiency:** DOTLPPF is nonexistent for the protection and care of MWA casualties.

**Non-Materiel Solutions:** *Doctrine*: Promulgate doctrine, policy, and procedures the application of CBRND standards for the protection of MWA casualties who cannot be adequately protected by standard IPE, including prevention of secondary exposure/contamination. *Organization*: Organizational considerations for the protection of MWA casualties who cannot be adequately protected by standard IPE, including prevention of secondary exposure/contamination. Includes ensuring resources, taskings, and trained

personnel are in place or available. *Training*: Establish training, exercise, and evaluation standards/criteria involving exposed MWA casualties who cannot be adequately protected by standard IPE. *Leadership*: Recognize criticality for the protection of MWA casualties who cannot be adequately protected by standard IPE, training providing skills to manage operations of these types, and willingness to implement necessary changes and activities to prepare to perform and support protective operations/activities. *Facilities*: Supporting infrastructure (e.g., consumables, transport COLPRO, power production, etc.) to enable survival of exposed and contaminated MWA casualties who cannot be adequately protected by standard IPE.

#### **10.8.3.2 IMA Assessment Summary**

N/A

**10.9 Task SNSHLD 9: Establish standards, criteria, and procedures for safe handling and transport of CBRN/TIM-exposed or -contaminated human and MWA remains****10.9.1 Functional Area Analysis****10.9.1.1 Definition**

To ensure the efficient, consistent, and safe handling and transport of exposed or contaminated human and MWA remains, including standards of mortuary care and common procedures for transporting remains across U.S., host nation, third-country, or international airspace, territory, or waters.

**10.9.1.2 Derivation**

*Joint Enabling Concept for CBRN/TIM Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (SN 1.1.5, SN 1.2.3, SN 4.2.2, SN 4.3.3, SN 4.3.4, SN 8.1.6, SN 9, SN 9.2.2).*

**10.9.1.2.1 Supported Task:** N/A

**10.9.1.2.2 Lateral Task:** SNSHA 3

**10.9.1.2.3 Supporting Task:** N/A

**10.9.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Some interoperability. (C2.2.6)
2. Partial joint staff integration. (C2.3.1.1)
3. Partial multinational integration. (C2.3.1.2)
4. Sufficient deployed supplies. (C2.8.2)
5. Sufficient CONUS resupply. (C2.8.3)
6. Slow pipeline responsiveness. (C2.8.3.1)
7. Limited prepositioned materiel. (C2.8.4)

**Civil**

1. Correct interdepartmental/interagency relationships. (C3.1.1.3)
2. Limited foreign government support (C3.2.1.3)

## **10.9.2 Functional Needs Analysis**

### **10.9.2.1 Capability and Deficiency Assessment Summary**

This section addresses the only capability that exists to perform the task to the designated standard. CJCS/joint staff institutes and provides joint Service oversight of comprehensive DOTMLPF program for the safe handling and transport of exposed or contaminated human and MWA remains addressing the chain of action and movement from theater to final interment.

#### **Current Capability and Deficiency**

CBRN/TIM-contaminated remains are handled as hazardous or infectious materials when crossing international borders and are under auspices of international treaties and standards. Nations conforming to United Nations treaties, regulations, and codes with impact upon international transport of remains are identified. However, these treaties and standards do not specifically address exposed and contaminated human and MWA remains resulting from a CBRN/TIM agent. U.S. national standards also exist for the movement of remains but do not extend to exposed and contaminated remains. CDC guidelines for movement of highly infectious remains exist and are applied to specific cases for epidemiological investigation only. Training standards also exist for transport of remains and mortuary activities. However, the transport standards and procedures do not adequately address CBRN/TIM-exposed or -contaminated remains. The overall current capability is assessed as “yellow.”

#### **Projected Near/Mid-Term Capability and Deficiency**

No changes are projected for this task.

#### **Projected Far-Term Capability and Deficiency**

No changes are projected for this task.

	FAA Measure	Scale
M1	International standards exist for transport of exposed or contaminated human and MWA remains.	<p><b>G:</b> Internationally accepted standards and procedures exist for the transport of exposed or contaminated human and MWA remains across international borders and are applicable to CBRN/TIM casualties.</p> <p><b>Y:</b> Internationally accepted standards and procedures exist for the transport of selected CBRN-exposed/contaminated human and MWA remains and are restricted to specifically identified international border movements.</p> <p><b>R:</b> Internationally accepted standards are nonexistent or inadequate for the international movement of CBRN-exposed/contaminated human and MWA remains across international borders.</p>
M2	International standards exist for mortuary care of exposed or contaminated human and MWA remains.	<p><b>G:</b> Internationally accepted standards and procedures exist for the mortuary care, storage, and preparation of exposed or contaminated human and MWA remains and are applicable to CBRN/TIM casualties that will cross international borders.</p> <p><b>Y:</b> Internationally accepted standards and procedures exist for the mortuary care, storage, and preparation of CBRN-exposed/contaminated human and MWA remains and are restricted to specifically identified international border movements.</p> <p><b>R:</b> Internationally accepted standards are nonexistent or inadequate for the mortuary care, storage, and preparation of CBRN-exposed/contaminated human and MWA remains for crossing international borders.</p>
M3	International standards for IPE exist for exposed or contaminated remains.	<p><b>G:</b> Internationally accepted standards and procedures exist for protective barrier materials and IPE for application to exposed or contaminated human and MWA remains crossing international borders and are applicable to CBRN/TIM casualties.</p> <p><b>Y:</b> Internationally accepted standards and procedures exist for protective barrier materials and IPE for application to CBRN/TIM-exposed or -contaminated human and MWA and are restricted to specifically identified international border movements.</p> <p><b>R:</b> Internationally accepted standards are nonexistent or inadequate for protective barrier materials and IPE for application to exposed or contaminated human and MWA remains that cross international borders.</p>

M4	National standards and procedures exist for transport of exposed or contaminated human and MWA remains, including across state boundaries.	<p><b>G:</b> Mandated national standards and procedures exist for the transport of exposed or contaminated human and MWA remains across state borders, are applicable to CBRN/TIM casualties, and are applied without variance and additional restrictive requirements across all states.</p> <p><b>Y:</b> National standards and procedures exist for the transport of exposed or contaminated human and MWA remains across state borders, are applicable to CBRN/TIM casualties, and are applied with minor additional restrictive requirements across all states.</p> <p><b>R:</b> National standards and procedures applicable to CBRN-exposed or -contaminated human and MWA remains are inadequate, nonexistent, are applied with significant additional restrictive requirements by the states, or widely vary between states.</p>
M5	Nations are identified that conform with international policies regarding the handling and transport of exposed or contaminated human and MWA remains.	<p><b>G:</b> Nations recognizing and conforming to internationally accepted standards and procedures for the handling and international transport of exposed and contaminated human and MWA remains are identified and published in DoD/joint procedures and TTPs.</p> <p><b>Y:</b> Nations recognizing and generally conforming to internationally accepted standards and procedures for the handling and international transport of exposed and contaminated human and MWA remains are identified and published in DoD/joint procedures and TTPs.</p> <p><b>R:</b> Identification and publishing within DoD/joint procedures and TTPs of nations recognizing and conforming to internationally accepted standards and procedures are nonexistent or inadequate for the handling and international transport of exposed and contaminated human and MWA remains.</p>
M6	DoD-level training standards exist for handling of exposed or contaminated human and MWA remains.	<p><b>G:</b> DoD-level CBRND training standards detail requirements and measures for the safe handling of exposed and contaminated human and MWA remains.</p> <p><b>Y:</b> DoD-level training standards provide general requirements and measures for the safe handling of exposed and contaminated human and MWA remains.</p> <p><b>R:</b> DoD-level CBRND training standards are nonexistent or inadequately address the safe handling of exposed and contaminated human and MWA remains.</p>
M7	DoD-level training standards exist for transport of exposed or contaminated human and MWA remains.	<p><b>G:</b> DoD-level CBRND training standards detail requirements for the safe transport of CBRN-exposed or -contaminated human and MWA remains.</p> <p><b>Y:</b> DoD-level CBRND training standards provide general requirements for the safe transport of CBRN-exposed or -contaminated human and MWA remains.</p> <p><b>R:</b> DoD-level CBRND training standards are nonexistent or inadequately address the safe transport of CBRN-exposed or -contaminated human and MWA remains.</p>
M8	DoD-level standards exist for protective equipment for exposed or contaminated remains (human and MWAs).	<p><b>G:</b> DoD-level standards detail requirements for protective barriers and equipment for CBRN-exposed or -contaminated human and MWA remains.</p> <p><b>Y:</b> DoD-level standards provide general requirements for protective barriers and equipment for CBRN-exposed or -contaminated human and MWA remains.</p> <p><b>R:</b> DoD-level CBRND training standards are nonexistent or inadequately address protective barriers and equipment for CBRN-exposed or -contaminated human and MWA remains.</p>

M9	DoD-level exercise evaluation criteria exist, including timing, type, content, and scoring.	<p><b>G:</b> Distinct DoD and joint exercise plans and evaluation requirements exist for sustained operations within a toxic CBRN/TIM environment and incorporates as a distinct critical area of evaluation the handling and movement of CBRN-exposed or -contaminated human and MWA remains. Service-specific exercises and evaluations are developed based upon the DoD and joint exercise plans and evaluation requirements.</p> <p><b>Y:</b> DoD and joint exercise plans and evaluation general requirements exist and include CBRN operations as components. Service-specific exercises and evaluations do not fully and sequentially address the entire process of handling and movement of CBRN-exposed or -contaminated human and MWA remains.</p> <p><b>R:</b> DoD, joint, and Service-specific exercise plans and evaluation requirements are inadequate, do not exist, or do not fully address CBRN operations and the handling/movement of CBRN-exposed or -contaminated human and MWA remains.</p>
M10	Standards and procedures are in place for containment of exposed and contaminated human and MWA remains to preclude secondary exposure and/or contamination.	<p><b>G:</b> Overarching single set of standards specify common and interoperable requirements and measures for the proper containment of CBRN-exposed or -contaminated human and MWA remains to preclude secondary exposure and/or contamination to processing, handling, transporting, and interment personnel, support equipment, and/or transport assets.</p> <p><b>Y:</b> Common guidelines are established for the containment of CBRN-exposed or -contaminated human and MWA remains to preclude secondary exposure and/or contamination to processing, handling, transporting, and interment personnel, support equipment, and/or transport assets.</p> <p><b>R:</b> Common and interoperable standards are inadequate or nonexistent for the containment of CBRN-exposed or -contaminated human and MWA remains to preclude secondary exposure and/or contamination to processing, handling, transporting, and interment personnel, support equipment, and/or transport assets.</p>
M11	Common and interoperable standards exist for handling exposed or contaminated human and MWA remains.	<p><b>G:</b> DoD/joint standards and procedures detail common and interoperable requirements for the safe handling of exposed or contaminated human and MWA remains. Service-specific standards and procedures incorporate the DoD/joint standards.</p> <p><b>Y:</b> DoD/joint standards and procedures provide common general guidance for the safe handling of exposed or contaminated human and MWA remains. Service-specific standards and procedures may vary, but not in critical aspects, from the DoD/joint standards and procedures.</p> <p><b>R:</b> Common standards and procedures are inadequate or nonexistent for the safe handling of exposed or contaminated human and MWA remains.</p>
M12	Common and interoperable standards exist for transporting exposed or contaminated human and MWA remains.	<p><b>G:</b> DoD/joint standards and procedures detail common and interoperable requirements for the safe transport of exposed or contaminated human and MWA remains. Service-specific standards and procedures incorporate the DoD/joint standards.</p> <p><b>Y:</b> DoD/joint standards and procedures provide common general guidance for the safe transport of exposed or contaminated human and MWA remains. Service-specific standards and procedures may vary, but not in critical aspects, from the DoD/joint standards and procedures.</p> <p><b>R:</b> Common standards and procedures are inadequate or nonexistent for the safe transport of exposed or contaminated human and MWA remains.</p>

M13	Standards address training mortuary, transport, and supporting units and personnel to contain, handle, and transport exposed and contaminated human and MWA remains.	<p><b>G:</b> Training standards address the application of protective containment, barrier, and protective assets and the safe processing, handling, transport, and interment of exposed or contaminated human and MWA remains.</p> <p><b>Y:</b> Training standards generally address the application of protective containment, barrier, and protective assets and the safe processing, handling, transport, and interment of exposed or contaminated human and MWA remains.</p> <p><b>R:</b> Training standards are nonexistent or inadequately address the application of protective containment, barrier, and protective assets and the safe processing, handling, transport, and interment of exposed or contaminated human and MWA remains.</p>
M14	Standards and procedures address training mortuary, transport, and supporting units and personnel to protect themselves, support equipment, and transportation assets against secondary exposure/contamination.	<p><b>G:</b> Training standards address the application of protective barrier materials, personal and containment assets, procedures, and detection equipment to protect personnel, equipment, and transport assets against secondary exposure/contamination from CBRN/TIM-exposed or -contaminated human and MWA remains.</p> <p><b>Y:</b> Training standards generally address the application of protective barrier materials, personal and containment assets, procedures, and detection equipment to protect personnel, equipment, and transport assets against secondary exposure/contamination from CBRN/TIM-exposed or -contaminated human and MWA remains.</p> <p><b>R:</b> Training standards are nonexistent or inadequately address the application of protective barrier materials, personal and containment assets, procedures, and detection equipment to protect personnel, equipment, and transport assets against secondary exposure/contamination from CBRN/TIM-exposed or -contaminated human and MWA remains.</p>
M15	Standards and procedures address equipping units and personnel handling or transporting exposed and contaminated human and MWA remains with CBRN/TIM protective equipment.	<p><b>G:</b> Overarching single set of standards specify common and interoperable requirements and measures for the protection of personnel and activities performing the processing, handling, transport, and interment of CBRN/TIM-exposed or -contaminated human and MWA remains.</p> <p><b>Y:</b> Common guidelines are established for the provision of protection of personnel and activities performing the processing, handling, transport, and interment of CBRN/TIM-exposed or -contaminated human and MWA remains.</p> <p><b>R:</b> Common and interoperable standards are inadequate or nonexistent for the provision of protection of personnel and activities associated with functions involving the the processing, handling, transport, and interment of CBRN/TIM-exposed or -contaminated human and MWA remains.</p>
M16	Standards and procedures address containment of exposed and contaminated human and MWA remains	<p><b>G:</b> Overarching single set of standards specify common and interoperable requirements and measures for the proper containment of CBRN-exposed or -contaminated human and MWA remains.</p> <p><b>Y:</b> Common guidelines are established for the containment of CBRN-exposed or -contaminated human and MWA remains.</p> <p><b>R:</b> Common and interoperable standards are inadequate or nonexistent for the containment of CBRN-exposed or -contaminated human and MWA remains.</p>
M17	Common procedures exist for marking the location of exposed and contaminated remains and include language, symbols, color, and shape.	<p><b>G:</b> Overarching single set of standards and procedures specify common and interoperable requirements for the marking the site location and maps for CBRN/TIM-exposed or -contaminated human and MWA remains to include language, symbols, color, and shape.</p> <p><b>Y:</b> Common guidelines are established for the marking the site location and maps for CBRN/TIM-exposed or -contaminated human and MWA remains to include language, symbols, color, and shape.</p> <p><b>R:</b> Common and interoperable standards are inadequate or nonexistent for the marking the site location and maps for CBRN/TIM-exposed or -contaminated human and MWA remains to include language, symbols, color, and shape.</p>

M18	All applicable personnel are trained to safely handle and transport exposed or contaminated casualties and MWAs.	<p><b>G:</b> Training standards address the application of protective equipment assets and the safe handling and transport of CBRN/TIM-exposed or -contaminated human and MWA remains by all applicable personnel (primary and augmentation).</p> <p><b>Y:</b> Training standards address the application of protective equipment assets and the safe handling and transport of CBRN/TIM-exposed or -contaminated human and MWA remains by personnel with these as designated responsibilities</p> <p><b>R:</b> Training standards are nonexistent or inadequately address the application of protective equipment assets and the safe handling and transport of CBRN/TIM-exposed or -contaminated human and MWA remains by personnel subject to perform these tasks.</p>
M19	All applicable personnel are equipped with protective equipment to safely handle and transport exposed and contaminated human and MWA remains.	<p><b>G:</b> All personnel subject to perform tasks associated with the handling and/or transport of CBRN/TIM-exposed and -contaminated human and MWA remains are appropriately equipped.</p> <p><b>Y:</b> Designated personnel with designated responsibilities to perform handling and/or transport of CBRN/TIM-exposed and -contaminated human and MWA remains are appropriately equipped.</p> <p><b>R:</b> Protective equipment assets are inadequate or nonexistent for the provision of protection of personnel possessing routine functions involving the handling and transport of CBRN/TIM-exposed and -contaminated human and MWA remains.</p>
M20	Protective containment systems are available for exposed and contaminated human and MWA remains.	<p><b>G:</b> CBRN protective equipment and materials for exposed and contaminated human and MWA remains are readily available and provide containment protection for an extended period.</p> <p><b>Y:</b> CBRN protective equipment assets for exposed contaminated human and MWA remains are available.</p> <p><b>R:</b> CBRN protective equipment is nonexistent or not available to support exposed and/or contaminated human and/or MWA remains.</p>
M21	Base/facility/units conduct annual CBRND exercises.	<p><b>G:</b> Annual CBRND exercises fully integrate all personnel and activities and address sustained operations within a CBRN/TIM environment and includes the handling and transport of exposed or contaminated human and MWA remains by all applicable personnel.</p> <p><b>Y:</b> Annual CBRND exercises fully involve military and direct mission civilian support personnel/functions and address operations within a toxic CBRN/TIM environment, to include aspects of the handling and transport of exposed or contaminated human and MWA remains by personnel possessing routine non-emergency functions involving these activities.</p> <p><b>R:</b> Annual CBRND exercises are not conducted or do not address operations within a CBRN/TIM environment and do not generally integrate the handling and transport of exposed or contaminated human and MWA remains.</p>

<sup>1</sup> DOTLPF is inadequate to accomplish this task.

<sup>2</sup> Contaminated remains are handled as hazardous or infectious materials when crossing international borders and are under the treaty auspices of the United Nations. The primary applicable codes are under the World Health Organization (WHO) and promulgated under the International Health Regulations of 1969 (as amended). Transport requirements are also governed by the international Civil Aviation Organization Technical Instructions (ICAO TI) on the Safe Transport of Dangerous Goods by Air; International Maritime Dangerous Goods (IDMG) Code, and the International Atomic Energy Agency (IAEA) Internal Atomic Energy Regulations for the Safe Transport of Radioactive Materials. However, these standards do not specifically address exposed or contaminated human and MWA remains as the result of a CBRN/TIM agent.

<sup>3</sup> International standards for mortuary activities for exposed and contaminated human and MWA remains as a result of a CBRN/TIM agent do not exist. Mortuary activities are generally determined by national standards.

<sup>4</sup> Internationally accepted standards do exist for the packaging of hazardous or infectious materials crossing international borders. These do not specifically address exposed and contaminated remains from a CBRN/TIM agent. The standards are promulgated under the auspices of the United Nations. The primary applicable codes are under the World

Health Organization (WHO) and promulgated under the International Health Regulations of 1969 (as amended). Transport packaging requirements are also governed by the international Civil Aviation Organization Technical Instructions (ICAO TI) on the Safe Transport of Dangerous Goods by Air; International Maritime Dangerous Goods (IDMG) Code, and the International Atomic Energy Agency (IAEA) Internal Atomic Energy Regulations for the Safe Transport of Radioactive Materials. However, these standards do not specifically address exposed or contaminated human and MWA remains as the result of a CBRN/TIM agent.

<sup>5</sup> National standards and procedures for the movement of human and MWA remains do exist. The extension of these standards and procedures to exposed and contaminated remains does not currently exist. CDC guidelines for movement of highly infectious remains do exist and are applied for specific cases of epidemiological investigation. It is also noted each state possess unique requirements for the movement and interment of remains.

<sup>6</sup> International standards specifically addressing exposed or contaminated human and MWA remains as the result of a CBRN/TIM agent do not exist. Nations conforming to existing United Nations treaties, regulations, and codes with impact upon international transport of exposed/contaminated materials and samples are identified.

<sup>7</sup> Training standards exist for primary duty personnel performing mortuary activities. However, augmentation and additional duty personnel are trained at the unit level and training in inadequate for CBRN/TIM-exposed/contaminated remains.

<sup>8</sup> Training standards exist for the transport of remains. However, these standards do not adequately address CBRN/TIM-exposed and -contaminated remains.

<sup>9</sup> CBRN/TIM containment packaging for exposed/contaminated remains is inadequate or nonexistent.

<sup>10</sup> Joint exercise plans include evaluation criteria, timing, type, content, and scoring. However, these are not the foundation for development of Service-specific exercise and evaluations. Additionally, there is a need for distinct CBRN/TIM-specific exercise/evaluations that include mortuary activities for CBRN/TIM exposed/contaminated remains.

<sup>11</sup> Standards and procedures exist for the handling of exposed/contaminated remains. However, these are generally only known and applied by primary duty mortuary personnel. Transporting and supporting units/personnel are generally trained to handle and transport unexposed/uncontaminated remains. The extension of existing standards and procedures addressing exposed/contaminated remains is inadequate or nonexistent.

<sup>12</sup> Standards and procedures for the movement of human and MWA remains do exist. The extension of these standards and procedures to exposed and contaminated remains does not currently exist. CDC guidelines for movement of highly infectious remains do exist and are applied for specific cases of epidemiological investigation. It is also noted each state possess unique requirements for the movement and interment of remains.

<sup>13</sup> Existing standards and procedures provide adequate protection of personnel against secondary exposure/contamination. Standards and procedures require the application of protective equipment and measures if the potential exists for contamination/exposure. Mortuary personnel performing decontamination and remains preparation additionally require splash protection against decontaminants and body fluids.

<sup>14</sup> Containment is not adequately address in current standards and procedures. CBRN/TIM containment packaging for exposed/contaminated remains is inadequate or nonexistent. Current procedures provide for decontamination and temporary interment to reduce and eliminate contaminants.

<sup>15</sup> Procedures for marking interment areas exist. However, containment markings standards do not exist.

<sup>16</sup> Protective containment systems are inadequate or nonexistent.

<sup>17</sup> Base, facilities, and units are required to conduct CBRND exercises. There is a need for distinct CBRN/TIM-specific exercise/evaluations that include mortuary activities.

### 10.9.3 Functional Solution Analysis

#### 10.9.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies associated with policies, standards, and criteria for the safe handling and transport of CBRN/TIM-exposed or -contaminated human and MWA remains. The deficiencies can be addressed by non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section. Non-materiel solutions include analysis of current and proposed national and international (U.S. and other nations) standards for their application to CBRN/TIM-exposed and -contaminated human and MWA remains; inclusion of identified standards into doctrine, policy, procedures, and TTPs; RDTE&A of containment and alternative protective systems for CBRN/TIM-contaminated or -exposed remains; and analysis of current and proposed national and international standards for marking and identification of CBRN/TIM-exposed and -contaminated human and MWA remains. Incorporate the safe handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated human and MWA casualties into doctrine, policy, procedures, and TTPs and require specific exercising and evaluation for these operations and activities encompassing all activities and functions performing these tasks, including nonmortuary activities and functions. Specify requirements and guidelines for the safe air transport of CBRN/TIM-exposed and -contaminated remains in doctrine, policy, procedures, and TTPs.

1. **Deficiency:** International standards for mortuary activities for exposed and contaminated remains as a result of a CBRN/TIM agent do not exist.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of identified international standards and requirements for mortuary activities as applied to exposed and contaminated remains resulting from a CBRN/TIM agent. *Training:* Include identified international standards and requirements for mortuary activities as applied to exposed/contaminated remains resulting from a CBRN/TIM agent as an essential element of formal and unit training, as well as exercise and evaluation standards and criteria. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe movement of exposed/contaminated remains resulting from a CBRN/TIM agent.
2. **Deficiency:** International standards for mortuary activities for exposed and contaminated MWA remains as a result of a CBRN/TIM agent do not exist.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of identified international standards and requirements for mortuary activities as applied to exposed and contaminated MWA remains resulting from a CBRN/TIM agent. *Training:* Include identified international standards and requirements for mortuary activities as applied to exposed/contaminated MWA remains resulting from a CBRN/TIM agent as an essential element of formal and unit training, as well as exercise and evaluation standards and criteria. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe movement of exposed/contaminated MWA remains resulting from a CBRN/TIM agent.

- 3. Deficiency:** The extension of national standards and procedures for the movement of exposed and contaminated remains is inadequate or nonexistent.
- Non-Materiel Solutions:** *Doctrine:* Coordinate with appropriate national agencies and authorities to establish in doctrine, policy, and procedures national standards and requirements for the movement of exposed/contaminated remains resulting from a CBRN/TIM agent. *Training:* Establish and implement training, exercise, and evaluation standards and criteria for the safe movement of exposed/contaminated remains resulting from a CBRN/TIM agent. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe movement of exposed/contaminated remains resulting from a CBRN/TIM agent. *Facilities:* Develop supporting infrastructure for the handling, movement, storage, and final disposition of exposed/contaminated remains resulting from a CBRN/TIM agent.
- 4. Deficiency:** The extension of national standards and procedures for the movement of MWA exposed and contaminated remains is inadequate or nonexistent.
- Non-Materiel Solutions:** *Doctrine:* Coordinate with appropriate national agencies and authorities to establish in doctrine, policy, and procedures national standards and requirements for the movement of exposed/contaminated MWA remains resulting from a CBRN/TIM agent. *Training:* Establish and implement training, exercise, and evaluation standards and criteria for the safe movement of exposed/contaminated MWA remains resulting from a CBRN/TIM agent. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe movement of exposed/contaminated MWA remains resulting from a CBRN/TIM agent. *Facilities:* Develop supporting infrastructure for the handling, movement, storage, and final disposition of exposed/contaminated MWA remains resulting from a CBRN/TIM agent.
- 5. Deficiency:** Augmentation and additional duty personnel training is inadequate for CBRN/TIM exposed/contaminated remains.
- Non-Materiel Solutions:** *Doctrine:* Incorporate institutional and unit-level training standards and criteria addressing the safe handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM exposed/contaminated casualties into doctrine, policy and procedures and require specific exercising and evaluation for these operations and activities that encompasses all activities and functions conducting these tasks, including nonmortuary activities and functions. *Training:* Train, exercise, and evaluate the handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM exposed/contaminated casualties by all functions and activities conducting these tasks including nonmortuary activities and functions and encompassing the prevention of secondary exposure/contamination. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM exposed/contaminated casualties by all functions and activities conducting these tasks including nonmortuary activities and functions.
- 6. Deficiency:** Augmentation and additional duty personnel training is inadequate for CBRN/TIM-exposed/contaminated MWA remains.

**Non-Materiel Solutions:** *Doctrine:* Incorporate institutional and unit-level training standards and criteria addressing the safe handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated MWA casualties into doctrine, policy and procedures and require specific exercising and evaluation for these operations and activities that encompasses all activities and functions conducting these tasks, including nonmortuary activities and functions. *Training:* Train, exercise, and evaluate the handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated MWA casualties by all functions and activities conducting these tasks including nonmortuary activities and functions and encompassing the prevention of secondary exposure/contamination. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated MWA casualties by all functions and activities conducting these tasks including nonmortuary activities and functions.

7. **Deficiency:** CBRN/TIM containment packaging for exposed/contaminated remains is inadequate or nonexistent.

**Non-Materiel Solutions:** *Doctrine:* Include the application of CBRN/TIM containment packaging/systems designed for exposed/contaminated remains in doctrine, policy, and procedures. *Organization:* Identify organizational resource and support requirements for the application of CBRN/TIM containment packaging/systems for exposed/contaminated remains. *Training:* Train, exercise, and evaluate the application of CBRN/TIM containment packaging/systems for exposed/contaminated remains. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe application of CBRN/TIM containment packaging/systems for exposed/contaminated remains.

8. **Deficiency:** DoD-level exercise evaluation criteria are not the foundation for development of Service-specific exercise and evaluations.

**Non-Materiel Solutions:** *Doctrine:* Reinforce existing doctrine and policy for the development of Service-specific exercises and evaluations based upon joint exercise plan and include the handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated human/MWA casualties that encompasses all functions and activities performing these tasks including nonmortuary activities and functions. *Training:* Ensure joint exercise plans are used in the development of Service-specific exercises and evaluations.

9. **Deficiency:** There is a need for distinct CBRN/TIM-specific exercise/evaluations that include mortuary activities for CBRN/TIM exposed/contaminated remains.

**Non-Materiel Solutions:** *Doctrine:* Incorporate the safe handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM exposed/contaminated human/MWA casualties into doctrine, policy and procedures and require specific exercising and evaluation for these operations and activities that encompasses all activities and functions conducting these tasks, including nonmortuary activities and functions. *Organization:* Ensure resources, taskings, and trained personnel are in place or available to support the handling, preparation, transport, protective measures,

mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated human/MWA casualties by all activities and functions conducting these tasks, including nonmortuary activities and functions. *Training:* Train, exercise, and evaluate the handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated human/MWA casualties by all activities and functions conducting these tasks, including nonmortuary activities and functions. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated human/MWA casualties by all activities and functions conducting these tasks, including nonmortuary activities and functions.

- 10. Deficiency:** Standards and procedures for the handling of exposed/contaminated remains are generally only known and applied by primary duty mortuary personnel.

**Non-Materiel Solutions:** *Doctrine:* Incorporate institutional and unit-level training standards and criteria addressing the safe handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated casualties into doctrine, policy and procedures and require specific exercising and evaluation for these operations and activities that encompasses all activities and functions conducting these tasks, including nonmortuary activities and functions. *Training:* Train, exercise, and evaluate the handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated casualties by all functions and activities conducting these tasks including nonmortuary activities and functions and encompassing the prevention of secondary exposure/contamination. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated casualties by all functions and activities conducting these tasks including nonmortuary activities and functions.

- 11. Deficiency:** Standards and procedures for the handling of exposed/contaminated MWA remains are generally only known and applied by primary duty mortuary personnel.

**Non-Materiel Solutions:** *Doctrine:* Incorporate institutional and unit-level training standards and criteria addressing the safe handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated MWA casualties into doctrine, policy and procedures and require specific exercising and evaluation for these operations and activities that encompasses all activities and functions conducting these tasks, including nonmortuary activities and functions. *Training:* Train, exercise, and evaluate the handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated MWA casualties by all functions and activities conducting these tasks including nonmortuary activities and functions and encompassing the prevention of secondary exposure/contamination. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated MWA casualties by all functions and activities conducting these tasks including nonmortuary activities and functions.

**12. Deficiency:** Transporting and supporting units/personnel are generally only trained to handle and transport unexposed/uncontaminated remains.

**Non-Materiel Solutions:** *Doctrine:* Incorporate institutional and unit-level training standards and criteria addressing the safe handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated casualties into doctrine, policy and procedures and require specific exercising and evaluation for these operations and activities that encompasses all activities and functions conducting these tasks, including nonmortuary activities and functions. *Organization:* Ensure resources, taskings, and trained personnel are in place or available to support the handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated casualties by all activities and functions conducting these tasks, including nonmortuary activities and functions. *Training:* Train, exercise, and evaluate the handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated casualties by all functions and activities conducting these tasks including nonmortuary activities and functions and encompassing the prevention of secondary exposure/contamination. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated casualties by all functions and activities conducting these tasks including nonmortuary activities and functions. *Facilities:* Supporting infrastructure for the handling, movement, storage, and final disposition of exposed/contaminated remains resulting from a CBRN/TIM agent.

**13. Deficiency:** Transporting and supporting units/personnel are generally only trained to handle and transport unexposed/uncontaminated MWA remains.

**Non-Materiel Solutions:** *Doctrine:* Incorporate institutional and unit-level training standards and criteria addressing the safe handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated MWA casualties into doctrine, policy and procedures and require specific exercising and evaluation for these operations and activities that encompasses all activities and functions conducting these tasks, including nonmortuary activities and functions. *Organization:* Ensure resources, taskings, and trained personnel are in place or available to support the handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated MWA casualties by all activities and functions conducting these tasks, including nonmortuary activities and functions. *Training:* Train, exercise, and evaluate the handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated MWA casualties by all functions and activities conducting these tasks including nonmortuary activities and functions and encompassing the prevention of secondary exposure/contamination. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated MWA casualties by all functions and activities conducting these tasks including nonmortuary activities and functions. *Facilities:* Supporting infrastructure for the handling, movement, storage, and final disposition of exposed/contaminated MWA remains resulting from a CBRN/TIM agent.

**14. Deficiency:** Prior decontamination of exposed/contaminated remains is the only identified means for protecting transportation assets against secondary contamination.

**Non-Materiel Solutions:** *Doctrine:* Include the application of CBRN/TIM containment packaging/systems designed for exposed/contaminated remains (as well as other alternative methods to preclude secondary exposure/contamination of resources) in doctrine, policy, and procedures. *Training:* Train, exercise, and evaluate the application of CBRN/TIM containment packaging/systems and other alternatives for exposed/contaminated remains. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe application of CBRN/TIM containment packaging/systems and other alternatives for exposed/contaminated remains.

**15. Deficiency:** Concerns about contaminating valuable airlift assets currently limit their availability to move exposed/contaminated remains. NOTE: This concern is compounded by the lack of effective aircraft interior decontamination systems and near-real-time low-level chemical and biological hazard detection systems.

**Non-Materiel Solutions:** *Doctrine:* Include the application of CBRN/TIM containment packaging/systems designed for exposed/contaminated remains (as well as other alternative methods to preclude secondary exposure/contamination of resources) in doctrine, policy, and procedures. *Training:* Train, exercise, and evaluate the application of CBRN/TIM containment packaging/systems and other alternatives for exposed/contaminated remains to preclude secondary exposure/contamination of airframes and aircrew. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe application of CBRN/TIM containment packaging/systems and other alternatives for exposed/contaminated remains to preclude secondary exposure/contamination of airframe and aircrew.

**16. Deficiency:** Containment is not adequately addressed in current standards and procedures.

**Non-Materiel Solutions:** *Doctrine:* Include the application of CBRN/TIM containment packaging/systems and other alternatives designed for exposed/contaminated remains in doctrine, policy, and procedures. *Training:* Train, exercise, and evaluate the application of CBRN/TIM containment packaging/systems and other alternatives for exposed/contaminated remains. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe application of CBRN/TIM containment packaging/systems for exposed/contaminated remains.

**17. Deficiency:** Protective containment systems are inadequate or nonexistent.

**Non-Materiel Solutions:** *Doctrine:* Include the application of CBRN/TIM containment packaging/systems and other alternatives designed for exposed/contaminated remains in doctrine, policy, and procedures. *Organization:* *Training:* Train, exercise, and evaluate the application of CBRN/TIM containment packaging/systems and other alternatives for exposed/contaminated remains. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe application of CBRN/TIM containment packaging/systems for exposed/contaminated remains.

**18. Deficiency:** Containment marking standards do not exist.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of identified international and national standards and marking requirements exposed and contaminated remains resulting from a CBRN/TIM agent. *Training:* Include identified international and national standards and marking requirements as applied to exposed/contaminated remains resulting from a CBRN/TIM agent as an essential element of formal and unit training, as well as exercise and evaluation standards and criteria. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the marking of exposed/contaminated remains resulting from a CBRN/TIM agent.

- 19. Deficiency:** There is a need for distinct CBRN/TIM-specific base, facility, and unit-level exercise/evaluations that include mortuary activities.

**Non-Materiel Solutions:** *Doctrine:* Incorporate the handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated human/MWA casualties into exercises and evaluations and encompass all functions and activities conducting these tasks, including nonmortuary activities and functions. *Training:* Train, exercise, and evaluate the handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated human/MWA casualties into exercises and evaluations and encompass all functions and activities conducting these tasks, including nonmortuary activities and functions. *Leadership:* Implement and manage training, equipping, protective measures, and exercising the prevention of secondary exposure of resources while performing handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated human/MWA casualties.

- 20. Deficiency:** DOTLPF is inadequate to accomplish this task.

**Non-Materiel Solutions:** *Doctrine:* Doctrine, policy, and procedures addressing the safe handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated remains. *Organization:* Organization structures, resources, taskings, and trained staff availability to enable and support the safe handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated remains. *Training:* Institutional and unit-level training for the safe handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated remains. *Leadership:* Recognize importance of the safe handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM-exposed/contaminated remains and ensure personnel are properly equipped, adequately trained, fully comply with requirements, and are prepared and ready to perform the necessary tasks and activities. *Facilities:* Supporting infrastructure for the handling, movement, storage, and final disposition of exposed/contaminated remains resulting from a CBRN/TIM agent.

### 10.9.3.2 IMA Assessment Summary

N/A

**10.10 Task SNSHLD 10: Determine CBRN/TIM protection requirements and means supporting CBRND national and strategic guidance, intent, plans, and taskings****10.10.1 Functional Area Analysis****10.10.1.1 Definition**

To establish current and projected CBRN/TIM protection capabilities and requirements to protect the force against threat CBRN/TIM agents and hazards. Ensures the successful and decisive accomplishment of operations within threat environments. The assessment includes the review of national and strategic guidance, intent, plans, and taskings to identify CBRN/TIM protection requirements. It also includes determining the appropriate supporting quantity and mix of CBRN/TIM protection equipment. The assessment and identification of CBRN/TIM protection requirements and means also entails

- reviewing current and projected threats, operations, and programs to determine protection capability requirements,
- assessing current and programmed protection capabilities to meet those requirements,
- identifying capability requirements that are unsatisfied (entirely or partially), and
- outlining nonmateriel and materiel solutions for subsequent action.

**10.10.1.2 Derivation**

*Joint Enabling Concept for CBRN/TIM Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (SN 1.1.5, SN 1.1.6, SN 2.4.1.2, SN 3.4.4, SN 4.3.3, SN 5.2, SN 5.2.3, SN 6.1, SN 7.5, SN 9, SN 9.2, AN 9.2.1, SN 9.2.2).*

**10.10.1.2.1 Supported Task: N/A****10.10.1.2.2 Lateral Tasks: SNSHA 5, SNSHLD 11****10.10.1.2.3 Supporting Tasks: STSHLD 1, STSHLD 5, STSHLD 6****10.10.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Partial multinational integration. (C2.3.1.2)
2. Extensive commercial procurement. (C2.8.6)

## **Civil**

1. Correct interdepartmental/interagency relationship. (C3.1.1.3)

### **10.10.2 Functional Needs Analysis**

#### **10.10.2.1 Capability and Deficiency Assessment Summary**

Table 10.10-1 discusses the only capability that exists to perform the task to the designated standard. CJCS/joint staff manages process to assess and determine CBRND requirements essential to the positive accomplishment of national and strategic goals, plans, and taskings.

#### **Current Capability and Deficiency**

Procedures exist to determine and assess capability requirements for both materiel and non-materiel in support of CBRND national and strategic guidance, intent, plans, and taskings. The process reviews and analyses both current and programmed capabilities against current and projected requirements. Strategic forces are adequately trained, equipped (or possess accessible resources), and prepared to support national and strategic operations. Deficiencies include the lack of available systems in sufficient quantities to support envisioned and published national military concurrent operations and existing CBRND COLPRO systems are not generally designed for expeditionary operations. The overall current assessment is “green.”

#### **Projected Near/Mid-Term Capability and Deficiency**

No projected changes to this task.

#### **Projected Far-Term Capability and Deficiency**

No projected changes to this task.

Table 10.10-1. SNSHLD 10: Capability and Deficiency Assessment

Capability: CJCS—Joint Staff	M1	M2	M3	M4	M5	M6	M7	M8

M7	Assessment identifies and ranks non-materiel solutions to meet unsatisfied capability requirements.	<p><b>G:</b> Overarching single process exists for the identification and ranking of solutions to required capabilities not satisfied by current and projected capabilities for non-materiel CBRND.</p> <p><b>Y:</b> Each Service operates a single process for the identification and ranking of solutions to required capabilities not satisfied by current and projected capabilities for non-materiel CBRND.</p> <p><b>R:</b> The process for identification and ranking of required capabilities not satisfied by current and projected capabilities for non-materiel CBRND is in adequate or nonexistent.</p>
M8	Assessment identifies and ranks materiel solutions to meet unsatisfied capability requirements.	<p><b>G:</b> Overarching single process exists for the identification and ranking of solutions to required capabilities not satisfied by current and projected capabilities for materiel CBRND.</p> <p><b>Y:</b> Each Service operates a single process for the identification and ranking of solutions to required capabilities not satisfied by current and projected capabilities for materiel CBRND.</p> <p><b>R:</b> The process for identification and ranking of required capabilities not satisfied by current and projected capabilities for materiel CBRND is in adequate or nonexistent.</p>

<sup>1</sup> There is effective DOTLPF in place to conduct this task.

<sup>2</sup> Available CBRND systems are not available in sufficient quantities to support the envisioned and published national military concurrent operations. CBRND systems required to support operations are identified by specific plans. However, the requirements of these plans are not centrally correlated with other plans. Comparison is essential to relate plan identified CBRND requirements against existing and programmed quantities and types. Comparison must consider support requirements of two or more concurrent operations with CBRN/TIM threat. Expeditionary operations are a particular concern. Existing COLPRO systems are not generally designed for a highly mobile force, with a reduced logistical footprint, and the initial period of operations until the theater matures (usually the first 30–90 days).

<sup>3</sup> Strategic forces are adequately equipped or accessible resources to support national and strategic operations. However, expeditionary operations remain a concern.

<sup>4</sup> Strategic forces are trained and prepared to support national and strategic operations.

<sup>5</sup> The JCIDS process, identified in CJCSI 3170.01D and CJCSM 3170.01A, provides the means for determining and assessing capability requirements (materiel and non-materiel). The process reviews and analyzes both current and programmed capabilities against current and projected operational requirements. Operational requirements are drawn from national strategies, JOCs, JFCs, JICs, integrated architectures, the *Universal Joint Task List (UJTL)*, the anticipated range of broad capabilities that an adversary might employ, and other sources as input. The FAA of the Joint Capabilities Integration and Development System (JCIDS) process performs this determination.

<sup>6</sup> The JCIDS process, identified in CJCSI 3170.01D and CJCSM 3170.01A, provides the means for determining and assessing capability requirements (materiel and non-materiel). The process reviews and analyzes both current and programmed capabilities against current and projected operational requirements. Both the JCIDS FAA and FNA review existing and projected protection capabilities.

<sup>7</sup> The FNA assesses the ability of current and programmed joint capabilities to accomplish the tasks that the FAA identified under the full range of operating conditions and to the designated standards. Using the tasks identified in the FAA as primary input, the FNA produces as output a list of capability gaps or shortcomings that require solutions and indicates the time frame in which those solutions are needed. The FNA may also identify redundancies in capabilities that reflect inefficiencies. The FNA includes supportability as an inherent part of defining capability needs.

<sup>8</sup> On the basis of the FNA-documented capability needs, potential solutions are identified in the JCIDS FSA, including (in order of priority) integrated DOTLPF changes leveraging existing materiel capabilities, product improvements to existing materiel or facilities, adoption of interagency or foreign materiel solutions, and finally, initiation of new materiel programs. Identified capability needs or redundancies (excess to the need) establish the basis for developing materiel approaches and/or DOTLPF approaches.

<sup>9</sup> The FSA ranks potential solutions. The priorities (in order) are (1) integrated DOTLPF changes that leverage existing materiel capabilities, (2) product improvements to existing materiel or facilities, (3) adoption of interagency or foreign materiel solutions, and (4) initiation of new materiel programs.

### 10.10.3 Functional Solution Analysis

#### 10.10.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies associated with policies, standards, and criteria for the determination of CBRN/TIM protection requirements and means supporting national and strategic guidance, intent, plans, and taskings. The deficiencies can be addressed by non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section. Non-materiel solutions include analysis to identify required quantities and types of CBRND systems to support concurrent operations; the application of JCIDS and, as required, RDTE&A activities for CBRND resources to support expeditionary operations. Additionally, institute in doctrine, policy, and procedures the central correlation of national and strategic plans and taskings to identify CBRND support requirements for two or more concurrent operations possessing CBRND threat and comparison to existing and programmed quantities and types of CBRND systems and resources.

- 1. Deficiency:** Available CBRND systems are not available in sufficient quantities to support the envisioned and published national military concurrent operations.

**Non-Materiel Solutions:** *Doctrine:* Institute in doctrine, policy, and procedures the central correlation of national and strategic plans and taskings to identify CBRND support requirements for two or more concurrent operations with CBRN/TIM threat with comparison to existing and programmed quantities and types of CBRND systems and resources. Perform analysis to identify required quantities and types of CBRND systems. *Leadership:* Implement development of plans and taskings consistent with available CBRND capabilities as determined by central correlation and comparison of national and strategic plans and taskings.
- 2. Deficiency:** The requirements of plans that identify CBRND systems required to support operations are not centrally correlated with other plans.

**Non-Materiel Solutions:** *Doctrine:* Institute in doctrine, policy, and procedures the central correlation of national and strategic plans and taskings to identify CBRND support requirements for two or more concurrent operations with CBRN/TIM threat with comparison to existing and programmed quantities and types of CBRND systems and resources. *Leadership:* Implement development of plans and taskings consistent with available CBRND capabilities as determined by central correlation and comparison of national and strategic plans and taskings.
- 3. Deficiency:** Existing COLPRO systems are not generally designed for a highly mobile force with a reduced logistical footprint, and the initial period of operations until the theater matures (usually the first 30–90 days).

**Non-Materiel Solutions:** *Doctrine:* Incorporate into doctrine, policy, and procedures standards for expeditionary forces possessing reduced logistical footprint during the first 30–90 days of operations following commencement of hostilities. Perform JCIDS and, as required, develop RDTE&A activities for CBRND resources supporting expeditionary operations. *Organization:* Develop organizational structures, resources, staffing, and

capabilities to conduct expeditionary operations while possessing reduced logistical footprint and during the first 30–90 days of operations following commencement of hostilities.

*Training:* Train, exercise, and evaluate expeditionary capabilities of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operation using CBRND resources supporting expeditionary operations. *Leadership:* Recognize differences and challenges associated with expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint, training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.

4. **Deficiency:** Expeditionary forces are not necessarily equipped to support national and strategic operations

**Non-Materiel Solutions:** *Doctrine:* Complete JCIDS process and central correlation/ comparison of national and strategic plans to identify CBRND resources necessary and available to support expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint. Conduct JCIDS and, as required, develop RDTE&A activities for CBRND resources supporting expeditionary operations. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct expeditionary operations while possessing reduced logistical footprint and during the first 30–90 days of operations following commencement of hostilities.

*Training:* Train, exercise, and evaluate expeditionary capabilities of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operation using CBRND resources supporting expeditionary operations. *Leadership:* Recognize differences and challenges associated with expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint, training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.

#### 10.10.3.2 IMA Assessment Summary

N/A

## **10.11 Task SNSHLD 11: Manage the provisioning of the force with CBRN/TIM protection systems, equipment and supplies addressing identified threats**

### **10.11.1 Functional Area Analysis**

#### **10.11.1.1 Definition**

To address the development and acquisition of systems of protection against current and projected CBRN/TIM threats. Includes the planning, coordination, programming, and oversight of research, development, and acquisition activities to protect the force. Also includes modification of existing systems and the development of new systems of protection to meet force requirements.

Note: Ties to SNSHLD 10 for identification of CBRN/TIM protection capability requirements.

#### **10.11.1.2 Derivation**

*Joint Enabling Concept for CBRN/TIM Operations, Protection Joint Functional Concept, UJTL (SN 1.1.5, SN 1.1.6, SN 2.4.1.2, SN 3.4.4, SN 4.3.3, SN 5.2, SN 5.2.3, SN 6.1, SN 7.5, SN 9, SN 9.2, AN 9.2.1, SN 9.2.2).*

##### **10.11.1.2.1 Supported Task: N/A**

##### **10.11.1.2.2 Lateral Tasks: SNSHA 5, SNSHLD 10**

##### **10.11.1.2.3 Supporting Task: N/A**

#### **10.11.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

##### **Military**

1. Some interoperability. (C2.2.6)
2. Partial joint staff integration. (C2.3.1.1)
3. Partial multinational integration. (C2.3.1.2)
4. Slow pipeline responsiveness. (C2.8.3.1)
5. Extensive commercial procurement. (C2.8.6)

##### **Civil**

1. Correct interdepartmental/interagency relationships. (C3.1.1.3)

**10.11.2 Functional Needs Analysis****10.11.2.1 Capability and Deficiency Assessment Summary**

Table 10.11-1 discusses the only capability that exists to perform the task to the designated standard. CJCS/joint staff supervises process to manage CBRN/TIM protective requirements essential to protect the force against identified threats and enable positive accomplishment of national and strategic goals, plans, and taskings.

**Current Capability and Deficiency**

Procedures exist to manage the provisioning of the force with CBRND protection systems, equipment, and supplies addressing the identified threats. The process reviews and analyses both current and programmed capabilities against current and projected requirements and to prioritize development, acquisition, and allocation actions. Deficiencies include the lack of available stockpiled CBRND systems in sufficient quantities to support envisioned and published national military concurrent operations, and the potential impact of critical components and protective systems manufactured outside the United States. The overall current assessment is “green.”

**Projected Near/Mid-Term Capability and Deficiency**

No projected changes to this task.

**Projected Far-Term Capability and Deficiency**

No projected changes to this task.

Table 10.11-1. SNSHLD 11: Capability and Deficiency Assessment

Capability: CJCS—Joint Staff	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10	M11

	FAA Measure	Scale
M1	Documented assessment identifies unsatisfied required CBRN/TIM protection capabilities addressing threat.	<p><b>G:</b> Overarching single process exists for the determination and assessment of required capabilities not satisfied by current and projected capabilities for both materiel and non-materiel CBRND.</p> <p><b>Y:</b> Each Service operates a single process for the determination and assessment of required capabilities not satisfied by current and projected capabilities for both materiel and non-materiel CBRND.</p> <p><b>R:</b> The process for determination and assessment of required capabilities not satisfied by current and projected capabilities for materiel and/or non-materiel CBRND is in adequate or nonexistent.</p>
M2	Required CBRN/TIM protection capabilities are evaluated to determine whether capabilities can be satisfied through non-materiel measures and activities.	<p><b>G:</b> Overarching single process exists for the identification and ranking of non-materiel solutions to required capabilities not satisfied by current and projected CBRND capabilities.</p> <p><b>Y:</b> Each Service operates a single process for the identification and ranking of non-materiel solutions to required capabilities not satisfied by current and projected CBRND capabilities.</p> <p><b>R:</b> The process for identification and ranking of non-materiel solutions to required capabilities not satisfied by current and projected CBRND capabilities is inadequate or nonexistent.</p>
M3	Required CBRN/TIM protection materiel capabilities are evaluated to determine whether capabilities can be satisfied by modification of current assets.	<p><b>G:</b> Overarching single process exists for the identification and ranking of potential materiel modification of current materiel solutions to required capabilities not satisfied by current and projected CBRND capabilities or by non-materiel solutions.</p> <p><b>Y:</b> Each Service operates a single process for the identification and ranking of potential materiel modification of current materiel solutions to required capabilities not satisfied by current and projected CBRND capabilities and or by non-materiel solutions.</p> <p><b>R:</b> The process for identification and ranking of potential materiel modification of current materiel solutions to required capabilities not satisfied by current and projected CBRND capabilities or by non-materiel solutions is inadequate or nonexistent.</p>
M4	Required CBRN/TIM protection materiel capabilities not satisfied by previous standard (M3) are evaluated to determine whether capabilities can be satisfied by modification of current assets of friendly governments.	<p><b>G:</b> Overarching single process exists for the identification and ranking of potential materiel modification of current friendly government materiel solutions to required capabilities not satisfied by current and projected CBRND capabilities or by non-materiel solutions and not solved by modification of current assets.</p> <p><b>Y:</b> Each Service operates a single process for the identification and ranking of potential materiel modification of current friendly government materiel solutions to required capabilities not satisfied by current and projected CBRND capabilities or by non-materiel solutions and not solved by modification of current assets.</p> <p><b>R:</b> The process for the identification and ranking of potential materiel modification of current friendly government materiel solutions to required capabilities not satisfied by current and projected CBRND capabilities or by non-materiel solutions and not solved by modification of current assets is inadequate or nonexistent.</p>

M5	Required CBRN/TIM protection materiel capabilities not satisfied by previous two standards (M3 and M4) are evaluated to determine whether capabilities can be satisfied using current technology and materiel.	<p><b>G:</b> Overarching single process exists for the identification and ranking of potential applications of current technology and materiel to required capabilities not satisfied by current and projected CBRND capabilities or by non-materiel solutions and not solved by modification of current U.S. and friendly government assets.</p> <p><b>Y:</b> Each Service operates a single process for the identification and ranking of potential applications of current technology and materiel to required capabilities not satisfied by current and projected CBRND capabilities or by non-materiel solutions and not solved by modification of current U.S. and friendly government assets.</p> <p><b>R:</b> The process for the identification and ranking of potential applications of current technology and materiel to required capabilities not satisfied by current and projected CBRND capabilities or by non-materiel solutions and not solved by modification of current U.S. and friendly government assets is inadequate or nonexistent.</p>
M6	Required CBRN/TIM protection materiel capabilities not satisfied by previous three standards (M3–M5) are evaluated to determine whether capabilities can be reasonably satisfied by current or ongoing research for development of new technologies or materials.	<p><b>G:</b> Overarching single process exists to evaluate and identify materiel capabilities which can be reasonably satisfied by current or ongoing research and development (R&amp;D) of new technologies/materials to enable required capabilities that are not satisfied by current and projected CBRND capabilities, cannot be satisfied by non-materiel solutions, cannot be solved by modification of current U.S. and friendly government assets, and cannot be achieved using current technologies and materiel.</p> <p><b>Y:</b> Each Service operates a single process to evaluate and identify materiel capabilities which can be reasonably satisfied by current or ongoing R&amp;D of new technologies/materials to enable required capabilities that are not satisfied by current and projected CBRND capabilities, cannot be satisfied by non-materiel solutions, cannot be solved by modification of current U.S. and friendly government assets, and cannot be achieved using current technologies and materiel.</p> <p><b>R:</b> The process to evaluate and identify materiel capabilities which can be reasonably satisfied by current or ongoing R&amp;D of new technologies/materials to enable required capabilities that are not satisfied by current and projected CBRND capabilities, cannot be satisfied by non-materiel solutions, cannot be solved by modification of current U.S. and friendly government assets, and cannot be achieved using current technologies and materiel is inadequate or nonexistent.</p>
M7	CBRN/TIM protection capability requirements can be satisfied within the next five years.	<p><b>G:</b> All identified CBRND protection requirements are satisfied within five years.</p> <p><b>Y:</b> Critical CBRND protection requirements are generally satisfied within five years, when possible under current technologies and materiel.</p> <p><b>R:</b> CBRND protection requirements are not satisfied within five years.</p>
M8	CBRN/TIM protection capability requirements are funded for resolution within the next five years.	<p><b>G:</b> All identified CBRND protection requirements are funded for resolution within five years.</p> <p><b>Y:</b> Critical CBRND protection requirements are generally funded for resolution within five years, when possible under current technologies and materiel.</p> <p><b>R:</b> CBRND protection requirements are not funded for resolution within five years.</p>
M9	All critical protection assets, materials, or components are manufactured within the United States, and U.S. manufacturing is able to meet demand.	<p><b>G:</b> All CBRND assets, components, and consumables are manufactured and assembled within the United States. Industry is able to meet routine replenishment requirements and to quickly surge to maintain support of operational and replenishment requirements.</p> <p><b>Y:</b> All critical CBRND assets, components, and consumables are manufactured within the United States. Industry is able to meet routine replenishment requirements and to surge for operational and replenishment support.</p> <p><b>R:</b> Critical CBRND assets, components, and/or consumables are not manufactured within the United States, and U.S. industry does not offer equivalent substitution.</p>

M10	CBRND requirements are fully stockpiled enabling sustained operations against multiple CBRN/TIM attacks in staggered major conflicts with concurrent smaller-scale contingency operations.	<p><b>G:</b> CBRND systems are stockpiled in plan identified required quantities and types to support sustained operations against multiple CBRN/TIM attacks in staggered major conflicts with concurrent smaller-scale contingency operations.</p> <p><b>Y:</b> CBRND systems are stockpiled or available to support sustained operations against multiple CBRN/TIM attacks in staggered major conflicts with concurrent smaller-scale contingency operations. Adjustments to plan requirements are made to adjust to limitations in quantities and types of CBRND systems.</p> <p><b>R:</b> CBRND systems are not stockpiled and/or available in sufficient quantities and types to support sustained operations against multiple CBRN/TIM attacks in staggered major conflicts with concurrent smaller-scale contingency operations.</p>
M11	Replenishment effectively maintains minimum CBRND asset stock levels.	<p><b>G:</b> Industry maintains capacity to support routine and operational minimum CBRND asset stock levels without any period of shortage.</p> <p><b>Y:</b> Industry maintains capacity to meet routine minimum CBRND asset stock level replenishment requirements and can surge production capacity over a period of time.</p> <p><b>R:</b> Routine and/or operational replenishment of minimum CBRND asset stock levels is inadequate or nonexistent.</p>

<sup>1</sup> Adequate DOTLPP exists to identify capability gaps and solutions. DOTLPP is not adequate for determination of the actual CBRND requirements for concurrent operations as defined in current national and strategic policy. Implementation of existing DOTLPP for stockpiling and replenishment is inadequate. Implementation is impacted by budgetary, logistical, and programmatic constraints as well as conflicting operational needs.

<sup>2</sup> The JCIDS process outlined in CJCSI 3170.01D and CJCSM 3170.01A detail the process for determining unsatisfied capabilities and identification of the means for resolution. The process reviews and analyzes both current and programmed capabilities against current and projected operational requirements. Both the JCIDS FAA and FNA review existing and projected protection capabilities. Using the tasks identified in the FAA as primary input, the FNA produces as output a list of capability gaps or shortcomings that require solutions and indicates the time frame in which those solutions are needed. The FNA may also identify redundancies in capabilities that reflect inefficiencies. The FNA includes supportability as an inherent part of defining capability needs.

<sup>3</sup> The FSA is an operationally based assessment of potential DOTLPP approaches to solving (or mitigating) one or more of the capability gaps (needs) identified in the FNA. The needs identified in the FNA are inputs to the FSA. The FSA's outputs are potential solutions to needs, including in order of priority: integrated DOTLPP changes, product improvements to existing materiel or facilities alone, adoption of interagency or foreign materiel solutions that have limited non-materiel DOTLPP consequences, and finally, new materiel starts that have limited non-materiel DOTLPP consequences.

<sup>4</sup> All CBRND protection capability requirements cannot be funded and resolved within the next five years. Constraints include funding availability, other critical operational requirements, and technological maturity. Prioritization of solutions to requirements for acquisition and development are determined and projected, as appropriate, to resolve or mitigate gaps and deficiencies. Funding and allocation authority for CBRND protection requirements are included in the POM process and compete with other requirements. The prioritization of solutions, anticipated costs, maturity of technology, criticality of the gap, method of resolution, production availability and capabilities, necessary research and development, testing and evaluation, supporting DOTLPP, and other factors influence the timeline for resolution and the associated budget projections. A gap may be quickly and easily resolved within five years of identification while others may require longer periods before the solution is fielded.

<sup>5</sup> Critical components for protective systems are manufactured outside the US. For example, carbon beads used for construction of JSLIST IPE is manufactured overseas. The process is proprietary and manufacturing within CONUS is not available. Production of JSLIST and similar products are also constrained by the availability and manufacturing capacities of components originating outside the United States. The trend towards globalization of trade emphasizing the development of specialties is increasing. Manufacturing capabilities, particularly textile, are moving off-shore. This has an impact upon the ability of the United States to rapidly respond to circumstances by increasing existing manufacturing capabilities. It also places the United States potentially at production risk should a supplying nation disagree with U.S. actions and policies, placing a block on exports to the United States for critical materials and components.

<sup>6</sup> Available CBRND systems are not stockpiled in sufficient quantities to support the envisioned and published national military concurrent operations. Systems are reallocated, when necessary, from stocks dispersed to installations and units for support of units deploying or operating within an area of operations. CBRND systems required to support operations are identified by specific plans. However, the requirements of these plans are not centrally correlated with other plans. Comparison is essential to relate plan identified CBRND requirements against existing and programmed quantities and types. Comparison must consider support requirements of two or more concurrent operations with

CBRN/TIM threat. Expeditionary operations are a particular concern. Existing COLPRO systems are not generally designed for a highly mobile force, with a reduced logistical footprint, and the initial period of operations until the theater matures (usually the first 30–90 days).

<sup>7</sup> Available CBRND systems are not stockpiled in sufficient quantities to support the envisioned and published national military concurrent operations. Timing for replenishment of systems is dependent upon manufacturing capabilities, system age, and funding availability. Production for replenishment by industry may require a period to expand or establish manufacturing capabilities which could exceed the necessary replenishment timeline. This is particularly applicable when components or systems are dependent upon non-U.S. manufacturing capabilities.

### 10.11.3 Functional Solution Analysis

#### 10.11.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies associated with policies, standards, and criteria for the provisioning of the force with CBRND protection systems, equipment, and supplies addressing the identified threats. The deficiencies can be addressed by non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section. Non-materiel solutions include analysis to identify prioritization of capability requirements to address threats, identification of critical components and systems manufactured outside the United States with identification of alternative sources or methods of supply; determined of required quantities and types of CBRND systems, including consumables, to support concurrent operations; the application of JCIDS and, as required, RDTE&A activities for CBRND resources to support expeditionary operations. Additionally, the task includes instituting in doctrine, policy, and procedures the central correlation of national and strategic plans and taskings to identify CBRND support requirements for two or more concurrent operations possessing CBRND threat and comparison to existing and programmed quantities and types of CBRND systems and resources.

- 1. Deficiency:** All CBRND protection capability requirements cannot be satisfied within the next five years.

**Non-Materiel Solutions:** *Doctrine:* Increase CBRND funding to meet anticipated needs. Prioritize solutions to requirements for development and/or acquisition. Conduct analysis to identify prioritization of capability requirements to address threat. *Organization:* Implement development of plans and taskings consistent with available and projected CBRND capabilities.
- 2. Deficiency:** Critical components for protective systems are manufactured outside the United States.

**Non-Materiel Solutions:** *Doctrine:* Incorporate into doctrine, policy, and procedures the identification of critical CBRND components and systems, to include the identification of alternatives (e.g., other sources of supply, stockpiling, manufacturing incentives, etc.). Conduct analysis to identify critical components and systems manufactured outside the United States and identification of alternative sources of supply. *Leadership:* Awareness of vulnerabilities associated with procurement of non-U.S. manufactured critical CBRND components and planning for vulnerability mitigation.
- 3. Deficiency:** Available CBRND systems are not stockpiled in sufficient quantities to support the envisioned and published national military concurrent operations.

**Non-Materiel Solutions:** *Doctrine:* Institute in doctrine, policy, and procedures the central correlation of national and strategic plans and taskings to identify CBRN/TIM support requirements for two or more concurrent operations with threat with comparison to existing and programmed quantities and types of CBRND systems and resources, to include replenishment. Stockpile as necessary to support determined requirements. Conduct analysis of required CBRND system types and quantities, including consumables. *Leadership:* Implement development of plans and taskings consistent with stockpile support capabilities.

4. **Deficiency:** The requirements of plans that identify CBRND systems required to support operations are not centrally correlated with other plans.

**Non-Materiel Solutions:** *Doctrine:* Institute in doctrine, policy, and procedures the central correlation of national and strategic plans and taskings to identify CBRN/TIM support requirements for two or more concurrent operations with threat with comparison to existing and programmed quantities and types of CBRND systems and resources, to include replenishment. Conduct analysis to identify required quantities and types of CBRND systems. *Leadership:* Implement development of plans and taskings consistent with available CBRND capabilities as determined by central correlation and comparison of national and strategic plans and taskings.

5. **Deficiency:** Existing COLPRO systems are not generally designed for a highly mobile force, with a reduced logistical footprint, and the initial period of operations until the theater matures (usually the first 30–90 days).

**Non-Materiel Solutions:** *Doctrine:* Complete JCIS process and central correlation/ comparison of national and strategic plans to identify CBRND resources necessary and available to support expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint. Conduct JCIDS and, as required, develop RDTE&A activities for CBRND resources supporting expeditionary operations. *Organization:* Organizational structures, resources, staffing, and capabilities to conduct expeditionary operations while possessing reduced logistical footprint and during the first 30–90 days of operations following commencement of hostilities. *Training:* Train, exercise, and evaluate expeditionary capabilities of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operations using CBRND resources supporting expeditionary operations. *Leadership:* Recognize differences and challenges associated with expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint, training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities:* Supporting infrastructure for expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.

6. **Deficiency:** DOTLPF is not adequate for determination of the actual CBRND requirements for concurrent operations as defined in current national and strategic policy.

**Non-Materiel Solutions:** *Doctrine:* Institute in doctrine, policy, and procedures the central correlation of national and strategic plans and taskings to identify CBRN/TIM support requirements for two or more concurrent operations with threat with comparison to existing and programmed quantities and types of CBRND systems and resources, to include replenishment. Conduct analysis to identify required quantities and types of CBRND systems. *Leadership:* Implement development of plans and taskings consistent with available CBRND capabilities as determined by central correlation and comparison of national and strategic plans and taskings.

- 7. Deficiency:** Implementation of existing DOTLPF for stockpiling and replenishment is inadequate.

**Non-Materiel Solutions:** *Doctrine:* Enforce existing DOTLPF for stockpiling and replenishment.

**10.11.3.2 IMA Assessment Summary**

N/A

**10.12 Task SNSHLD 12: Allocate protection resources for CBRND****10.12.1 Functional Area Analysis****10.12.1.1 Definition**

To ensure adequate, efficient, and timely availability of CBRN/TIM protection resources to the force. Also supports assistance to nations provided under military assistance and the family of engagement plans to eliminate WMD vulnerabilities. Effective allocation of CBRND resources includes the identification, stockpiling, prepositioning, movement, distribution, and management of these resources to optimize protection of the force. Allocation of resources includes the development, positioning, and movement of generic unit CBRND kits. These kits contain common CBRND assets (consumable and nonconsumable) for a standard size unit or set of units. The kits are basic building blocks tailorable to specific requirements. The kits provide ready CBRND resources for a rapidly deployed force and are prepositioned to reduce planning and preparation, unit deployment logistics, time-phased force and deployment list (TPFDL), and movement requirements.

**10.12.1.2 Derivation**

*Joint Enabling Concept for CBRN/TIM Operations, Protection Joint Functional Concept, UJTL (SN 1.1.5, SN 1.1.6, SN 2.4.1.2, SN 3.4.4, SN 4.3.3, SN 5.2, SN 5.2.3, SN 6.1, SN 7.5, SN 9, SN 9.2, AN 9.2.1, SN 9.2.2).*

**10.12.1.2.1 Supported Task: N/A****10.12.1.2.2 Lateral Task: SNSHA 5****10.12.1.2.3 Supporting Tasks: STSHLD 2, STSHLD 3, STSHLD 4, STSHLD 8, STSHLD 11****10.12.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Limited military commitments from other nations. (C2.1.1.7)
2. Some interoperability. (C2.2.6)
3. Partially completed mission preparation. (C2.1.3)
4. Partial joint staff integration. (C2.3.1.1)
5. Partial multinational integration. (C2.3.1.2)

6. Sufficient deployed supplies. (C2.8.2)
7. Sufficient CONUS resupply. (C2.8.3)
8. Slow pipeline responsiveness. (C2.8.3.1)
9. Limited prepositioned materiel. (C2.8.4)
10. Extensive commercial procurement. (C2.8.6)

**Civil**

1. Correct interdepartmental/interagency relationships. (C3.1.1.3)

**10.12.2 Functional Needs Analysis****10.12.2.1 Capability and Deficiency Assessment Summary**

Table 10.12-1 discusses the only capability that exists to perform the task to the designated standard. CJCS/joint staff identifies CBRND resource requirements and availability, prepares resource taskings to support requirements, and allocates resources to support national and strategic planning.

**Current Capability and Deficiency**

Logistics procedures exist to allocate protection resources for CBRND of the force. Deficiencies include the lack of prepositioned and stockpiled CBRND systems in sufficient quantities to support envisioned and published national military concurrent operations and the potential impact of critical components and protective systems manufactured outside the United States. Overall current assessment is “red.”

**Projected Near/Mid-Term Capability and Deficiency**

No change projected for this task.

**Projected Far-Term Capability and Deficiency**

No change projected for this task.

Table 10.12-1. SNSHLD 12: Capability and Deficiency Assessment

M11	Required unit CBRND resources are available and ready.	<p><b>G:</b> Generic unit CBRND kits are defined, prepositioned, stockpiled, and available in plan identified required quantities to support a basic range of sustained operations against multiple CBRN/TIM attacks in staggered major conflicts with concurrent smaller-scale contingency operations.</p> <p><b>Y:</b> Generic unit CBRND kits are defined, prepositioned, stockpiled, or available to support sustained operations against multiple CBRN/TIM attacks in staggered major conflicts with concurrent smaller-scale contingency operations. Adjustments to plan requirements are made to adjust to limitations in quantities of available generic unit CBRND kits.</p> <p><b>R:</b> Generic unit CBRND kits are not defined, prepositioned, stockpiled, and/or available in sufficient quantities to support sustained operations against multiple CBRN/TIM attacks in staggered major conflicts with concurrent smaller-scale contingency operations.</p>

M12	Required non-mission support civilian CBRND equipment is stockpiled and prepositioned.	<p><b>G:</b> Non-mission support civilian CBRND is adequately stockpiled and prepositioned to support national and strategic operations with a CBRN/TIM threat.</p> <p><b>Y:</b> Non-mission support civilian CBRND is generally stockpiled and deployed to support national and strategic operations with threat.</p> <p><b>R:</b> Stockpiles and/or prepositioned CBRND equipment for non-mission support civilians are inadequate or nonexistent and unable to support national and strategic operations with a CBRN/TIM threat.</p>
M13	Required prepositioned CBRND assets are at designated locations.	<p><b>G:</b> Prepositioned CBRND assets are identified and available in plan identified required types and quantities to support a basic range of sustained operations against multiple CBRN/TIM attacks in staggered major conflicts with concurrent smaller-scale contingency operations.</p> <p><b>Y:</b> Prepositioned CBRND assets are available in adequate types and quantities to support sustained operations against multiple CBRN/TIM attacks in staggered major conflicts with concurrent smaller-scale contingency operations. Adjustments to plan requirements are made to adjust to limitations in quantities of available generic unit CBRND kits.</p> <p><b>R:</b> Prepositioned CBRND assets are inadequate or nonexistent to support sustained operations against multiple CBRN/TIM attacks in staggered major conflicts with concurrent smaller-scale contingency operations.</p>

<sup>1</sup> General logistics DOTLPF exists addressing the allocation, prepositioning, and stockpiling of materiel. The application and implementation of this DOTLPF is inadequate. Further, the general logistics DOTLPF requires review and adjustment to support the force during and following transformation.

<sup>2</sup> Available CBRND systems are not prepositioned in sufficient quantities to support the envisioned and published national military concurrent operations. CBRND systems, when available, are moved from stockpiles to support operations. Additional systems are reallocated, when necessary, from stocks dispersed to installations and units for support of units deploying or operating within an area of operations. Both reallocations necessitate TPDF allocation and support. CBRND systems required to support operations are identified by specific plans. However, the requirements of these plans are not centrally correlated with other plans. Comparison is essential to relate plan identified CBRND requirements against existing and programmed quantities and types. Comparison must consider support requirements of two or more concurrent operations with CBRN/TIM threat. Expeditionary operations are a particular concern. Existing COLPRO systems are not generally designed for a highly mobile force, with a reduced logistical footprint, and the initial period of operations until the theater matures (usually the first 30–90 days). Prepositioning is accomplished using prelocated material within friendly nations and onboard ships. However, prepositioning must consider the potential for operations without seaports and where access is restricted by noninvolved nations.

<sup>3</sup> Available CBRND systems are not prepositioned in sufficient quantities to support the envisioned and published national military concurrent operations. Timing for replenishment of systems is dependent upon manufacturing capabilities, system age, and funding availability. Production for replenishment by industry may require a period to expand or establish manufacturing capabilities which could exceed the necessary replenishment timeline. This concern is particularly applicable when components or systems are dependent upon non-U.S. manufacturing capabilities.

<sup>4</sup> Current doctrine and policy does not adequately address sustained operations within a CBRN/TIM environment. Strategic force equipage is based upon current doctrine, policy, and associated planning documents.

<sup>5</sup> Mature theater CPS is available. These include Joint Transportable Collective Protection System (JTCOPS), Chemically Protected Deployable Medical System (CP-DEPMEDS), Tent, Expandable, Modular, Personnel (TEMPER) systems, and Service-designed systems. Current CPS is inadequate to support expeditionary operations, particularly in austere environments by highly mobile forces and possessing a reduced logistical footprint.

<sup>6</sup> Not all critical facilities and activities are equipped with COLPRO.

<sup>7</sup> Mobile COLPRO exists in selected tactical combat and support vehicles. The quantities and types of these vehicles are limited and are dedicated to specific missions. Current mobile COLPRO is inadequate to support operations by highly mobile forces.

<sup>8</sup> Generic unit CBRND kits are not defined in current doctrine. Limited CBRND asset assemblies do exist and are prepositioned at selected sites. However, these assemblies are generally unit specific.

<sup>9</sup> Non-mission support civilian CBRND equipment is not stockpiled and prepositioned.

### 10.12.3 Functional Solution Analysis

#### 10.12.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies associated with policies, standards, and criteria for the provisioning of the force with CBRND protection systems, equipment, and supplies addressing the identified threats. The deficiencies can be addressed by non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section. Non-materiel solutions include analysis to identify critical components and systems manufactured outside the United States with identification of alternative sources or methods of supply; determination of required quantities and types of CBRND systems, including consumables, to support concurrent operations; identification of common CBRND assets (including consumables) and quantities for standard size units; identification of critical facilities and activities; analysis and RD&E to establish standards for equipping potential populations; application of JCIDS and, as required, RDTE&A activities (as appropriate) to obtain, stockpile, and preposition CBRND materiel and to support expeditionary operations. Additionally, institute in doctrine, policy, and procedures the central correlation of national and strategic plans and taskings to identify CBRND support requirements for two or more concurrent operations possessing CBRND threat and comparison to existing and programmed quantities and types of CBRND systems and resources; sustained operations within a CBRN/TIM environment; and define and incorporate generic CBRND kits. Conduct review and adjustment of general logistics DOTLPF to support the force during and following transformation.

1. **Deficiency:** Available CBRND systems are not stockpiled in sufficient quantities to support the envisioned and published national military concurrent operations.

**Non-Materiel Solutions:** *Doctrine:* Institute in doctrine, policy, and procedures the central correlation of national and strategic plans and taskings to identify CBRN/TIM support requirements for two or more concurrent operations with threat with comparison to existing and programmed quantities and types of CBRND systems and resources, to include replenishment. Stockpile as necessary to support determined requirements. Conduct analysis of required CBRND system types and quantities, including consumables. *Leadership:* Implement development of plans and taskings consistent with stockpile support capabilities.

2. **Deficiency:** The requirements of national and strategic plans are not centrally correlated with other plans.

**Non-Materiel Solutions:** *Doctrine:* Institute in doctrine, policy, and procedures the central correlation of national and strategic plans and taskings to identify CBRN/TIM support requirements for two or more concurrent operations with threat with comparison to existing and programmed quantities and types of CBRND systems and resources, to include replenishment. Conduct analysis to identify required quantities and types of CBRND systems. *Leadership:* Implement development of plans and taskings consistent with available CBRND capabilities as determined by central correlation and comparison of national and strategic plans and taskings.

- 3. Deficiency:** Existing COLPRO systems are not generally designed for a highly mobile force, with a reduced logistical footprint, in austere environment, and the initial period of operations until the theater matures (usually the first 30–90 days).

**Non-Materiel Solutions:** *Doctrine:* Complete JCIS process and central correlation/ comparison of national and strategic plans to identify CBRND resources necessary and available to support expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint. Conduct JCIDS and, as required, develop RDTE&A activities for CBRND resources supporting expeditionary operations. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct expeditionary operations while possessing reduced logistical footprint and during the first 30–90 days of operations following commencement of hostilities. *Training:* Train, exercise, and evaluate expeditionary capabilities of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operations using CBRND resources supporting expeditionary operations. *Leadership:* Recognize differences and challenges associated with expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint; training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.
- 4. Deficiency:** Current doctrine and policy does not adequately address sustained operations within a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, and procedures sustained operations within a CBRN/TIM environment. *Organization:* Ensure resources, taskings, and staff are in place or available to perform sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and wiliness and ability to implement necessary changes and activities to prepare and appropriately apply the force.
- 5. Deficiency:** Not all critical facilities and activities are equipped with COLPRO.

**Non-Materiel Solutions:** *Doctrine:* Enforce existing doctrine and policies. *Remaining Non-Materiel Needs:* Conduct analysis to identify critical facilities and activities.
- 6. Deficiency:** CBRND asset assemblies or kits are generally unit-specific.

**Non-Materiel Solutions:** *Doctrine:* Incorporate generic and unit-specific CBRND kits into doctrine, policy, and procedures. Unit-specific CBRND kits should tailor generic kits. Conduct analysis to identify common CBRND assets (including consumables) and quantities for standard size units. *Facilities:* Supporting infrastructure for the acquisition, stockpiling, prepositioning, maintenance, and movement of generic CBRND unit kits.
- 7. Deficiency:** Generic unit CBRND kits are not defined in current doctrine.

**Non-Materiel Solutions:** *Doctrine:* Incorporate generic and unit-specific CBRND kits into doctrine, policy, and procedures. Unit-specific CBRND kits should tailor generic kits.

*Facilities:* Supporting infrastructure for the acquisition, stockpiling, prepositioning, maintenance, and movement of generic CBRND unit kits. *Remaining Non-Materiel Needs:* Conduct analysis to identify common CBRND assets (including consumables) and quantities for standard size units.

8. **Deficiency:** Non-mission support civilian CBRND equipment is not stockpiled and prepositioned.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the provisioning of civilians addressing the variation within a potential population. Institute in doctrine, policy, and procedures the central correlation of national and strategic plans and taskings to identify eligible civilian CBRND support requirements for two or more concurrent operations with threat with comparison to existing and programmed quantities and types of CBRND systems and resources, to include replenishment and prepositioning of CBRND assets for civilians. Conduct analysis and RD&E to establish standards for equipping potential population. Conduct JCIDS and develop RDTE&A, as appropriate, to obtain, stockpile, and preposition CBRND for potential population. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRND training, exercises, and evaluations, as appropriate. *Leadership:* Implement planning and management of CBRND training, equipping, stockpiling, prepositioning, and protection of eligible civilians. *Facilities:* Develop supporting infrastructure for the acquisition, stockpiling, prepositioning, maintenance, and movement of eligible civilian CBRND resources.

9. **Deficiency:** The application and implementation of this DOTLPP is inadequate.

**Non-Materiel Solutions:** *Doctrine:* General logistics DOTLPP requires review, adjustment, and aggressive implementation to support the force during and following transformation.

## 11.0 Strategic Theater Shield

### 11.0.1 Introduction

Strategic level of war is divided into two sublevels: Strategic National and Strategic Theater (ST). This chapter focuses upon the ST level of war at the national (combatant command) level of task development and implementation. At this level, combatant command (COCOM) authorities—often in cooperation with other nations—implement and establish national or multinational (alliance or coalition) security objectives and guidance and develop and apply national resources to accomplish these objectives. Decisions and activities at the ST level implement national and multinational military objectives, specify the sequencing of activities and actions, develop supporting global plans and means to attain these objectives, delineate limits and assess risks for the application of military power, and provide military forces and other capabilities as outlined in strategic plans.<sup>1</sup>

This chapter, detailing the Strategic Theater area, restates relevant information from the chemical, biological, radiological, and nuclear defense (CBRND) Functional Area Analysis (FAA), including a description of each of the 11 ST Shield (SHLD) tasks, derivation of the task, an indication of other linked tasks, and the pertinent conditions. The Functional Needs Analysis (FNA) section addresses the capability and deficiency analysis, and a brief description of potential near-term changes. Once all the capabilities are considered, the assessment concludes with a separate, overarching look at the entire capability spectrum to identify remaining gaps and/or synergies. The Functional Solutions Analysis (FSA) section addresses possible solutions for the deficiencies identified in the FNA section. Solutions for STSHLD are non-materiel and are reflected in one or more of the six areas of DOTLPP: doctrine, organization, training, leadership, personnel, and facilities. Annotations under Materiel are non-materiel in nature, but do not align in one of the six non-materiel aspects of DOTLPP. These annotations include research, analysis, and other actions to address and establish solutions for the deficiencies.

Most of the ST tasks involve doctrine, policies, and procedures providing parameters for planning, decisioning, and actions or activities to accomplish the tasks. These range from the positioning and sustainment of CBRND materiel and resources, through protection of forces throughout the deployment cycle and the integration of coalition CBRND resources, to mass medical and contaminated/exposed casualty and remains operations.

Tasks associated with forces include constituent elements of the transforming force such as civilians, military working animals (MWAs), coalition/alliance forces, and third-party nationals. Increasing reliance upon nonmilitary personnel (such as government employees and contractors) as operational enablers dictated their inclusion as force members.

### 11.0.2 FNA Summary

Table 11.0-1 summarizes the overall current and projected capability to perform the STSHLD tasks identified in the CBRND FAA. The overall capability to conduct STSHLD tasks in the

---

<sup>1</sup> Appendix A to Enclosure B, para. 3a, CJCMS 3500.04C, *Universal Joint Task List*, July 2002, CJCS.

current time frame is assessed as “yellow.” There are key deficiencies in COCOM ability to protect populations other than military members as well as support concurrent CBRND operations, especially those associated with sustained and expeditionary operations within a chemical, biological, radiological, and nuclear (CBRN)/toxic industrial material (TIM) environment. It is projected that the overall status will remain “yellow” in the near/mid term, with limited improvements in specific measures within specific tasks.

**Table 11.0-1. Strategic Theater Shield Summary FNA Findings**

CBRN Strategic Theater Shield Task Number	CBRN Strategic Theater Shield Task Title	Capability		
		Current	Near/Mid	Far
STSHLD 1	Determine CBRN/TIM protection requirements and means supporting CBRND national and Strategic Theater guidance, intent, plans, and taskings	●	●	●
STSHLD 2	Provide for the allocation, sustainment, and positioning of CBRN/TIM protection supplies, equipment, and systems	●	●	●
STSHLD 3	Coordinate medical prophylaxis to reduce impact of CBRN/TIM	●	●	●
STSHLD 4	Establish standards, criteria, and procedures for training, equipping, and protecting eligible civilians not supporting the mission from threat CBRN/TIM agents	●	●	●
STSHLD 5	Establish appropriate CBRN/TIM protective measures and resources for deploying/redeploying joint forces at assembly, staging, embarkation, debarkation, and en route locations	●	●	●
STSHLD 6	Establish Protective Posture Protocols to ensure protection level is consistent with the threat and minimizes risk while limiting the impact on mission execution	●	●	●
STSHLD 7	Integrate coalition/non-U.S. and joint force CBRN/TIM protective measures and assets	●	●	●

STSHLD 8	Ensure adequate protective measures and resources are available to coalition partners and other designated non-U.S. forces	●	●	●
STSHLD 9	Provide COLPRO for critical activities/functions, rest and relief	●	●	●
STSHLD 10	Employ protective measures to minimize the effects of adversary use of CBRN weapons and TIM exposure	●	●	●
STSHLD 11	Ensure adequate CBRN/TIM protective equipment and supplies to support medical operations	●	●	●
<b>OVERALL</b>		●	●	●

### 11.0.3 FSA Summary

The paragraphs below summarize the assessment of all potential doctrine, organization, training, materiel, leadership and education, personnel, and facilities (DOTMLPF) solutions for the capability gaps identified in the FNA section. The summaries also address the non-materiel solutions annotated under Materiel as discussed earlier. STSHLD addresses non-materiel actions and activities. Therefore, materiel solutions are not applicable to this level of war.

#### 11.0.3.1 DOTLPF

The non-materiel DOTLPF solutions identified in this chapter are associated primarily with the level of protection afforded by CBRND systems and measures and the readiness of force populations for CBRND activities and actions. Non-materiel solutions are identified. These solutions include such actions as the establishment of doctrine addressing the needs of the force, its constituent populations, and mass medical operations involving non-U.S. military personnel, applicable training programs, infrastructures and organizational structures supporting CBRND operations within sustained CBRN/TIM environments for the transformed force, leadership CBRND awareness and decisioning enablers, and criteria for civilian personnel performing mission related activities within a CBRN/TIM environment. Also identified are analyses, assessments, evaluations, and programs to assist the clarification and resolution of identified deficiencies.

#### 11.0.3.2 IMA

All solutions identified for the Strategic Theater level of war within Shield are non-materiel approaches. Materiel solutions are not applicable to this Shield level of war.

**11.1 Task STSHLD 1: Determine CBRN/TIM protection requirements and means supporting CBRND national and Strategic Theater guidance, intent, plans, and taskings****11.1.1 Functional Area Analysis****11.1.1.1 Definition**

To establish current and projected CBRN/TIM protection capabilities and requirements to protect against threat CBRN/TIM agents and hazards. Ensures the successful and decisive accomplishment of operations within threat environments. Includes the assessment of national and theater guidance, intent, plans, and taskings against current and future threats and operations. The assessment identifies CBRN/TIM protection needs and determines the appropriate supporting quantity and mix of CBRN/TIM protection resources. The determination of protective resources balances operational requirements with optimal CBRN/TIM protection. The determination seeks to minimize hazards, physical encumbrances, performance limitations, and adverse impacts on mission capabilities. Supports assistance to nations provided under military assistance and the family of engagement plans to eliminate weapons of mass destruction (WMD) vulnerabilities.

**11.1.1.2 Derivation**

*Joint Enabling Concept for CBRN/TIM Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (ST 2.2.1, ST 2.4, ST 2.4.1.1, ST 2.4.1.2, ST 4.2.6, ST 5, ST 5.1, ST 5.1.1, ST 5.1.2, ST 5.1.3, ST 5.2, ST 5.2.1, ST 5.3.1.1, ST 5.3.1.4, ST 5.4.1, ST 6, ST 6.2, ST 7.1.1, ST 9, ST 9.3, ST 9.4).*

**11.1.1.2.1 Supported Task: SNSHLD 10****11.1.1.2.2 Lateral Task: STSHA 3****11.1.1.2.3 Supporting Task: N/A****11.1.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Partially completed mission preparation. (C2.1.3)
2. Partial interoperability. (C2.2.6)
3. Partial joint staff integration. (C2.3.1.1)

4. Partial multinational integration. (C2.3.1.2)
5. Limited deployed supplies. (C2.8.2)
6. Sufficient continental United States (CONUS) resupply. (C2.8.3)
7. Slow pipeline responsiveness. (C2.8.3.1)
8. Limited prepositioned materiel.(C2.8.4)
9. Extensive commercial procurement. (C2.8.6)

### **Civil**

1. Correct interdepartmental/interagency relationships. (C3.1.1.3)
2. Limited foreign government support. (C3.1.2.3)
3. TIMs present in the civilian sector. (C3.3.7.5)

## **11.1.2 Functional Needs Analysis**

### **11.1.2.1 Capability and Deficiency Assessment Summary**

Table 11.1-1 discusses the only capability that exists to perform the task to the designated standard.

### **Current Capability and Deficiency**

Procedures exist to assess national and Strategic Theater guidance, intent, plans, taskings, and threats are assessed by the Cocom staff to determine operational requirements and to identify CBRND protection needs supporting future and ongoing operations. The process includes the training, acquisition, allocation, and equipping of forces. Strategic Theater forces are adequately trained, equipped (or resources are accessible), and prepared to conduct Strategic Theater operations. Adequate DOTLPF exists to assess requirements, identify and allocate resources, and to equip the force. Deficiencies include the availability, in sufficient quantities and types, of CBRND systems to support envisioned and published Strategic Theater concurrently. Further, existing CBRND collective protection (COLPRO) systems are not generally designed for a highly mobile expeditionary force, in an austere environment, with a reduced logistical footprint, and during the initial period of operations until the theater matures, usually the first 30–90 days following commencement of hostilities. The overall current capability is “yellow.”

### **Projected Near/Mid-Term Capability and Deficiency**

No change is projected for this task.

### **Projected Far-Term Capability and Deficiency**

No change is projected for this task.

Table 11.1-1. STSHLD 1 Capability and Deficiency Assessment

Capability: COCOM Staff	M1	M2	M3	M4	M5
Current Overall Capability <sup>1</sup>	Y <sup>2</sup>	R <sup>3</sup>	Y <sup>4</sup>	G <sup>5</sup>	Y <sup>6</sup>

Far-Term Overall Capability	Y	R	Y	G	Y

	FAA Measure	Scale
M1	Guidance, intent, plans, and taskings are assessed for required CBRN/TIM protection requirements.	<p><b>G:</b> National and strategic guidance, intent, plans, and taskings are assessed to determine supporting CBRND systems capabilities and means and encompass quantities and types necessary to support multiple concurrent Strategic Theater military operations with threat.</p> <p><b>Y:</b> National and strategic guidance, intent, plans, and taskings are assessed to determine supporting CBRND systems capabilities and means encompassing quantities and types necessary to support Strategic Theater military operations with threat.</p> <p><b>R:</b> The assessment of national and strategic guidance, intent, plans, and/or taskings is inadequate or nonexistent to determine supporting CBRND systems capabilities and/or means encompassing quantities and/or types necessary to support Strategic Theater military operations with threat.</p>
M2	Required protective systems are available.	<p><b>G:</b> CBRND systems are available in plan-identified required quantities and types to support multiple concurrent Strategic Theater military operations with threat.</p> <p><b>Y:</b> CBRND systems are available in sufficient quantities and types to support concurrent Strategic Theater operations with threat. Adjustments to plan requirements are made to adjust to limitations in quantities and types of CBRND systems.</p> <p><b>R:</b> CBRND systems are not available in sufficient quantities and types to support concurrent theater operations with threat.</p>
M3	Forces are equipped to conduct theater operations.	<p><b>G:</b> Strategic Theater forces are adequately equipped and possess ready access to CBRND resources to support Strategic Theater operations with threat.</p> <p><b>Y:</b> Strategic Theater forces are equipped and possess access to CBRND resources upon notification to support Strategic Theater operations with threat.</p> <p><b>R:</b> Strategic Theater forces are inadequately equipped or possess inadequate access to CBRND resources to support Strategic Theater operations with threat.</p>
M4	Forces are trained and prepared to conduct theater operations.	<p><b>G:</b> Strategic Theater forces are trained and exercised routinely for the attainment and assessment of the skills, knowledge, and abilities to support Strategic Theater operations with threat.</p> <p><b>Y:</b> Selected Strategic Theater forces are trained and exercised routinely for the attainment and assessment of the skills, knowledge, and abilities to support theater operations with threat. Remaining strategic forces are trained and exercised upon notification to prepare for Strategic Theater operations with threat.</p> <p><b>R:</b> Training and exercising of strategic forces for Strategic Theater operations with threat is inadequate or nonexistent.</p>
M5	Protection capability requirements are determined.	<p><b>G:</b> Plans, guidance, threats, and taskings are assessed to determine CBRND capability requirements for support of multiple concurrent Strategic Theater operations with threat.</p> <p><b>Y:</b> Plans, guidance, threats, and taskings are assessed to determine CBRND capability requirements for support of Strategic Theater operations with threat.</p> <p><b>R:</b> The process for determination and assessment of CBRND protection capability requirements is inadequate or nonexistent.</p>

<sup>1</sup> Adequate DOTMLPF exists to assess requirements, identify and allocate resources, and equipping the force. DOTMLPF is not adequate for determination of the actual CBRND requirements for concurrent operations as defined in current national and Strategic Theater policy. DOTMLPF is also inadequate for this task to support sustained operations within a CBRN/TIM environment, particularly expeditionary operations during the first 30–60 days.

<sup>2</sup> Plans, guidance, threats, and taskings are assessed by the COCOM staff to determine operational requirements, including CBRND. However, dual taskings can occur on specific resources necessitating changes in taskings for concurrent operations. Limitations upon resource availability may necessitate adjustments to the planned mix and quantities. These adjustments may impact optimal CBRND protection with implications for operational planning and support.

<sup>3</sup> Available CBRND systems are not available in sufficient quantities to support concurrent military operations. CBRND systems required to support operations are identified by specific plans. However, the requirements of these plans are not always correlated with other plans. Comparison is essential to relate plan identified CBRND requirements against existing and programmed quantities and types. Comparison must consider support requirements of two or more concurrent operations with CBRN/TIM threat. Expeditionary operations are a particular concern. Existing COLPRO systems are not generally designed for a highly mobile force, with a reduced logistical footprint, and the initial period of operations until the theater matures (usually the first 30–90 days).

<sup>4</sup> Strategic Theater forces are adequately equipped or resources are accessible to support Strategic Theater operations. However, expeditionary and concurrent operations remain a concern.

<sup>5</sup> Strategic Theater forces are trained and prepared to support Strategic Theater operations.

<sup>6</sup> Plans, guidance, threats, and taskings are assessed by the COCOM staff to determine operational CBRND capability requirements. However, dual taskings can occur on specific resource capabilities necessitating changes in taskings for concurrent and operations. Identification of capabilities supporting sustained operations within a CBRN/TIM environment and expeditionary operations during the first 30–60 days are a concern.

### 11.1.3 Functional Solution Analysis

#### 11.1.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the Ideas for Materiel Approaches (IMA) section.

1. **Deficiency:** Dual taskings can occur on specific resources necessitating changes in taskings for concurrent operations. Limitations upon resource availability may necessitate adjustments to the planned mix and quantities, potentially impacting optimal CBRND protection with implications for operational planning and support.

**Non-Materiel Solutions:** *Doctrine:* Institute in doctrine, policy, and procedures the central correlation of Strategic Theater plans and taskings to identify CBRND support requirements for two or more concurrent operations with CBRN/TIM threat with comparison to existing and programmed quantities and types of CBRND systems and resources. *Leadership:* Implement development of plans and taskings consistent with available CBRND capabilities as determined by central correlation and comparison of Strategic Theater plans and taskings.

2. **Deficiency:** Available CBRND systems are not available in sufficient quantities to support concurrent military operations.

**Non-Materiel Solutions:** *Doctrine:* Institute in doctrine, policy, and procedures the central correlation of Strategic Theater plans and taskings to identify CBRND support requirements for two or more concurrent operations with CBRN/TIM threat with comparison to existing and programmed quantities and types of CBRND systems and resources. *Leadership:* Implement development of plans and taskings consistent with available CBRND capabilities as determined by central correlation and comparison of Strategic Theater plans and taskings.

3. **Deficiency:** The CBRN/TIM system requirements identified by specific plans are not centrally correlated with other plans. Comparison is essential to identify CBRN/TIM systems and supporting levels of consumables required for the anticipated duration of operations and to consider support requirements of two or more concurrent operations with CBRN/TIM threat.

**Non-Materiel Solutions:** *Doctrine:* Institute in doctrine, policy, and procedures the central correlation of national and Strategic Theater plans and taskings to identify CBRN/TIM support requirements for two or more concurrent operations with threat with comparison to existing and programmed quantities and types of CBRND systems and resources, including replenishment. *Leadership:* Implement development of plans and taskings consistent with available CBRND capabilities as determined by central correlation and comparison of national and strategic plans and taskings.

4. **Deficiency:** Expeditionary and concurrent operations forces may be insufficiently equipped to conduct theater operations.

**Non-Materiel Solutions:** *Doctrine:* Complete the Joint Capabilities Integration and Development System (JCIDS) process and central correlation/comparison of national and strategic plans to identify CBRND resources necessary and available to support

expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint. *Organization*: Organization structures, resources, staffing, and capabilities to conduct expeditionary operations while possessing reduced logistical footprint and during the first 30–90 days of operations following commencement of hostilities. *Training*: Train, exercise, and evaluate expeditionary capabilities of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operation using CBRND resources supporting expeditionary operations. *Leadership*: Recognize differences and challenges associated with expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint; training providing skills and knowledge to manage operations in these circumstances; and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities*: Develop supporting infrastructure for expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.

5. **Deficiency**: Expansion of DOTMLPF for determination of actual CBRND requirements for concurrent operations as defined in current national and Strategic Theater policy.

**Non-Materiel Solutions**: *Doctrine*: Institute in doctrine, policy, and procedures the central correlation of Strategic Theater plans and taskings to identify CBRND support requirements for two or more concurrent operations with CBRN/TIM threat with comparison to existing and programmed quantities and types of CBRND systems and resources. *Leadership*: Implement development of plans and taskings consistent with available CBRND capabilities as determined by central correlation and comparison of Strategic Theater plans and taskings.

6. **Deficiency**: Expansion of DOTMLPF to support sustained operations within a CBRN/TIM environment, particularly expeditionary operations during the first 30–60 days.

**Non-Materiel Solutions**: *Doctrine*: Include in doctrine, policy, and procedures sustained operations within a CBRN/TIM environment. *Organization*: Ensure resources, taskings, and staff are in place or available to perform sustained operations within a CBRN/TIM environment. *Training*: Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership*: Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force. *Facilities*: Develop supporting infrastructure for expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.

### 11.1.3.2 IMA Assessment Summary

N/A

**11.2 Task STSHLD 2: Provide for the allocation, sustainment, and positioning of CBRN/TIM protection supplies, equipment, and systems****11.2.1 Functional Area Analysis****11.2.1.1 Definition**

To ensure adequate, efficient, and timely availability of CBRN/TIM protection resources to the force. This task includes the identification, stockpiling, prepositioning, movement, distribution, and management of resources to optimize protection of the force against the effects of CBRN/TIM agents. Encompasses the planning, programming, and oversight of acquisition activities to obtain CBRN/TIM protection equipment, supplies, and systems to meet force requirements against identified threats. Since units are vulnerable during initial period of arrival in theater, CBRN/TIM protective assets must be on the ground early during deployment. The CBRN/TIM threat in the area of responsibility (AOR) will drive timing and quantity of protective assets required. Each Service possesses CBRND assets contributing to the overall CBRN/TIM protection capability. Forward-positioned forces and prepositioning of equipment will help overcome initial vulnerabilities. Protective assets include collective protection shelters (CPSs), stockpile of protection supplies, protection of general equipment and supplies, and medical resources. Nuclear, biological, and chemical (NBC) staff officers coordinate with logisticians and operational planners to ensure CBRN/TIM protective assets are strategically placed near the area where they will likely be needed. Supports assistance to nations provided under military assistance and the family of engagement plans to eliminate WMD vulnerabilities.

**11.2.1.2 Derivation**

*Joint Enabling Concept for CBRN/TIM Operations, Protection Joint Functional Concept, UJTL (ST 1.1.2, ST 2.4.1.1, ST 6, ST 6.2, St 7.1.1, ST 9, ST 9.3, ST 9.4).*

**11.2.1.2.1 Supported Task: SNSHLD 12****11.2.1.2.2 Lateral Task: STSHA 3****11.2.1.2.3 Supporting Task: OPSHLD 8****11.2.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Partially completed mission preparation. (C2.1.3)

2. Partial interoperability. (C2.2.6)
3. Partial joint staff integration. (C2.3.1.1)
4. Partial multinational integration. (C2.3.1.2)
5. Limited deployed supplies. (C2.8.2)
6. Sufficient CONUS resupply. (C2.8.3)
7. Slow pipeline responsiveness. (C2.8.3.1)
8. Limited prepositioned materiel. (C2.8.4)
9. Limited host-nation support. (C2.8.5)
10. Extensive commercial procurement. (C2.8.6)

## **Civil**

1. Correct interdepartmental/interagency relationships. (C3.1.1.3)

### **11.2.2 Functional Needs Analysis**

#### **11.2.2.1 Capability and Deficiency Assessment Summary**

Table 11.2-1 discusses the only capability that exists to perform the task to the designated standard.

#### **Current Capability and Deficiency**

General logistics DOTLPF exists addressing the allocation, sustainment, prepositioning, and stockpiling of materiel. Deficiencies include inadequate quantities and types of COLPRO to support envisioned and published Strategic Theater concurrent operations; CBRND of deploying/redeploying/relocating/en route forces (as well as personnel at CONUS and selected non-high-threat area [HTA] sites outside the Continental United States[OCONUS]); lack of COLPRO in tactical/strategic airframes (particularly airlift) and supporting vessels (e.g., hospital ships, cargo vessels, etc.); availability of stockpiles and prepositioned CBRND stocks; and critical facility COLPRO and COLPRO systems (designs, quantities, and types) supporting highly mobile and expeditionary forces with reduced logistical footprint and the initial period of operations until maturity of the theater, usually the first 30–90 days from commencement of hostilities. The overall current assessment is “red.”

#### **Projected Near/Mid-Term Capability and Deficiency**

No change is projected for this task.

#### **Projected Far-Term Capability and Deficiency**

No change is projected for this task.

Table 11.2-1. STSHLD 2: Capability and Deficiency Assessment

M9	Required mobile CPSs are available and operational.	<p><b>G:</b> Operational mobile CPSs are available in required quantities and types to support the full range of envisioned and planned operations.</p> <p><b>Y:</b> Operational mobile CPSs are available in sufficient types and quantities to support major operations.</p> <p><b>R:</b> Operational mobile CPSs are inadequate or nonexistent to support operations.</p>
M10	Required generic unit CBRND kits are available and ready.	<p><b>G:</b> Generic unit CBRND kits are defined, prepositioned, stockpiled, and available in plan-identified required quantities to support a basic range of sustained operations against multiple CBRN/TIM attacks in staggered major conflicts with concurrent smaller-scale contingency operations.</p> <p><b>Y:</b> Generic unit CBRND kits are defined, prepositioned, stockpiled, or available to support sustained operations against multiple CBRN/TIM attacks in staggered major conflicts with concurrent smaller-scale contingency operations. Adjustments to plan requirements are made to adjust to limitations in quantities of available generic unit CBRND kits.</p> <p><b>R:</b> Generic unit CBRND kits are not defined, prepositioned, stockpiled, and/or available in sufficient quantities to support sustained operations against multiple CBRN/TIM attacks in staggered major conflicts with concurrent smaller-scale contingency operations.</p>

M11	Required non-mission support civilian CBRND equipment and supplies are stockpiled and prepositioned.	<p><b>G:</b> Non-mission support civilian CBRND is adequately stockpiled and prepositioned to support national and Strategic Theater operations with a CBRN/TIM threat.</p> <p><b>Y:</b> Non-mission support civilian CBRND is generally stockpiled and deployed to support national and Strategic Theater operations with threat.</p> <p><b>R:</b> Stockpiles and/or prepositioned CBRND equipment for non-mission support civilians are inadequate or nonexistent and unable to support national and Strategic Theater operations with a CBRN/TIM threat.</p>
M12	Required prepositioned CBRND assets are at designated locations.	<p><b>G:</b> Prepositioned CBRND assets are identified and available in plan identified required types and quantities to support a basic range of sustained operations against multiple CBRN/TIM attacks in staggered major conflicts with concurrent smaller-scale contingency operations.</p> <p><b>Y:</b> Prepositioned CBRND assets are available in adequate types and quantities to support sustained operations against multiple CBRN/TIM attacks in staggered major conflicts with concurrent smaller-scale contingency operations. Adjustments to plan requirements are made to adjust to limitations in quantities of available generic unit CBRND kits.</p> <p><b>R:</b> Prepositioned CBRND assets are inadequate or nonexistent to support sustained operations against multiple CBRN/TIM attacks in staggered major conflicts with concurrent smaller-scale contingency operations.</p>
M13	Documented assessment identifies unsatisfied required CBRND requirements addressing threat.	<p><b>G:</b> National and Strategic Theater guidance, intent, plans, and taskings are assessed to determine and document supporting CBRND systems capabilities and means and encompass quantities and types necessary to support multiple concurrent Strategic Theater military operations with threat.</p> <p><b>Y:</b> National and strategic guidance, intent, plans, and taskings are assessed to determine and document supporting CBRND systems capabilities and means encompassing quantities and types necessary to support Strategic Theater military operations with threat.</p> <p><b>R:</b> The assessment of national and strategic guidance, intent, plans, and/or taskings is inadequate or nonexistent to determine and/or document supporting CBRND systems capabilities and/or means encompassing quantities and/or types necessary to support Strategic Theater military operations with threat.</p>

<sup>1</sup> General logistics DOTMLPF exists addressing the allocation, prepositioning, and stockpiling of materiel. The application and implementation of this DOTMLPF is inadequate. Further, the general logistics DOTMLPF requires review and adjustment to support the force during and following transformation.

<sup>2</sup> Maneuvering forces are inadequately equipped with COLPRO capabilities. Insufficient COLPRO is available to support rest and resupply activities for all personnel within a 24-hour period necessary to support sustained operations within a contaminated environment. This statement is particularly true of forward-operating light forces. Fixed-site operations within a mature theater may possess sufficient COLPRO to provide access to personnel within a 24-hour period. Current doctrine, policies, plans, and TTPs do not adequately address sustained operations within a CBRN/TIM environment. Current concept is contamination avoidance or withdrawal.

<sup>3</sup> Forces are equipped or possess access to individual CBRN/TIM protective equipment when stationed in HTAs. Personnel assigned to CONUS and selection OCONUS locations do not possess or have ready access to individual protective equipment. CBRND equipment is often not issued and available to deploying forces until after arrival in the area of operations (AO). Protection while deploying en route to the AO is often not considered. The individual combat load places limitations upon weight and type of equipment and consumables. Protective equipment may be reduced or eliminated despite threat level.

<sup>4</sup> Available CBRND systems are not prepositioned in sufficient quantities and types to support operations. Many CBRND systems (e.g., transportable and mobile CPSs, individual protective equipment [IPE], prophylaxis, etc.) are in limited quantities and not prepositioned until preparations for implementation of operations. Availability of certain systems may be impacted by concurrent operations in other AOs. Expeditionary operations requiring rapid movement of highly mobile forces with limited notice into an austere environment at the extremes of the lines of communication are a concern.

<sup>5</sup> Available CBRND systems are not nationally stockpiled in sufficient quantities to support the envisioned and published national military concurrent operations. Limited stockpiling at existing fixed sites within HTA does exist but is generally associated with the provisioning of the forces at those sites. Reallocation from stocks dispersed to installations and units for deploying joint force elements is accomplished by the COCOM staff when necessary and possible.

<sup>6</sup> Not all critical facilities and activities are equipped with COLPRO.

<sup>7</sup> CBRND systems required to support operations are identified by specific plans. However, the requirements of these plans are not centrally correlated with other plans. Comparison is essential to identify CBRN/TIM systems and supporting levels of consumables required for the anticipated duration of operations. Comparison must also consider support requirements of two or more concurrent operations with CBRN/TIM threat. Expeditionary operations are a particular concern. CBRND systems are not generally designed for a highly mobile force, with a reduced logistical footprint, and for the initial period of operations until the theater matures (usually the first 30–90 days).

<sup>8</sup> Mature theater CPSs are available in limited quantities. These include Joint Transportable Collective Protection System (JTCOPS), Chemically Protected Deployable Medical System (CP-DEPMEDS), Tent, Expandable, Modular, Personnel (TEMPER) systems, and Service-designed systems. Integration of Service-specific systems into joint plans provides additional COLPRO capabilities. These, however, are identified in the Service component plans. They are not generally integrated in COCOM joint plans. Current CPSs are inadequate to support expeditionary operations, particularly in austere environments by highly mobile forces and possessing reduced logistical footprint.

<sup>9</sup> Quantities and availability of mobile COLPRO are inadequate. Mobile COLPRO exists in selected tactical combat and support vehicles. The quantities and types of these vehicles are limited and are dedicated to specific missions. Current mobile COLPRO is inadequate to support operations by highly mobile forces. Airframe COLPRO is limited to tactical combat airframes. Airlift (both tactical and strategic) are not equipped with COLPRO. Sea-based COLPRO (the CITADEL System) is available in specific classes of naval warfare vessels (e.g., amphibious assault ship [LHA], destroyer, etc.). Most naval vessels (including supply and transport vessels, carriers, and others) do not possess COLPRO.

<sup>10</sup> Generic unit CBRND kits are not defined in current doctrine. Limited CBRND asset assemblies do exist and are prepositioned at selected sites. However, these assemblies are generally unit-specific.

<sup>11</sup> Non-mission support civilian CBRND equipment is not stockpiled and prepositioned.

<sup>12</sup> Available CBRND systems are not prepositioned in sufficient quantities to support the envisioned and published national military concurrent operations. Timing for replenishment of systems is dependent upon manufacturing capabilities, system age, and funding availability. Production for replenishment by industry may require a period to expand or establish manufacturing capabilities which could exceed the necessary replenishment timeline. This concern is particularly applicable when components or systems are dependent upon non-U.S. manufacturing capabilities.

<sup>13</sup> Plans, guidance, threats, and taskings are assessed by the COCOM staff to determine operational requirements, including CBRND. However, dual taskings can occur on specific resources necessitating changes in taskings for concurrent operations. Unsatisfied requirements are reviewed for potential adjustments within available resources and/or identification and action for resolution. Limitations upon resource availability may necessitate adjustments to the planned mix and quantities. These adjustments may impact optimal CBRND protection with implications for operational planning and support. Identification of unsatisfied requirements are forwarded to Service and/or joint review and resolution assistance.

### 11.2.3 Functional Solution Analysis

#### 11.2.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** Maneuvering forces are inadequately equipped with COLPRO capabilities.  
**Non-Materiel Solutions:** *Doctrine:* Complete the JCIDS process and central correlation/ comparison of national and strategic plans to identify CBRND resources necessary and available to support maneuver operations, particularly expeditionary operations during the first 30–90 days following commencement of hostilities, with a reduced logistical footprint. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct maneuver operations, particularly expeditionary operations during the first 30–90 days of operations following commencement of hostilities, while possessing reduced logistical footprint. *Training:* Train, exercise, and evaluate maneuver capabilities (particularly expeditionary capabilities) of the force in a CBRN/TIM threat with logistical footprint during the initial 30–90 days of operations using organic, prepositioned, and planned CBRND resource supporting operations. *Leadership:* Recognize differences and challenges associated with maneuver operations, particularly expeditionary operations during the first 30–90 days following commencement of hostilities, with a reduced logistical footprint; training providing skills and knowledge to manage operations in these circumstances; and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.
- 2. Deficiency:** Insufficient COLPRO is available to support rest and resupply activities for all personnel within a 24-hour period necessary to support sustained operations within a contaminated environment. This is particularly true of forward-operating light forces.  
**Non-Materiel Solutions:** *Doctrine:* Enforce existing doctrine and policies.
- 3. Deficiency:** Current doctrine, policies, plans, and TTPs do not adequately address sustained operations within a CBRN/TIM environment.  
**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, and procedures sustained operations within a CBRN/TIM environment. *Organization:* Ensure resources, taskings, and staff are in place or available to perform sustained operations within a CBRN/TIM environment. *Organization:* Ensure resources, taskings, and staff are in place or available to perform sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.

- 4. Deficiency:** Personnel assigned to CONUS and selected OCONUS locations do not possess or have ready access to individual protective equipment.  
**Non-Materiel Solutions:** *Doctrine:* Institute in doctrine, policy, and procedures CBRND of personnel (military and civilian) located in U.S. Department of Defense (DoD) installations, sites, and facilities to include equipping, training, exercising, and evaluations for CBRN/TIM survival. *Organization:* Ensure resources, taskings, and staff are in place or available to support and conduct CBRND. *Training:* Train, exercise, and evaluate the force for survivability within a CBRN/TIM environment. *Leadership:* Implement development of plans and taskings consistent with stockpile support capabilities.
- 5. Deficiency:** CBRND equipment is not available to deploying forces after arrival in the AO.  
**Non-Materiel Solutions:** *Doctrine:* Emphasize in doctrine, policies, and procedures for preparation of the force for CBRND protection through deployment, redeployment, relocation, and en route phases of movement. *Organization:* Ensure resources, taskings, and staff are in place or available to perform CBRND operations within a CBRN/TIM environment by deploying, redeploying, relocating, and en route forces. *Training:* Train, exercise, and evaluate the force for CBRND operations within a CBRN/TIM environment while deploying, redeploying, relocating, and en route. *Leadership:* Recognize criticality of readiness of the force for potential CBRND operations within a CBRN/TIM environment while deploying, redeploying, relocating, and en route. *Facilities:* Develop supporting infrastructure for CBRND operations of the force while preparing, deploying, redeploying, relocating, and en route.
- 6. Deficiency:** Protection while deploying en route to the AO is often not considered.  
**Non-Materiel Solutions:** *Doctrine:* Enforce existing doctrine and policies. *Organization:* Ensure resources, taskings, and staff are in place or available to perform CBRND operations within a CBRN/TIM environment by en route forces. *Training:* Train, exercise, and evaluate the force for CBRND operations within a CBRN/TIM environment while en route. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately protect the force. *Facilities:* Develop supporting infrastructure for CBRND operations of the force while en route.
- 7. Deficiency:** The individual combat load places limitations upon weight and type of equipment and consumables. Protective equipment may be reduced or eliminated despite threat level.  
**Non-Materiel Solutions:** *Leadership:* Recognize impact upon mission success and force survivability for reduction of CBRND measures not consistent with threat.
- 8. Deficiency:** Available CBRND systems are not stockpiled and prepositioned in sufficient quantities to support concurrent military operations.  
**Non-Materiel Solutions:** *Doctrine:* Institute in doctrine, policy, and procedures the central correlation of national and Strategic Theater plans and taskings to identify CBRN/TIM support requirements for two or more concurrent operations with threat with comparison to existing and programmed quantities and types of CBRND systems and resources, including

replenishment. *Leadership*: Implement development of plans and taskings consistent with stockpile and prepositioning support capabilities. *Facilities*: Develop supporting infrastructure for CBRND stockpile and prepositioning supporting plans and taskings. Stockpile and preposition as necessary to support determined requirements.

**9. Deficiency:** Not all critical facilities and activities are equipped with COLPRO.

**Non-Materiel Solutions:** *Doctrine*: Enforce existing doctrine and policies.

**10. Deficiency:** The CBRN/TIM system requirements identified by specific plans are not centrally correlated with other plans. Comparison is essential to identify CBRN/TIM systems and supporting levels of consumables required for the anticipated duration of operations and to consider support requirements of two or more concurrent operations with CBRN/TIM threat.

**Non-Materiel Solutions:** *Doctrine*: Institute in doctrine, policy, and procedures the central correlation of national and Strategic Theater plans and taskings to identify CBRN/TIM support requirements for two or more concurrent operations with threat with comparison to existing and programmed quantities and types of CBRND systems and resources, including replenishment. *Leadership*: Implement development of plans and taskings consistent with available CBRND capabilities as determined by central correlation and comparison of national and strategic plans and taskings.

**11. Deficiency:** Service-specific systems are not generally integrated in COCOM joint plans.

**Non-Materiel Solutions:** *Doctrine*: Emphasis in doctrine, policy, and procedures the central correlation of national and Strategic Theater plans and taskings to identify CBRN/TIM support requirements for two or more concurrent operations with threat with comparison to existing and programmed quantities and types of CBRND systems and resources, joint and Service-specific, including replenishment. *Leadership*: Implement development of plans and taskings consistent with joint and Service-specific CBRND support capabilities.

**12. Deficiency:** Expeditionary operations are a particular concern. CBRND systems are not generally designed for a highly mobile force in an austere environment at the extremes of the lines of communication, with a reduced logistical footprint, and for the initial period of operations until the theater matures (usually the first 30–90 days).

**Non-Materiel Solutions:** *Doctrine*: Complete the JCIDS process and central correlation/ comparison of national and strategic plans to identify CBRND resources necessary and available to support expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint. *Organization*: Develop organizational structures, resources, staffing, and capabilities to conduct expeditionary operations while possessing reduced logistical footprint and during the first 30–90 days of operations following commencement of hostilities. *Training*: Train, exercise, and evaluate expeditionary capabilities of the force in a CBRN/TIM threat with a reduced logistical footprint during the initial 30–90 days of operations using CBRND resources supporting expeditionary operations. *Leadership*: Recognize differences and challenges associated with expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint; training providing skills and knowledge to manage operations in these circumstances; and ability and willingness to implement necessary

changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities*: Develop supporting infrastructure for CBRND of highly mobile forces.

- 13. Deficiency:** Current mobile COLPRO is inadequate in quantities, types, and availability to support operations by highly mobile forces.

**Non-Materiel Solutions:** *Doctrine*: Completion of analysis and central correlation/ comparison of national and strategic plans to identify quantities and types of mobile COLPRO (and supporting consumables) necessary and available to support highly mobile forces for envisioned plans and taskings. *Organization*: Develop organizational structures, resources, staffing, and capabilities to conduct CBRND, including mobile COLPRO, of highly mobile forces. *Training*: Train, exercise, and evaluate CBRND, including mobile COLPRO, capabilities of the force in a CBRN/TIM threat during highly mobile force operations. *Leadership*: Recognize differences and challenges associated with CBRND operations by highly mobile forces; training providing skills and knowledge to manage operations in these circumstances; and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities*: Develop supporting infrastructure for CBRND of highly mobile forces.

- 14. Deficiency:** Airlift assets (both intratheater and intertheater) are not equipped with COLPRO.

**Non-Materiel Solutions:** *Doctrine*: Incorporate into doctrine, policy, and procedures the provision of COLPRO to aircrew and passengers in appropriate airframes (military and civilian). *Training*: Train, exercise, and evaluate aircrews and supporting entities for airframe COLPRO operations for CBRND. *Leadership*: Recognize criticality of protecting aircrew and passengers of appropriate intratheater and intertheater airframes from the effects of CBRN/TIM agents. *Facilities*: Develop supporting infrastructure (e.g., logistics, aircraft maintenance, etc.) for airframe COLPRO. NOTE: Non-materiel solutions will not address the absence of COLPRO for air mobility airframes.

- 15. Deficiency:** Most naval vessels (including supply and transport vessels, carriers, and others) do not possess COLPRO.

**Non-Materiel Solutions:** *Doctrine*: Incorporate into doctrine, policy, and procedures the provision of COLPRO for at-risk vessels (civilian contract and military). *Organization*: Develop organizational structures, resources, staffing, and capabilities to support COLPRO operations on vessels supporting operations and at risk. *Training*: Train, exercise, and evaluate crews for vessel COLPRO operations for CBRND. *Leadership*: Recognize differences and challenges associated with CBRND operations by at-risk vessels (both military and contract civilian) supporting operations. *Facilities*: supporting infrastructure (e.g., logistics, maintenance, power systems, etc.) for vessel COLPRO.

- 16. Deficiency:** Generic unit CBRND kits are not defined in current doctrine.

**Non-Materiel Solutions:** *Doctrine*: Incorporate generic and unit-specific CBRND kits into doctrine, policy, and procedures. Unit-specific CBRND kits should tailor generic kits. *Facilities*: Develop supporting infrastructure for the acquisition, stockpiling, prepositioning, maintenance, and movement of generic CBRND unit kits.

**17. Deficiency:** Non-mission support civilian CBRND equipment is not stockpiled and prepositioned.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the provisioning of civilians addressing the variation within a potential population. Institute in doctrine, policy, and procedures the central correlation of national and strategic plans and taskings to identify eligible civilian CBRND support requirements for two or more concurrent operations with CBRN/TIM threat with comparison to existing and programmed quantities and types of CBRND systems and resources, including replenishment and prepositioning of CBRND assets for civilians. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRND training, exercises, and evaluations, as appropriate. *Leadership:* Implement planning and management of CBRND training, equipping, stockpiling, prepositioning, and protection of eligible civilians. *Facilities:* Develop supporting infrastructure for the acquisition, stockpiling, prepositioning, maintenance, and movement of eligible civilians CBRND resources.

**18. Deficiency:** General logistics DOTLPF address the allocation, prepositioning, and stockpiling of materiel is inadequate.

**Non-Materiel Solutions:** *Doctrine:* General logistics DOTLPF requires review, adjustment, and aggressive implementation to support the force during and following transformation.

#### 11.2.3.2 IMA Assessment Summary

N/A

### 11.3 Task STSHLD 3: Coordinate medical prophylaxis to reduce impact of CBRN/TIM

#### 11.3.1 Functional Area Analysis

##### 11.3.1.1 Definition

To coordinate the issuance/administration of medical prophylaxes against the debilitating effects of CBRN/TIM agents to the force, MWAs, and eligible civilians. This task includes emphasis upon medical prophylaxes (including pre- and post-exposure) against the effects of CBRN/TIM agents as a continuing requirement. Currently, personnel and MWAs can be immunized against effects of some biological threat agents prior to exposure. Other pre- and post-exposure prophylactic measures exist for a number of chemical, biological, and radiological agents. Medical prophylaxes do not generally guarantee immunity but prevent or reduce the number and severity of casualties when exposed to particular agents. These preventive measures also decrease the impact upon operations resulting from exposure to CBRN/TIM agents.

##### 11.3.1.2 Derivation

*Joint Enabling Concept for CBRN/TIM Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (ST 2.4.1.1, ST 5.4.1, ST 6, ST 9.4).*

##### 11.3.1.2.1 Supported Task: SNSHLD 12

##### 11.3.1.2.2 Lateral Task: STSHA 7

##### 11.3.1.2.3 Supporting Task: N/A

##### 11.3.1.3 Condition

Perform this task under conditions of:

#### Physical

1. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

#### Military

1. Partially completed mission preparation. ( 2.1.3)
2. Marginal to strong forces assigned. (C2.2.1)
3. Fair personnel nutrition and health. (C2.2.4.1)
4. Good personnel physical conditioning. (C2.2.4.3)
5. Poor mission-essential government-service civilian physical conditioning. (C2.2.4.3 – NEW<sup>2</sup>)

---

<sup>2</sup> The current UJTL condition description applies only to military personnel. The description should be expanded to include essential government service civilians.

6. Poor mission-essential contract-service civilian physical conditioning. (C2.2.4.3 – NEW<sup>3</sup>)
7. Negligible personnel experience. (C2.2.4.5)
8. Limited deployed supplies. (C2.8.2)
9. Limited prepositioned materiel. (C2.8.4)

### Civil

1. Fair civil health. (C3.3.1.4)
2. High health risk. (C3.3.1.5)

## 11.3.2 Functional Needs Analysis

### 11.3.2.1 Capability and Deficiency Assessment Summary

Table 11.3-1 discusses the only capability that exists to perform the task to the designated standard.

#### Current Capability and Deficiency

The only identified individual capability is the coordination of issuance and administration of medical prophylaxis to the military force against the debilitating effects of CBRN/TIM agents. Doctrine, policy, and procedures exist for the coordination of issuance and administration of medical prophylaxis to the military force against the debilitating effects of CBRN/TIM agents. Deficiencies include the lack of medical prophylaxes for all threat CBRN/TIM agents, predeployment medical screenings do not consider prior presymptomatic low-dose CBRN/TIM exposures and associated potential long-term effects as relates to CBRN/TIM threats, the wide variance in efficacy of existing prophylaxes, lack of prophylaxes for MWDs, the inadequate provision of medical prophylaxes to eligible civilians, and the inadequacy of existing doctrine, policy, and procedures for MWAs and eligible civilians. The overall current capability is “yellow.”

#### Projected Near/Mid-Term Capability and Deficiency

No change is projected for this task.

#### Projected Far-Term Capability and Deficiency

No change is projected for this task.

---

<sup>3</sup> The current UJTL condition description applies only to military personnel. The description should be expanded to include essential contractor service personnel.

Table 11.3-1. STSHLD 3: Capability and Deficiency Assessment

Capability: COCOM Staff	M1	M2	M3	M4	M5	M6	M7	M8	M9
Current Overall Capability <sup>1</sup>	R <sup>2</sup>	Y <sup>3</sup>	R <sup>4</sup>	G <sup>5</sup>	G <sup>6</sup>	G <sup>7</sup>	R <sup>8</sup>	Y <sup>9</sup>	Y <sup>10</sup>
Near/Mid-Term Overall Capability	R	Y	R	G	G	G	R	Y	Y
Far-Term Overall Capability	R	Y	R	G	G	G	R	Y	Y

	FAA Measure	Scale
M1	Forces are protected by medical prophylaxes.	<p><b>G:</b> Medical CBRND countermeasures exist for all threat CBRN and high-risk TIM agents and encompass all eligible at-risk populations.</p> <p><b>Y:</b> Medical CBRND countermeasures exist for selected high-threat CBRN and high-risk TIM agents for U.S. military and eligible civilian members.</p> <p><b>R:</b> Medical CBRND countermeasures are inadequate or do not exist for high-threat CBRN and high-risk TIM agents.</p>
M2	All theater medical facilities are able to treat contaminated/exposed casualties.	<p><b>G:</b> All theater medical facilities are equipped and exercised for the reception, decontamination, and treatment of contaminated/exposed casualties. All assigned medical practitioners and medical support personnel (including emergency medical services [EMS], medical aides, etc.) are formally trained, and receive recurring training, for the evaluation and care of contaminated/exposed casualties. Medical provider based medical treatment is provided, when needed, throughout the process from reception to post-decontamination.</p> <p><b>Y:</b> Theater medical facilities are equipped and exercised for the reception, decontamination, and treatment of contaminated/exposed casualties. Formal training is available to for the evaluation and treatment of contaminated/exposed casualties. Medical support personnel (including EMS, medical aides, etc.) are trained, on the evaluation, decontamination, and care of contaminated/exposed casualties.</p> <p><b>R:</b> The ability of theater medical facilities to treat contaminated/exposed casualties is inadequate or nonexistent.</p>
M3	Forces are protected against all identified threat CBRN/TIM capabilities.	<p><b>G:</b> Strategic Theater forces are equipped, prepared, and possess ready access to CBRND measures and assets against all known CBRN/TIM threat capabilities.</p> <p><b>Y:</b> Strategic Theater forces are equipped, prepared, and possess ready access to CBRND measures and assets against known CBRN/TIM threat capabilities upon notification to support Strategic Theater operations with threat.</p> <p><b>R:</b> Strategic Theater forces are inadequately equipped, prepared, and/or possess inadequate access to CBRND resources to support Strategic Theater operations with CBRN/TIM threat.</p>
M4	Force completed deployment medical training and preparation.	<p><b>G:</b> Strategic Theater forces are medically trained and prepared for operations with threat.</p> <p><b>Y:</b> Selected Strategic Theater forces are generally medically trained and prepared for operations with threat.</p> <p><b>R:</b> Strategic Theater forces medical training and preparedness for operations with threat is inadequate or nonexistent.</p>
M5	Force completed predeployment screening.	<p><b>G:</b> Strategic Theater forces are predeployed screened for operations with threat.</p> <p><b>Y:</b> Selected Strategic Theater forces generally are predeployment screened for operations with threat.</p> <p><b>R:</b> Strategic Theater forces predeployment screening for operations with threat is inadequate or nonexistent.</p>
M6	Force completed post-deployment screening.	<p><b>G:</b> Strategic Theater forces are post-deployed screened for operations with threat.</p> <p><b>Y:</b> Selected Strategic Theater forces generally are post-deployed screened for operations with threat.</p> <p><b>R:</b> Strategic Theater forces post-deployment screening from operations with threat is inadequate or nonexistent.</p>

M7	All MWAs are prepared for operations in CBRN/TIM environment.	<p><b>G:</b> Strategic Theater MWA forces are fully equipped, trained, and prepared for survival while performing operations involving CBRN/TIM threat.</p> <p><b>Y:</b> Selected Strategic Theater MWA forces are fully equipped, trained, and prepared for survival while performing operations involving CBRN/TIM threat.</p> <p><b>R:</b> Strategic Theater MWA forces are inadequately equipped, trained, and/or prepared for survival while performing operations involving CBRN/TIM threat.</p>
M8	Medical prophylaxes are available for issue/administration.	<p><b>G:</b> Medical prophylaxis is available for issue and administration to all at-risk populations; including military members, eligible civilians, and MWAs.</p> <p><b>Y:</b> Medical prophylaxis is available for issue and administration to military personnel.</p> <p><b>R:</b> Availability of medical prophylaxis is inadequate or nonexistent for issue and administration.</p>
M9	Medical prophylaxes are issued/administered.	<p><b>G:</b> Medical prophylaxis is issued and administered to all at-risk populations; including military members, eligible civilians, and MWAs.</p> <p><b>Y:</b> Medical prophylaxis is issued and administered to military personnel.</p> <p><b>R:</b> Medical prophylaxis issuance and/or administration is inadequate or nonexistent.</p>

<sup>1</sup> DOTMLPF is effective for the military force. However, existing DOTMLPF is inadequate, or nonexistent, for MWA and eligible civilians.

<sup>2</sup> Medical prophylaxis does not exist for all threat CBRN/TIM and TIM agents. Current prophylaxis and supporting doctrine, policy, and procedures do not address presymptomatic medical CBRN/TIM protective countermeasures by other than U.S. forces, excluding MWA and eligible civilians. Prophylaxis against most high-threat TIMs are not currently available due to the relatively recent consideration of these agents as a potential threat. Additionally, the efficacy of existing prophylaxis, particularly vaccines, widely varies.

<sup>3</sup> Existing medical facilities within an HTA exercise the reception of contaminated/exposed casualties. Training for the treatment of contaminated/exposed casualties is available through the Army Medical Department but is not mandatory for medical practitioners identified for deployment or assignment where there exists a CBRN/TIM threat. The ability of the COCOM staff to ensure medical capabilities for CBRND is limited by routine medical operations and requirements. Periodic exercises are performed with medical activities, but on a limited basis, to provide training opportunities and to assess capabilities. Treatment of casualties is currently performed following completion of casualty decontamination. Generally, casualty care until completion of decontamination is performed by medical corpsmen, not medical practitioners.

<sup>4</sup> Forces are not protected against all identified threat CBRN/TIM capabilities. Medical prophylaxis does not exist for all threat CBRN/TIM and TIM agents.

<sup>5</sup> The COCOM staff tracks units identified to support plans for their readiness to deploy. However, the routine rotation and movement of personnel to and from units, the administration period of some vaccines for acquired immunity, and other taskings impact medical readiness. Completion of deployment medical training and preparation is contingent upon timing of notice to deployment, availability of medical personnel to perform training and preparation, and the availability of sufficient medical prophylaxis to meet preparation requirements. Short-notice operations and reallocated taskings also impact medical predeployment readiness for the threat. Forces have, and may in the future, require medical training and preparation upon arrival in the AOR. The COCOM staff plans generally include provisions for medical preparation of the force including both predeployment and AOR arrival.

<sup>6</sup> COCOM plans include the medical review of personnel identified against deployment taskings. Screenings of deployable personnel are periodically performed for potential limitations. Often, these are associated with annual medical physicals. However, predeployment medical screenings do not consider prior presymptomatic low-dose CBRN/TIM exposures, associated potential cumulative long-term effects, and the potential threat. The routine rotation and movement of personnel to and from units. Timing of notice of deployment and the availability of medical personnel impact the conduct of predeployment screenings. Short-notice operations and reallocated taskings may also impact the conduct of predeployment medical screenings. The COCOM staff plans attempt to provide for early (prior to deployment notice) and continued medical screening of tasked forces. Plans also include provisions for the conduct of predeployment screenings by medical personnel upon notification of deployment. However, annual physicals, when used to meet deployment screening requirements, may be conducted several months before a deployment. Often, a record review is conducted of the period following the physical for indications of issues precluding deployment.

<sup>7</sup> COCOM staff planning includes medical review and screening prior to returning units to their originating location or before release. These reviews and screening activities are frequently performed at the returning unit's location. Units are medically held until completion of medical review and screening before release.

<sup>8</sup> MWAs are not equipped, trained, and prepared for survival in a CBRN/TIM environment.

<sup>9</sup> Medical prophylaxes are developed for the military force. Prophylaxis for MWAs is virtually nonexistent. Prophylaxis for eligible civilians is not addressed. Availability of prophylaxis is questionable for issue and administration to eligible civilians. The issue and administration of prophylaxis to eligible civilians requires review due to questions regarding applicability to the range of body types, ages, and physical/medical factors inherent within a potential population, as well as possible long-term health issues and legal implications. The availability of medical prophylaxis to military force members is dependent upon identification of the threat, preplanning for a threat, positioning of stocks for issue and administration, timing of notification to administer/issue prophylaxis, availability of medical personnel to perform administration (if required), and the available quantity of sufficient medical prophylaxis to meet requirements. Short-notice operations and reallocated taskings impact the administration and issue of prophylaxis for the threat. Forces have, and may in the future, require medical prophylaxis administration/issue upon arrival in the AOR. However, the administration of many vaccines require multiple administrations over a period of time for acquired immunity. The COCOM staff plans generally include provisions for medical preparation of the force.

<sup>10</sup> Medical prophylaxis is issued/administered for identified CBRN/TIM threats to the military force. The administration and issuance of prophylaxis is addressed by the COCOM staff during the planning and support for operations. Prophylaxis for MWA is virtually nonexistent. Prophylaxis for eligible civilians is not adequately addressed in current doctrine, policy, and procedures.

### 11.3.3 Functional Solution Analysis

#### 11.3.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Current prophylaxis and supporting doctrine, policy, and procedures do not address presymptomatic medical CBRN/TIM protective countermeasures by other than U.S. forces, excluding eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing eligible civilians during CBRND operations and the provision of CBRND protection, including prophylaxis. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians.

2. **Deficiency:** Current prophylaxis and supporting doctrine, policy, and procedures do not address presymptomatic medical CBRN/TIM protective countermeasures by other than U.S. forces, excluding MWAs.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing MWAs during CBRND operations and the provision of CBRND protection, including prophylaxis. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWDs.

3. **Deficiency:** Prophylaxis administration programs widely vary.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of baseline standards for prophylactic CBRND protection against all threat agents. *Leadership:* Enforce compliance with established standards (see Doctrine) for prophylactic CBRND protection.

4. **Deficiency:** The ability of the COCOM staff to ensure medical capabilities for CBRND is limited by routine medical operations and requirements.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures requiring comprehensive participation and integration of all potentially affected personnel and activities in CBRND exercises. *Organization:* Ensure that all affected entities are aware of and participate in comprehensive exercises. *Training:* All personnel (military and nonmilitary) are trained in appropriate CBRND protective measures. *Leadership:* Recognize importance of Medical Services and balance with criticality for readiness to rapidly and accurately perform CBRND and conduct medical operations associated with CBRN/TIM environments and hazards. Recognition of the value of comprehensive exercises to enhance readiness, survival, and promote interaction between activities.

5. **Deficiency:** Forces are not protected against all identified threat CBRN/TIM capabilities.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards for prophylactic CBRND protection against all threat agents. *Leadership:* Enforce compliance with established standards (see Footnote 17 above) for prophylactic CBRND protection.

6. **Deficiency:** Forces have, and may in the future, require medical training and preparation upon arrival in the AOR.

**Non-Materiel Solutions:** *Doctrine:* Emphasize in doctrine, policies, and procedures for preparation of the force for CBRND protection during throughout deployment, redeployment, relocation, and en route phases of movement. *Organization:* Ensure resources, taskings, and staff are in place or available to perform CBRND operations within a CBRN/TIM environment by deploying, redeploying, relocating, and en route forces. *Training:* Train, exercise, and evaluate the force for CBRND operations within a CBRN/TIM environment while deploying, redeploying, relocating, and en route. *Leadership:* Recognize criticality of readiness of the force for potential CBRND operations within a CBRN/TIM environment while deploying, redeploying, relocation, and en route; training providing the skills to manage the force in these circumstances; and willingness and ability to implement necessary changes and activities to prepare and appropriately protect the force. *Facilities:* Develop supporting infrastructure for CBRND operations of the force while preparing, deploying, redeploying, relocating, and en route.

7. **Deficiency:** Predeployment medical screenings do not consider prior presymptomatic low-dose CBRN/TIM exposures, associated potential cumulative long-term effects, and the potential threat.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of low-dose exposure limits and cumulative long-term low-dose exposures in predeployment medical screenings. *Leadership:* Enforce compliance with established doctrine, policy, and procedures (see Footnote 10 above) for low-dose exposure limits and cumulative long-term low-dose exposures in predeployment medical screenings.

8. **Deficiency:** MWAs are not equipped, trained, and prepared for survival in a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of MWAs (particularly MWDs) and training for CBRN/TIM environment survival. *Organization:* Organizational consideration for maintenance and support of MWA (particularly MWD) CBRND protective equipment, measures, and activities. *Training:* Develop institutional and unit training of handlers and MWAs (particularly MWDs) for CBRND measures and activities. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for MWD survivability. *Facilities:* Develop supporting infrastructure for MWA (particularly MWD) CBRND (e.g., logistics, veterinary surveillance, etc.).

9. **Deficiency:** Prophylaxis for MWAs is virtually nonexistent.

**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of MWAs (particularly MWDs) and training for CBRN/TIM environment survival. *Organization:* Organizational consideration for maintenance and support of MWA

(particularly MWD) CBRND protective equipment, measures, and activities. *Training:* Develop institutional and unit training of handlers and MWAs (particularly MWDs) for CBRND measures and activities. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for MWA (particularly MWD) survivability. *Facilities:* Develop supporting infrastructure for MWA (particularly MWD) CBRND (e.g., logistics, veterinary surveillance, etc.).

**10. Deficiency:** Prophylaxis for eligible civilians is not addressed.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures requirement to address the administration, provision, and application of medical CBRN/TIM protective countermeasures by other than U.S. forces (e.g., civilians, non-U.S. forces, etc.). *Organization:* Address organizational issues (e.g., who provides the equipment, support forces to train and equip, etc.) related to the provision of CBRN/TIM protection to eligible civilians, and non-U.S. forces. *Training:* Include eligible civilians in CBRND training, exercises, and evaluations. Identify training requirements and responsibilities for non-U.S. forces. *Leadership:* Ensure leadership awareness of criticality of resources and increased dependence of military operations upon civilians. *Personnel:* Requirements eligible civilians supporting the mission meet minimum standards for safe use of CBRND resources.

**11. Deficiency:** Availability of prophylaxis is questionable for issue and administration to eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of CBRND standards and prophylaxis for protection of eligible civilians addressing the variation within a potential protected population. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRN/TIM training, exercises, and evaluations, where appropriate. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians.

**12. Deficiency:** The issue and administration of prophylaxis to eligible civilians requires review due to questions regarding applicability to the range of body types, ages, and physical/medical factors inherent within a potential population, as well as possible long-term health issues and legal implications.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of CBRND standards and prophylaxis for protection of eligible civilians addressing the variation within a potential protected population. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRN/TIM training, exercises, and evaluations, where appropriate. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians.

**13. Deficiency:** The administration of vaccines frequently requires multiple administrations over a period of time for acquired immunity.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, and procedures requirement for CBRN/TIM protective prophylaxis protecting the force through the deployment cycle. *Organization:* Establish organizational incentives to address CBRN/TIM protective prophylaxis providing protection of the force throughout the deployment cycle. *Leadership:* Ensure standards, criteria, and metrics for CBRN/TIM medical prophylaxis R&D are concise

and adequately protect the force throughout the deployment cycle with a minimum of administrations, preferably one.

**11.3.3.2 IMA Assessment Summary**

N/A

**11.4 Task STSHLD 4: Ensure adequate individual protection for eligible civilians****11.4.1 Functional Area Analysis****11.4.1.1 Definition**

To ensure that civilians (including evacuees, host-nation personnel, contractors, and other designated nonmilitary personnel) possess individual protection for survival. IPE must provide optimal individual protection from CBRN/TIM by the proper use of masking devices (respiration and ocular) and wear of protective gear and clothing (percutaneous). The equipment must ensure survivability by prohibiting agents from entering the body while allowing individuals to perform their tasks (which is dependent upon the type of activity performed by the individual) while wearing it. While some performance degradation and physical encumbrances are inherent because of the physical properties of the protective gear, the goal is to reduce the physical and mental stresses of its wear without substantially degrading required mission performance. Planners must include medical prophylaxes for eligible civilians. The afforded protection is commensurate with the mission and performed task and may require protection to the same level as military counterparts. Supports assistance to nations provided under military assistance and the family of engagement plans to eliminate WMD vulnerabilities.

**11.4.1.2 Derivation**

*Joint Enabling Concept for CBRN/TIM Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (ST 4.2.4, ST 5.4.3, ST 6.2, ST 7, ST 9.4).*

**11.4.1.2.1 Supported Task: SNSHLD 12****11.4.1.2.2 Lateral Task: STSHA 4****11.4.1.2.3 Supporting Task: OPSHLD 6****11.4.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Partially completed mission preparation. (C2.1.3)
2. Marginal to strong forces assigned. (C2.2.1)
3. Fair personnel nutrition and health. (C2.2.4.1)
4. Good personnel physical conditioning. (C2.2.4.3)

5. Poor mission-essential government-service civilian physical conditioning. (C2.2.4.3 – NEW)
6. Poor mission-essential contract-service civilian physical conditioning. (C2.2.4.3 – NEW)
7. Negligible personnel experience. (C2.2.4.5)
8. Partial interoperability. (C2.2.6)
9. Limited prepositioned materiel. (C2.8.4)

**Civil**

1. Limited foreign government support. (C3.1.2.3)
2. Moderately opposed foreign public opinion. (C3.1.2.4)
3. Fair civil health. (C 3.3.1.4)

**11.4.2 Functional Needs Analysis****11.4.2.1 Capability and Deficiency Assessment Summary****Current Capability and Deficiency**

The only identified individual capabilities are the existing Noncombatant Evacuation Operations (NEO) procedures addressing primarily military dependents at HTA fixed-site locations that provide for the provisioning of minimal protective equipment drawn from mission stocks or obtained commercially off-the-shelf (COTS, and the limited number of eligible civilians provided and equipped with IPE as part of their primary function. Some government civilians are provided and equipped with IPE as part of their primary function (e.g., hazardous materials, fire response, readiness flight [Air Force]), and selected others. Deficiencies include the lack of a clear definition of eligible civilians; inadequate doctrine, policy, and procedures addressing CBRND of eligible civilians; the lack of IPE and medical prophylaxes addressing the variations within the population (e.g., babies, young children, disabled, tall, short, thin, obese, pregnant, etc.); and the absence of training, exercising, and evaluation of these personnel. The overall current capability is “red.”

**Projected Near/Mid-Term Capability and Deficiency**

No change is projected for this task.

**Projected Far-Term Capability and Deficiency**

No change is projected for this task.

Table 11.4-1. STSHLD 4: Capability and Deficiency Assessment

Capability: COCOM Staff	M1	M2	M3	M4	M5	M6	M7	M8

M5	All members of the civilian workforce requiring military force–level protection are equivalently equipped.	<p><b>G:</b> All eligible civilians supporting operations are equipped with military force–level protection minimally equivalent to protection afforded military personnel performing the same function.</p> <p><b>Y:</b> All eligible civilians performing mission critical functions which cannot or are not performed by uniformed personnel are provided military force–level protective equipment and measures.</p> <p><b>R:</b> Protection of eligible civilians enabling the performance of functions necessary to operations is inadequate or nonexistent.</p>

M6	All members of the civilian workforce requiring military force-level protection are appropriately immunized.	<b>G:</b> All eligible civilians supporting operations are equipped with military force-level protection minimally equivalent to protection afforded military personnel performing the same function. <b>Y:</b> All eligible civilians performing mission critical functions which cannot or are not performed by uniformed personnel are provided military force-level protective equipment and measures. <b>R:</b> Protection of eligible civilians enabling the performance of functions necessary to operations is inadequate or nonexistent.
M7	Evacuee protective equipment covers both genders and range of body types, ages, and disabilities.	<b>G:</b> Evacuee protective equipment is stocked, prepositioned, and readily available to cover the range of body types, genders, ages, and disabilities. <b>Y:</b> Evacuee protective equipment and measures are stocked and readily available for a target population. <b>R:</b> Evacuee protective equipment and measures are inadequate or nonexistent.
M8	Adequate evacuee IPE (e.g., overgarment, gloves, boots, and masks) is available.	<b>G:</b> Evacuee protective equipment is stocked, prepositioned, and readily available to cover the range of body types, genders, ages, and disabilities. <b>Y:</b> Evacuee protective equipment and measures are stocked and readily available for a target population. <b>R:</b> Evacuee protective equipment and measures are inadequate or nonexistent.

<sup>1</sup> DOTMLPF is inadequate or nonexistent for protection of eligible civilians within a CBRN/TIM environment.

<sup>2</sup> Policies and plans do not adequately address the protection of eligible civilians from CBRN/TIM. The definition of “eligible civilians” is not clear. COCOM staff does not possess clear guidance for planning and providing CBRN/TIM protection of eligible civilians.

<sup>3</sup> Some government civilians are provided and equipped with IPE as part of their primary function (e.g., hazardous materials, fire response, readiness flight [Air Force], and selected others). However, most civilians are not equipped or have access to IPE for survival within a CBRN/TIM environment. This statement is particularly true of contractors. COCOM staff does not possess clear guidance for planning and providing CBRN/TIM protection of eligible civilians.

<sup>4</sup> Prophylaxis of eligible civilians is not addressed. The issuance of CBRN/TIM prophylaxis to eligible civilians requires review due to questions regarding applicability to the range of body types, ages, and physical/medical factors inherent within a potential population, as well as possible long-term health issues and legal implications. Some government civilians may be issued medical prophylactic countermeasures as part of their primary function (e.g., hazardous materials, readiness flight [Air Force], and selected others). However, civilians (e.g., general government employees, contractors, dependents, etc.) are not issued prophylaxis. COCOM staff does not possess clear guidance for planning and providing CBRN/TIM protection of eligible civilians.

<sup>5</sup> Eligible civilians are not generally trained to operate in CBRN/TIM hazards. Some government civilians are trained as part of their primary function (e.g., hazardous materials, fire response, readiness flight [Air Force], and selected others). However, civilians (e.g., general government employees, contractors, dependents, etc.) do not receive training to survive a CBRN/TIM environment. COCOM staff does not possess clear guidance for planning and providing CBRN/TIM protection of eligible civilians.

<sup>6</sup> Some government civilians are equivalently equipped as part of their primary function (e.g., hazardous materials, fire response, readiness flight [Air Force], and selected others). However, most civilians performing essential activities supporting operations are not equivalently equipped to their military counterparts. This statement is particularly true of contractors. COCOM staff does not possess clear guidance for planning and providing CBRN/TIM protection of eligible civilians.

<sup>7</sup> Prophylaxis (CBRN/TIM vaccination) of eligible civilians is not addressed. The administration of CBRN/TIM prophylaxis to eligible civilians requires review due to questions regarding applicability to the range of body types, ages, and physical/medical factors inherent within a potential population, as well as possible long-term health issues and legal implications. Selected medical prophylaxis may be administered based upon medical judgment. COCOM staff does not possess clear guidance for planning and providing CBRN/TIM protection of eligible civilians.

<sup>8</sup> NEO plans for selected areas include the provisioning of non-mission support civilians with minimal protective equipment; generally drawn from mission stocks or obtained in advance through COTS. However, protective equipment for non-mission support civilians is not generally stocked for the full range of body types, ages, and physical capabilities inherent within a potential population. COCOM staff does not possess clear guidance for planning and providing CBRN/TIM protection of eligible civilians.

<sup>9</sup> NEO plans for selected areas include the provisioning of non-mission support civilians with minimal protective equipment; generally drawn from mission stocks or obtained in advance through COTS. Short-notice NEO evacuation operations for other than existing areas prepared in advance for NEO activities, are likely to necessitate the use of military force assets which may provide inadequate protection for segments of the potential population (e.g., babies, young children, disabled, etc.). COCOM staff does not possess clear guidance for planning and providing CBRN/TIM protection of eligible civilians.

### 11.4.3 Functional Solution Analysis

#### 11.4.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Policies and plans do not adequately address the protection of eligible civilians from CBRN/TIM.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing civilian personnel and operations for CBRND. *Organization:* Identify organizational services and activities supporting the mission performed by civilian personnel and operations.

*Training:* Establish CBRND training, exercise, and evaluation criteria and programs for civilian personnel and operations supporting the mission; and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of civilian personnel and operations supporting the mission. *Personnel:* Ensure civilian personnel and operations supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment.

2. **Deficiency:** The definition of “eligible civilians” is not clear.

**Non-Materiel Solutions:** *Doctrine:* Define eligible civilians supporting the mission/military operations for CBRND and establish their inclusion in the force within doctrine, policy, procedures, and TTPs. *Organization:* Identify organizational services dependent upon civilians for mission/military operations success. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians supporting the mission/military operations and conduct CBRND training, exercises, and evaluations.

*Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians supporting the mission/military operations. *Personnel:* Ensure that personnel meeting the definition of eligible civilians supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment.

3. **Deficiency:** COCOM staff does not possess clear guidance for planning and providing CBRN/TIM protection of eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing civilian personnel and operations for CBRND. *Organization:* Identify organizational services and activities supporting the mission performed by civilian personnel and operations.

*Training:* Establish CBRND training, exercise, and evaluation criteria and programs for civilian personnel and operations supporting the mission; and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of civilian personnel and operations supporting the mission. *Personnel:* Ensure that civilian personnel and operations supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment.

- 4. Deficiency:** Most civilians are not equipped or have access to IPE for survival within a CBRN/TIM environment. This statement is particularly true of contractors.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the provisioning of civilians addressing the variation within a potential population. Institute in doctrine, policy, and procedures the central correlation of national and strategic plans and taskings to identify eligible civilian CBRND support requirements for two or more concurrent operations with threat with comparison to existing and programmed quantities and types of CBRND systems and resources, including replenishment and prepositioning of CBRND assets for civilians. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRND training, exercises, and evaluations, as appropriate. *Leadership:* Implement planning and management of CBRND training, equipping, stockpiling, prepositioning, and protection of eligible civilians. *Facilities:* Develop supporting infrastructure for the acquisition, stockpiling, prepositioning, maintenance, and movement of eligible civilian CBRND resources.
- 5. Deficiency:** Prophylaxis of eligible civilians is not addressed.  
**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing eligible civilians during CBRND operations and the provision of CBRND protection, including prophylaxis. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians.
- 6. Deficiency:** The issuance of CBRN/TIM prophylaxis to eligible civilians requires review due to questions regarding applicability to the range of body types, ages, and physical/medical factors inherent within a potential population, as well as possible long-term health issues and legal implications.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards and measures for protection of eligible civilians addressing the variation within the potential protected population. *Leadership:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRN/TIM training, exercises, and evaluations.
- 7. Deficiency:** Eligible civilians are not generally trained to operate in CBRN/TIM hazards.  
**Non-Materiel Solutions:** *Doctrine:* Establish CBRND training, exercise, and evaluation standards and criteria for eligible civilians. *Organization:* *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRN/TIM training, exercises, and evaluations, where appropriate. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians. *Personnel:* Establish CBRND training, exercise, and evaluation standards and criteria for eligible civilians.
- 8. Deficiency:** Most civilians performing essential activities supporting operations are not equivalently equipped to their military counterparts. This statement is particularly true of contractors.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards for protection of eligible civilians supporting the mission/military operations addressing the variation within the potential protected working population. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians supporting the mission/military operations and conduct CBRN/TIM training, exercises, and evaluations.

- 9. Deficiency:** Protective equipment for non-mission support civilians is not generally stocked for the full range of body types, ages, and physical capabilities inherent within a potential population.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards for protection of eligible civilians not supporting the mission/military operations addressing the variation within a potential protected population. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians not support the mission/military operations and conduct CBRN/TIM training, exercises, and evaluations, where appropriate.

- 10. Deficiency:** Short-notice NEO evacuation operations for other than existing areas prepared in advance for NEO activities, are likely to necessitate the use of military force assets which may provide inadequate protection for segments of the potential population (e.g., babies, young children, disabled, etc.).

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards for protection of eligible civilians not supporting the mission/military operations addressing the variation within a potential protected population. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians not support the mission/military operations and conduct CBRN/TIM training, exercises, and evaluations, where appropriate.

- 11. Deficiency:** DOTMLPF is inadequate or nonexistent for protection of eligible civilians within a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing eligible civilian personnel and operations for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of eligible civilian personnel within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for civilian personnel and operations; and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilian personnel.

#### 11.4.3.2 IMA Assessment Summary

N/A

## **11.5 Task STSHLD 5: Establish appropriate CBRN/TIM protective measures and resources for deploying/redeploying joint forces at assembly, staging, and embarkation, debarkation, and en route locations**

### **11.5.1 Functional Area Analysis**

#### **11.5.1.1 Definition**

To begin protection of forces at CONUS bases and extend it to overseas locations. Includes training bases, depots, staging areas, headquarters, medical facilities, command and control facilities, force projection bases, traffic routes, and transload bases. Forces being deployed, redeployed, or rotated must be protected from CBRN/TIM threats. Cooperative security and CBRN/TIM response arrangements are required with local authorities, en route host nations, and in-theater governments and agencies. CBRND is an integrated part of total force protection. CBRN/TIM situational awareness is vital to the protection of personnel and critical resources. Protective measures (e.g., medical prophylaxes, CBRND hardening of facilities, COLPRO, and covering of supplies) can minimize the effects of CBRN/TIM weapon attacks.

#### **11.5.1.2 Derivation**

*Joint Enabling Concept for CBRN/TIM Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (ST 1.1.2, ST 5.2, ST 5.3.3, ST 5.4.1, ST 6, ST 6.2, ST 6.2.1, ST 7.1.1, ST 9.3, ST 9, ST 9.4).*

##### **11.5.1.2.1 Supported Task: SNSHLD 10**

##### **11.5.1.2.2 Lateral Task: STSHA 6**

##### **11.5.1.2.3 Supporting Task: N/A**

#### **11.5.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Undeveloped to highly developed land. (C1.1)
2. Riverine to open sea. (C1.2)
3. Natural and induced air. (C1.3)
4. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

##### **Military**

1. Partially completed mission preparation. (C2.1.3)
2. Marginal to strong forces assigned. (C2.2.1)
3. Negligible personnel experience. (C2.2.4.5)

4. Moderate to severe personnel fatigue. (C2.2.4.6)
5. Partial interoperability. (C2.2.6)
6. Limited prepositioned materiel. (C2.8.4)
7. Limited host-nation support. (C2.8.5)
8. Extensive commercial procurement. (C2.8.6)

## Civil

1. Limited foreign government support. (C3.1.2.3)

## 11.5.2 Functional Needs Analysis

### 11.5.2.1 Capability and Deficiency Assessment Summary

Table 11.5-1 discusses the only capability that exists to perform the task to the designated standard. Doctrine, policy, and procedures exist for the planning, logistics support, equipping, training, and movement of U.S. forces. Deficiencies include the protection of deploying/redeploying forces at assembly, staging, embarkation, debarkation, and en route locations. Included in the deficiencies are the organic capabilities of CONUS and non-HTA OCONUS for CBRND of moving and resident forces.

### Current Capability and Deficiency

Planning for the movement of forces to perform operations involving a CBRN/TIM threat includes the training, equipping, and preparation of the involved forces. Cooperative security and CBRND response arrangements with host and en route nations are established for en route forces when there is a threat and host nation support is appropriate. Planning for force movement generally seeks to use locations substantially operated by U.S. forces in other nations and where cooperative security agreements are in existence. DOTLPF is adequate for the protection of these forces at HTA OCONUS locations. Deficiencies include the lack of adequate CBRND COLPRO at CONUS and most non-HTA OCONUS locations. Radiological sheltering does exist at these locations but does not provide protection from chemical or biological warfare, toxic industrial chemicals (TICs), and toxic industrial biological (TIB) material. Garrison forces at these locations are generally not equipped and have access to CBRND measures and equipment. Deploying forces are often not issued sufficient IPE and medical countermeasures to perform CBRND during deployment and redeployment. Eligible civilians are not adequately addressed for CBRND and protection of MWDs is virtually nonexistent.

### Projected Near/Mid-Term Capability and Deficiency

The fielding of improved joint IPE (Joint Service Lightweight Integrated Suit Technology [JSLIST], Joint Service Aircrew Mask [JSAM], Joint Service General Purpose Mask [JSGPM], and Joint Protective Aircrew Ensemble [JPACE]) provides improved protection for the force. The IPE will provide protection against limited TIMs in addition to the known CBRN warfare agents. National Institute for Occupational Safety and Health review for compliance with Occupational Safety and Health Administration standards was requested to support joint and

DoD requirements. The initial operational capability fielding of the Joint Operational Effects Federation and Joint Effects Model in the mid term provides increased capabilities for planning and resource determination. Otherwise, no changes from current capabilities are identified.

### **Projected Far-Term Capability and Deficiency**

No change is projected for this task.

#### **11.5.2.2 Capability Description**

**COCOM Staff:** Planning, prepositioning, and positioning of resources, equipping, and training of forces and the establishment of cooperative arrangements (with local authorities, en route host nations, and in-theater governments and agencies, as appropriate and necessary) for CBRN/TIM protection of deploying forces throughout movement from originating locations (to in-theatre deployment reception destinations).

Table 11.5-1. STSHLD 5: Capability and Deficiency Assessment

	FAA Measure	Scale
M1	Forces are trained to operate in a CBRN/TIM environment.	<p><b>G:</b> All Strategic Theater forces (military, eligible civilians, and MWA) are trained and prepared to perform their functions and conduct operations within a CBRN/TIM environment.</p> <p><b>Y:</b> Military personnel and eligible civilians supporting the mission are fully trained and prepared to perform their functions and conduct operations within a CBRN/TIM environment.</p> <p><b>R:</b> Training and preparedness of Strategic Theater forces (including military, eligible civilians, and/or MWA) to perform functions and conduct operations within a CBRN/TIM environment is inadequate or nonexistent.</p>
M2	Forces are equipped to operate in a CBRN/TIM environment.	<p><b>G:</b> All Strategic Theater forces (military, eligible civilians, and MWA) are adequately equipped to perform their functions and conduct operations within a CBRN/TIM environment.</p> <p><b>Y:</b> Military personnel and eligible civilians supporting the mission are adequately equipped to perform their functions and conduct operations within a CBRN/TIM environment.</p> <p><b>R:</b> Equipping of Strategic Theater forces (including military, eligible civilians, and/or MWA) to perform functions and conduct operations within a CBRN/TIM environment is inadequate or nonexistent.</p>
M3	Base/facility force protection plan includes CBRN/TIM protection.	<p><b>G:</b> Antiterrorism/force protection (AT/FP) plans address and provide for the ready protection of the base/facility populace against exposure to and the effects of CBRN/TIM agents.</p> <p><b>Y:</b> AT/FP plans address and provide for the ready protection of the at-risk base/facility populace against exposure to and the effects of CBRN/TIM agents.</p> <p><b>R:</b> AT/FP plans addressing and providing protection against CBRN/TIM agents are inadequate or nonexistent.</p>
M4	CBRN/TIM response agreement exists with en route/in-theater host nation.	<p><b>G:</b> CBRN/TIM response agreements are established when there is a threat, the agreement is appropriate, and host nation capabilities exist.</p> <p><b>Y:</b> CBRN/TIM response agreements are established with friendly nations and where Status of Forces agreements exist.</p> <p><b>R:</b> CBRN/TIM response agreements are nonexistent or do not support deploying forces.</p>
M5	Required base/facility CBRN/TIM emergency response protective equipment is on hand.	<p><b>G:</b> All base/facility emergency response forces are trained and possess adequate CBRND protective equipment and measures for response to a CBRN/TIM incident without drawing upon warfighting assets.</p> <p><b>Y:</b> All base/facility emergency response forces are trained and possess adequate CBRND protective equipment and measures for response to a CBRN/TIM incident.</p> <p><b>R:</b> Base/facility emergency response force training and/or CBRND protective equipment and measures are inadequate or nonexistent for response to a CBRN/TIM incident.</p>
M6	Cooperative security agreement exists with en route/in-theater host nation.	<p><b>G:</b> Cooperative security agreements are established when there is a threat, the agreement is appropriate, and host nation capabilities exist.</p> <p><b>Y:</b> Cooperative security agreements are established with friendly nations and where Status of Forces agreements exist.</p> <p><b>R:</b> Cooperative security agreements are nonexistent or do not support deploying forces.</p>

M7	Adequate COLPRO is available to support deploying and base/facility forces.	<p><b>G:</b> Sufficient and adequate COLPRO is available and operational to provide sufficient CBRN/TIM protected spaces for base/facility populace plus deploying forces.</p> <p><b>Y:</b> Sufficient and adequate COLPRO is available and operational to provide sufficient CBRN/TIM protected spaces for essential base/facility operations plus deploying forces.</p> <p><b>R:</b> COLPRO is inadequate, insufficient, nonexistent, and/or non-operational and unable to support CBRN/TIM protection of base/facility populace and/or deploying forces.</p>
M8	Adequate individual protection is available to support deploying and base/facility forces.	<p><b>G:</b> All forces (including military, eligible civilians, and MWAs) are trained and possess adequate and readily available and operational CBRND protective equipment and measures. Base/facility forces supporting deploying forces are trained and possess adequate CBRND protective equipment and measures for response to a CBRN/TIM incident without drawing upon warfighting assets.</p> <p><b>Y:</b> All forces (including military, eligible civilians, and MWAs) are trained and possess adequate and readily available and operational CBRND protective equipment and measures. Base/facility forces supporting deploying forces are trained and possess adequate CBRND protective equipment and measures for response to a CBRN/TIM incident.</p> <p><b>R:</b> Deployable force (includes military, eligible civilians, and MWAs) training and/or CBRND protective equipment and measures are inadequate or nonexistent for response to a CBRN/TIM incident; and/or base/facility emergency response force training and/or CBRND protective equipment and measures are inadequate or nonexistent for response to a CBRN/TIM incident.</p>

<sup>1</sup> DOTMLPF is currently inadequate to address CONUS and non-HTA OCONUS CBRND. DOTMLPF is adequate to address CBRND of forces located at HTA OCONUS locations. En route protection of deploying forces OCONUS is a function of perceived threat, existing capabilities, host nation willingness, and available resources.

<sup>2</sup> Planning for deploying forces includes training for operations within threat CBRN/TIM environments. Nondeploying military forces within CONUS possess varying levels of training based upon prior training at overseas locations and initial Service training (“boot camp”). OCONUS fixed-site military personnel within an HTA are trained to survive a CBRN/TIM environment. Eligible civilians are not generally trained to operate in CBRN/TIM hazards. Some government civilians are trained as part of their primary function (e.g., hazardous materials, fire response, readiness flight [Air Force], and selected others.). However, civilians (e.g., general government employees, contractors, dependents, etc.) do not receive training to survive a CBRN/TIM environment. This statement is particularly true of CONUS locations. MWA elements of the military force (deploying and nondeploying) are not trained to survive a CBRN/TIM environment. COCOM staff does not possess clear guidance for planning and providing CBRN/TIM protection training to eligible civilians and MWAs. The Guardian Program, working with the COCOMs and installations, is addressing installation/facility CBRN/TIM event capabilities.

<sup>3</sup> Planning for deploying forces includes equipping for operations within threat CBRN/TIM environments. However, deployable force equipment is generally stored and not readily available to personnel within CONUS (and non-HTA OCONUS sites). Selected units, for example Service police elements, may elect to retain certain items and amounts of CBRND assets for duty support from warfighting stocks. Most CONUS (and non-HTA OCONUS) garrison forces are not equipped or possess ready access to protective equipment for CBRN/TIM survival. The exceptions may include hazardous materials, fire response, and other at-risk primary duty personnel. OCONUS fixed-site personnel within an HTA are equipped to survive a CBRN/TIM environment. Eligible civilians are not generally equipped to operate in CBRN/TIM hazards. Some government civilians are equipped as part of their primary function (e.g., hazardous materials, fire response, readiness flight [Air Force], and selected others.). However, civilians (e.g., general government employees, contractors, dependents, etc.) are not equipped to survive a CBRN/TIM environment. This statement is particularly true of CONUS locations. MWA elements of the military force (deploying and nondeploying) are not equipped to survive a CBRN/TIM environment. COCOM staff does not possess clear guidance for equipping eligible civilians and MWA for CBRN/TIM survival. The Guardian Program, working with the COCOMs and the sites, is addressing installation/facility CBRN/TIM event capabilities.

<sup>4</sup> HTA OCONUS fixed-site force protection plans address CBRN/TIM protection for military forces. The fixed-site AT/FP plan includes a CBRN/TIM annex. Capabilities for CBRN/TIM protection varying according to location and threat. CONUS and non-HTA OCONUS garrison forces are not generally equipped or possess ready access to protective equipment for CBRN/TIM survival. Deployable force equipment is generally stored and not readily available to forces at these sites. Military forces at OCONUS sites within an HTA are equipped and possess ready access to CBRND equipment. COLPRO within CONUS and some OCONUS locations does exist for radiological (fallout). However, COLPRO for other than radiological is almost nonexistent, including critical facilities, outside HTA OCONUS, particularly CONUS sites. The Guardian Program, working with the COCOMs and installations, is addressing installation/facility CBRN/TIM event capabilities.

<sup>5</sup> Response agreements are requested by COCOM staffs and established when there is a threat and host-nation response is appropriate. COCOM staffs plan primarily for movement of forces through en route locations substantially operated by U.S. forces (e.g., U.S. bases located in other nations).

<sup>6</sup> Selected CONUS and non-HTA OCONUS units, for example Service police elements, may elect to retain certain items and amounts of CBRND assets for duty support from warfighting stocks. Garrison emergency response forces (e.g., hazardous materials and fire response) possess variable levels of protection against CBRN/TIM agents. However, other emergency response forces are not equipped for CBRN/TIM response. These include DoD and contract police/security forces, EMS, and other first responders. Installation CBRN/TIM response is also currently limited to the initial response. These issues are currently being addressed by the Guardian Program. HTA OCONUS fixed sites are equipped to perform emergency response to a CBRN/TIM event. In both cases, eligible civilians are not generally equipped to operate in CBRN/TIM hazards. Some government civilians are equipped as part of their primary function (e.g., hazardous materials, fire response, readiness flight [Air Force], and selected others.). However, civilians (e.g., general government employees, contractors, dependents, etc.) are not equipped to survive a CBRN/TIM environment. This statement is particularly true of CONUS locations. MWA elements of the military force are not equipped to survive a CBRN/TIM environment. COCOM staff does not possess clear guidance for equipping eligible civilians and MWAs for CBRN/TIM survival. The Guardian Program, working with the COCOMs and installations, is addressing installation/facility CBRN/TIM event capabilities.

<sup>7</sup> Cooperative security agreements are requested by COCOM staffs and established when there is a threat and host nation security is appropriate. COCOM staffs plan primarily for movement of forces through en route locations substantially operated by U.S. forces (e.g., U.S. bases located in other nations) and where cooperative security agreements are in existence.

<sup>8</sup> COLPRO within CONUS and some OCONUS locations does exist for radiological (fallout). However, COLPRO for other than radiological is almost nonexistent, including critical facilities, outside HTA OCONUS, particularly CONUS sites.

### 11.5.3 Functional Solution Analysis

#### 11.5.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** Non-deploying military forces within CONUS possess varying levels of training based upon prior training at overseas locations and initial Service training (“boot camp”).  
**Non-Materiel Solutions:** *Doctrine:* Institute in doctrine, policy, and procedures CBRND of personnel (military and civilian) located in DoD installations, sites, and facilities to include equipping, training, exercising, and evaluations for CBRN/TIM survival. *Organization:* Ensure resources, taskings, and staff are in place or available to support and conduct CBRND training. *Training:* Train, exercise, and evaluate the force for survivability within a CBRN/TIM environment. *Leadership:* Implement equipping, training, exercise, and evaluation of CBRND of personnel (military and civilians) for readiness to conduct CBRND.
- 2. Deficiency:** Eligible civilians (e.g., general government employees, contractors, dependents, etc.) are not generally trained to operate and/or survive in CBRN/TIM hazards, particularly at CONUS locations.  
**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing eligible civilian personnel and operations for CBRND. *Organization:* Identify organizational services and activities supporting the mission performed by civilian personnel and operations. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilian personnel and operations supporting the mission and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilian personnel and operations supporting the mission. *Personnel:* Ensure eligible civilian personnel and operations supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities:* Develop supporting infrastructure for the acquisition, stockpiling, prepositioning, maintenance, and movement of eligible civilian CBRND resources.
- 3. Deficiency:** MWA, particularly MWD, elements of the military force (deploying and nondeploying) are not trained to survive a CBRN/TIM environment.  
**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of MWAs, with emphasis upon MWDs, and training for CBRN/TIM environment survival. *Organization:* Organizational consideration for maintenance and support of MWD CBRND protective equipment, measures, and activities. *Training:* Develop institutional and unit training of handlers and MWAs for CBRND measures and activities. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for MWA survivability. *Facilities:* Develop supporting infrastructure for MWA CBRND (e.g., logistics, veterinary surveillance, etc.).

4. **Deficiency:** COCOM staff does not possess clear guidance for planning and providing CBRN/TIM protection training to eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing eligible civilian personnel and operations for CBRND. *Organization:* Identify organizational services and activities performed by, and required to support, eligible civilian personnel and operations for CBRND. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilian personnel and operations; and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilian personnel and operations supporting the mission. *Personnel:* Ensure eligible civilian personnel and operations supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities:* Develop supporting infrastructure for the acquisition, stockpiling, prepositioning, maintenance, and movement of eligible civilian CBRND resources.

5. **Deficiency:** COCOM staff does not possess clear guidance for planning and providing CBRN/TIM protection training to MWAs.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing MWAs and operations for CBRND. *Organization:* Identify organizational services and activities performed by, and required to support, MWAs and operations for CBRND. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and operations and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWDs and operations supporting the mission. *Personnel:* Ensure that eligible civilian personnel and operations supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities:* Develop supporting infrastructure for the acquisition, stockpiling, prepositioning, maintenance, and movement of MWA CBRND resources.

6. **Deficiency:** Deployable force equipment is generally stored and not readily available to personnel within CONUS (and non-HTA OCONUS sites).

**Non-Materiel Solutions:** *Doctrine:* Institute in doctrine, policy, and procedures CBRND of personnel (military and civilian) located in DoD installations, sites, and facilities to include equipping, training, exercising, and evaluations for CBRN/TIM survival. Identified equipment should not be assets identified for deployment. *Organization:* Ensure resources, taskings, and staff are in place or available to support and conduct CBRND. Identified physical resources should not be those identified for deployment. *Training:* Train, exercise, and evaluate the force for survivability within a CBRN/TIM environment, both for home location as well as for deployable operations. *Leadership:* Implement development of plans and taskings consistent with stockpile support capabilities for nondeployable requirements.

7. **Deficiency:** Most CONUS (and non-HTA OCONUS) garrison forces are not equipped or possess ready access to protective equipment for CBRN/TIM survival.

**Non-Materiel Solutions:** *Doctrine:* Institute in doctrine, policy, and procedures CBRND of personnel (military and civilian) located in DoD installations, sites, and facilities to include equipping, training, exercising, and evaluations for CBRN/TIM survival. *Organization:*

Ensure resources, taskings, and staff are in place or available to support and conduct CBRND. *Training*: Train, exercise, and evaluate the force for survivability within a CBRN/TIM environment. *Leadership*: Implement development of plans and taskings consistent with stockpile support capabilities.

8. **Deficiency**: COLPRO for other than radiological is almost nonexistent, including critical facilities, outside HTA OCONUS, particularly CONUS sites.

**Non-Materiel Solutions**: *Doctrine*: Enforce existing doctrine and policy.

9. **Deficiency**: All emergency response forces are not equipped for CBRN/TIM response. These include DoD and contract police/security forces, EMS, and other first responders.

**Non-Materiel Solutions**: *Doctrine*: Establish in doctrine, policy, and procedures the minimal psychological and physiological requirements for equipping, training, exercising, and evaluation for CBRND emergency response of all elements of first response or at-risk as primary responders to an AT/FP event, whether military or as an eligible civilian.

*Organization*: Establish organization resources and staffing to support CBRND emergency response. *Training*: Institute training, exercising, and evaluation to prepare and maintain readiness to conduct an emergency response with a CBRN/TIM threat and to enable survival if an event is subsequent to response determined to involve a CBRN/TIM agent. *Leadership*: Implement and manage measures and activities to obtain and maintain response and survival capabilities for CBRN/TIM threats. *Personnel*: Ensure that eligible civilian personnel performing these functions meet psychological and physiological requirements for performing CBRND measures and accomplishing their tasks within a CBRN/TIM environment. *Facilities*: Develop supporting infrastructure (e.g., logistics, training, medical, etc.) for responder CBRND.

10. **Deficiency**: Installation CBRN/TIM response is currently limited to the initial response.

**Non-Materiel Solutions**: *Doctrine*: Establish in doctrine, policy, and procedures the minimal psychological and physiological requirements, equipping, training, exercising, and evaluation for CBRND emergency response of all elements of first response or at-risk as primary responders to an AT/FP event, whether military or as an eligible civilian. *Organization*: Establish organization resources and staffing to support CBRND emergency response.

*Training*: Institute training, exercising, and evaluation to prepare and maintain readiness to conduct an emergency response with a CBRN/TIM threat and to enable survival if an event is subsequent to response determined to involve a CBRN/TIM agent. *Leadership*: Implement and manage measures and activities to obtain and maintain response and survival capabilities for CBRN/TIM threats. *Personnel*: Ensure that eligible civilian personnel performing these functions meet psychological and physiological requirements for performing CBRND measures and accomplishing their tasks within a CBRN/TIM environment. *Facilities*: Develop supporting infrastructure (e.g., logistics, training, medical, etc.) for responder CBRND.

11. **Deficiency**: DOTMLPF is currently inadequate to address CONUS and non-HTA OCONUS CBRND.

**Non-Materiel Solutions**: *Doctrine*: Establish in doctrine, policy, and procedures the equipping, training, exercising, and evaluation for CBRND all personnel (military and

eligible civilians) and activities in CONUS and non-HTA OCONUS locations. *Organization:* Establish organization resources and staffing to support CBRND. *Training:* Institute training, exercising, and evaluation to prepare and maintain readiness for CBRND at CONUS and non-HTA OCONUS locations. *Leadership:* Implement and manage measures and activities to obtain and maintain CBRND capabilities at CONUS and non-HTA OCONUS locations. *Personnel:* Ensure that eligible civilian personnel supporting the mission/military operations meet psychological and physiological requirements for performing CBRND measures and accomplishing their tasks within a CBRN/TIM environment. *Facilities:* Develop supporting infrastructure (e.g., logistics, training, medical, etc.) for CBRND.

#### **11.5.3.2 IMA Assessment Summary**

N/A

**11.6 Task STSHLD 6: Establish Protective Posture Protocols to ensure protection level is consistent with the threat and minimizes risk while limiting the impact on mission execution****11.6.1 Functional Area Analysis****11.6.1.1 Definition**

To establish general guidance for protective posture at theater level based on the friendly and enemy situation, mission, terrain and weather, state of CBRND training, availability of protective equipment and supplies, and medical considerations. This guidance considers all possible threat capabilities and establishes plans and procedures to react to the adversary's use of any type of CBRN/TIM weapon/agent combination and/or material releases resulting from accidents or combat actions. The protocol is flexible and tailorable at lower levels of command to accommodate current intelligence/enemy action and status/mission of friendly forces. Threat, vulnerability, and risk assessments are essential inputs to determining the appropriate protective posture. The goal is to establish and maintain the lowest possible protective postures (to reduce performance degradation and minimize physical encumbrances) while minimizing the risk of exposure or contamination. NBC staff officers provide the commander and other staff officers with information concerning protective posture effects on mission performance.

**11.6.1.2 Derivation**

*Joint Enabling Concept for CBRN/TIM Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (ST 2.4.1.1, ST 2.4.1.2, ST 5.3.3, ST 5.4.1, ST 6, ST 6.1.6, ST 6.2, ST 6.2.1, ST 9.4).*

Perform this task under conditions of:

**Physical**

1. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Partially completed mission preparation. (C2.1.3)
2. Adequate forces allocated. (C2.2.3)
3. Normal personnel experience. (C2.2.4.5)

4. Partial interoperability. (C2.2.6)
5. Negligible staff expertise (C2.3.1.3)
6. Limited deployed supplies. (C2.8.2)
7. Limited prepositioned materiel. (C2.8.4)

Civil. N/A

## 11.6.2 Functional Needs Analysis

### 11.6.2.1 Capability and Deficiency Assessment Summary

Table 11.6-1 discusses the only capability that exists to perform the task to the designated standard. Adequate doctrine, policy, and procedures exist for the planning and implementation of Protective Posture Protocols. They are developed, disseminated, and monitored based upon the potential threat and the assessment of force vulnerabilities and risks to subordinate command levels. Included is the provisioning of the force with appropriate CBRND capabilities. Included in the deficiencies is the ability of the force to maintain operations tempo within a sustained CBRN/TIM environment.

#### Current Capability and Deficiency

Adequate doctrine, policy, and procedures exist to guide commanders and staffs on these flexible levels of protection. The provisioning of the forces with adequate CBRND capabilities is determined based upon the identified threat used to develop the Protective Posture Protocols. Forces are generally equipped with IPE when stationed in HTAs, and IPE positioning and force equipment are included during planning. Existing fixed sites and mature theaters possess limited amounts of CPS to conduct CBRND. The COCOM and staff adjust the plans, reallocate, and obtain additional COLPRO systems as necessary to meet operational requirements. The combination of established force organic assets, materiel acquisitions, prepositioned materiel, available host-nation/coalition contributions, and the movement of identified CBRND resources from stockpiles and reallocation activities are all pursued to prepare and support the deploying forces. The Joint Mission Essential Task Lists (JMETLs), based upon the *Universal Joint Task List (UJTL)*, are developed to identify essential tasks to be performed by to attain the mission. Training of the force against the identified threat is performed, and the implementation of the protocols is monitored. Deficiencies include the availability of COLPRO systems and the significant logistics required to move and support the existing systems; the limited quantities of CPSs available for use at originating and en route locations to protect deploying, redeploying, and en route forces from potential CBRN/TIM threats; the inadequacy of current CPSs to support forced entry and expeditionary operations, and lack of IPE at CONUS and non-HTA OCONUS locations to protect garrisoned personnel (military and civilian). MWDs are not afforded CBRND protective equipment, measures, and are not adequately addressed in DOTLPF for CBRND operations. Plan requirements, further, are not centrally correlated with other plans to determine CBRND support requirements of two or more concurrent operations and sustained operations within a CBRN/TIM environment is not addressed in DOTLPF.

**Projected Near/Mid-Term Capability and Deficiency**

No change is projected for this task.

**Projected Far-Term Capability and Deficiency**

No change is projected for this task.

Table 11.6-1. STSHLD 6: Capability and Deficiency Assessment

Capability: COCOM Staff	M1	M2	M3	M4	M5	M6	M7	M8
Current Overall Capability <sup>1</sup>	G <sup>2</sup>	G <sup>3</sup>	Y <sup>4</sup>	Y <sup>5</sup>	R <sup>6</sup>	Y <sup>7</sup>	Y <sup>8</sup>	Y <sup>9</sup>

Far-Term Overall Capability	G	G	Y	Y	R	Y	Y	Y

	FAA Measure	Scale
M1	Protective Posture Protocols are established and disseminated.	<p><b>G:</b> Specific, flexible Protective Posture Protocols are incorporated into plans and disseminated to all units in the force. All personnel are trained and ready to perform the associated protective actions.</p> <p><b>Y:</b> General Protective Posture Protocols are incorporated into plans and disseminated to force units. Unit personnel are trained and ready to perform protective actions.</p> <p><b>R:</b> Protective Posture Protocols are inadequate, not widely disseminated, and/or force personnel are not trained and/or ready to perform protective actions.</p>
M2	Protective posture protocols have been implemented.	<p><b>G:</b> In-place Protective Posture Protocols are rapidly and effectively implemented by all affected force units.</p> <p><b>Y:</b> In-place Protective Posture Protocols are implemented by all affected force units.</p> <p><b>R:</b> Implementation of Protective Posture Protocols is inadequate or nonexistent.</p>
M3	CPSs are available for in-place forces.	<p><b>G:</b> COLPRO is available in required quantities and types to support the full range of envisioned and planned operations.</p> <p><b>Y:</b> COLPRO is available in sufficient types and quantities to support major operations.</p> <p><b>R:</b> COLPRO is inadequate or nonexistent to support operations.</p>
M4	CPSs are available for deploying forces.	<p><b>G:</b> COLPRO is available in required quantities and types to support the full range of envisioned and planned operations.</p> <p><b>Y:</b> COLPRO is available in sufficient types and quantities to support major operations.</p> <p><b>R:</b> COLPRO is inadequate or nonexistent to support operations.</p>
M5	IPE is issued to in-place forces.	<p><b>G:</b> All Strategic Theater forces (military, eligible civilians, and MWAs) are adequately equipped to perform their functions and conduct operations within a CBRN/TIM environment.</p> <p><b>Y:</b> Military personnel and eligible civilians supporting the mission are adequately equipped to perform their functions and conduct operations within a CBRN/TIM environment.</p> <p><b>R:</b> Equipping of Strategic Theater forces (including military, eligible civilians, and/or MWAs) to perform functions and conduct operations within a CBRN/TIM environment is inadequate or nonexistent.</p>
M6	Forces are trained, manned, and equipped to operate in a CBRN/TIM environment.	<p><b>G:</b> All Strategic Theater forces (military, eligible civilians, and MWAs) are adequately equipped to perform their functions and conduct operations within a CBRN/TIM environment.</p> <p><b>Y:</b> Military personnel and eligible civilians supporting the mission are adequately equipped to perform their functions and conduct operations within a CBRN/TIM environment.</p> <p><b>R:</b> Equipping of Strategic Theater forces (including military, eligible civilians, and/or MWAs) to perform functions and conduct operations within a CBRN/TIM environment is inadequate or nonexistent.</p>

M7	All units that perform Joint Mission Essential Tasks (JMETs) are fully prepared to successfully perform the tasks in a CBRN/TIM environment.	<p><b>G:</b> All units performing JMETs are fully prepared and ready to successfully conduct their tasks within a CBRN/TIM environment.</p> <p><b>Y:</b> Units performing JMETs are generally prepared and ready to successfully conduct their tasks within a CBRN/TIM environment.</p> <p><b>R:</b> Units performing JMETs are inadequately prepared and/or ready to successfully conduct their tasks within a CBRN/TIM environment.</p>
M8	Deploying forces meet CBRN/TIM protection requirements.	<p><b>G:</b> All Strategic Theater forces (military, eligible civilians, and MWA) meet CBRN/TIM protection requirements to perform their functions and conduct operations within a CBRN/TIM environment.</p> <p><b>Y:</b> Military personnel and eligible civilians supporting the mission meet CBRN/TIM protection requirements to perform their functions and conduct operations within a CBRN/TIM environment.</p> <p><b>R:</b> Strategic Theater forces (including military, eligible civilians, and/or MWA) meeting CBRN/TIM protection requirements to perform functions and conduct operations within a CBRN/TIM environment are inadequate or nonexistent.</p>

<sup>1</sup> Adequate DOTMLPF exists to address planning and support of the force. However, DOTMLPF is inadequate or nonexistent addressing CBRND of eligible civilians and MWAs.

<sup>2</sup> COCOM staff develop and disseminate Protective Posture Protocols based upon the potential threat and their assessments of force vulnerabilities and risks. U.S. forces may be required to operate after radiological attacks or in areas contaminated from fallout caused by attacks not directed at U.S. forces. In these cases, the current Radiation Exposure Status categories do not provide commanders sufficient guidance to manage risk to their forces. They do not address low-level radiation and are based on the assumption that the United States is directly engaged in a nuclear conflict. Dissemination of the Protective Posture Protocols is through the subordinate command levels.

<sup>3</sup> COCOM staff monitors overall implementation of Protective Posture Protocols to ensure force readiness for the CBRN/TIM threat. Subordinate levels of command monitor the implementation for their subordinate units.

<sup>4</sup> Not all critical facilities and activities are equipped with COLPRO. Existing fixed sites and mature theaters possess limited amounts of CPS for CBRND. JTCOPS, CP-DEPMEDS, TEMPER systems, and Service-designed systems provide CPS for mature theaters and may supplement CPS at existing fixed sites. COCOM staff planning includes CBRND for identified threats and identifies type, quantity, and allocation to meet mission requirements. However, these systems are in limited numbers and require significant logistics to move and establish. Concurrent operations with CBRN/TIM threat may further restrict the availability of COLPRO systems to meet plan and operational requirements. The COCOM staff adjusts plans, reallocates, and obtains COLPRO systems as necessary to meet operational requirements.

<sup>5</sup> Limited quantities of existing CPSs at originating and en route locations limits the ability to provide COLPRO to deploying forces. Positioning of transportable shelters (e.g., JTCOPS, TEMPER systems, and Service-designed systems) at these locations is dependent upon threat, operational need, ongoing operations, movement and establishment requirements, and availability of the systems. CPSs for the AO to support deploying forces is dependent upon a number of factors. These include concurrent operations, availability of CPSs of the required types, mission requirements, stage of operations (initial or mature), and threat. These factors are addressed both during the planning and execution phase by the COCOM staff. The COCOM staff adjusts plans, reallocates, and obtains COLPRO systems as necessary to meet operational requirements. Availability of CPSs within the AO is likely to increase as the AO matures and the threat is validated. Additionally, the longer the preparatory period between plan notice of execution and before commencement of hostilities, the more likely CPSs will be available and established in support of operations. However, CPSs are inadequate to support expeditionary and forced-entry operations. This statement is particularly true for austere environments, locations deep within adversary territory, and highly mobile forces possessing reduced logistical footprints.

<sup>6</sup> The COCOM staff plans for the provisioning of forces with appropriate CBRND capabilities based upon the identified threat. IPE positioning and force equipment are included in the plan. Forces are generally equipped or possess access to CBRND IPE when stationed in HTAs. Personnel assigned to CONUS and selected OCONUS locations do not possess or have ready access to IPE. Forces within a mature theater forces and at established support centers within the AO, where a CBRN/TIM threat exists, are equipped or possess access to CBRN/TIM IPE. However, fixed-site operations frequently include civilians directly supporting force activities. Although some government civilians are provided and equipped with IPE as part of their primary function (e.g., hazardous materials, fire response, readiness flight [Air Force] and selected others, most civilians are not equipped or have access to IPE enabling survival within a CBRN/TIM environment. This statement is particularly true of contractors. Further, MWAs (particularly MWDs) elements of the force do not possess CBRND protection. The COCOM staff does not possess clear guidance for planning and providing CBRND protection of eligible civilians and MWAs.

<sup>7</sup> The COCOM staff identifies forces and the potential threat for planned operations. Time permitting, specified forces train and prepare for operations involving the potential threat. Equipping the task force is an integral part of planning and preparation. The COCOM staff tracks force readiness for planned operations. Readiness issues are addressed by the staff. The combination of established force organic assets, materiel acquisitions, prepositioned materiel, available host-nation/coalition contributions, and movement of identified CBRND resources from stockpiles and reallocation activities are pursued by the COCOM staff to prepare and support deploying forces as outlined by the appropriate plan. However, plan requirements are not centrally correlated with other plans for consideration of CBRND support requirements of two or more concurrent operations with CBRN/TIM threat. Expeditionary operations are a particular concern as most CBRND systems and associated logistics are not designed for a highly mobile force, with a reduced logistical footprint, and for the initial period of operations until the theater matures (usually the first 30–90 days). Deploying units may not possess full CBRND resources and capabilities during the initial stages of deployment and until after arrival within the AOR. Additionally, deploying eligible civilians and MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment. COCOM staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians and MWAs.

<sup>8</sup> The COCOM staff develops JMETLs, based upon the UJTL, essential to the accomplishment of the planned mission(s). The JMETLs provide the ability to develop joint training requirements, planning and executing joint training, and assessing joint proficiency. Plan identified forces are trained and assessed against the JMETLs for readiness to perform the tasks successfully. Assessment is performed through a variety of means including inspections, exercises, and reporting. However, current doctrine the UJTL and operational planning do not adequately address sustained operations within a CBRN/TIM environment. JMETL development generally does not specify these circumstances as an execution condition. Exercises and training do not emphasize task performance and operations in these conditions.

<sup>9</sup> The combination of established force organic assets, materiel acquisitions, prepositioned materiel, available host-nation/coalition contributions, and movement of identified CBRND resources from stockpiles and reallocation activities are pursued by the COCOM staff to prepare and support deploying forces as outlined by the appropriate plan. However, plan requirements are not centrally correlated with other plans for consideration of CBRND support requirements of two or more concurrent operations with CBRN/TIM threat. Expeditionary operations are a particular concern as most CBRND systems and associated logistics do not support a highly mobile force, with a reduced logistical footprint, and sustained activity during the initial period of operations (the period until the theater matures, usually the first 30–90 days). Deploying units may not achieve full CBRND readiness and capabilities during the initial stages of deployment and until after arrival within the AOR. Additionally, deploying eligible civilians and MWAs (particularly MWDs) are not generally prepared to survive a CBRN/TIM environment. COCOM staff does not possess clear guidance for CBRN/TIM protection readiness of deploying eligible civilians and MWAs.

### 11.6.3 Functional Solution Analysis

#### 11.6.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** There is a lack of doctrine for risk management of forces operating in radiological contaminated environments. Current guidance is based on cold-war assumptions and does not reflect modern threats and mission priorities.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policies, and procedures that address appropriate operationally oriented command dose levels for low-level radiation exposure based on mission priority across the range of military operations. *Training:* Train leaders and personnel on operationally oriented low-level radiation exposure control standards and procedures
- 2. Deficiency:** Not all critical facilities and activities are equipped with COLPRO.

**Non-Materiel Solutions:** *Doctrine:* Enforce existing doctrine and policy.
- 3. Deficiency:** COLPRO systems are in limited numbers and require significant logistics to move and establish. Concurrent operations with CBRN/TIM threat may further restrict the availability of COLPRO systems to meet plan and operational requirements.

**Non-Materiel Solutions:** *Doctrine:* Institute in doctrine, policy, and procedures the central correlation of Strategic Theater plans and taskings to identify CBRND support requirements for two or more concurrent operations with CBRN/TIM threat with comparison to existing and programmed quantities and types of CBRND systems and resources. *Leadership:* Implement development of plans and taskings consistent with available CBRND capabilities as determined by central correlation and comparison of Strategic Theater plans and taskings.
- 4. Deficiency:** Limited quantities of existing CPSs at originating and en route locations limit the ability to provide COLPRO to deploying forces.

**Non-Materiel Solutions:** *Doctrine:* Enforce planning for CBRND of deploying, redeploying, and en route forces. Institute in doctrine, policy, and procedures the central correlation of Strategic Theater plans and taskings to identify CBRND support requirements for two or more concurrent operations with CBRN/TIM threat with comparison to existing and programmed quantities and types of CBRND systems and resources, ability and willingness of en route and host nations to provide CBRND of moving forces, and the availability and feasibility of support by existing OCONUS U.S. military installations. *Organization:* Organization structures, resources, staffing, and capabilities to provide CBRND of deploying, redeploying, relocation, and en route forces as well as organic forces. *Training:* Train, exercise, and evaluate capabilities of locations providing support to deploying, redeploying, relocating, and en route forces to conduct and provide CBRND. *Leadership:* Recognize challenges associated with CBRND support of deploying, redeploying, relocating, and en route forces as well as organic forces. Plan for the provision of CBRND and conduct comprehensive exercises and evaluations to ensure readiness of the

organic force to perform CBRND and protect transient forces. *Facilities*: Develop supporting infrastructure to protect transient forces from the effects of CBRN/TIM agents.

5. **Deficiency**: CPSs are inadequate to support expeditionary and forced entry operations. This statement is particularly true for austere environments, locations deep within adversary territory, and highly mobile forces possessing reduced logistical footprints.

**Non-Materiel Solutions**: *Doctrine*: Incorporate into doctrine, policy, and procedures standards for expeditionary forces possessing reduced logistical footprint during the first 30–90 days of operations following commencement of hostilities. *Organization*: Develop organizational structures, resources, staffing, and capabilities to conduct expeditionary operations while possessing reduced logistical footprint and during the first 30–90 days of operations following commencement of hostilities. *Training*: Train, exercise, and evaluate expeditionary capabilities of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operation using CBRND resources supporting expeditionary operations. *Leadership*: Recognize differences and challenges associated with expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint; training providing skills and knowledge to manage operations in these circumstances; and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities*: Develop supporting infrastructure for expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint

6. **Deficiency**: Personnel assigned to CONUS and selected OCONUS locations do not possess or have ready access to IPE.

**Non-Materiel Solutions**: *Doctrine*: Institute in doctrine, policy, and procedures CBRND of personnel (military and civilian) located in DoD installations, sites, and facilities to include equipping, training, exercising, and evaluations for CBRN/TIM survival. *Organization*: Ensure resources, taskings, and staff are in place or available to support and conduct CBRND. *Training*: Train, exercise, and evaluate the force for survivability within a CBRN/TIM environment. *Leadership*: Implement development of plans and taskings consistent with stockpile support capabilities.

7. **Deficiency**: Fixed site operations frequently include civilians directly supporting force activities. Although some government civilians are provided and equipped with IPE as part of their primary function (e.g., hazardous materials, fire response, readiness flight [Air Force] and selected others), most civilians are not equipped or have access to IPE enabling survival within a CBRN/TIM environment. This statement is particularly true of contractors.

**Non-Materiel Solutions**: *Doctrine*: Establish in doctrine, policy, and procedures the application of standards for protection of eligible civilians supporting the mission/military operations addressing the variation within the potential protected working population. *Leadership*: Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians supporting the mission/military operations and conduct CBRN/TIM training, exercises, and evaluations.

- 8. Deficiency:** MWA (particularly MWD) elements of the force do not possess CBRND protection.
- Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of MWAs, particularly MWDs, and training for CBRN/TIM environment survival. *Organization:* Ensure organizational consideration for maintenance and support of MWA CBRND protective equipment, measures, and activities. *Training:* Develop institutional and unit training of handlers and MWAs for CBRND measures and activities. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for MWA survivability. *Facilities:* Develop supporting infrastructure for MWA CBRND (e.g., logistics, veterinary surveillance, etc.).
- 9. Deficiency:** The COCOM staff does not possess clear guidance for planning and providing CBRND protection of eligible civilians.
- Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing civilian personnel and operations for CBRND. *Organization:* Identify organizational services and activities supporting the mission performed by civilian personnel and operations. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians; and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians. *Personnel:* Ensure that eligible civilians supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities:* Develop supporting infrastructure for eligible civilian CBRND (e.g., logistics, medical, veterinary surveillance, training, communications, etc.).
- 10. Deficiency:** The COCOM staff does not possess clear guidance for planning and providing CBRND protection of MWAs.
- Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing MWA, particularly MWD, operations for CBRND. *Organization:* Identify organizational services and activities supporting the mission performed by MWA operations. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWAs. *Facilities:* Develop supporting infrastructure for MWA CBRND (e.g., logistics, medical, veterinary surveillance, training, communications, etc.).
- 11. Deficiency:** Plan requirements are not centrally correlated with other plans for consideration of CBRND support requirements of two or more concurrent operations with CBRN/TIM threat.
- Non-Materiel Solutions:** *Doctrine:* Institute in doctrine, policy, and procedures the central correlation of national and Strategic Theater plans and taskings to identify CBRN/TIM support requirements for two or more concurrent operations with threat with comparison to existing and programmed quantities and types of CBRND systems and resources, including replenishment. *Leadership:* Implement development of plans and taskings consistent with available CBRND capabilities as determined by central correlation and comparison of national and strategic plans and taskings.

**12. Deficiency:** Expeditionary operations are a particular concern as most CBRND systems and associated logistics are not designed for a highly mobile force, with a reduced logistical footprint, and for the initial period of operations until the theater matures (usually the first 30–90 days).

**Non-Materiel Solutions:** *Doctrine:* Complete the JCIDS process and central correlation/ comparison of national and strategic plans to identify CBRND resources necessary and available to support expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct expeditionary operations while possessing reduced logistical footprint and during the first 30–90 days of operations following commencement of hostilities. *Training:* Train, exercise, and evaluate expeditionary capabilities of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operations using CBRND resources supporting expeditionary operations. *Leadership:* Recognize differences and challenges associated with expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint; training providing skills and knowledge to manage operations in these circumstances; and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.

**13. Deficiency:** Deploying units may not possess full CBRND resources and capabilities during the initial stages of deployment and until after arrival within the AOR.

**Non-Materiel Solutions:** *Doctrine:* Emphasize in doctrine, policies, and procedures for preparation of the force for CBRND protection during and throughout deployment, redeployment, relocation, and en route phases of movement. *Organization:* Ensure resources, taskings, and staff are in place or available to perform CBRND operations within a CBRN/TIM environment by deploying, redeploying, relocating, and en route forces. *Training:* Train, exercise, and evaluate the force for CBRND operations within a CBRN/TIM environment while deploying, redeploying, relocating, and en route. *Leadership:* Recognize criticality of readiness of the force for potential CBRND operations within a CBRN/TIM environment while deploying, redeploying, relocation, and en route; training providing the skills to manage the force in these circumstances; and willingness and ability to implement necessary changes and activities to prepare and appropriately protect the force. *Facilities:* Develop supporting infrastructure for CBRND operations of the force while preparing, deploying, redeploying, relocating, and en route

**14. Deficiency:** Deploying eligible civilians are not equipped and trained to survive a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of eligible civilians and training for CBRN/TIM environment survival. *Organization:* Organizational consideration for maintenance and support of eligible civilians CBRND protective equipment, measures, and activities. *Training:* Develop institutional and unit training of eligible civilians for CBRND measures and activities. Integrate into CBRND exercises and evaluations. *Leadership:* Ensure awareness and planning for CBRND measures

and requirements for eligible civilians survivability. *Facilities*: Develop supporting infrastructure for eligible civilians CBRND (e.g., logistics, medical, veterinary surveillance, communications, training, etc.).

- 15. Deficiency:** Deploying MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine*: Establish doctrine, policy, and procedures CBRND protection of MWAs, particularly MWDs and training for CBRN/TIM environment survival. *Organization*: Ensure organizational consideration for maintenance and support of MWA CBRND protective equipment, measures, and activities. *Training*: Develop institutional and unit training of MWA handlers and MWAs for CBRND measures and activities. Integration into CBRND exercises and evaluations. *Leadership*: Ensure awareness and planning for CBRND measures and requirements for MWA survivability. *Facilities*: Develop supporting infrastructure for MWA CBRND (e.g., logistics, medical, veterinary surveillance, communications, training, etc.).

- 16. Deficiency:** Current doctrine, the *UJTL*, and operational planning do not adequately address sustained operations within a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine*: Include in doctrine, policy, procedures, and *UJTL* sustained operations within a CBRN/TIM environment. *Organization*: Ensure resources, taskings, and staff are in place or available to plan and perform sustained operations within a CBRN/TIM environment. *Training*: Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership*: Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.

- 17. Deficiency:** JMETL development generally does not specify sustained operations in a CBRN/TIM environment as an execution condition.

**Non-Materiel Solutions:** *Doctrine*: Include in doctrine, policy, procedures, and *UJTL* sustained operations within a CBRN/TIM environment. *Organization*: Ensure resources, taskings, and staff are in place or available to plan and perform sustained operations within a CBRN/TIM environment. *Training*: Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership*: Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.

- 18. Deficiency:** Exercises and training do not emphasize sustained task performance and operations in a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine*: Include in doctrine, policy, and procedures sustained operations within a CBRN/TIM environment. *Organization*: Ensure resources, taskings, and staff are in place or available to plan and perform sustained operations within a CBRN/TIM environment. *Training*: Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership*: Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills

to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.

**19. Deficiency:** DOTMLPF is inadequate or nonexistent addressing CBRND of eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing eligible civilian personnel for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of eligible civilian personnel within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians; and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilian personnel.

**20. Deficiency:** DOTMLPF is inadequate or nonexistent addressing CBRND MWAs.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing MWA, particularly MWDs for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of MWAs within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWA; and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWAs.

#### 11.6.3.2 IMA Assessment Summary

N/A

## **11.7 Task STSHLD 7: Integrate coalition/non-U.S. and joint force CBRN/TIM protective measures and assets**

### **11.7.1 Functional Area Analysis**

#### **11.7.1.1 Definition**

To integrate CBRN/TIM protection for joint force elements to ensure survivability and the sustained conduct of operations despite the CBRN/TIM threat. The availability of CBRN/TIM protective and medical assets is both a joint and coalition/non-U.S. force concern. The base/facility FP plan must consider all tenant units and the base/facility general populace to maximize capability and minimize vulnerability. Operational units must determine the level of CBRND training and protective equipment status of sister and coalition/non-U.S. forces. Planners and NBC staff officers must have knowledge of and track the status of protective assets of coalition/non-U.S. partners and each U.S. component and major unit. Assets may require redistribution depending on local threats and/or actual adversary use of CBRN/TIM. Plans for sustained operations in a hazardous environment must be prepared, reviewed, and coordinated. Supports assistance to nations provided under military assistance and the family of engagement plans to eliminate WMD vulnerabilities.

#### **11.7.1.2 Derivation**

*Joint Enabling Concept for CBRN/TIM Operations, Protection Joint Functional Concept, UJTL (ST 2.4.1.1, ST 2.4.1.2, ST 4.2.4, ST 5.1.3, ST 5.1.4, ST 5.2, ST 5.4.1, ST 5.4.3, ST 6, ST 6.2, ST 6.2.1, ST 6.2.2, 8.1.2, ST 8.1.3, ST 8.1.4, ST 8.2, ST 8.3.2, ST 9.3, ST 9.4, ST 9.5, ST 9.6).*

##### **11.7.1.2.1 Supported Task: N/A**

##### **11.7.1.2.2 Lateral Task: STSHA 11**

##### **11.7.1.2.3 Supporting Task: OPSHLD 2**

#### **11.7.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

##### **Military**

1. Partially completed mission preparation. (C2.1.3)
2. Marginal to strong forces assigned. (C2.2.1)
3. Negligible personnel experience. (C2.2.4.5)
4. Partial interoperability. (C2.2.6)

5. Partial joint staff integration. (C2.3.1.1)
6. Moderate staff expertise. (C2.3.1.3)
7. Limited deployed supplies. (C2.8.2)
8. Sufficient CONUS resupply. (C2.8.3)
9. Limited prepositioned materiel. (C2.8.4)
10. Limited host-nation support. (C2.8.5)

### Civil

1. Limited foreign government support (C3.1.2.3)
2. Technical language translation. (C3.2.1.1)
3. Few language translators. (C3.2.1.2)

## 11.7.2 Functional Needs Analysis

### 11.7.2.1 Capability and Deficiency Assessment Summary

Table 11.7-1 discusses the only capability that exists to perform the task to the designated standard. Adequate doctrine, policy, and procedures exist for the planning and implementation of integration of coalition and non-U.S. force CBRND measures and assets. Coordination with participant coalition and non-U.S. force staffs provides common frameworks for information, asset, and capability sharing for successful operation outcome. Discussions and negotiations between partners determine the capabilities of each partner within the full spectrum of support. Force requirements and commitments are obtained from each participant and minimum capability standards and a certification process covering the areas of concern is established. Specific tasks are assigned to the elements of the overall force most capable of completing the task. Included in the deficiencies is the ability of the force to maintain operations tempo within a sustained CBRN/TIM environment and to integrate Service-specific logistical information into a single overall logistics picture.

### Current Capability and Deficiency

Adequate doctrine, policy, and procedures exist to guide commanders and staffs with coalition and non-U.S. force participation in joint operations. Planning, tracking, and monitoring is performed in coordination with partner staffs under a negotiated plan outlining requirements, taskings, training, reporting, information sharing, standards, and operational certifications for participation. Although the provision of CBRND equipment to national forces ultimately resides with their nations, mutual support among partners is planned to complement capabilities and to minimize weaknesses. Acquisition Cross-Service Agreements (ACSA) between partners enable acquisition and cross-servicing support between the partners. The more specific agreement, the Implementing Arrangement (IA), provides for a wide range of support including sheltering, medical care, and other support activities. The COCOM and combined staff monitor, track, and assess the readiness of the Joint Coalition Force and addresses issues and concerns as they arise. Deficiencies include the limited availability of COLPRO systems in each of the COLPRO categories, the inadequacy of COLPRO systems located within CONUS and non-HTA

OCONUS as well as for highly mobile/expeditionary forces, visibility of CBRND resources, and the protection of eligible civilians and MWDs.

**Projected Near/Mid-Term Capability and Deficiency**

No change is projected for this task.

**Projected Far-Term Capability and Deficiency**

No change is projected for this task.

Table 11.7-1. STSHLD 7: Capability and Deficiency Assessment

Capability: COCOM HQ	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10
Current Overall Capability <sup>1</sup>	Y <sup>2</sup>	G <sup>3</sup>	G <sup>3</sup>	G <sup>3</sup>	G <sup>4</sup>	R <sup>5</sup>	Y <sup>6</sup>	Y <sup>7</sup>	R <sup>8</sup>	R <sup>9</sup>
Near/Mid-Term Overall Capability	Y	G	G	G	G	R	Y	Y	R	R
Far-Term Overall Capability	Y	G	G	G	G	R	Y	Y	R	R

	FAA Measure	Scale
M1	Joint forces are equipped with or possess access to COLPRO.	<b>G:</b> COLPRO is available in required quantities and types to support the full range of envisioned and planned operations. <b>Y:</b> COLPRO is available in sufficient types and quantities to support major operations. <b>R:</b> COLPRO is inadequate or nonexistent to support operations.
M2	Coalition/non-U.S. forces are equipped with or possess access to COLPRO.	<b>G:</b> Planning and coordination is conducted to address partner forces equipping or access to COLPRO. <b>Y:</b> Partner force equipping or access to COLPRO is considered when planning operations with threat. <b>R:</b> Partner force equipping or access to COLPRO is not considered or is inadequately considered when planning operations with threat.
M3	Joint forces meet combatant commander CBRN/TIM protection requirements (training, equipping, and manning).	<b>G:</b> Processes and means exist to monitor, track, and assess joint forces readiness and preparations status against COCOM requirements. <b>Y:</b> Processes exist to identify joint forces readiness meeting COCOM requirements. <b>R:</b> Processes and/or means are inadequate or nonexistent to identify joint forces readiness and/or preparations meeting COCOM requirements.
M4	Coalition/non-U.S. forces meet combatant commander CBRN/TIM protection requirements (training, equipping, and manning).	<b>G:</b> Processes and means exist to monitor, track, and assess coalition/non-U.S. forces readiness and preparations status against COCOM requirements. <b>Y:</b> Processes exist to identify coalition/non-U.S. forces readiness meeting COCOM requirements. <b>R:</b> Processes and/or means are inadequate or nonexistent to identify coalition/non-U.S. forces readiness and/or preparations meeting COCOM requirements.
M5	Joint and coalition/non-U.S. force CBRN/TIM protection consumables are interoperable.	<b>G:</b> CBRN/TIM protection consumables are interoperable between coalition/non-U.S. forces and joint forces or adequate stocks of noninteroperable consumables are determined and available to support operations with threat. <b>Y:</b> CBRN/TIM protection consumables are interoperable between coalition/non-U.S. forces and joint forces or stocks of noninteroperable consumables are available to support operations with threat. <b>R:</b> CBRN/TIM protection consumables are noninteroperable between coalition/non-U.S. forces and joint forces and/or stocks of noninteroperable consumables are inadequate or nonexistent to support operations with threat.
M6	Sustained operational planning includes allocation and placement (and redistribution if necessary) of joint and coalition force CBRN/TIM protection assets.	<b>G:</b> The planned and operational control of allocation, placement, and, when necessary, redistribution of CBRN/TIM protection assets of coalition and joint forces is performed and coordinated throughout operations to sustain and support forces. <b>Y:</b> Allocation and placement of CBRN/TIM protection assets of coalition and joint forces is performed and coordinated prior to commencement of operations. <b>R:</b> The planned and operational control of the allocation, placement, and/or redistribution of joint and coalition force CBRN/TIM protection assets is inadequate or nonexistent.

M7	Theaterwide system to identify and track CBRN/TIM protective equipment for joint and coalition/non-U.S. forces in place.	<p><b>G:</b> Integrated and interoperable logistics systems provide theaterwide identification, tracking, status, and visibility of joint, coalition, and non-U.S. forces CBRN/TIM protective equipment to the COCOM.</p> <p><b>Y:</b> Processes and means exist to provide the COCOM with information about joint, coalition, and non-U.S. forces CBRN/TIM protective equipment.</p> <p><b>R:</b> Process and means are inadequate or nonexistent to provide the COCOM with information about joint, coalition, and non-U.S. forces CBRN/TIM protective equipment.</p>
M8	Theaterwide system to track CBRN/TIM protective training of joint, and coalition/non-U.S. forces in place.	<p><b>G:</b> Integrated and interoperable systems provide theaterwide identification, tracking, status, and visibility of joint, coalition, and non-U.S. forces CBRN/TIM protective training to the COCOM.</p> <p><b>Y:</b> Processes and means exist to provide the COCOM with information about joint, coalition, and non-U.S. forces CBRN/TIM protective training status.</p> <p><b>R:</b> Process and means are inadequate or nonexistent to provide the COCOM with information about joint, coalition, and non-U.S. forces CBRN/TIM protective training status.</p>
M9	FP plan for bases/facilities includes CBRN/TIM protection for base/facility general populace.	<p><b>G:</b> AT/FP plans address and provide for the ready protection of the base/facility general populace against exposure to and the effects of CBRN/TIM agents.</p> <p><b>Y:</b> AT/FP plans address and provide for the ready protection of the at-risk base/facility general populace against exposure to and the effects of CBRN/TIM agents.</p> <p><b>R:</b> AT/FP plans addressing and providing general populace protection against CBRN/TIM agents are inadequate or nonexistent.</p>
M10	FP plan for bases/facilities includes CBRN/TIM protection for tenant and transiting units/forces.	<p><b>G:</b> AT/FP plans address and provide for the ready protection of tenant and transiting units/forces against exposure to and the effects of CBRN/TIM agents.</p> <p><b>Y:</b> AT/FP plans address and provide for the ready protection of the at-risk tenant and transiting units/forces against exposure to and the effects of CBRN/TIM agents.</p> <p><b>R:</b> AT/FP plans addressing and providing tenant and transiting units/forces protection against CBRN/TIM agents are inadequate or nonexistent.</p>

<sup>1</sup> DOTMLPF is adequate for the coordination and integration of coalition forces. Adequate DOTMLPF exists to address and support these forces. However, DOTMLPF is inadequate or nonexistent addressing CBRND of eligible civilians and MWAs. DOTMLPF does not adequately address sustained operations within a CBRN/TIM environment.

<sup>2</sup> Limited quantities of COLPRO are available for operations. Not all critical facilities and activities are equipped with COLPRO. Transportable CPSs (e.g., JTCOPS, CP-DEPMEDS, TEMPER systems, and Service-designed systems) provide CPS for mature theaters or within the AO if there exists adequate time between notification of plan activation and the commencement of hostilities. However, these systems are in limited numbers, require significant logistics to move and establish, and concurrent operations with CBRN/TIM threat may further limit their availability. Mobile CPSs (ground) are also limited in quantities and types. Coalition partner and host-nation (when applicable) CPSs may offset these limitations. The COCOM staff, in coordination with coalition partner staff, develop the campaign plan and address requirements and commitments by each coalition participant. Discussions and negotiations between the COCOM staff and partners determine the capabilities of each partner within the full spectrum of support. Commitments are obtained from each participant. Specific tasks are assigned to elements of the coalition force most capable of completing the task. Although the provision of CBRND equipment to national forces ultimately resides with their nations, mutual support among coalition partners is planned to complement partners' capabilities and to minimize weaknesses. ACSAs between coalition partners enable acquisition and cross-servicing support between the partners. The IA, a more specific arrangement, provides for a wide range of support exchange including sheltering, medical care, and other support activities.

<sup>3</sup> In coordination with coalition partner staff, the COCOM staff develops a comprehensive campaign plan for successful achievement of the desired end states. Discussions and negotiations between partners determine the capabilities of each partner within the full spectrum of support. Force requirements and commitments are obtained from each coalition participant. Minimum capability standards for participation and a certification process covering areas of concern (e.g., training level competence, logistics capabilities, deployment, sustainment, and redeployment readiness, etc.) are established and applied by all participants. Specific tasks are assigned to elements of the coalition force most capable of

completing the task. Although the provision of CBRND equipment to national forces ultimately resides with their nations, mutual logistics support among coalition partners is planned to complement partners' capabilities and to minimize weaknesses. For example, U.S. Marine Corps forces were equipped with lightweight CBRN/TIM IPE by the U.K. during Operation Desert Storm. The United States installed COLPRO capabilities in Saudi critical command and control facilities for the same operation. The COCOM and the combined staff monitors, tracks, and assesses the readiness of the joint coalition force. COLPRO availability and readiness is addressed throughout the process for CBRND.

<sup>4</sup> In coordination with coalition partner staff, the COCOM staff determines logistical efficiencies among the partners during the planning process. Standardization and interoperability between the participating nations is assessed and adjustments are made as necessary to plans. Support consumable levels are determined and incorporated into the plans. Commitments are obtained from each coalition participant. Minimum capability standards for participation and a certification process covering areas of concern (including logistics capabilities) are established and applied by all participants. ACSAs between coalition partners enable acquisition and cross-servicing support between the partners. The IA, a more specific arrangement, provides for sheltering, medical care, consumables, and other support activities. Standardization of consumables for interoperability, although sought and existing with selected countries (e.g., North Atlantic Treaty Organization [NATO] participants), may not be possible with all coalition partners and U.S. forces. Interoperability between two or more partners may alleviate the increased logistics of nonstandardized consumables. Issues associated with nonstandardized consumables are addressed when necessary and appropriate during planning.

<sup>5</sup> The allocation, placement, and reallocation of protective assets is a function of the planning and operational control of the COCOM, COCOM staff, and combined staff. ACSAs between coalition partners enable acquisition and cross-servicing support between the partners. The IA, a more specific arrangement, provides for a wide range of support exchange including consumables, sheltering, medical care, and other support activities. However, sustained operations within a CBRN/TIM environment are not adequately addressed in DOTMLPF and, subsequently, in planning.

<sup>6</sup> Service logistics systems provide some visibility of the location of CBRN/TIM protective equipment (real and warehoused property). These systems also include a standardized condition indicator. However, these indicators are assigned upon receipt of property and are generally unchanged unless there is an assigned limitation code specifying automatic condition code downgrade timing or Lot Number identifier. Issued property from logistics warehouse systems, other than real property, are not identified in the wholesale logistics system. The accuracy of logistics systems are dependent upon the quality of inventory controls and logistics management. Service-specific supply systems do not exchange information at the theater and local level. The Defense Logistics Agency does possess a degree of ability to view and track assets across the services. The COCOM staff does not possess this capability and must request the information from the component Services. The allocation, operation, manning, management, and resupply of non-U.S. force CBRND assets are generally the responsibility of the owning nation. The tracking of these assets are internal to those forces and nations. Integration of U.S. and non-U.S. logistics systems is not currently required. Tracking of non-U.S. equipment supplied for U.S. force application is largely performed manually and not integrated with existing component Service systems.

<sup>7</sup> CBRN/TIM protective training is tracked and recorded by individual force units. A theaterwide system to track CBRN/TIM protective training does not exist. Readiness monitoring is performed by the COCOM staff. However, CBRN/TIM is part of a composite readiness rating. CBRN/TIM protective training of non-U.S. forces is generally the responsibility of the owning nation. The training of these forces is tracked internally to those forces and nations. The integration of training tracking systems between the U.S. and non-U.S. systems is not currently required.

<sup>8</sup> AT/FP plans include a CBRN/TIM annex. The annex must address the notification and protective measures for the base/facility general populace. However, CBRND protective equipment is not issued or available to the base/facility general populace at CONUS and non-HTA OCONUS locations. The Guardian Program is addressing these issues. FP plans for bases and facilities within HTA do address CBRN/TIM protection. However, the common assumption is nonessential civilians will be evacuated prior to commencement of hostilities or the hazard area will be limited; therefore, nonessential civilians are not generally addressed for protection in other than in generic terms or NEO planning. Operations frequently include civilians directly supporting force activities. Although some government civilians are provided and equipped with IPE as part of their primary function (e.g., hazardous materials, fire response, readiness flight [Air Force] and selected others, most civilians are not equipped or have access to IPE enabling survival within a CBRN/TIM environment. This statement is particularly true of contractors. Further, MWAs (particularly MWDs) elements of the force do not possess CBRND protection. The COCOM staff does not possess clear guidance for planning and providing CBRND protection of eligible civilians and MWA.

<sup>9</sup> AT/FP plans generally do not include protection for transiting units/forces. Tenant organizations are included in garrison/base protection plans and planning. Operations frequently include civilians directly supporting force activities and other eligible civilians (not supporting the mission). Although some government civilians are provided and equipped with IPE as part of their primary function (e.g., hazardous materials, fire response, readiness flight [Air Force] and selected others, most civilians are not equipped or have access to IPE enabling survival within a CBRN/TIM environment. This statement is particularly true of contractors. Further, MWAs (particularly MWDs) elements of the force do not possess CBRND protection. The COCOM staff does not possess clear guidance for planning and providing CBRND protection of eligible civilians and MWAs.

### 11.7.3 Functional Solution Analysis

#### 11.7.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** Not all critical facilities and activities are equipped with COLPRO.  
**Non-Materiel Solutions:** *Doctrine:* Enforce existing doctrine and policy.
- 2. Deficiency:** Mobile CPSs (ground) are limited in quantity and type.  
**Non-Materiel Solutions:** *Doctrine:* Complete analysis and central correlation/comparison of national and strategic plans to identify quantities and types of mobile COLPRO (and supporting consumables) necessary and available to support highly mobile forces for envisioned plans and taskings. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct CBRND, including mobile COLPRO, of highly mobile forces. *Training:* Train, exercise, and evaluate CBRND, including mobile COLPRO, capabilities of the force in a CBRN/TIM threat during highly mobile force operations. *Leadership:* Recognize differences and challenges associated with CBRND operations by highly mobile forces; training providing skills and knowledge to manage operations in these circumstances; and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for CBRND of highly mobile forces.
- 3. Deficiency:** Transportable COLPRO systems are in limited numbers and require significant logistics to move and establish.  
**Non-Materiel Solutions:** *Doctrine:* Institute in doctrine, policy, and procedures the central correlation of Strategic Theater plans and taskings to identify CBRND support requirements for two or more concurrent operations with CBRN/TIM threat with comparison to existing and programmed quantities and types of CBRND systems and resources. *Leadership:* Implement development of plans and taskings consistent with available CBRND capabilities as determined by central correlation and comparison of Strategic Theater plans and taskings.
- 4. Deficiency:** Concurrent operations with CBRN/TIM threat may limit CPS availability.  
**Non-Materiel Solutions:** *Doctrine:* Institute in doctrine, policy, and procedures the central correlation of Strategic Theater plans and taskings to identify CBRND support requirements for two or more concurrent operations with CBRN/TIM threat with comparison to existing and programmed quantities and types of CBRND systems and resources. *Leadership:* Implement development of plans and taskings consistent with available CBRND capabilities as determined by central correlation and comparison of Strategic Theater plans and taskings.
- 5. Deficiency:** Sustained operations within a CBRN/TIM environment are not adequately addressed in DOTMLPF and, subsequently, in planning.  
**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, and procedures sustained operations within a CBRN/TIM environment. *Organization:* Ensure resources, taskings, and

staff are in place or available to perform sustained operations within a CBRN/TIM environment. *Training*: Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership*: Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.

6. **Deficiency**: Issued property from logistics warehouse systems, other than real property, is not identified in the wholesale logistics system.

**Non-Materiel Solutions**: *Organization*: Develop structures for logistics systems integration and information sharing to support decisioning and asset visibility. *Facilities*: Develop logistics infrastructure (national to unit) supporting flow of information.

7. **Deficiency**: Service-specific supply systems do not exchange information at the theater and local level.

**Non-Materiel Solutions**: *Organization*: Develop structures for logistics systems integration and information sharing to support decisioning and asset visibility. *Facilities*: Develop logistics infrastructure (national to unit) supporting flow of information.

8. **Deficiency**: The COCOM staff does not possess the ability to view and track CBRND assets across the services and must request the information from the component Services.

**Non-Materiel Solutions**: *Organization*: Develop structures for logistics systems integration and information sharing to support decisioning and asset visibility. *Facilities*: Develop logistics infrastructure (national to unit) supporting flow of information.

9. **Deficiency**: Tracking of non-U.S. equipment supplied for U.S. force application is largely performed manually and not integrated with existing component Service systems.

**Non-Materiel Solutions**: *Organization*: Develop structures for logistics systems integration and information sharing to support decisioning and asset visibility, including assets provided by other nations to support U.S. forces. *Facilities*: Develop logistics infrastructure (national to unit) supporting flow of information, including information on assets provided by other nations to support U.S. forces.

10. **Deficiency**: A theaterwide system to track CBRN/TIM protective training does not exist.

**Non-Materiel Solutions**: *Organization*: Develop structures for Service-specific training tracking systems integration and information sharing to support decisioning and asset visibility. *Facilities*: Develop automated systems infrastructure supporting the compilation and flow of information of all force elements.

11. **Deficiency**: CBRND protective equipment is not issued or available to the base/facility general populace at CONUS and non-HTA OCONUS locations.

**Non-Materiel Solutions**: *Doctrine*: Institute in doctrine, policy, and procedures CBRND of personnel (military and civilian) located in DoD installations, sites, and facilities to include equipping, training, exercising, and evaluations for CBRN/TIM survival. *Organization*: Ensure resources, taskings, and staff are in place or available to support and conduct CBRND. *Training*: Train, exercise, and evaluate the force for survivability within a

CBRND/TIM environment. *Leadership*: Implement development of plans and taskings consistent with stockpile support capabilities.

- 12. Deficiency:** The common assumption for HTA fixed sites is that nonessential civilians will be evacuated prior to commencement of hostilities or the hazard area will be limited; therefore, nonessential civilians are not generally addressed for protection in other than in generic terms or NEO planning.

**Non-Materiel Solutions:** *Doctrine*: Develop doctrine, policy, and procedures addressing eligible civilian personnel for CBRND. *Organization*: Identify organizational services and activities supporting eligible civilians. *Training*: Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilian personnel and conduct CBRND training, exercises, and evaluations. *Leadership*: Implement and manage CBRND training, equipping, and protection of eligible civilian personnel. *Facilities*: Develop supporting infrastructure for the acquisition, stockpiling, prepositioning, maintenance, and movement of eligible civilian CBRND resources.

- 13. Deficiency:** Although some government civilians are provided and equipped with IPE as part of their primary function (e.g., hazardous materials, fire response, readiness flight [Air Force] and selected others), most civilians are not equipped or have access to IPE enabling survival within a CBRND/TIM environment. This statement is particularly true of contractors.

**Non-Materiel Solutions:** *Doctrine*: Establish in doctrine, policy, and procedures the application of standards for protection of eligible civilians supporting the mission/military operations addressing the variation within the potential protected working population. *Leadership*: Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians supporting the mission/military operations and conduct CBRND/TIM training, exercises, and evaluations.

- 14. Deficiency:** MWA, particularly MWD, elements of the force do not possess CBRND protection.

**Non-Materiel Solutions:** *Doctrine*: Establish doctrine, policy, and procedures CBRND protection of MWAs and training for CBRND/TIM environment survival. *Organization*: Organizational consideration for maintenance and support of MWA CBRND protective equipment, measures, and activities. *Training*: Develop institutional and unit training of handlers and MWAs for CBRND measures and activities. *Leadership*: Ensure awareness and planning for CBRND measures and requirements for MWA survivability. *Facilities*: Develop supporting infrastructure for MWA CBRND (e.g., logistics, veterinary surveillance, etc.).

- 15. Deficiency:** The COCOM staff does not possess clear guidance for planning and providing CBRND protection of eligible civilians.

**Non-Materiel Solutions:** *Doctrine*: Develop doctrine, policy, and procedures addressing civilian personnel and operations for CBRND. *Organization*: Identify organizational services and activities supporting the mission performed by civilian personnel and operations. *Training*: Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRND training, exercises, and evaluations. *Leadership*: Implement and manage CBRND training, equipping, and protection of eligible civilians. *Personnel*: Ensure that eligible civilians supporting the mission/military operations are

qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities*: Develop supporting infrastructure for eligible civilian CBRND (e.g., logistics, medical, veterinary surveillance, training, communications, etc.).

- 16. Deficiency:** The COCOM staff does not possess clear guidance for planning and providing CBRND protection of MWAs.

**Non-Materiel Solutions:** *Doctrine*: Develop doctrine, policy, and procedures addressing MWA, particularly MWD, operations for CBRND. *Organization*: Identify organizational services and activities supporting the mission performed by MWA operations. *Training*: Establish CBRND training, exercise, and evaluation criteria and programs for MWDs and conduct CBRND training, exercises, and evaluations. *Leadership*: Implement and manage CBRND training, equipping, and protection of MWAs. *Facilities*: Develop supporting infrastructure for MWD CBRND (e.g., logistics, medical, veterinary surveillance, training, communications, etc.).

- 17. Deficiency:** AT/FP plans generally do not include protection for transiting units/forces.

**Non-Materiel Solutions:** *Doctrine*: Enforce planning for CBRND support of deploying, redeploying, and en route forces by supporting installations. *Organization*: Develop organization structures, resources, staffing, and capabilities to provide CBRND support of deploying, redeploying, relocation, and en route forces as well as organic forces. *Training*: Train, exercise, and evaluate capabilities of locations providing support to deploying, redeploying, relocating, and en route forces to conduct and provide CBRND. *Leadership*: Recognize challenges associated with CBRND support of deploying, redeploying, relocating, and en route forces as well as organic forces. Plan for the provision of CBRND and conduct comprehensive exercises and evaluations to ensure readiness of the organic force to perform CBRND and protect transient forces. *Facilities*: Develop supporting infrastructure to protect transient forces from the effects of CBRN/TIM agents.

- 18. Deficiency:** DOTMLPF is inadequate or nonexistent addressing CBRND of eligible civilians.

**Non-Materiel Solutions:** *Doctrine*: Develop doctrine, policy, and procedures addressing eligible civilian personnel for CBRND. *Organization*: Identify organization services and activities necessary to support survivability of eligible civilian personnel within a CBRN/TIM environment. *Training*: Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRND training, exercises, and evaluations. *Leadership*: Implement and manage CBRND training, equipping, and protection of eligible civilian personnel.

- 19. Deficiency:** DOTMLPF is inadequate or nonexistent addressing CBRND of MWAs.

**Non-Materiel Solutions:** *Doctrine*: Develop doctrine, policy, and procedures addressing MWDs for CBRND. *Organization*: Identify organization services and activities necessary to support survivability of MWDs within a CBRN/TIM environment. *Training*: Establish CBRND training, exercise, and evaluation criteria and programs for MWDs and conduct CBRND training, exercises, and evaluations. *Leadership*: Implement and manage CBRND training, equipping, and protection of MWDs.

**20. Deficiency:** DOTMLPF does not adequately address sustained operations within a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, procedures, and *UJTL* sustained operations within a CBRN/TIM environment. *Organization:* Ensure resources, taskings, and staff are in place or available to plan and perform sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.

#### **11.7.3.2 IMA Assessment Summary**

N/A

**11.8 Task STSHLD 8: Ensure adequate protective measures and resources are available to coalition partners and other designated non-U.S. forces****11.8.1 Functional Area Analysis****11.8.1.1 Definition**

To ensure that CBRN/TIM protective measures and resources are available to coalition/non-U.S. forces. The availability of CBRN/TIM protective measures and resources is both a joint and coalition/non-U.S. force concern. This task includes IPE, COLPRO, CBRND equipment and supplies, protection of equipment and supplies, and medical CBRN/TIM countermeasure resources. The base/facility FP plan must integrate coalition forces to maximize capability and minimize vulnerability. Operational units must determine and track the level of NBC training and equipment status of their fellow coalition/non-U.S. forces. Planners and NBC staff officers must establish and track the status of protective assets of coalition/non-U.S. partners. U.S. forces may be required to provide protective assets (especially IPE, detection and warning devices, medical support, and decontaminants) to coalition/non-U.S. partners, depending on local threats and/or actual adversary use of CBRN/TIM. Joint forces NBC staff officers should offer to review coalition/non-U.S. force CBRN/TIM protection plans and assist as necessary. U.S. forces may be required to train coalition/non-U.S. forces in CBRND. Supports assistance to nations provided under military assistance and the family of engagement plans to eliminate WMD vulnerabilities.

**11.8.1.2 Derivation**

*Joint Enabling Concept for CBRN/TIM Operations, Protection Joint Functional Concept, UJTL (ST 2.4.1.1, ST 2.4.1.1, ST 4.2.4, ST 5.4.1, ST 5.4.3, ST 6, ST 6.2, ST 6.2.1, ST 8.1.4, ST 8.2, ST 8.3.2, ST 9.3, ST 9.4).*

**11.8.1.2.1 Supported Task: SNSHLD 12****11.8.1.2.2 Lateral Task: STSHA 4****11.8.1.2.3 Supporting Task: OPSHLD 5****11.8.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Undeveloped to highly developed land. (C1.1)
2. Riverine to open sea. (C 1.2)
3. Natural and induced air. (C 1.3)
4. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Partially completed mission preparation. (C2.1.3)
2. Marginal to strong forces assigned. (C2.2.1)
3. Partial joint staff integration. (C2.3.1.1)
4. Moderate staff expertise. (C2.3.1.3)
5. Fair personnel nutrition and health. (C2.2.4.1)
6. Partial interoperability. (C2.2.6)
7. Limited deployed supplies. (C2.8.2)
8. Sufficient CONUS resupply. (C2.8.3)
9. Limited prepositioned materiel. (C2.8.4)
10. Limited host-nation support. (C2.8.5)
11. Extensive commercial procurement. (C2.8.6)

**Civil**

1. Correct interdepartmental/interagency relationships. (C3.1.1.3)
2. Limited foreign government support. (C3.1.2.3)
3. Moderately opposed foreign public opinion. (C3.1.2.4)

**11.8.2 Functional Needs Analysis****11.8.2.1 Capability and Deficiency Assessment Summary**

Table 11.8-1 discusses the only capability that exists to perform the task to the designated standard. Adequate doctrine, policy, and procedures exist for ensuring the adequacy of protective measures and resources of coalition partners and other designed non-U.S. forces. Structures for mutual support can be applied in cases where necessary to complement capabilities and minimize weaknesses within the Joint Coalition Force. No deficiencies were noted within this task.

**Current Capability and Deficiency**

Adequate doctrine, policy, and procedures exist to guide commanders and staffs with coalition and non-U.S. force participation in joint operations. Planning, tracking, and monitoring is performed in coordination with partner staffs under a negotiated plan outlining requirements, taskings, training, reporting, information sharing, standards, and operational certifications for participation. Although the provision of CBRND equipment to national forces ultimately resides with their nations, mutual support among partners is planned to complement capabilities and to minimize weaknesses. ACSAs between partners enables acquisition and cross-servicing support between the partners. The more specific IA provides for a wide range of support including sheltering, medical care, and other support activities. The COCOM and combined staff monitors, tracks, and assesses the readiness of the Joint Coalition Force and addresses issues and concerns as they arise. No deficiencies were noted within this task.

**Projected Near/Mid-Term Capability and Deficiency**

No change is projected for this task.

**Projected Far-Term Capability and Deficiency**

No change is projected for this task.

**Table 11.8-1. STSHLD 8: Capability and Deficiency Assessment**

<b>Capability: COCOM HQ</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>G<sup>2</sup></b>	<b>G<sup>3</sup></b>	<b>G<sup>4</sup></b>	<b>G<sup>5</sup></b>
<b>Near/Mid-Term Overall Capability</b>	<b>G</b>	<b>G</b>	<b>G</b>	<b>G</b>
<b>Far-Term Overall Capability</b>	<b>G</b>	<b>G</b>	<b>G</b>	<b>G</b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Coalition/non-U.S. forces are protected by medical prophylaxes.	<b>G:</b> Planning and coordination is conducted to address partner forces readiness and preparations for operations with CBRN/TIM threat and includes all CBRND protective measures. <b>Y:</b> Partner forces CBRND capabilities are considered when planning operations with CBRN/TIM threat. <b>R:</b> Partner force CBRND capabilities are not considered or is inadequately considered when planning operations with CBRN/TIM threat.
M2	Coalition/non-U.S. forces are equipped with or possess access to CBRN/TIM COLPRO.	<b>G:</b> Planning and coordination is conducted to address partner forces equipping or access to COLPRO. <b>Y:</b> Partner force equipping or access to COLPRO is considered when planning operations with threat. <b>R:</b> Partner force equipping or access to COLPRO is not considered or is inadequately considered when planning operations with threat.
M3	Coalition/non-U.S. forces are trained to operate in CBRN/TIM hazards.	<b>G:</b> Processes and means exist to monitor, track, and assess coalition/non-U.S. forces training, readiness, and preparations status against COCOM requirements. <b>Y:</b> Processes exist to identify coalition/non-U.S. forces training meeting COCOM requirements. <b>R:</b> Process and/or means are inadequate or nonexistent to identify coalition/non-U.S. forces training meeting COCOM requirements.
M4	Coalition/non-U.S. forces are equipped with CBRN/TIM IPE.	<b>G:</b> Processes and means exist to monitor, track, and assess coalition/non-U.S. forces equipping, readiness, and preparations status against COCOM requirements. <b>Y:</b> Processes exist to identify coalition/non-U.S. forces equipping meeting COCOM requirements. <b>R:</b> Process and/or means are inadequate or nonexistent to identify coalition/non-U.S. forces equipping meeting COCOM requirements.

<sup>1</sup> There is adequate DOTMLPF in place to conduct this task.

<sup>2</sup> National policies of the coalition/non-U.S. forces regarding medical prophylaxis is a factor the COCOM and supporting staff must consider during planning and operations. Religious considerations may also impact the use of medical prophylaxis. In coordination with coalition/non-U.S. forces partner staff, the COCOM staff develop and address requirements and commitments by each partner. Discussions and negotiations between the COCOM staff and partners determine the capabilities of each partner within the full spectrum of support. Although the provision of CBRND resources to national forces ultimately resides with their nations, mutual support among partners is planned to complement partners' capabilities and to minimize weaknesses. ACSAs between partners enable acquisition and cross-servicing support between the partners. The IA, a more specific arrangement, provides for a wide range of support exchange, including sheltering, medical care, and other support activities. Indigenous forces supporting operations may not be equipped or have access to medical prophylaxis.

<sup>3</sup> In coordination with coalition/non-U.S. forces partner staff, the COCOM staff develop and address requirements and commitments by each partner. Discussions and negotiations between the COCOM staff and partners determine the capabilities of each partner within the full spectrum of support. Specific tasks are assigned to elements of the coalition force most capable of completing the task. Although the provision of CBRND resources to national forces ultimately resides with their nations, mutual support among partners is planned to complement partners' capabilities and to minimize weaknesses. ACSAs between partners enable acquisition and cross-servicing support between the partners. The IA, a

more specific arrangement, provides for a wide range of support exchange, including sheltering, medical care, and other support activities. Indigenous forces supporting operations may not be equipped or have access to CBRND COLPRO.

<sup>4</sup> In coordination with coalition/non-U.S. forces partner staff, the COCOM staff develop a comprehensive plan for successful achievement of the desired end states. Discussions and negotiations between partners determine the capabilities of each partner within the full spectrum of support. Force requirements and commitments are obtained from each participant. Minimum capability standards for participation and a certification process covering areas of concern (e.g., training level competence, logistics capabilities, deployment, sustainment, and redeployment readiness, etc.) are established and applied by all participants. The COCOM and the combined staff monitor, track, and assess the readiness of the joint coalition force. Indigenous forces supporting operations may not be equipped and prepared for CBRND operations. The COCOM staff, in coordination with partners, determines the need for CBRND capabilities of these forces based upon the threat. A determination is made on the provision CBRND training to these forces.

<sup>5</sup> In coordination with coalition/non-U.S. forces partner staff, the COCOM staff develop and address requirements and commitments by each partner. Discussions and negotiations between the COCOM staff and partners determine the capabilities of each partner within the full spectrum of support. Although the provision of CBRND resources to national forces ultimately resides with their nations, mutual support among partners is planned to complement partners' capabilities and to minimize weaknesses. ACSAs between partners enable acquisition and cross-servicing support between the partners. The IA, a more specific arrangement, provides for a wide range of support exchange, including sheltering, medical care, and other support activities. Indigenous forces supporting operations may not be equipped or have access to CBRND IPE. The COCOM staff, in coordination with partners, determine the need for IPE based upon the threat.

### **11.8.3 Functional Solution Analysis**

#### **11.8.3.1 DOTLPF Assessment Summary**

No deficiencies were noted within this task.

#### **11.8.3.2 IMA Assessment Summary**

N/A

**11.9 Task STSHLD 9: Provide COLPRO for critical activities/functions, rest, and relief****11.9.1 Functional Area Analysis****11.9.1.1 Definition**

To provide COLPRO by CPSs, which provide protection against CBRN/TIM hazards in particulate, liquid, or vapor forms. *JP 1-02* defines COLPRO as “protection provided to a group of individuals in a nuclear, biological, and chemical environment which permits relaxation of individual nuclear, biological, and chemical protection.” COLPRO provides a contamination-free environment where critical activities (e.g., command and control, communication, and medical activities and maintenance of low-density assets) can be performed and provides mission-oriented protective posture relief for individuals, units, and MWAs.

A collective protection system (CPS) is a complete and integrated system of protection. The components are designed to function in concert to successfully protect the occupants. COLPRO may be incorporated in or an additive component to a fixed facility, transportable shelter, mobile mounted shelter, vehicle, aircraft, ship, or an expedient shelter. Prior to an actual attack, a CPS may be activated and the following tasks performed:

- CPS are assessed and prepared for use. The commander may place a CPS into operation or on standby for an anticipated attack.
- Facilities, vehicles, vessels, and aircraft are prepared wherever possible against infiltration of a CBRN/TIM agent.
- Expedient shelters are established in facilities, vehicles, vessels, aircraft, etc., for protection of resources. Expedient shelters also may be constructed using available materials.

**11.9.1.2 Derivation**

*Joint Enabling Concept for CBRN/TIM Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (ST 5, ST 5.1, ST 5.1.2, ST 6, ST 6.2.1, ST 9.3, ST 9.4).*

2. Marginal to strong forces assigned. (C2.2.1)
3. Partial interoperability. (C2.2.6)
4. Moderate staff expertise. (C2.3.1.3)

**Civil.** N/A

## **11.9.2 Functional Needs Analysis**

### **11.9.2.1 Capability and Deficiency Assessment Summary**

Table 11.9-1 discusses the only capability that exists to perform the task to the designated standard. Doctrine, policy, and procedures exist to provide CBRND COLPRO for critical activities, functions, and to enable rest and relief of the force. Deficiencies include limitations in types, quantities, and application of existing COLPRO.

### **Current Capability and Deficiency**

Radiological (fallout) COLPRO does exist in CONUS and OCONUS. The combination of individual protection, contamination avoidance, and available COLPRO provides critical activities and functions with a level of capability. Allocation of limited COLPRO resources is made based upon the threat, mission, criticality of performed activity, and availability of COLPRO for the function. Planning and prioritization of COLPRO resources is performed during operational planning. Fixed-site operations within a mature theater may possess sufficient COLPRO to provide access to personnel within a 24-hour period. The current concept for CBRN/TIM environment operations is contamination avoidance or withdrawal. Mobile COLPRO does exist in selected tactical combat mobile assets (air, ground, and sea) and support vehicles. Mature theater-transportable CPSs are available in limited quantities and inclusion of Service-specific systems provides additional COLPRO capabilities to the force. Fixed-site critical facilities within HTA are prioritized and equipped for COLPRO based upon mission, criticality, assessments, and available funding. Transportable CPSs as an expansion of existing fixed-site capabilities are planned as appropriate and necessary. Deficiencies include inadequate quantities and types of COLPRO; lack of COLPRO in tactical/strategic airframes (particularly airlift) and supporting vessels (e.g., hospital ships, cargo vessels, etc.); critical facility COLPRO; COLPRO systems (designs, quantities, and types) supporting highly mobile and expeditionary forces; and the lack of doctrine, policy, and procedures for the implementation and application of expedient COLPRO. The overall current assessment is “red.”

**Projected Near/Mid-Term Capability and Deficiency**

No change is projected for this task.

**Projected Far-Term Capability and Deficiency**

No change is projected for this task.

Table 11.9-1. STSHLD 9: Capability and Deficiency Assessment

Capability: COCOM HQ	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10

M1	All critical activities and functions are collectively protected.	<b>G:</b> All critical facilities and activities are equipped with operational COLPRO. <b>Y:</b> All identified critical facilities and activities possess or are programmed to be equipped with COLPRO. <b>R:</b> COLPRO is inadequate or nonexistent to support operations.
M2	Operational activities and functions are not degraded/unavailable due to CBRN/TIM attacks.	<b>G:</b> All operational activities and functions are protected and are not degraded and/or unavailable as a result of CBRN/TIM attacks. <b>Y:</b> All operational activities and functions are afforded protection and are not seriously degraded and/or unavailable as a result of CBRN/TIM attacks. <b>R:</b> Protection of operational activities and/or functions is inadequate or nonexistent and may result in serious degradation or nonavailability resulting from CBRN/TIM attacks.
M3	Sustained operational capability is achievable with COLPRO.	<b>G:</b> Sufficient and adequate COLPRO is available and operational to sustain operational capabilities in a CBRN/TIM environment. <b>Y:</b> Sustainable operational capabilities for selected functions and activities are achievable with available and operational COLPRO. <b>R:</b> Sustainable operational capabilities are not sustainable with available and operational COLPRO.
M4	Forces are trained to apply and use expedient COLPRO.	<b>G:</b> Forces are trained and routinely exercised and evaluated on the effective application of expedient COLPRO measures and equipment. <b>Y:</b> Forces are trained and exercised and evaluated on the application of expedient COLPRO measures and equipment upon predeployment notification for operations with threat. <b>R:</b> Training, exercising, and evaluation of forces on the application of expedient COLPRO measures and equipment is inadequate or nonexistent.
M5	Required expedient collective protective kits and materials (e.g., adaptation kits, plywood, sprays, gel packs, tape, etc.) are readily available.	<b>G:</b> The full range of expedient COLPRO kits and materials are readily available for application by forces in the field. <b>Y:</b> Expedient COLPRO kits and materials are generally available for force application in selected field environments. <b>R:</b> Expedient COLPRO kits are inadequate, unavailable, or nonexistent.
M6	Adequate CPSs are available for in-place forces.	<b>G:</b> COLPRO is available in required quantities and types to support the full range of envisioned and planned operations. <b>Y:</b> COLPRO is available in sufficient types and quantities to support major operations. <b>R:</b> COLPRO is inadequate or nonexistent to support operations.

M7	Adequate CPSs are available for deploying forces.	<b>G:</b> COLPRO is available in required quantities and types to support the full range of envisioned and planned operations. <b>Y:</b> COLPRO is available in sufficient types and quantities to support major operations. <b>R:</b> COLPRO is inadequate or nonexistent to support operations.
M8	Required mobile CPSs are available.	<b>G:</b> Operational mobile CPSs are available in required quantities and types to support the full range of envisioned and planned operations. <b>Y:</b> Operational mobile CPSs are available in sufficient types and quantities to support major operations. <b>R:</b> Operational mobile CPSs are inadequate or nonexistent to support operations.
M9	Required transportable CPSs are available.	<b>G:</b> Operational transportable CPSs are available in required quantities and types to support the full range of envisioned and planned operations. <b>Y:</b> Operational transportable CPSs are available in sufficient types and quantities to support major operations. <b>R:</b> Operational transportable CPSs are inadequate or nonexistent to support operations.
M10	Required CPSs for fixed facilities are installed and available.	<b>G:</b> All fixed facilities and activities are equipped with operational COLPRO. <b>Y:</b> All critical fixed facilities and activities are equipped with operational COLPRO. <b>R:</b> COLPRO within fixed facilities and activities is inadequate or nonexistent to support operations.

<sup>1</sup> DOTMLPF is inadequate to support sustained operations within a CBRN/TIM environment, particularly expeditionary operations, during the first 30–60 days. Current DOTMLPF does not adequately address the establishment and operation of expedient COLPRO activities and measures.

<sup>2</sup> Not all critical facilities and activities are equipped with COLPRO. COLPRO within CONUS and some OCONUS locations does exist for radiological (fallout). However, COLPRO for other than radiological is almost nonexistent, including critical facilities, outside HTA OCONUS, particularly CONUS sites. Expeditionary operations are a particular concern. Existing COLPRO systems are not generally designed for a highly mobile force, with a reduced logistical footprint, and the initial period of operations until the theater matures (usually the first 30–90 days). The combination of individual protection, contamination avoidance, and available COLPRO provides critical activities and functions with a level of capability. However, the encumbrances and limitations associated with these measures are considerations in the planning and conduct of operations to ensure mission success.

<sup>3</sup> The limited availability of COLPRO systems requires careful planning and prioritization of resources. The COCOM staff and the components establish and allocate COLPRO resources based upon the threat, risk, and vulnerability assessments. Operational activities and functions are prioritized based upon mission, criticality, assessments, and available resources. The combination of individual protection, contamination avoidance, and available COLPRO provides operational activities and functions with a level of capability. However, the encumbrances and limitations associated with these measures are considerations in the planning and conduct of operations to ensure mission success.

<sup>4</sup> Current doctrine, policies, plans, and TTPs do not adequately address sustained operations within a CBRN/TIM environment. The establishment and operation of existing COLPRO for sustained CBRN/TIM environment operations will require DOTMLPF and significant logistical support. Expeditionary operations are a particular concern. Existing COLPRO systems are not generally designed for a highly mobile force, with a reduced logistical footprint, and the initial period of operations until the theater matures (usually the first 30–90 days). The combination of individual protection, contamination avoidance, and available COLPRO provides a level of capability. However, the encumbrances and limitations associated with these measures are considerations in the planning and conduct of operations to ensure mission success.

<sup>5</sup> Expedient COLPRO kits, procedures, and training do not currently exist.

<sup>6</sup> Expedient COLPRO kits, procedures, and training do not currently exist. Identification, development and/or acquisition of assets for Joint Expeditionary Collective Protection (JECF) include ECP assets for adaptation of tentage and structures to support expeditionary operations. The JECF effort is currently proceeding through the JCIDS process.

<sup>7</sup> The limited availability of COLPRO systems requires careful planning and prioritization of resources. The COCOM staff and the components establish and allocate COLPRO resources based upon the threat, risk, and vulnerability assessments. Operational activities and functions are prioritized based upon mission, criticality, assessments, and available resources. The combination of individual protection, contamination avoidance, and available COLPRO provides operational activities and functions with a level of capability. However, the encumbrances and limitations associated with these measures are considerations in the planning and conduct of operations to ensure mission success.

<sup>8</sup> Maneuvering forces are inadequately equipped with COLPRO capabilities. Insufficient COLPRO is available to support rest and resupply activities for all personnel within a 24-hour period necessary to support sustained operations within a contaminated environment. This statement is particularly true of forward-operating light forces. COLPRO within

---

CONUS and some OCONUS locations does exist for radiological (fallout). However, COLPRO for other than radiological is almost nonexistent, including critical facilities, outside HTA OCONUS, particularly CONUS sites. Fixed-site operations within a mature theater may possess sufficient COLPRO to provide access to personnel within a 24-hour period. Current doctrine, policies, plans, and TTPs do not adequately address sustained operations within a CBRN/TIM environment. Current concept is contamination avoidance or withdrawal.

<sup>9</sup> Quantities and availability of mobile COLPRO is inadequate. Mobile COLPRO exists in selected tactical combat and support vehicles. The quantities and types of these vehicles are limited and dedicated to specific missions. Current mobile COLPRO is inadequate to support operations by highly mobile forces. Airframe COLPRO is limited to tactical combat airframes. Airlift (both tactical and strategic) are not equipped with COLPRO. Sea-based COLPRO (the CITADEL System) is available in specific classes of naval warfare vessels (e.g., amphibious assault ship [LHA], destroyer, etc.). Most naval vessels (including supply and transport vessels, carriers, and others) do not possess COLPRO.

<sup>10</sup> Mature theater CPSs are available in limited quantities. These include JTCOPS, CP-DEPMEDS, TEMPER systems, and Service-designed systems. Integration of Service-specific systems into joint plans provides additional COLPRO capabilities. These, however, are identified in the Service component plans. They are not generally integrated in COCOM joint plans. Current CPSs are inadequate to support expeditionary operations, particularly in austere environments by highly mobile forces and possessing reduced logistical footprint.

<sup>11</sup> COLPRO within CONUS and some OCONUS locations does exist for radiological (fallout). However, COLPRO for other than radiological is almost nonexistent, including critical facilities, outside HTA OCONUS, particularly CONUS sites. COLPRO within HTA is installed and available for selected critical facilities and operations. The COCOM staff and the components establish and allocate funding and resources based upon the threat, risk, and vulnerability assessments. Fixed facilities (e.g., permanent structures, etc.) within the HTA are prioritized for COLPRO based upon mission, criticality, assessments, and available funding. Expansion of COLPRO capabilities is planned, as appropriate and necessary, using transportable COLPRO systems.

### 11.9.3 Functional Solution Analysis

#### 11.9.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Not all critical facilities and activities are equipped with COLPRO.  
**Non-Materiel Solutions:** *Doctrine:* Enforce existing doctrine and policy.
2. **Deficiency:** COLPRO for other than radiological is almost nonexistent, including critical facilities, outside HTA OCONUS, particularly CONUS sites.  
**Non-Materiel Solutions:** *Doctrine:* Enforce existing doctrine and policy.
3. **Deficiency:** Expeditionary operations are a particular concern. Existing COLPRO systems are not generally designed for a highly mobile force, with a reduced logistical footprint, and the initial period of operations until the theater matures (usually the first 30–90 days).  
**Non-Materiel Solutions:** *Doctrine:* Complete the JCIDS process and central correlation/ comparison of national and strategic plans to identify CBRND resources necessary and available to support expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct expeditionary operations while possessing reduced logistical footprint and during the first 30–90 days of operations following commencement of hostilities. *Training:* Train, exercise, and evaluate expeditionary capabilities of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operations using CBRND resources supporting expeditionary operations. *Leadership:* Recognize differences and challenges associated with expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint; training providing skills and knowledge to manage operations in these circumstances; and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.
4. **Deficiency:** Expedient COLPRO (ECP) kits, procedures, and training do not currently exist.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, procedures, and TTPs the use and application of ECP for CBRND. *Organization:* Organizational structures supporting the application of ECP for CBRND. *Training:* Institutional and unit level training on the application of ECP to support operations and provide for CBRND of the force. *Leadership:* Awareness and knowledge of versatility and application of ECP for operations within a CBRN/TIM environment. *Facilities:* Infrastructure to support ECP (e.g., logistics, training, etc.).
5. **Deficiency:** Maneuvering forces are inadequately equipped with COLPRO capabilities.

**Non-Materiel Solutions:** *Doctrine:* Complete the JCIDS process and central correlation/ comparison of national and strategic plans to identify CBRND resources necessary and available to support maneuver operations, particularly expeditionary operations during the first 30–90 days following commencement of hostilities, with a reduced logistical footprint. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct maneuver operations, particularly expeditionary operations during the first 30–90 days of operations following commencement of hostilities, while possessing reduced logistical footprint. *Training:* Train, exercise, and evaluate maneuver capabilities (particularly expeditionary capabilities) of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operations using organic, prepositioned, and planned CBRND resources supporting operations. *Leadership:* Recognize differences and challenges associated with maneuver operations, particularly expeditionary operations during the first 30–90 days following commencement of hostilities, with a reduced logistical footprint; training providing skills and knowledge to manage operations in these circumstances; and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.

6. **Deficiency:** Insufficient COLPRO is available to support rest and resupply activities for all personnel within a 24-hour period necessary to support sustained operations within a contaminated environment. This statement is particularly true of forward-operating light forces.

**Non-Materiel Solutions:** *Doctrine:* Enforce existing doctrine and policies.

7. **Deficiency:** Current doctrine, policies, plans, and TTPs do not adequately address sustained operations within a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, and procedures sustained operations within a CBRN/TIM environment. *Organization:* Ensure resources, taskings, and staff are in place or available to perform sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.

8. **Deficiency:** Current mobile COLPRO is inadequate in quantities, types, and availability to support operations by highly mobile forces.

**Non-Materiel Solutions:** *Doctrine:* Completion of analysis and central correlation/ comparison of national and strategic plans to identify quantities and types of mobile COLPRO (and supporting consumables) necessary and available to support highly mobile forces for envisioned plans and taskings. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct CBRND, including mobile COLPRO, of highly mobile forces. *Training:* Train, exercise, and evaluate CBRND, including mobile COLPRO, capabilities of the force in a CBRN/TIM threat during highly mobile force operations. *Leadership:* Recognize differences and challenges associated with CBRND

operations by highly mobile forces; training providing skills and knowledge to manage operations in these circumstances; and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities*: Develop supporting infrastructure for CBRND of highly mobile forces.

**9. Deficiency:** Airlift (both tactical and strategic) are not equipped with COLPRO.

**Non-Materiel Solutions:** *Doctrine*: Incorporate into doctrine, policy, and procedures the provision of COLPRO to aircrew and passengers in appropriate airframes (military and civilian). *Training*: Train, exercise, and evaluate aircrews and supporting entities for airframe COLPRO operations for CBRND. *Leadership*: Recognize criticality of protecting aircrew and passengers of appropriate tactical and strategic airframes from the effects of CBRN/TIM agents. *Facilities*: Develop supporting infrastructure (e.g., logistics, aircraft maintenance, etc.) for airframe COLPRO.

**10. Deficiency:** Most naval vessels (including supply and transport vessels, carriers, and others) do not possess COLPRO.

**Non-Materiel Solutions:** *Doctrine*: Incorporate into doctrine, policy, and procedures the provision of COLPRO for at-risk vessels (civilian contract and military). *Organization*: Develop organizational structures, resources, staffing, and capabilities to support COLPRO operations on vessels supporting operations and at risk. *Training*: Train, exercise, and evaluate crews for vessel COLPRO operations for CBRND. *Leadership*: Recognize differences and challenges associated with CBRND operations by at-risk vessels (both military and contract civilian) supporting operations. *Facilities*: Develop supporting infrastructure (e.g., logistics, maintenance, power systems, etc.) for vessel COLPRO.

**11. Deficiency:** Service-specific COLPRO capabilities are not generally integrated in COCOM joint plans.

**Non-Materiel Solutions:** *Doctrine*: Emphasize in doctrine, policy, and procedures the central correlation of national and Strategic Theater plans and taskings to identify CBRN/TIM support requirements for two or more concurrent operations with threat with comparison to existing and programmed quantities and types of CBRND systems and resources, joint and Service-specific, including replenishment. *Leadership*: Implement development of plans and taskings consistent joint and Service-specific CBRND support capabilities.

**12. Deficiency:** Current CPSs are inadequate to support expeditionary operations, particularly in austere environments by highly mobile forces and possessing reduced logistical footprint.

**Non-Materiel Solutions:** *Doctrine*: Incorporate into doctrine, policy, and procedures standards for expeditionary forces possessing reduced logistical footprint during the first 30–90 days of operations following commencement of hostilities. *Organization*: Develop organizational structures, resources, staffing, and capabilities to conduct expeditionary operations while possessing reduced logistical footprint and during the first 30–90 days of operations following commencement of hostilities. *Training*: Train, exercise, and evaluate expeditionary capabilities of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operation using CBRND resources supporting

expeditionary operations. *Leadership*: Recognize differences and challenges associated with expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint, training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities*: Develop supporting infrastructure for expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.

**13. Deficiency:** Current DOTMLPF does not adequately address the establishment and operation of expedient COLPRO activities and measures.

**Non-Materiel Solutions:** *Doctrine*: Establish in doctrine, policy, procedures, and TTPs the use and application of ECP for CBRND. *Organization*: Organizational structures supporting the application of ECP for CBRND. *Training*: Institutional and unit level training on the application of ECP to support operations and provide for CBRND of the force. *Leadership*: Awareness and knowledge of versatility and application of ECP for operations within a CBRN/TIM environment. *Facilities*: Infrastructure to support ECP (e.g., logistics, training, etc.).

#### 11.9.3.2 IMA Assessment Summary

N/A

**11.10 Task STSHLD 10: Employ protective measures to minimize the effects of adversary use of CBRN weapons and TIM exposure****11.10.1 Functional Area Analysis****11.10.1.1 Definition**

To protect resources (with an emphasis on people) from the effects of CBRN/TIM weapons/exposure and permit friendly forces to continue operations with minimum performance degradation. Staffs normally direct general protective actions, which delineate broad policy and guidance. Commanders must balance protection against the need to perform the mission and maintain personnel in a fit-to-fight status. The results of not performing protective tasks adequately are degradation of mission or task performance as well as casualties/fatalities from CBRN/TIM exposure or contamination.

**11.10.1.2 Derivation**

*Joint Enabling Concept for CBRN/TIM Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (ST 2.4.1, ST 2.4.1.1, ST 2.4.1.2, St 5.3.1.1, ST 5.3.1.2, ST 5.3.1.3, ST 5.3.1.4, ST 5.4.1, ST 6, ST 6.1.6, ST 6.2, ST 6.2.1, ST 6.2.2, ST 9, ST 9.3, ST 9.4, ST 9.5).*

Perform this task under conditions of:

**Physical**

1. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Partially completed mission preparation. (C2.1.3)
2. Marginal to strong forces assigned. (C2.2.1)
3. Adequate forces allocated. (C2.2.3)
4. Negligible personnel experience. (C2.2.4.5)
5. Partial interoperability. (C2.2.6)
6. Partial joint staff integration. (C2.3.1.1)
7. Moderate staff expertise. (C2.3.1.3)
8. Limited deployed supplies. (C2.8.2)

9. Limited prepositioned materiel. (C2.8.4)
10. Limited host-nation support. (C2.8.5)

Civil. N/A

## **11.10.2 Functional Needs Analysis**

### **11.10.2.1 Capability and Deficiency Assessment Summary**

Table 11.10-1 discusses the only capability that exists to perform the task to the designated standard. Doctrine, policy, and procedures exist for the implementation, adjustment, and direction of planned CBRND measures for the protection of deploying military forces against the effects of adversary employment of CBRN/TIM. Deficiencies include the lack of medical prophylaxis against all threat CBRN/TIM agents, eligible civilian and MWA readiness for CBRND, and sustained operations within a CBRN/TIM environment.

#### **Current Capability and Deficiency**

Predeployment planning and preparation includes the vaccination of the force to an adequate level of acquired immunity against threat CBRN/TIM agents. Other prophylaxis (e.g., presymptomatic medications, protective creams, etc.) are applied alone or in concert upon direction as appropriate and based upon established plans and guidance. JMETLs are developed based upon the *UJTL* and identify essential tasks for mission accomplishment. Plan-identified forces are trained and assessed against the JMETLs for readiness to perform the tasks. The combination of established force organic assets, materiel acquisitions, prepositioned materiel, available host-nation/coalition contributions, and movement of identified CBRND resources from stockpiles and relocation activities are performed as outlined in the plan and adjusted as necessary. Planning and plan execution seeks to balance mission requirements with CBRND protection of the force. DOTLPF is adequate for planning, training, equipping, and deploying military forces. Deficiencies the lack of medical prophylaxis against all threat CBRN/TIM agents and the efficacy of existing prophylaxis (particularly vaccines) widely varies. Current prophylaxis and supporting CBRND doctrine, policy, and procedures fail to adequately address the application of prophylactic protection by eligible civilians and MWDs. Further, eligible civilians and MWDs are not adequately equipped, trained, and prepared to survive a CBRN/TIM environment. Current doctrine, policy, *UJTL*, procedures, and TTPs fail to address sustained operations within a CBRN/TIM environment and exercises/evaluations fail to emphasize and assess task performance (including JMETLs) in these conditions. The overall current capability is assessed as “yellow.”

#### **Projected Near/Mid-Term Capability and Deficiency**

No change is projected for this task.

#### **Projected Far-Term Capability and Deficiency**

No change is projected for this task.

Table 11.10-1. STSHLD 10: Capability and Deficiency Assessment

Capability: COCOM HQ	M1	M2	M3	M4	M5	M6
Current Overall Capability <sup>1</sup>	R <sup>2</sup>	R <sup>3</sup>	Y <sup>4</sup>	Y <sup>5</sup>	G <sup>6</sup>	G <sup>7</sup>
Near/Mid-Term Overall Capability	R	R	Y	Y	G	G
Far-Term Overall Capability	R	R	Y	Y	G	G

	FAA Measure	Scale
M1	Forces are protected by medical prophylaxes.	<p><b>G:</b> Medical CBRND countermeasures exist for all threat CBRN and high-risk TIM agents and encompass all eligible at-risk populations.</p> <p><b>Y:</b> Medical CBRND countermeasures exist for selected high-threat CBRN and high-risk TIM agents for U.S. military and eligible civilian members.</p> <p><b>R:</b> Medical CBRND countermeasures are inadequate or do not exist for high-threat CBRN and high-risk TIM agents.</p>
M2	Forces are trained and equipped to operate in a CBRN/TIM environment.	<p><b>G:</b> All Strategic Theater forces (military, eligible civilians, and MWAs) are adequately trained and equipped to perform their functions and conduct operations within a CBRN/TIM environment.</p> <p><b>Y:</b> Military personnel and eligible civilians supporting the mission are adequately trained and equipped to perform their functions and conduct operations within a CBRN/TIM environment.</p> <p><b>R:</b> Equipping and/or training of Strategic Theater forces (including military, eligible civilians, and/or MWAs) to perform functions and conduct operations within a CBRN/TIM environment is inadequate or nonexistent.</p>
M3	All units that perform JMETs are fully prepared to successfully perform the tasks in a CBRN/TIM environment.	<p><b>G:</b> All units performing JMETLs are fully prepared and ready to successfully conduct their tasks within a CBRN/TIM environment.</p> <p><b>Y:</b> Units performing JMETLs are generally prepared and ready to successfully conduct their tasks within a CBRN/TIM environment.</p> <p><b>R:</b> Units performing JMETLs are inadequately prepared and/or ready to successfully conduct their tasks within a CBRN/TIM environment.</p>
M4	Deploying forces meet CBRN/TIM protection standards.	<p><b>G:</b> All Strategic Theater forces (military, eligible civilians, and MWA) meet CBRN/TIM protection requirements to perform their functions and conduct operations within a CBRN/TIM environment.</p> <p><b>Y:</b> Military personnel and eligible civilians supporting the mission meet CBRN/TIM protection requirements to perform their functions and conduct operations within a CBRN/TIM environment.</p> <p><b>R:</b> Strategic Theater forces (including military, eligible civilians, and/or MWA) meeting CBRN/TIM protection requirements to perform functions and conduct operations within a CBRN/TIM environment are inadequate or nonexistent.</p>
M5	Warfighting capability is not degraded as a result of enemy CBRN/TIM attacks.	<p><b>G:</b> Warfighting capabilities are protected and are not degraded and/or unavailable as a result of CBRN/TIM attacks.</p> <p><b>Y:</b> Warfighting activities and functions are afforded protection and are not seriously degraded and/or unavailable as a result of CBRN/TIM attacks.</p> <p><b>R:</b> Protection of warfighting capabilities is inadequate or nonexistent and may result in serious degradation or non-availability resulting from CBRN/TIM attacks.</p>

M6	Adequate resources are available to implement the required protective measures.	<p><b>G:</b> CBRND systems and resources are available in plan identified quantities and types to implement identified protective measures.</p> <p><b>Y:</b> CBRND systems and resources are available in sufficient quantities and types to support protective measures. Adjustments are made to adjust to limitations in quantities and types of specific CBRND systems.</p> <p><b>R:</b> CBRND systems and/or resources are inadequate or not available to implement protective measures.</p>
----	---	--

<sup>1</sup> DOTMLPF is adequate for planning, training, equipping, and deploying forces. However, DOTMLPF is inadequate to support sustained operations within a CBRN/TIM environment, particularly expeditionary operations, during the first 30–60 days. Current DOTMLPF does not fully address the unique aspects of CBRND and the impact upon operations within a CBRN/TIM environment. Current DOTMLPF is inadequate for preparing, training, and equipping deploying eligible civilians and MWAs.

<sup>2</sup> Medical prophylaxis does not exist for all threat CBRN/TIM and TIM agents. Current prophylaxis and supporting doctrine, policy, and procedures do not address presymptomatic medical CBRN/TIM protective countermeasures by other than U.S. forces, excluding MWAs and eligible civilians. Prophylaxis against most high-threat TIMs is not currently available due to the relatively recent consideration of these agents as potential threats. Additionally, the efficacy of existing prophylaxis, particularly vaccines, widely varies. FP using medical prophylaxis is dependent upon identification of the threat, preplanning for a threat, positioning of stocks for issue and administration, timing of notification to administer/issue prophylaxis, availability of medical personnel to perform administration (if required), ongoing operational requirements, and the available quantity of sufficient medical prophylaxis to meet requirements. Vaccination to acquired immunity by force personnel prior to entry into the theater or completion of an adequate level of acquired immunity prior to adversary CBRN/TIM agent employment is a function of the preplanning and deployment operations. However, many agents require the application of, if not in concert with vaccination, of other prophylaxis. These include immunity assistive and barrier medical materials (e.g., medications, lotions, etc.). The COCOM staff directs the implementation of these measures when and as appropriate based upon established plans and guidance.

<sup>3</sup> Planning for deploying forces includes training for operations within threat CBRN/TIM environments. Nondeploying military forces within CONUS possess varying levels of training based upon prior training at overseas locations and initial Service training (“boot camp”). OCONUS fixed-site military personnel within an HTA are trained to survive a CBRN/TIM environment. Eligible civilians are not generally trained to operate in CBRN/TIM hazards. Some government civilians are trained as part of their primary function (e.g., hazardous materials, fire response, readiness flight [Air Force], and selected others.). However, civilians (e.g., general government employees, contractors, dependents, etc.) do not receive training to survive a CBRN/TIM environment. This statement is particularly true of CONUS locations. MWA elements of the military force (deploying and nondeploying) are not trained to survive a CBRN/TIM environment. COCOM staff does not possess clear guidance for planning and providing CBRN/TIM protection training to eligible civilians and MWA. The Guardian Program, working with the COCOMs and installations, is addressing installation/facility event capabilities. The COCOM staff preplanning for operations also includes continuing training of personnel within the theater prior to hostilities.

<sup>4</sup> The COCOM staff developed JMETLs are based upon the UJTLs and the essential tasks for accomplishment of the planned mission(s). Plan-identified forces are trained and assessed against the JMETLs for their readiness to perform the tasks successfully. However, current doctrine, the UJTL, and operational planning guidance do not adequately address sustained operations within a CBRN/TIM environment. JMETL development generally does not specify these circumstances as an execution condition. Exercises and training do not emphasize task performance and operations in these conditions. However, the JMETLs can usually be accomplished successfully with adjustments for the environment and allowances for the limitations and encumbrances associated with CBRN/TIM protective equipment.

<sup>5</sup> The combination of established force organic assets, material acquisitions, prepositioned material, available host-nation/coalition contributions, and movement of identified CBRND resources from stockpiles and reallocation activities pursued by the COCOM staff during the period prior to and through deployment of forces are as outlined by the appropriate plan and adjusted as necessary to reflect actual available resources against requirements. Elements of deploying forces may not achieve full CBRND readiness and capabilities during the initial stages of deployment and until after arrival within the AOR. Adjustments to tasked units reflecting other ongoing commitments and the length of the preparatory period between plan notice of execution and before commencement of hostilities may affect element readiness for CBRN/TIM environment operations. Additionally, deploying eligible civilians and MWAs (particularly MWDs) are not generally prepared to survive a CBRN/TIM environment.

<sup>6</sup> The COCOM staff planning and plan execution seeks to balance mission requirements with protection of the force against CBRN/TIM threat(s). Planning considers the impact of operations within CBRN/TIM environments and provide for adjustments to ensure successful retention of warfighting capabilities. Operations within a CBRN/TIM environment will degrade individual and unit capabilities. The combination of training, readiness, and flexibility to adjust and maintain operational capabilities provides the basis for maintenance of mission capability. However, current DOTMLPF and operational planning do not adequately address sustained operations within a CBRN/TIM environment.

<sup>7</sup> The combination of established force organic assets, material acquisitions, prepositioned material, available host-nation/coalition contributions, and movement of identified CBRND resources from stockpiles and reallocation activities pursued by the COCOM staff during the period prior to and through deployment of forces are as outlined by the appropriate plan and adjusted as necessary to reflect actual available resources against requirements. Elements of deploying forces may not be issued their full CBRND capabilities during the initial stages of deployment and until after arrival within the AOR. The COCOM staff also provides guidance and direction on the implementation of planned protective measures. However, deploying eligible civilians and MWAs (particularly MWDs) are not generally equipped and prepared to survive a CBRN/TIM environment.

### 11.10.3 Functional Solution Analysis

#### 11.10.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Current prophylaxis and supporting doctrine, policy, and procedures do not address presymptomatic medical CBRN/TIM protective countermeasures by other than U.S. forces, excluding eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing eligible civilians during CBRND operations and the provision of CBRND protection, including prophylaxis. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians.

2. **Deficiency:** Current prophylaxis and supporting doctrine, policy, and procedures do not address presymptomatic medical CBRN/TIM protective countermeasures by other than U.S. forces, excluding MWAs.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing MWAs, particularly MWDs, during CBRND operations and the provision of CBRND protection, including prophylaxis. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWAs.

3. **Deficiency:** Prophylaxis against most high-threat TIMs are not currently available.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of metrics for standards and criteria for protection against all high-threat TIM agents. *Training:* Train, exercise, and evaluate personnel (military and eligible civilians) on the use of prophylactic CBRND protection against threat agents. *Leadership:* Enforce compliance with established metrics (see Footnote 7 above) for standards and criteria. Implement and ensure training is adequate and conduct exercises and evaluations to ensure readiness.

4. **Deficiency:** Eligible civilians (e.g., general government employees, contractors, dependents, etc.) are not generally trained to operate in CBRN/TIM hazards, particularly at CONUS locations.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing eligible civilian personnel and operations for CBRND. *Organization:* Identify organizational services and activities supporting the mission performed by civilian personnel and operations. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilian personnel and operations supporting the mission; and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND

training, equipping, and protection of eligible civilian personnel and operations supporting the mission. *Personnel*: Ensure eligible civilian personnel and operations supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities*: Develop supporting infrastructure for the acquisition, stockpiling, prepositioning, maintenance, and movement of eligible civilian CBRND resources.

5. **Deficiency**: MWAs, with emphasis on MWD elements of the military force (deploying and nondeploying), are not trained to survive a CBRN/TIM environment.

**Non-Materiel Solutions**: *Doctrine*: Establish doctrine, policy, and procedures CBRND protection of MWAs, particularly MWDs, and training for CBRN/TIM environment survival. *Organization*: Organizational consideration for maintenance and support of MWA CBRND protective equipment, measures, and activities. *Training*: Develop institutional and unit training of handlers and MWAs for CBRND measures and activities. *Leadership*: Ensure awareness and planning for CBRND measures and requirements for MWD survivability. *Facilities*: Develop supporting infrastructure for MWAs CBRND (e.g., logistics, veterinary surveillance, etc.).

6. **Deficiency**: COCOM staff does not possess clear guidance for planning and providing CBRN/TIM protection training to eligible civilians.

**Non-Materiel Solutions**: *Doctrine*: Develop doctrine, policy, and procedures addressing eligible civilian personnel and operations for CBRND. *Organization*: Identify organizational services and activities performed by, and required to support, eligible civilian personnel and operations for CBRND. *Training*: Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilian personnel and operations; and conduct CBRND training, exercises, and evaluations. *Leadership*: Implement and manage CBRND training, equipping, and protection of eligible civilian personnel and operations supporting the mission. *Personnel*: Ensure eligible civilian personnel and operations supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities*: Develop supporting infrastructure for the acquisition, stockpiling, prepositioning, maintenance, and movement of eligible civilian CBRND resources.

7. **Deficiency**: COCOM staff does not possess clear guidance for planning and providing CBRN/TIM protection training to MWAs.

**Non-Materiel Solutions**: *Doctrine*: Develop doctrine, policy, and procedures addressing MWAs, particularly MWDs and operations for CBRND. *Organization*: Identify organizational services and activities performed by, and required to support, MWAs and operations for CBRND. *Training*: Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and operations; and conduct CBRND training, exercises, and evaluations. *Leadership*: Implement and manage CBRND training, equipping, and protection of MWAs and operations supporting the mission. *Facilities*: Develop supporting infrastructure for the acquisition, stockpiling, prepositioning, maintenance, and movement of MWA CBRND resources.

- 8. Deficiency:** Current doctrine, the *UJTL*, and operational planning guidance do not adequately address JMETLS for sustained operations within a CBRN/TIM environment.  
**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, procedures, and *UJTL* sustained operations within a CBRN/TIM environment. *Organization:* Ensure resources, taskings, and staff are in place or available to plan and perform sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.
- 9. Deficiency:** JMETL development generally does not specify sustained operations within a CBRN/TIM environment as an execution condition.  
**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, procedures, and *UJTL* sustained operations within a CBRN/TIM environment. *Organization:* Ensure resources, taskings, and staff are in place or available to plan and perform sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.
- 10. Deficiency:** Exercises and training do not emphasize JMETL task performance and sustained operations in a CBRN/TIM environment.  
**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, *UJTL*, and procedures sustained operations within a CBRN/TIM environment. *Organization:* Ensure resources, taskings, and staff are in place or available to plan and perform sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.
- 11. Deficiency:** Deploying eligible civilians are not generally equipped and prepared to survive a CBRN/TIM environment.  
**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of eligible civilians and training for CBRN/TIM environment survival. *Organization:* Organizational consideration for maintenance and support of eligible civilians CBRND protective equipment, measures, and activities. *Training:* Develop institutional and unit training of eligible civilians for CBRND measures and activities. Integration into CBRND exercises and evaluations is critical. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for eligible civilians survivability. *Personnel:* Ensure eligible civilian personnel and operations supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities:* Develop supporting infrastructure for eligible civilians CBRND (e.g., logistics, medical, communications, training, etc.).

**12. Deficiency:** Deploying MWAs (particularly MWDs) are not generally equipped and prepared to survive a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of MWA, particularly MWDs and training for CBRN/TIM environment survival. *Organization:* Organizational consideration for maintenance and support of MWA CBRND protective equipment, measures, and activities. *Training:* Develop institutional and unit training of MWA handlers, and MWAs for CBRND measures and activities. Integration into CBRND exercises and evaluations is critical. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for MWA survivability. *Facilities:* Develop supporting infrastructure for MWA CBRND (e.g., logistics, medical, veterinary surveillance, communications, training, etc.).

**13. Deficiency:** DOTMLPF is inadequate to support sustained operations within a CBRN/TIM environment, particularly expeditionary operations, during the first 30–60 days.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, and procedures sustained operations within a CBRN/TIM environment. *Organization:* Ensure resources, taskings, and staff are in place or available to perform sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force (military and eligible civilians) for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force. *Personnel:* Ensure eligible civilian personnel and operations supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment.

**14. Deficiency:** Current DOTMLPF does not fully address the unique aspects of CBRND and the impact upon operations within a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, procedures, and *UJTL* sustained operations within a CBRN/TIM environment. *Organization:* Ensure resources, taskings, and staff are in place or available to plan and perform sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force. *Personnel:* Ensure eligible civilian personnel and operations supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment.

**15. Deficiency:** Current DOTMLPF is inadequate for preparing, training, and equipping deploying eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing eligible civilian personnel for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of eligible civilian personnel within a

CBRN/TIM environment. *Training*: Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRND training, exercises, and evaluations. *Leadership*: Implement and manage CBRND training, equipping, and protection of eligible civilian personnel. *Personnel*: Ensure eligible civilian personnel and operations supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities*: Develop supporting infrastructure for eligible civilians CBRND (e.g., logistics, medical, communications, training, etc.).

**16. Deficiency:** Current DOTMLPF is inadequate for preparing, training, and equipping deploying MWAs.

**Non-Materiel Solutions:** *Doctrine*: Develop doctrine, policy, and procedures addressing MWAs, particularly MWDs, for CBRND. *Organization*: Identify organization services and activities necessary to support survivability of MWAs within a CBRN/TIM environment. *Training*: Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations. *Leadership*: Implement and manage CBRND training, equipping, and protection of MWAs. *Facilities*: Develop supporting infrastructure for MWA CBRND (e.g., logistics, medical, communications, training, etc.).

#### 11.10.3.2 IMA Assessment Summary

N/A

**11.11 Task STSHLD 11: Ensure adequate CBRN/TIM protective equipment and supplies to support medical operations****11.11.1 Functional Area Analysis****11.11.1.1 Definition**

To position medical and support resources (equipment, supplies, and personnel) to ensure the efficient and consistent application of medical care and measures preparing and protecting the force against the debilitating effects of CBRN/TIM hazards (threat or actual). This task includes the identification, movement, application, and management of CBRND and medical resources. These resources perform immunizations of the force and eligible civilians, isolate infected or contaminated personnel and/or MWAs until risk is resolved, and conduct quarantine to prevent the spread of infectious disease. The task addresses the full range of necessary resources required to attend to and resolve the circumstances.

**11.11.1.2 Derivation**

*Joint Enabling Concept for CBRN/TIM Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (ST 1.1.2, ST 2.4.1.1, ST 4.2.2, ST 5.1.1, ST 5.1.3, ST 5.2.1, ST 5.3.3, ST 5.4.1, ST 6, ST 7.1.1, ST 9.4).*

**11.11.1.2.1 Supported Task: SNSHLD 12****11.11.1.2.2 Lateral Task: STSHA 4****11.11.1.2.3 Supporting Task: N/A****11.11.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Undeveloped to highly developed land. (C1.1)
2. Riverine to open sea. (C1.2)
3. Natural and induced air. (C1.3)
4. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Partially completed mission preparation. (C2.1.3)
2. Marginal to strong forces assigned. (C2.2.1)
3. Fair personnel nutrition and health. (C2.2.4.1)
4. Good personnel physical conditioning (C2.2.4.3)

5. Poor mission-essential government-service civilian physical conditioning. (C2.2.4.3 – NEW)
6. Poor mission-essential contract-service civilian physical conditioning. (C2.2.4.3 – NEW)
7. Negligible personnel experience. (C2.2.4.5)
8. Partial interoperability. (C2.2.6)
9. Partial joint staff integration. (C2.3.1.1)
10. Limited deployed supplies. (C2.8.2)
11. Sufficient CONUS resupply. (C2.8.3)
12. Limited prepositioned materiel. (C2.8.4)
13. Limited host-nation support. (C2.8.5)
14. Extensive commercial procurement. (C2.8.6)

### Civil

1. Fair civil health. (C3.3.1.4)
2. High health risk. (C3.3.1.5)

## 11.11.2 Functional Needs Analysis

### 11.11.2.1 Capability and Deficiency Assessment Summary

Table 11.11-1 discusses the two capabilities existing to perform the task to the designated standard. The COCOM and staff identify the required capabilities, conduct planning and coordination to identify CBRND resources, requirements, and taskings for CBRND. This task includes the integration of medical operations and support requirements for CBRND as well as the direction for development of supporting medical plans and procedures. Doctrine, policy, and procedures exist for the planning, equipping, and deployment of forces and coordination of Medical Services support for CBRND operations. Deficiencies include inadequacies in DOTLPF addressing eligible civilians and MWDs for CBRND, and sustained operations within a CBRN/TIM environment. The second capability is within Medical Services and the Medical Services staffs. They coordinate with the COCOM and COCOM staff to address medical aspects and support requirements for COCOM planning and operations. The Medical Services staff(s) prepare medical plans to support COCOM plans and include CBRND considerations and requirements in the plans. The staff further identifies required capabilities and conducts planning and coordination to identify medical and support resources to ensure medical care and measures to prepare and protect the force, including the identification, movement, application, and management of medical service and medical CBRND resources. Adequate DOTLPF exists for planning, equipping, and deploying of forces, and for coordination of Medical Services support. Deficiencies include inadequacies in DOTLPF for preparing and equipping deploying eligible civilians and MWD; sustained operations in CBRN/TIM environments; and addressing large-scale medical operations, especially quarantine operations potentially involving non-U.S. personnel.

**Current Capability and Deficiency**

The COCOM and Medical Services staff planning includes predeployment medical screening and the stockpiling, allocation, and distribution of medical prophylaxis. COCOM plans generally address medical measures in generic terms and refer to implementing or topic medical plans. The Medical Services staff planning addresses the specifics to perform medical activities and procedures in support of the COCOM plans. Specific implementation for the application of prophylactic immunizations is addressed in the Medical Services plans supporting COCOM plans. Planning for large-scale medical operations are coordinated by the Medical Services Staffs with the COCOM staff for COCOM planning support and appropriate resourcing. COCOM plans address medical activities by referring to appropriate medical plans, policies, and procedures. The Medical Services Staff plans and associated policies address medical activities and procedures. The invocation of quarantine and enforcement of medical isolation are Medical Services decisions, coordinated with the COCOM and COCOM staff, supported by the COCOM, and are a consideration for medical planning for operations with a CBRN/TIM threat. The prevention of the need for stringent mass medical activity includes predeployment screening, the provision of medical prophylaxis, and medical surveillance. Coordination between the COCOM and Medical Services staffs provides for an integrated and rapid response to an event. Should large-scale medical operations be required (e.g., mass immunizations, quarantine, etc.), both staffs respond applying their resources as appropriate. Deficiencies include inadequate DOTLPP to address large-scale medical CBRN/TIM operations; particularly sustained operations within a CBRN/TIM environment. FP using medical prophylaxis is dependent upon identification of the threat, preplanning for a threat, positioning of stocks for issue and administration, timing of notification to administer/issue prophylaxis, availability of medical personnel to perform administration (if required), ongoing operational requirements, and the available quantity of sufficient medical prophylaxis to meet requirements. Vaccination to achieve acquired immunity by force personnel prior to entry into the theater or completion of an adequate level of acquired immunity prior to adversary CBRN/TIM agent employment is a function of the preplanning and deployment operations. However, many agents require the application of, if not in concert with vaccination, of other prophylaxis. These include immunity assistive and barrier medical materials (e.g., medications, lotions, etc.). The COCOM staff directs the implementation of these measures when and as appropriate based upon established plans and guidance. The Medical Services Staff administers and issues these measures upon direction of the COCOM and as based upon established Medical Services plans and guidance. COCOM and Medical Services actions associated with large-scale medical operations (especially those involving non-U.S. personnel such as indigenous civilians, third-party nations, and others) is not adequately discussed and outlined in DOTLPP. Medical prophylaxis does not exist for all threat CBRN/TIM agents. Efficacy of the medical prophylaxis that does exist widely varies. Their application to eligible civilians and MWAs is inadequately addressed in existing DOTLPP. DOTLPP is also inadequate for large-scale medical quarantine and/or enforcement of medical isolation by both Medical Services and the COCOM. The overall current capability is “yellow.”

**Projected Near/Mid-Term Capability and Deficiency**

No change is projected for this task.

**Projected Far-Term Capability and Deficiency**

No change is projected for this task.

Table 11.11-1. STSHLD 11: Capability and Deficiency Assessment

Capabilities/Measures	M1	M2	M3	M4	M5

	FAA Measure	Scale
M1	Plans exist for large-scale medical operations addressing CBRN/TIM.	<p><b>G:</b> Detailed plans exist and are coordinated between COCOM and Medical Services staffs for large-scale CBRN/TIM medical operations involving the forces and non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).</p> <p><b>Y:</b> Plans exist and are coordinated between COCOM and Medical Services staffs for Medical Services support of operations involving CBRN/TIM threat and address large-scale medical operations the forces and non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).</p> <p><b>R:</b> Plans addressing large-scale medical operations are inadequate, nonexistent, not coordinated between the COCOM and Medical Services staffs, and/or do not address the forces and/or non-U.S. personnel (e.g., indigenous civilians, third-party nations, etc.).</p>
M2	Theater policy addresses the conditions and authorities required to invoke quarantine and/or enforce medical isolation.	<p><b>G:</b> Detailed policies and plans exist and are coordinated between COCOM and Medical Services staffs specifying the conditions and appropriate authorities and actions/activities to invoke quarantine and/or enforce medical isolation for large-scale CBRN/TIM medical operations involving forces and non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.)</p> <p><b>Y:</b> Policies and plans exist and are coordinated between COCOM and Medical Services staffs for large-scale Medical Services operations involving quarantine and/or enforcement of medical isolation..</p> <p><b>R:</b> Plans and policies addressing large-scale medical quarantine and/or medical isolation are inadequate, nonexistent, and/or are not coordinated between the COCOM and Medical Services staffs.</p>
M3	Forces are protected by medical prophylaxes.	<p><b>G:</b> Medical CBRND countermeasures exist for all threat CBRN and high-risk TIM agents and encompass all eligible at-risk populations.</p> <p><b>Y:</b> Medical CBRND countermeasures exist for selected high-threat CBRN and high-risk TIM agents for U.S. military and eligible civilian members.</p> <p><b>R:</b> Medical CBRND countermeasures are inadequate or do not exist for high-threat CBRN and high-risk TIM agents.</p>

M4	Force has completed deployment medical preparation.	<b>G:</b> Strategic Theater forces are medically prepared for operations with threat. <b>Y:</b> Selected Strategic Theater forces generally are generally medically prepared for operations with threat. <b>R:</b> Strategic Theater forces medical preparedness for operations with threat is inadequate or nonexistent.
M5	All required protective supplies and equipment are available.	<b>G:</b> CBRND systems, components, and consumables are available in plan identified quantities and types to support sustained large-scale medical operations involving the forces and non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.) within a CBRN/TIM environment. <b>Y:</b> CBRND systems, components, and consumables are identified in plans and are adjusted to limitations in quantities and types to support medical operations involving CBRN/TIM threat. <b>R:</b> CBRND systems, components, and consumables are inadequate or insufficient to support medical operations involving CBRN/TIM threat.

<sup>1</sup> COCOM staff plans includes predeployment medical screening and the stockpiling, allocation, and distribution of medical prophylaxis. Specific implementation for the application of prophylactic immunizations is address in medical support plans. Planning for large-scale medical operations are coordinated by the Medical Services staffs with the COCOM staff for COCOM support and appropriate resourcing. However, DOTMLPF is inadequate to address large-scale medical CBRN/TIM operations, particularly sustained operations within a CBRN/TIM environment and/or COCOM actions associated with large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>2</sup> COCOM plans address medical activities by referring to appropriate medical plans, policies, and procedures. The invocation of quarantine and enforcement of medical isolation are within the purview of medical authorities. The COCOM staff provides support as defined in the coordinated and appropriate medical plans. However, DOTMLPF is inadequate to address COCOM actions associated with medical quarantine and/or enforcement of medical isolation involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>3</sup> Medical prophylaxis does not exist for all threat CBRN/TIM and TIM agents. Current prophylaxis and supporting doctrine, policy, and procedures do not address presymptomatic medical CBRN/TIM protective countermeasures by other than U.S. forces, excluding MWA and eligible civilians. Prophylaxis against most high-threat TIMs are not currently available due to the relatively recent consideration of these agents as potential threats. Additionally, the efficacy of existing prophylaxis, particularly vaccines, widely varies. FP using medical prophylaxis is dependent upon identification of the threat, preplanning for a threat, positioning of stocks for issue and administration, timing of notification to administer/issue prophylaxis, availability of medical personnel to perform administration (if required), ongoing operational requirements, and the available quantity of sufficient medical prophylaxis to meet requirements. Vaccination to achieve acquired immunity by force personnel prior to entry into the theater or completion of an adequate level of acquired immunity prior to adversary CBRN/TIM agent employment is a function of the preplanning and deployment operations. However, many agents require the application of, if not in concert with vaccination, of other prophylaxis. These include immunity assistive and barrier medical materials (e.g., medications, lotions, etc.). The COCOM staff directs the implementation of these measures when and as appropriate based upon established plans and guidance. However, the application of medical prophylaxis is not adequately addressed for eligible civilians and MWA within the force.

<sup>4</sup> The COCOM staff tracks the deployment status of tasked units throughout the deployment process. However, the routine rotation and movement of personnel to and from units, the administration period of some vaccines for acquired immunity, and other considerations impact completion of medical preparation for deployment. Completion of deployment medical preparation is contingent upon timing of notice to deployment, availability of medical personnel to perform force preparation, and the availability of sufficient medical prophylaxis to meet preparation requirements. Short-notice operations and reallocated taskings also impact medical preparations prior to deployment into theater. Forces have, and may in the future, require medical preparation upon arrival in the AOR. The COCOM staff plans generally include provisions for medical preparation of the force including both predeployment and AOR arrival. Supporting Medical Services plans, coordinated with the COCOM staff, discuss Medical Services activities to attain force preparedness for operations.

<sup>5</sup> The COCOM staff plans include the identification of CBRND supplies and equipment for operations with a CBRN/TIM threat. Equipping the tasked force is an integral part of planning and preparation. The combination of established force organic assets, materiel acquisitions, prepositioned materiel, available host-nation/coalition contributions, and movement of identified CBRND resources from stockpiles and reallocation activities are pursued by the Joint Task Force staff with the COCOM staff to prepare and support deploying forces as outlined by the appropriate plan. Systems are reallocated, when necessary, from prepositioned and dispersed stocks of units deploying or operating within a Joint Operations Area (JOA). Elements of deploying forces may not be issued their full CBRND capabilities during the initial stages of deployment and until after arrival within the AOR. Expeditionary operations are a particular concern. Mass medical operations may not be possible until the theater matures or additional resources are allocated to the

AOR. Additionally, deploying eligible civilians and MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment. The COCOM staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians and MWAs. Current doctrine and policy does not adequately address sustained operations within a CBRN/TIM environment. Large-scale medical activities and actions are not adequately addressed in DOTMLPF; especially those involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>6</sup> COCOM plan support planning by Medical Services staff includes predeployment medical screening and the stockpiling, allocation, and administration/ distribution of medical prophylaxis. Specific implementation for the application of prophylactic immunizations is addressed in the Medical Services plans. Planning for large-scale medical operations are coordinated by the Medical Services staffs with the COCOM staff for COCOM planning support and appropriate resourcing. However, DOTMLPF is inadequate to address large-scale medical CBRN/TIM operations, particularly sustained operations within a CBRN/TIM environment and/or Medical Services actions associated with large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>7</sup> The Medical Services staff plans and associated policies address medical activities and procedures. The invocation of quarantine and enforcement of medical isolation are within the purview of medical authorities and are a consideration for medical planning for operations with a CBRN/TIM threat. The Medical Services staff coordinates with the COCOM staff for Medical Services support requirements and associated taskings and their inclusion in COCOM staff planning. However, DOTMLPF is inadequate to address Medical Services actions associated with medical quarantine and/or enforcement of medical isolation involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>8</sup> Medical prophylaxis does not exist for all threat CBRN/TIM and TIM agents. Current prophylaxis and supporting doctrine, policy, and procedures do not address presymptomatic medical CBRN/TIM protective countermeasures by other than U.S. forces, excluding MWA and eligible civilians. Prophylaxis against most high-threat TIMs are not currently available due to the relatively recent consideration of these agents as potential threats. Additionally, the efficacy of existing prophylaxis, particularly vaccines, widely varies. FP using medical prophylaxis is dependent upon identification of the threat, preplanning for a threat, positioning of stocks for issue and administration, timing of notification to administer/issue prophylaxis, availability of medical personnel to perform administration (if required), ongoing operational requirements, and the available quantity of sufficient medical prophylaxis to meet requirements. Vaccination to achieve acquired immunity by force personnel prior to entry into the theater or completion of an adequate level of acquired immunity prior to adversary CBRN/TIM agent employment is a function of the preplanning and deployment operations. However, many agents require the application of, if not in concert with vaccination, of other prophylaxis. These include immunity assistive medical materials (e.g., medications, etc.). The Medical Services staff administers and issues these measures upon direction of the COCOM and as based upon established Medical Services plans and guidance. However, the application of medical prophylaxis is not adequately addressed for eligible civilians and MWA within the force.

<sup>9</sup> The Medical Services staff tracks the medical deployment status of tasked units throughout the deployment process. However, the routine rotation and movement of personnel to and from units, the administration period of some vaccines for acquired immunity, and other considerations impact completion of medical preparation for deployment. Completion of deployment medical preparation is contingent upon timing of notice to deployment, availability of medical personnel to perform force preparation, and the availability of sufficient medical prophylaxis to meet preparation requirements. Short-notice operations and reallocated taskings also impact medical preparations prior to deployment into theater. Forces have, and may in the future, require medical preparation upon arrival in the AOR. The Medical Services staff plans include provisions for medical preparation of the force including both predeployment and AOR arrival. The Supporting Medical Services plans, coordinated with the COCOM staff, task Medical Services and outline medical activities to attain force preparedness for operations.

<sup>10</sup> The COCOM and Medical Services staffs conduct coordinated planning for operations including the identification of CBRND supplies and equipment for operations with a CBRN/TIM threat. Equipping the tasked Medical Services units are an integral part of planning and preparation. The combination of established force organic assets, material acquisitions, prepositioned material, available host-nation/coalition contributions, and movement of identified CBRND resources from stockpiles and reallocation activities are pursued by the Medical Services staff with the COCOM staff to prepare and support deploying forces as outlined by the appropriate plan. Medical resources and systems are reallocated, when necessary and in coordination with the COCOM staff, from prepositioned and dispersed stocks of Medical Services units deploying or operating within the JOA. Expeditionary operations are a particular concern. Mass medical operations may not be possible until the theater matures or additional resources are allocated to the AOR. Additionally, deploying eligible civilians and MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment. The COCOM Medical Services staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians and MWA. Current doctrine and policy does not adequately address sustained operations within a CBRN/TIM environment. Large-scale medical activities and actions are not adequately addressed in DOTMLPF; especially those involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>11</sup> DOTLPF is adequate for planning, equipping, deployment of forces, and coordination of Medical Services support. DOTLPF is inadequate to support sustained operations (medical and nonmedical) within a CBRN/TIM environment, particularly expeditionary operations, during the first 30–60 days. Current DOTLPF does not fully address the unique

aspects of CBRND and the impact upon operations within a CBRN/TIM environment. Current DOTLPF is inadequate for preparing and equipping deploying eligible civilians and MWA. DOTLPF is also inadequate to address large-scale medical CBRN/TIM operations, particularly sustained operations within a CBRN/TIM environment and/or COCOM and Medical Services actions associated with large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.). DOTLPF is, further, inadequate for medical quarantine and/or enforcement of medical isolation involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nations, etc.).

<sup>12</sup> COCOM and Medical Services staff plans includes predeployment medical screening and the stockpiling, allocation, and distribution of medical prophylaxis. Specific implementation for the application of prophylactic immunizations is addressed in the Medical Services plans supporting COCOM plans. Planning for large-scale medical operations are coordinated by the Medical Services staffs with the COCOM staff for COCOM planning support and appropriate resourcing. DOTLPF is inadequate to address large-scale medical CBRN/TIM operations, particularly sustained operations within a CBRN/TIM environment and/or COCOM and Medical Services actions associated with large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>13</sup> COCOM plans address medical activities by referring to appropriate medical plans, policies, and procedures. The Medical Services staff plans and associated policies address medical activities and procedures. The invocation of quarantine and enforcement of medical isolation are within the purview of medical authorities and are a consideration for medical planning for operations with a CBRN/TIM threat. The Medical Services staff coordinates with the COCOM staff for Medical Services support requirements and associated taskings and their inclusion in COCOM staff planning. DOTLPF is inadequate to address COCOM and Medical Services actions associated with medical quarantine and/or enforcement of medical isolation involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>14</sup> FP using medical prophylaxis is dependent upon identification of the threat, preplanning for a threat, positioning of stocks for issue and administration, timing of notification to administer/issue prophylaxis, availability of medical personnel to perform administration (if required), ongoing operational requirements, and the available quantity of sufficient medical prophylaxis to meet requirements. Vaccination to achieve acquired immunity by force personnel prior to entry into the theater or completion of an adequate level of acquired immunity prior to adversary CBRN/TIM agent employment is a function of the preplanning and deployment operations. However, many agents require the application of, if not in concert with vaccination, of other prophylaxis. These include immunity assistive and barrier medical materials (e.g., medications, lotions, etc.). The COCOM staff directs the implementation of these measures when and as appropriate based upon established plans and guidance. The Medical Services staff administers and issues these measures upon direction of the COCOM and as based upon established Medical Services plans and guidance. Medical prophylaxis does not exist for all threat CBRN/TIM and TIM agents. Current prophylaxis and supporting doctrine, policy, and procedures do not address presymptomatic medical CBRN/TIM protective countermeasures by other than U.S. forces, excluding MWAs and eligible civilians. Prophylaxis against most high-threat TIMs are not currently available due to the relatively recent consideration of these agents as potential threats. Additionally, the efficacy of existing prophylaxis, particularly vaccines, widely varies. The application of medical prophylaxis is not adequately addressed for eligible civilians and MWAs within the force.

<sup>15</sup> The COCOM staff tracks the deployment status of tasked units throughout the deployment process. The Medical Services staff also tracks the medical deployment status of tasked units throughout the deployment process. However, the routine rotation and movement of personnel to and from units, the administration period of some vaccines for acquired immunity, and other considerations impact completion of medical preparation for deployment. Completion of deployment medical preparation is contingent upon timing of notice to deployment, availability of medical personnel to perform force preparation, and the availability of sufficient medical prophylaxis to meet preparation requirements. Short-notice operations and reallocated taskings also impact medical preparations prior to deployment into theater. Forces have, and may in the future, require medical preparation upon arrival in the AOR. The COCOM and Medical Service staff plans include provisions for medical preparation of the force including both predeployment and AOR arrival. Supporting Medical Services plans, coordinated with the COCOM staff, task Medical Services and outline medical activities to attain force preparedness for operations.

<sup>16</sup> The COCOM and Medical Services staffs conduct coordinated planning for operations including the identification of CBRND supplies and equipment for operations with a CBRN/TIM threat. Equipping the tasked Medical Services units are an integral part of planning and preparation. The combination of established force organic assets, material acquisitions, prepositioned material, available host-nation/coalition contributions, and movement of identified CBRND resources from stockpiles and reallocation activities are pursued by the Medical Services staff with the COCOM staff to prepare and support deploying forces as outlined by the appropriate plan. Medical resources and systems are reallocated, when necessary and in coordination with the COCOM staff, from prepositioned and dispersed stocks of Medical Services units deploying or operating within the JOA. Expeditionary operations are a particular concern. Mass medical operations may not be possible until the theater matures or additional resources are allocated to the AOR. Deploying eligible civilians and MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment. The COCOM Medical Services staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians and MWA. Current doctrine and policy does not adequately address sustained operations within a CBRN/TIM environment. Large-scale medical activities and actions are not adequately addressed in DOTLPF; especially those involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

### 11.11.3 Functional Solution Analysis

#### 11.11.3.1 DOTLPP Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** DOTMLPP is inadequate to address large-scale medical CBRN/TIM operations, particularly sustained operations within a CBRN/TIM environment and/or COCOM and Medical Services actions associated with large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, procedures, and *UJTL* sustained operations (medical and nonmedical) within a CBRN/TIM environment. Include COCOM and Medical Services activities associated with the planning, coordination, implementation, operation, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Organization:* Ensure resources, taskings, and staff are in place or available to plan and perform sustained operations (medical and nonmedical) within a CBRN/TIM environment and/or operations addressing COCOM and Medical Services actions associated with the planning, coordination, implementation, operation, support, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Training:* Train, exercise, and evaluate the force for sustained operations (medical and nonmedical) within a CBRN/TIM environment and/or operations addressing COCOM and Medical Services actions associated with the planning, coordination, implementation, operation, support, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Leadership:* Recognize criticality of readiness of the force for potential sustained operations (medical and nonmedical) within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare the force and appropriately support large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Personnel:* Ensure eligible civilian personnel and operations supporting the mission/military operations (medical and nonmedical) are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities:* Develop supporting infrastructure for sustained operations within a CBRN/TIM environment and operations associated with large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.).

2. **Deficiency:** DOTMLPP is inadequate to address COCOM and Medical Services actions associated with medical quarantine and/or enforcement of medical isolation involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, procedures, and *UJTL* COCOM and Medical Services activities associated with the planning, coordination, implementation, operation, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Organization:* Ensure resources, taskings, and staff are in place or available for operations addressing COCOM and Medical Services actions associated with the planning, coordination, implementation, operation, support, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Training:* Train, exercise, and evaluate the force for COCOM and Medical Services actions associated with the planning, coordination, implementation, operation, support, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Leadership:* Recognize criticality of readiness of the force for potential operations (medical and nonmedical) within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare the force and appropriately support large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Personnel:* Ensure eligible civilian personnel and operations supporting the mission/military operations (medical and nonmedical) are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities:* Develop supporting infrastructure for operations associated with large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.)

3. **Deficiency:** Medical prophylaxis does not exist for all threat CBRN/TIM and TIM agents.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards for prophylactic CBRND protection against all threat agents. *Training:* Train, exercise, and evaluate personnel (military and eligible civilians) on the use of prophylactic CBRND protection against threat agents. *Leadership:* Enforce compliance with established standards (see Footnote 1 above) for prophylactic CBRND protection. Implement and ensure training is adequate and conduct exercises and evaluations to ensure readiness.

4. **Deficiency:** Current prophylaxis and supporting doctrine, policy, and procedures do not address presymptomatic medical CBRN/TIM protective countermeasures by other than U.S. forces, excluding eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing eligible civilians during CBRND operations and the provision of CBRND protection, including prophylaxis. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians.

5. **Deficiency:** Current prophylaxis and supporting doctrine, policy, and procedures do not address presymptomatic medical CBRN/TIM protective countermeasures by other than U.S. forces, excluding MWAs.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing MWAs during CBRND operations and the provision of CBRND protection, including prophylaxis. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWDs.

6. **Deficiency:** Prophylaxis against most high-threat TIMs are not currently available.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of metrics for standards and criteria for protection against all high-threat TIM agents. *Training:* Train, exercise, and evaluate personnel (military and eligible civilians) on the use of prophylactic CBRND protection against threat agents. *Leadership:* Enforce compliance with established metrics (see Footnote 7 above) for standards and criteria. Implement and ensure training is adequate and conduct exercises and evaluations to ensure readiness.

7. **Deficiency:** The efficacy of existing prophylaxis, particularly vaccines, widely varies.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of baseline standards for prophylactic CBRND protection against all threat agents. *Leadership:* Enforce compliance with established standards (see Footnote 5 above) for prophylactic CBRND protection.

8. **Deficiency:** The application of medical prophylaxis is not adequately addressed for eligible civilians within the force.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures requirement to address the administration, provision, and application of medical CBRN/TIM protective countermeasures by eligible civilians. *Organization:* Address organizational issues (e.g., who provides the equipment, support forces to train and equip, etc.) related to the provision of CBRN/TIM protection to eligible civilians. *Training:* Include eligible civilians in CBRND training, exercises, and evaluations. Identify training requirements and responsibilities for non-U.S. forces. *Leadership:* Ensure leadership awareness of criticality of increased dependence of military operations upon civilians. *Personnel:* Require eligible civilians supporting the mission to meet minimum standards for safe use of CBRND resources. *Facilities:* Develop supporting infrastructure for eligible civilian CBRND (e.g., logistics, Medical Services, veterinary surveillance, etc.).

9. **Deficiency:** The application of medical prophylaxis is not adequately addressed for MWAs within the force.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures requirement to address the administration, provision, and application of medical CBRN/TIM protective countermeasures by MWAs, particularly MWDs. *Organization:* Address organizational issues (e.g., who provides the equipment, support forces to train and equip, etc.) related to the provision of CBRN/TIM protection to MWAs, particularly MWDs. *Training:* Include MWAs in CBRND training, exercises, and evaluations. *Leadership:*

Ensure leadership awareness of criticality of MWA, particularly MWD resources. *Facilities:* Develop supporting infrastructure for MWA, particularly MWD CBRND (e.g., logistics, Medical Services, veterinary surveillance, etc.).

**10. Deficiency:** Expeditionary operations are a particular concern. Mass medical operations may not be possible until the theater matures or additional resources are allocated to the AOR.

**Non-Materiel Solutions:** *Doctrine:* Complete the JCIDS process and central correlation/comparison of operations plans to identify CBRND resources necessary and available to support expeditionary medical operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct expeditionary medical operations while possessing reduced logistical footprint and during the first 30–90 days of operations following commencement of hostilities. *Training:* Train, exercise, and evaluate expeditionary capabilities of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operations using CBRND resources supporting expeditionary medical operations. *Leadership:* Recognize differences and challenges associated with expeditionary medical operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint, training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary medical operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for expeditionary medical operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.

**11. Deficiency:** Deploying eligible civilians are not equipped and trained to survive a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of eligible civilians and training for CBRN/TIM environment survival.

*Organization:* Ensure organizational consideration for maintenance and support of eligible civilians CBRND protective equipment, measures, and activities. *Training:* Develop institutional and unit training of eligible civilians for CBRND measures and activities. Integration into CBRND exercises and evaluations. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for eligible civilians survivability.

*Facilities:* Develop supporting infrastructure for eligible civilians CBRND (e.g., logistics, medical, veterinary surveillance, communications, training, etc.).

**12. Deficiency:** Deploying MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of MWAs, particularly MWDs and training for CBRN/TIM environment survival.

*Organization:* Organizational consideration for maintenance and support of MWA CBRND protective equipment, measures, and activities. *Training:* Develop institutional and unit training of MWA handlers and MWAs for CBRND measures and activities. Integrate into CBRND exercises and evaluations. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for MWA survivability. *Facilities:* Develop supporting

infrastructure for MWA CBRND (e.g., logistics, medical, veterinary surveillance, communications, training, etc.).

- 13. Deficiency:** DOTMLPF is inadequate to support sustained operations (medical and nonmedical) within a CBRN/TIM environment, particularly expeditionary operations, during the first 30–60 days.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, and procedures sustained operations (medical and nonmedical) within a CBRN/TIM environment. *Organization:* Ensure resources, taskings, and staff are in place or available to perform sustained operations (medical and nonmedical) within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force (military and eligible civilians) for sustained operations (medical and nonmedical) within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations (medical and nonmedical) within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.

- 14. Deficiency:** Current DOTMLPF does not fully address the unique aspects of CBRND and the impact upon operations within a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, procedures, and *UJTL* sustained operations (medical and nonmedical) within a CBRN/TIM environment. *Organization:* Ensure resources, taskings, and staff are in place or available to plan and perform sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations (medical and nonmedical) within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations (medical and nonmedical) within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force. *Personnel:* Ensure eligible civilian personnel and operations supporting the mission/military operations (medical and nonmedical) are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment.

## **CHAPTER 12. OPERATIONAL SHIELD TASKS**

## Table of Contents

List of Acronyms .....	ii
12.0 Operational Shield .....	1
12.1 Task OPSHLD 1: Adjust Protective Posture Protocols to ensure protection level is consistent with the threat and minimizes risk while limiting the impact on mission execution .....	5
12.2 Task OPSHLD 2: Integrate coalition/non-U.S. and joint force CBRN/TIM protective measures and assets.....	14
12.3 Task OPSHLD 3: Establish local medical prophylactic approach to reduce impact of CBRN/TIM.....	22
12.4 Task OPSHLD 4: Ensure that IPE for forces (including patients) and MWAs are ready to minimize casualties and to ensure survivability and effective performance .....	37
12.5 Task OPSHLD 5: Ensure adequate protective measures and resources are available to coalition partners and other designated non-U.S. forces.....	49
12.6 Task OPSHLD 6: Ensure adequate individual protection for eligible civilians .....	56
12.7 Task OPSHLD 7: Provide COLPRO for all critical activities/functions, rest, and relief .....	65
12.8 Task OPSHLD 8: Supply protective measure consumables, expendables, and replacements .....	75
12.9 Task OPSHLD 9: Ensure safety of water/food supplies to protect forces.....	86
12.10 Task OPSHLD 10: Protect equipment and supplies through coatings, coverings, and packaging to reduce contamination of contents and to contain contamination .....	91
12.11 Task OPSHLD 11: Provide protective measures for forced-entry forces operating in antiaccess and area-denial CBRN/TIM environments.....	100
12.12 Task OPSHLD 12: Employ protective measures to minimize effects of adversary use of CBRN weapons and TIM exposure .....	110
12.13 Task OPSHLD 13: Establish large-scale medical CBRND operations .....	124
12.14 Task OPSHLD 14: Establish mortuary process to handle contaminated remains.....	149

## 12.0 Operational Shield

### 12.0.1 Introduction

This chapter focuses upon the operational (OP) level of war at the Joint Task Force (JTF) level of task development and implementation. The OP level of war is where campaigns and major operations are planned, organized, executed, conducted, and sustained to accomplish the defined strategic objectives within theaters or areas of operations (AOs). Plans and activities at the OP level link tactics and strategy through defining and establishing operational objectives essential for the successful accomplishment of the strategic objectives, sequencing events achieving the operational objectives, initiating actions and activities, and applying resources to generate and sustain these events. OP activities involve a broader and more “macro” concept of time or space than is inherent to tactics. These activities include the adequate support and provisioning of forces and means to exploit tactical successes to achieve strategic objectives. It includes the integration of coalition and partner force capabilities to enhance JTF capacity to successfully achieve operational and strategic goals.<sup>1</sup>

This chapter restates relevant information from the chemical, biological, radiological, and nuclear defense (CBRND) Functional Area Analysis (FAA) including a description of each of the 11 OP Shield (SHLD) tasks, derivation of the task, an indication of other linked tasks, and the pertinent conditions. The Functional Needs Analysis (FNA) section addresses the capability and deficiency analysis and a brief description of potential near-term changes. Once all the capabilities are considered, the assessment concludes with a separate, overarching look at the entire capability spectrum to identify remaining gaps and/or synergies. The Functional Solutions Analysis (FSA) section addresses possible solutions for the deficiencies identified in the FNA section. OPSHLD solutions are non-materiel and are reflected in one or more of the six areas of DOTLPF: doctrine, organization, training, leadership, personnel, and facilities. Annotations under Materiel are non-materiel in nature, but do not align in one of the six non-materiel aspects of DOTLPF. These annotations include research, analysis, and other actions to address and establish solutions for the deficiencies.

Most of the OPSHLD tasks involve doctrine, policies, and procedures providing parameters for planning, decisioning, and actions or activities to accomplish the tasks. These range from the positioning and sustainment of CBRND materiel and resources, through protection of forces throughout the deployment cycle and the integration of coalition CBRND resources, to mass medical and contaminated/exposed casualty and remains operations.

Tasks associated with forces includes constituent elements of the transforming force such as civilians, military working animals (MWAs), coalition/alliance forces, and third-party nationals. Increasing reliance upon nonmilitary personnel (such as government employees and contractors) as operational enablers dictated their inclusion as force members.

---

<sup>1</sup> Appendix A to Enclosure B, para. 3b, CJCMS 3500.04C, *Universal Joint Task List*, July 2002, CJCS.

## 12.0.2 FNA Summary

Table 12.0-1 summarizes the overall current and projected capability to perform the OPSHLD tasks identified in the CBRND FAA. The overall capability to conduct these tasks in the current time frame is assessed as “yellow.” There are key deficiencies in combatant command (COCOM) ability to protect populations other than military members as well as support concurrent CBRND operations, especially those associated with sustained and expeditionary operations within a CBRN/TIM environment. It is projected that the overall status will remain “yellow” in the near/mid term with limited improvements in specific measures within specific tasks.

**Table 12.0-1. Operational Shield Summary FNA Findings**

### 12.0.3 FSA Summary

The paragraphs below summarize the assessment of all potential doctrine, organization, training, materiel, leadership and education, personnel, and facilities (DOTMLPF) solutions for the capability gaps identified in the FNA section. The summaries also address the non-materiel solutions annotated under Materiel as discussed earlier. OPSHLD addresses non-materiel actions and activities. Therefore, materiel solutions are not applicable to this level of war.

#### 12.0.3.1 DOTLPF

The non-materiel DOTLPF solutions identified in this chapter are associated primarily with the the level of protection afforded by CBRND systems and measures and the readiness of force populations for CBRND activities and actions. Non-materiel solutions are identified. These solutions include such actions as the establishment of doctrine addressing the needs of the force, its constituent populations, and mass medical operations potentially involving non-U.S. military personnel; applicable training programs, infrastructures, and organizational structures supporting

CBRND operations within sustained CBRN/TIM environments for the transformed force; leadership CBRND awareness and decisioning enablers; and criteria for civilian personnel performing mission-related activities within a CBRN/TIM environment. Also identified are analyses, assessments, evaluations, and programs to assist the clarification and resolution of identified deficiencies.

#### **12.0.3.2 IMA**

All identified OPSHLD solutions are non-materiel approaches. Materiel solutions are not applicable to this Shield level of war.

## **12.1 Task OPSHLD 1: Adjust Protective Posture Protocols to ensure protection level is consistent with the threat and minimizes risk while limiting the impact on mission execution**

### **12.1.1 Functional Area Analysis**

#### **12.1.1.1 Definition**

To ensure that general guidance for protective posture is established at theater level and adjusted to

- operational friendly and enemy situation;
- mission;
- terrain and weather;
- state of chemical, biological, radiological, and nuclear (CBRN)/toxic industrial material (TIM) defense trainin;
- availability of protective equipment and supplies; and
- medical considerations.

The protocol is flexible and tailorable at lower levels of command to accommodate current intelligence/enemy action and status/mission of friendly forces. Threat, vulnerability, and risk assessments are essential inputs to determining the appropriate protective posture. The goal is to establish and maintain the lowest possible protective postures (to reduce performance degradation and minimize physical encumbrances) while minimizing the risk of exposure or contamination. Nuclear, biological, and chemical (NBC) personnel provide the commander and other staff officers with information concerning protective posture effects on mission performance.

#### **12.1.1.2 Derivation**

*Joint Enabling Concept for CBRN/TIM Operation, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (OP 2.2, OP 2.2.1, OP 2.4.1.1, OP 2.4.1.2, OP 5.1.1, OP 5.2, OP 5.2.1, OP 5.3, OP 5.3.1, OP 5.3.4, OP 5.3.5, OP 5.3.6, OP 5.3.7, OP 5.3.9, OP 5.4, OP 5.4.2, OP 5.4.4, OP 7.2, OP 7.3).*

##### **12.1.1.2.1 Supported Task: STSHLD 6**

##### **12.1.1.2.2 Lateral Task: OPSHA 6**

##### **12.1.1.2.3 Supporting Task: N/A**

**12.1.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Tropical, temperate, arctic, and arid climate. (C1.3.1)
2. Cold to hot air temperature. (C1.3.1.3.1)
3. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Partially completed mission preparation. ( 2.1.3)
2. Adequate forces allocated. (C2.2.3)
3. Limited personnel experience. (C2.2.4.5)
4. Partial interoperability. (C2.2.6)
5. Limited staff expertise. (C2.3.1.3)
6. Limited deployed supplies. (C2.8.2)
7. Limited prepositioned materiel. (C2.8.4)

**Civil**

1. TIMs present in the civilian sector. (C3.3.7.5)

**12.1.2 Functional Needs Analysis****12.1.2.1 Capability and Deficiency Assessment Summary**

Table 12.1-1 discusses the only capability that exists to perform the task to the designated standard. Adequate doctrine, policy, and procedures exist for the planning and implementation of Protective Posture Protocols. They are developed, disseminated, and monitored based upon the potential threat and the assessment of force vulnerabilities and risks to subordinate command levels. Included is the provisioning of the force with appropriate CBRND capabilities. Included in the deficiencies is the ability of the force to maintain operations tempo (OPTEMPO) within a sustained CBRN/TIM environment.

**Current Capability and Deficiency**

JTF HQ staffs assess threat capabilities, risk, and vulnerabilities. They also establish plans and procedures to react to adversary's use of any type of CBRN/TIM weapon/agent combination and/or material releases resulting from accidents or combat actions. Developed plans and procedures minimize protective postures while maximizing CBRND protection. They integrate into protocols flexibility for tailoring and adaptation by subordinate commanders to their specific circumstances based upon expert advice. They also monitor implementation of protective postures. Adequate doctrine, policy, and procedures exist to guide commanders and staffs on

these flexible levels of protection. The provisioning of the forces with adequate CBRND capabilities is determined based upon the identified threat used to develop the Protective Posture Protocols. The JTF staff adjusts the plans, reallocates, and obtains additional COLPRO systems as necessary to meet operational requirements. The combination of established force organic assets, materiel acquisitions, prepositioned materiel, available host-nation/coalition contributions, and the movement of identified CBRND resources from stockpiles and reallocation activities are all pursued to prepare and support the deploying forces. The COCOM-developed Joint Mission Essential Task Lists (JMETLs), based upon the *Universal Joint Task List (UJTL)*, are adjusted by the JTF staff to reflect the essential tasks to be performed for mission attainment. Training of the force against the identified threat is performed and the implementation of the protocols is monitored. Deficiencies include the inadequacy, or absence, of DOTMLPF addressing CBRND and the application of the Protective Posture Protocols to eligible civilians and MWAs and deploying units may not possess full CBRND resources and capabilities until after arrival in the area of responsibility (AOR). The overall current capability is assessed as “yellow.”

**Projected Near/Mid-Term Capability and Deficiency**

No change is projected for this task.

**Projected Far-Term Capability and Deficiency**

No change is projected for this task.

M2	Forces are trained, manned, and equipped to perform sustained operations in a CBRN/TIM environment.	<p><b>G:</b> All joint force elements (military, eligible civilians, and MWAs) are adequately trained, equipped, and manned to perform their functions and conduct sustained operations within a CBRN/TIM environment.</p> <p><b>Y:</b> Military personnel and eligible civilians supporting the mission are adequately trained, equipped, and manned to perform their functions and conduct sustained operations within a CBRN/TIM environment.</p> <p><b>R:</b> Training, equipping, and/or manning of joint forces (including military, eligible civilians, and/or MWAs) to perform functions and conduct sustained operations within a CBRN/TIM environment is inadequate or nonexistent.</p>
M3	All units that perform Joint Mission Essential Tasks (JMETs) are fully prepared to successfully perform the tasks in a CBRN/TIM environment.	<p><b>G:</b> All units performing JMETs are fully prepared and ready to successfully conduct their tasks within a CBRN/TIM environment.</p> <p><b>Y:</b> Units performing JMETs are generally prepared and ready to successfully conduct their tasks within a CBRN/TIM environment.</p> <p><b>R:</b> Units performing JMETs are inadequately prepared and/or ready to successfully conduct their tasks within a CBRN/TIM environment.</p>

<sup>1</sup> Adequate DOTMLPF exists to address the application and adjustment of Protective Posture Protocols for the force. However, DOTMLPF is inadequate or nonexistent addressing CBRND of eligible civilians and MWAs.

<sup>2</sup> The JTF staff planning incorporates Protective Posture Protocols developed and disseminated by the COCOM. The protocols are adjusted based upon the potential threat and the JTF staff's assessment of force vulnerabilities, risks, mission and the CBRN/TIM threat. Flexibility for JTF elements to further adjust the protocols for their conditions, functions, missions, and local threats are incorporated into the plan. However, the DOTMLPF for Protective Posture Protocols is inadequate or nonexistent addressing CBRND of eligible civilians and MWAs.

<sup>3</sup> The JTF staff reviews identified forces and the potential threat for planned operations. Specified forces, time permitting, train and prepare for operations involving the potential threat. Equipping the tasked force is an integral part of planning and preparation. The JTF staff tracks force readiness for planned operations. Readiness issues are addressed by the staff. The combination of established force organic assets, material acquisitions, prepositioned material, available host-nation/coalition contributions, and movement of identified CBRND resources from stockpiles and reallocation activities are pursued by the JTF staff to prepare and support deploying forces as outlined by the appropriate plan. Expeditionary operations are a particular concern as most CBRND systems and associated logistics are not designed for a highly mobile force, with a reduced logistical footprint, and for the initial period of operations until the theater matures (usually the first 30–90 days). Deploying units may not possess full CBRND resources and capabilities during the

initial stages of deployment and until after arrival within the AOR. Additionally, deploying eligible civilians and MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment. The JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians and MWAs.

<sup>4</sup> The JTF staff adjusts the COCOM-developed JMETLs to reflect the tasks essential to the accomplishment of the planned mission(s). The JMETLs provide the ability to develop joint training requirements, planning and executing joint training, and assessing joint proficiency. Plan-identified forces are trained and assessed against the JMETLs for readiness to perform the tasks successfully. Assessment is performed through a variety of means including inspections, exercises, and reporting. However, current doctrine the UJTL, and operational planning do not adequately address sustained operations within a CBRN/TIM environment. JMETL development generally does not specify these circumstances as an execution condition. Exercises and training do not emphasize task performance and operations in these conditions.

### 12.1.3 Functional Solution Analysis

#### 12.1.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the Ideas for Materiel Approaches (IMA) section.

- 1. Deficiency:** DOTMLPF for Protective Posture Protocols is inadequate or nonexistent addressing CBRND of eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing eligible civilian personnel for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of eligible civilian personnel within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilian personnel.
- 2. Deficiency:** DOTMLPF for Protective Posture Protocols is inadequate or nonexistent addressing CBRND of MWAs.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing MWAs, particularly military working dogs (MWDs), for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of MWAs within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWAs.
- 3. Deficiency:** There is a lack of doctrine for risk management of forces operating in radiologically contaminated environments. Current guidance is based on cold-war assumptions and does not reflect modern threats and mission priorities.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policies, and procedures that address appropriate operationally oriented command dose levels for low-level radiation exposure based on mission priority across the range of military operations. *Training:* Train leaders and personnel on operationally oriented low-level radiation exposure control standards and procedures
- 4. Deficiency:** There is a lack of doctrine and data supporting risk management of forces exposed to low-level chemical contamination.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policies, and procedures that address appropriate operationally oriented exposure limits and how to keep personnel from exceeding those limits using available detection and monitoring equipment and techniques. *Training:* Train leaders and personnel on operationally oriented low-level chemical exposure control standards and procedures.
- 5. Deficiency:** Expeditionary operations are a particular concern as most CBRND systems and associated logistics are not designed for a highly mobile force, with a reduced logistical

footprint, and for the initial period of operations until the theater matures (usually the first 30–90 days).

**Non-Materiel Solutions:** *Doctrine:* Complete the Joint Capabilities Integration and Development System (JCIDS) process and central correlation/comparison of national and strategic plans to identify CBRND resources necessary and available to support expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct expeditionary operations while possessing reduced logistical footprint and during the first 30–90 days of operations following commencement of hostilities. *Training:* Train, exercise, and evaluate expeditionary capabilities of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operations using CBRND resources supporting expeditionary operations. *Leadership:* Recognize differences and challenges associated with expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint, training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.

6. **Deficiency:** Deploying units may not possess full CBRND resources and capabilities during the initial stages of deployment and until after arrival within the AOR.

**Non-Materiel Solutions:** *Doctrine:* Emphasize in doctrine, policies, and procedures for preparation of the force for CBRND protection during throughout deployment, redeployment, relocation, and en route phases of movement. *Organization:* Ensure resources, taskings, and staff are in place or available to perform CBRND operations within a CBRN/TIM environment by deploying, redeploying, relocating, and en route forces. *Training:* Train, exercise, and evaluate the force for CBRND operations within a CBRN/TIM environment while deploying, redeploying, relocating, and en route. *Leadership:* Recognize criticality of readiness of the force for potential CBRND operations within a CBRN/TIM environment while deploying, redeploying, relocation, and en route; training providing the skills to manage the force in these circumstances; and willingness and ability to implement necessary changes and activities to prepare and appropriately protect the force. *Facilities:* Develop supporting infrastructure for CBRND operations of the force while preparing, deploying, redeploying, relocating, and en route

7. **Deficiency:** Deploying eligible civilians are not equipped and trained to survive a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of eligible civilians and training for CBRN/TIM environment survival. *Organization:* Ensure organizational consideration for maintenance and support of eligible civilians CBRND protective equipment, measures, and activities. *Training:* Provide institutional and unit training of eligible civilians for CBRND measures and activities. Integrate into CBRND exercises and evaluations. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for eligible civilians. *Facilities:* Develop

supporting infrastructure for eligible civilians CBRND (e.g., logistics, medical, communications, training, etc.).

8. **Deficiency:** Deploying MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of MWAs, particularly MWDs, and training for CBRN/TIM environment survival. *Organization:* Ensure organizational consideration for maintenance and support of MWA CBRND protective equipment, measures, and activities. *Training:* Provide institutional and unit training of MWA handlers and MWAs for CBRND measures and activities. Integrate into CBRND exercises and evaluations. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for MWA survivability. *Facilities:* Develop supporting infrastructure for MWA CBRND (e.g., logistics, medical, veterinary surveillance, communications, training, etc.).

9. **Deficiency:** The JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing civilian personnel and operations for CBRND. *Organization:* Identify organizational services and activities supporting the mission performed by civilian personnel and operations. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWAs and eligible civilians. *Personnel:* Ensure that eligible civilians supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities:* Develop supporting infrastructure for eligible civilian CBRND (e.g., logistics, medical, training, communications, etc.).

10. **Deficiency:** The JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying MWAs.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing MWAs, particularly MWDs, and operations for CBRND. *Organization:* Identify organizational services and activities supporting CBRN/TIM survival of MWAs and MWA mission operations. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWAs. *Facilities:* Develop supporting infrastructure for MWD CBRND (e.g., logistics, medical, veterinary surveillance, training, communications, etc.).

11. **Deficiency:** Current doctrine, the *UJTL*, and operational planning do not adequately address sustained operations within a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, procedures, and *UJTL* sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a

CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force

- 12. Deficiency:** JMETL development generally does not specify these circumstances as an execution condition.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, procedures, and *UJTL* sustained operations within a CBRN/TIM environment. *Organization:* Ensure resources, taskings, and staff are in place or available to plan and perform sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.

- 13. Deficiency:** Exercises and training do not emphasize task performance and operations in a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, and procedures sustained operations within a CBRN/TIM environment. *Organization:* Ensure resources, taskings, and staff are in place or available to plan and perform sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.

#### 12.1.3.2 IMA Assessment Summary

N/A

## **12.2 Task OPSHLD 2: Integrate coalition/non-U.S. and joint force CBRN/TIM protective measures and assets**

### **12.2.1 Functional Area Analysis**

#### **12.2.1.1 Definition**

To integrate CBRN/TIM protection for joint force elements to ensure survivability and the sustained conduct of operations despite the CBRN/TIM threat. The availability of CBRN/TIM protective and medical assets is a joint and coalition/non-U.S. force concern. Operational units must determine the level of CBRND training and protective equipment status of sister and coalition/non-U.S. forces. Joint and coalition/non-U.S. force requirements and assets must be assessed to ensure all forces are adequately protected and survivability is promoted. Joint and coalition/non-U.S. force assets may require redistribution depending on local threats and/or actual adversary use of CBRN/TIM. Redistribution and integration may require mixes of forces and assets between joint and coalition/non-U.S. force elements to enhance survivability and operational success. Plans for sustained operations in a hazardous environment must be prepared, reviewed, and coordinated.

#### **12.2.1.2 Derivation**

*Joint Enabling Concept for CBRN/TIM Operations, Protection Joint Functional Concept, UJTL (OP 1.3.1, OP 2.2, OP 2.2.1, OP 2.4.1.1, OP 2.4.1.2, OP 2.4.2.1, OP 5, OP 5.1.1, OP 5.2, OP 5.2.1, OP 5.2.2, OP 5.3, OP 5.3.2, OP 5.3.4, OP 5.3.5, OP 5.3.6, OP 5.3.7, OP 5.3.8, OP 5.3.9, OP 5.4, OP 5.4.2, OP 5.4.4, OP 5.4.5, OP 5.5, OP 5.5.1, OP 5.5.2, OP 5.5.7, OP 5.5.8, OP 5.7, OP 5.7.3, OP 5.7.4, OP 5.7.5, OP 5.7.6, OP 6.2.1, OP 7, OP 7.1, OP 7.2, OP 7.3, OP 7.4).*

##### **12.2.1.2.1 Supported Task: STSHLD 7**

##### **12.2.1.2.2 Lateral Task: OPSHA 8**

##### **12.2.1.2.3 Supporting Task: N/A**

#### **12.2.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Undeveloped to highly developed land. (C1.1)
2. Riverine to open sea. (C1.2)
3. Natural and induced air. (C1.3)
4. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Partially completed mission preparation. (C2.1.3)
2. Marginal to strong forces assigned. (C2.2.1)
3. Negligible personnel experience. (C2.2.4.5)
4. Some interoperability. (C2.2.6)
5. Partial Joint Staff integration. (C2.3.1.1)
6. Partial multinational integration. (C2.3.1.2)
7. Limited staff expertise. (C2.3.1.3)
8. Mobile facility survivability. (C2.7.6)
9. Limited deployed supplies. (C2.8.2)
10. Sufficient continental United States (CONUS) resupply. (C2.8.3)
11. Limited prepositioned materiel. (C2.8.4)
12. Limited host nation support. (C2.8.5)
13. Limited commercial procurement. (C2.8.6)

**Civil**

1. Technical language translation. (C3.2.1.1)
2. Few language translators. (C3.2.1.2)

**12.2.2 Functional Needs Analysis****12.2.2.1 Capability and Deficiency Assessment Summary**

Table 12.2-1 discusses the only capability that exists to perform the task to the designated standard. Adequate doctrine, policy, and procedures exist for the planning and implementation of integration of coalition and non-U.S. force CBRND measures and assets. Coordination with participant coalition and non-U.S. force staffs provides common frameworks for information, asset, and capability sharing for successful operation outcome. Each participant in the force must meet minimum capability standards and a certification process covering the areas of concern is applied. Specific tasks are assigned to the elements of the overall force most capable of completing the task. Included in the deficiencies is the ability of the force to maintain OPTEMPO within a sustained CBRN/TIM environment.

**Current Capability and Deficiency**

JTF HQ staffs conduct planning and coordination with coalition partners to determine resources, requirements, and taskings best accomplishing mission tasking. They track readiness of forces and equipment for operations. They also adjust plans and resources as necessary to meet changing operational needs and conditions. Adequate doctrine, policy, and procedures exist to guide commanders and staffs with coalition and non-U.S. force participation in joint operations. Planning, tracking, and monitoring is performed in coordination with partner staffs under a negotiated plan outlining requirements, taskings, training, reporting, information sharing, standards, and operational certifications for participation. Although the provision of CBRND equipment to national forces ultimately resides with their nations, mutual support among partners

is planned to complement capabilities and to minimize weaknesses. Acquisition Cross-Service Agreements (ACSAs) between partners enables acquisition and cross-servicing support between the partners. The more specific agreement, the Implementing Arrangement (IA), provides for a wide range of support including sheltering, medical care, and other support activities. The JTF Commander, JTF staff, and combined staff monitors, tracks, and assesses the readiness of the Joint Coalition Force and addresses issues and concerns as they arise. Deficiencies include the limited availability of COLPRO systems in each of the COLPRO categories, and the protection of eligible civilians and MWDs.

**Projected Near/Mid-Term Capability and Deficiency**

No change projected for this task.

**Projected Far-Term Capability and Deficiency**

No change projected for this task.

Table 12.2-1. OPSHLD 2: Capability and Deficiency Assessment

Capability: JTF HQ Staff	M1	M2	M3	M4	M5	M6
Current Overall Capability <sup>1</sup>	Y <sup>2</sup>	G <sup>3</sup>	Y <sup>4</sup>	G <sup>3</sup>	Y <sup>6</sup>	R <sup>7</sup>
Near/Mid-Term Overall Capability	Y	G	Y	G	Y	R
Far-Term Overall Capability	Y	G	Y	G	Y	R

	FAA Measure	Scale
M1	Joint forces are equipped with or possess access to COLPRO.	<b>G:</b> COLPRO is available in required quantities and types to support the full range of envisioned and planned operations. <b>Y:</b> COLPRO is available in sufficient types and quantities to support major operations. <b>R:</b> COLPRO is inadequate or nonexistent to support operations.
M2	Coalition/non-U.S. forces are equipped with or possess access to COLPRO.	<b>G:</b> Planning and coordination is conducted to address partner forces equipping or access to COLPRO. <b>Y:</b> Partner force equipping or access to COLPRO is considered when planning operations with threat. <b>R:</b> Partner force equipping or access to COLPRO is not considered or is inadequately considered when planning operations with threat.
M3	Joint forces meet combatant commander CBRN/TIM protection requirements (training, equipping, and manning).	<b>G:</b> All joint force elements (military, eligible civilians, and MWAs) meet CBRN/TIM protection requirements (training, equipping, and manning) to perform their functions and conduct operations within a CBRN/TIM environment. <b>Y:</b> Military personnel and eligible civilians supporting the mission meet CBRN/TIM protection requirements to perform their functions and conduct operations within a CBRN/TIM environment. <b>R:</b> Joint forces (including military, eligible civilians, and/or MWAs) meeting CBRN/TIM protection requirements to perform functions and conduct operations within a CBRN/TIM environment are inadequate or nonexistent.
M4	Coalition/non-U.S. forces meet combatant commander CBRN/TIM protection requirements (training, equipping, and manning).	<b>G:</b> Processes and means exist to monitor, track, and assess joint forces readiness and preparations status against COCOM requirements. <b>Y:</b> Processes exist to identify joint forces readiness meeting COCOM requirements. <b>R:</b> Processes and/or means are inadequate or nonexistent to identify joint forces readiness and/or preparations meeting COCOM requirements.
M5	Joint and coalition/non-U.S. force CBRN/TIM protection consumables are interoperable.	<b>G:</b> CBRN/TIM protection consumables are interoperable between coalition/non-U.S. forces and joint forces or adequate stocks of noninteroperable consumables are determined and available to support operations with threat. <b>Y:</b> CBRN/TIM protection consumables are interoperable between coalition/non-U.S. forces and joint forces or stocks of noninteroperable consumables are available to support operations with threat. <b>R:</b> CBRN/TIM protection consumables are noninteroperable between coalition/non-U.S. forces and joint forces and/or stocks of noninteroperable consumables are inadequate or nonexistent to support operations with threat.

M6	Sustained operational planning includes allocation and placement (and redistribution if necessary) of joint and coalition/non-U.S. force CBRN/TIM protection assets.	<p><b>G:</b> The planned and operational control of allocation, placement, and, when necessary, redistribution of CBRN/TIM protection assets of coalition/non-U.S. and joint forces is performed and coordinated throughout operations to sustain and support forces.</p> <p><b>Y:</b> Allocation and placement of CBRN/TIM protection assets of coalition/non-U.S. and joint forces is performed and coordinated prior to commencement of operations.</p> <p><b>R:</b> The planned and operational control of the allocation, placement, and/or redistribution of joint and coalition force CBRN/TIM protection assets is inadequate or nonexistent.</p>
----	--	---

<sup>1</sup> DOTMLPF is adequate for the coordination and integration of coalition forces. Adequate DOTMLPF exists to address and support these forces. However, DOTMLPF is inadequate or nonexistent addressing CBRND of eligible civilians and MWAs. DOTMLPF does not adequately address sustained operations within a CBRN/TIM environment.

<sup>2</sup> Limited quantities of COLPRO are available for operations. Not all critical facilities and activities are equipped with COLPRO. Transportable collective protection systems (CPSs) (e.g., Joint Transportable Collective Protection System [JTCOPS], Chemically Protected Deployable Medical System [CP-DEPMEDS], Tent, Expandable, Modular, Personnel [TEMPER] systems, and Service designed systems) provide CPSs for mature theaters or within the AO if there exists adequate time between notification of plan activation and the commencement of hostilities. However, these systems are in limited numbers and require significant logistics to move and establish, and concurrent operations with CBRN/TIM threat may further limit their availability. Mobile CPSs (ground) are also limited in quantities and types. Coalition partner and host-nation (when applicable) CPSs may offset these limitations. In coordination with COCOM and coalition partner staffs, JTF staff develops plans and addresses requirements and commitments by each coalition participant in the JTF. Based upon the guidance and restrictions identified by the COCOM, specific tasks are assigned to elements of the coalition force most capable of completing the task. Although the provision of CBRND equipment to national forces ultimately resides with their nations, mutual support among coalition partners is planned to complement partners' capabilities and to minimize weaknesses. ACSAs between coalition partners enable acquisition and cross-servicing support between the partners. The IA, a more specific arrangement, provides for a wide range of support exchange including sheltering, medical care, and other support activities.

<sup>3</sup> In coordination with the COCOM and coalition partner staffs, JTF staff develops a comprehensive plan for successful achievement of the desired end states. Force requirements and commitments are obtained from each coalition participant and identified to the JTF by the COCOM. Minimum capability standards for participation and a certification process covering areas of concern (e.g., training level competence, logistics capabilities, deployment, sustainment, and redeployment readiness, etc.) are established and applied by all participants. Specific tasks are assigned to elements of the coalition force most capable of completing the task. Although the provision of CBRND equipment to national forces ultimately resides with their nations, mutual logistics support among coalition partners is planned to complement partners' capabilities and to minimize weaknesses. For example, U.S. Marine Corps forces were equipped with lightweight CBRN/TIM individual protective equipment (IPE) by the United Kingdom during Operation Desert Storm. The United States installed COLPRO capabilities in Saudi critical command and control facilities for the same operation. The JTF Commander, JTF staff, and the combined staff monitor, track, and assess the readiness of the joint coalition force.

<sup>4</sup> In coordination with the COCOM and coalition partner staffs, JTF staff develops a comprehensive plan for successful achievement of the desired end states. Force requirements and commitments are obtained from each coalition participant and identified to the JTF by the COCOM. Minimum capability standards for participation and a certification process covering areas of concern (e.g., training level competence, logistics capabilities, deployment, sustainment, and redeployment readiness, etc.) are established and applied by all participants. The JTF Commander, JTF staff, and the combined staff monitor, track, and assess the readiness of the joint coalition force.

<sup>5</sup> In coordination with the COCOM and coalition partner staffs, JTF staff develops a comprehensive plan for successful achievement of the desired end states. Force requirements and commitments are obtained from each coalition participant and identified to the JTF by the COCOM. Minimum capability standards for participation and a certification process covering areas of concern (e.g., training level competence, logistics capabilities, deployment, sustainment, and redeployment readiness, etc.) are established and applied by all participants. The JTF Commander, JTF staff, and the combined staff monitor, track, and assess the readiness of the joint coalition force.

<sup>6</sup> In coordination with the COCOM and coalition partner staffs, JTF staff identifies and applies logistical efficiencies among the partners during the planning process. Standardization and interoperability between the participating nations is assessed and adjustments are made as necessary to plans. Support consumable levels are determined and incorporated into the plans. Minimum capability standards for participation and a certification process covering areas of concern (including logistics capabilities) are established and applied by all participants. ACSAs between coalition partners enable acquisition and cross-servicing support between the partners. The IA, a more specific arrangement, provides for sheltering, medical care, consumables, and other support activities. Standardized consumables may not be possible with all coalition partners and U.S. forces. Issues associated with nonstandardized consumables are addressed when necessary and appropriate during planning.

<sup>7</sup> The allocation, placement, and reallocation of protective assets is a function of the planning and operational control of the JTF Commander, JTF staff, and combined staff. ACSAs between coalition partners enable acquisition and cross-servicing support between the partners. The IA, a more specific arrangement, provides for a wide range of support exchange including consumables, sheltering, medical care, and other support activities. However, sustained operations within a CBRN/TIM environment are not adequately addressed in DOTMLPF and, subsequently, in planning.

### 12.2.3 Functional Solution Analysis

#### 12.2.3.1 DOTLPP Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Not all critical facilities and activities are equipped with COLPRO.  
**Non-Materiel Solutions:** *Doctrine:* Enforce existing doctrine and policy.
2. **Deficiency:** Mobile COLPRO (ground) is limited in quantities and types.  
**Non-Materiel Solutions:** *Doctrine:* Completion of analysis and central correlation/ comparison of national and strategic plans to identify quantities and types of mobile COLPRO (and supporting consumables) necessary and available to support highly mobile forces for envisioned plans and taskings. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct CBRND, including mobile COLPRO, of highly mobile forces. *Training:* Train, exercise, and evaluate CBRND, including mobile COLPRO, capabilities of the force in a CBRN/TIM threat during highly mobile force operations. *Leadership:* Recognize differences and challenges associated with CBRND operations by highly mobile forces, training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for CBRND of highly mobile forces.
3. **Deficiency:** Transportable COLPRO systems are in limited numbers and require significant logistics to move and establish.  
**Non-Materiel Solutions:** *Doctrine:* Institute in doctrine, policy, and procedures the central correlation of strategic theater plans and taskings to identify CBRND support requirements for two or more concurrent operations with CBRN/TIM threat with comparison to existing and programmed quantities and types of CBRND systems and resources. *Leadership:* Implement development of plans and taskings consistent with available CBRND capabilities as determined by central correlation and comparison of strategic tactical plans and taskings.
4. **Deficiency:** Concurrent operations with CBRN/TIM threat may limit COLPRO availability.  
**Non-Materiel Solutions:** *Doctrine:* Institute in doctrine, policy, and procedures the central correlation of strategic theater plans and taskings to identify CBRND support requirements for two or more concurrent operations with CBRN/TIM threat with comparison to existing and programmed quantities and types of CBRND systems and resources. *Leadership:* Implement development of plans and taskings consistent with available CBRND capabilities as determined by central correlation and comparison of strategic tactical plans and taskings.
5. **Deficiency:** Sustained operations within a CBRN/TIM environment are not adequately addressed in DOTMLPP and, subsequently, in planning.  
**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, and procedures sustained operations within a CBRN/TIM environment. *Organization:* Ensure resources, taskings, and

staff are in place or available to perform sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.

6. **Deficiency:** DOTMLPF is inadequate or nonexistent addressing CBRND of eligible civilians and MWAs.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing eligible civilian personnel and MWDs for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of MWDs and eligible civilian personnel within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWDs and eligible civilians and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilian personnel and MWDs.

7. **Deficiency:** DOTMLPF does not adequately address sustained operations within a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, procedures, and *UJTL* sustained operations within a CBRN/TIM environment. *Organization:* Ensure resources, taskings, and staff are in place or available to plan and perform sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.

### 12.2.3.2 IMA Assessment Summary

N/A

## **12.3 Task OPSHLD 3: Establish local medical prophylactic approach to reduce impact of CBRN/TIM**

### **12.3.1 Functional Area Analysis**

#### **12.3.1.1 Definition**

To assess potential operational impacts of CBRN/TIM agents based on the threat information. Identify medical and veterinary services resources, and develop employment plans to minimize the effects of CBRN/TIM attacks.

Prophylaxes exist for a number of chemical, biological, and radiological agents. Prophylaxes may be administered prior to actual exposure or following exposure but prior to presentation of signs and symptoms. Prophylaxes can eliminate or reduce the agent effects from exposures and/or increase the effectiveness of post-exposure treatments. The use of prophylaxes, if indicated, is determined and the required resources allocated. Integration and information resource sharing between the commander's NBC cell staff and supporting medical services are essential to force effectiveness and survivability as relating to a CBRN/TIM attack or release other than attack (ROTA).

Medical and veterinary personnel review the prophylactic status of force members, MWAs, and eligible civilians to ensure currency. Installations and units will have varied levels of diagnosis and treatment options available to treat CBRN/TIM casualties. Items such as surfactant topicals and oral prophylaxes should be issued to force members, MWA handlers, and eligible civilians to carry instead of bulk packaged and shipped. Issuance ensures the availability of protection immediately rather than when the bulk-packed items are broken out and disseminated.

Adequate medical plans, availability of trained medical and veterinary personnel, quantity and range of treatments and other medical supplies, and well-equipped facilities are key.

#### **12.3.1.2 Derivation**

*Joint Enabling Concept for CBRN/TIM Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (OP 2.4.1.1, OP 2.4.1.2, OP 5.1.1, OP 5.3.2, OP 5.3.9, OP 5.4, OP 5.4.2, OP 6.2.10, OP 7, OP 7.1, OP 7.3, OP 7.4).*

**12.3.1.2.1 Supported Task:** N/A

**12.3.1.2.2 Lateral Task:** OPSHA 7

**12.3.1.2.3 Supporting Task:** N/A

### 12.3.1.3 Condition

Perform this task under conditions of:

#### Physical

1. Undeveloped to highly developed land. (C1.1)
2. Riverine to open sea. (C1.2)
3. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

#### Military

1. Partially completed mission preparation. (C2.1.3)
2. Marginal to strong forces assigned. (C2.2.1)
3. Negligible personnel experience. (C2.2.4.5)
4. Limited staff expertise. (C2.3.1.3)
5. Limited deployed supplies. (C2.8.2)
6. Limited prepositioned materiel. (C2.8.4)

#### Civil

1. Poor civil health. (C3.3.1.4)
2. High health risk. (C3.3.1.5)
3. TIMs present in the civilian sector. (C3.3.7.5)

## 12.3.2 Functional Needs Analysis

### 12.3.2.1 Capability and Deficiency Assessment Summary

Table 12.3-1 discusses the two capabilities that exist to perform the task to the designated standard. The JTF HQ staff coordinates the issuance and administration of medical prophylaxis for CBRND of the force. Doctrine, policy, and procedures exist for the coordination of issuance and administration of medical prophylaxis to the military force against the debilitating effects of CBRN/TIM agents. Deficiencies include the lack of prophylaxis against all threat CBRN/TIM agents, the absence of medical prophylaxes for MWAs and the inadequate provision of medical prophylaxes to eligible civilians. The JTF Medical Services staff coordinates and manages the issuance and administration of CBRND medical prophylaxis to the force. The deficiencies are shared with the JTF HQ staff.

#### Current Capability and Deficiency

The identified individual capabilities are the coordination and management of issuance and administration of medical prophylaxis to the military force against the debilitating effects of CBRN/TIM agents. Doctrine, policy, and procedures require all command levels perform CBRN/TIM threat and risk assessment for their units and operations. Coordination with coalition

and non-U.S. forces minimizes weaknesses in capabilities while maximizing the strengths that exist, including medical. Existing or negotiated agreements facilitate the exchange of services and materiel. Predeployment screening is planned and performed of forces allocated and tasked under the JTF. Preplanning for CBRND includes the positioning of stocks, based upon the identified threat, for issue and administration, availability of sufficient medical personnel to perform required administrations, and the availability of sufficient medical prophylaxis to meet the anticipated need. Adverse reactions to prophylactic materials are annotated in the individual's medical records for future screening and follow-up activities. Minimization of the potential for adverse reaction to prophylaxis is included in the research and development (R&D) specifications for the material. Medical facilities regularly conduct exercises including the reception and treatment of contaminated/exposed casualties. All Services have mandated CBRN basic training, but it is not fully implemented at this time. Medical Services planning includes medical surveillance and medical activities to support the JTF, including CBRND-related activities and actions. Deficiencies include the lack of medical prophylaxes for all threat CBRN/TIM agents; predeployment medical screenings do not consider prior presymptomatic low-dose CBRND exposures and associated potential long-term effects as relates to CBRN/TIM threats; the wide variance in efficacy of existing prophylaxes; lack of prophylaxes for MWDs; the absence of a requirement for mandatory in-depth institutional medical CBRN/TIM casualty handling and treatment training for all deployable medical practitioners; and the inadequacy of existing doctrine, policy, and procedures for MWAs and eligible civilians.

**Projected Near/Mid-Term Capability and Deficiency**

No change projected for this task.

**Projected Far-Term Capability and Deficiency**

No change projected for this task.

Table 12.3-1. OPSHLD 3: Capability and Deficiency Assessment

	FAA Measure	Scale
M1	All units have prepared medical threat and risk assessment reports.	<p><b>G:</b> Doctrine, policy, procedures, and TTPs require all command levels perform threat and risk assessments for their units and operations. Detailed guidance, processes, and requirements address the determination and evaluation of CBRN/TIM, medical, and operational threats to the force and operations.</p> <p><b>Y:</b> Doctrine, policy, procedures, and TTPs require all command levels perform threat and risk assessments for their units and operations. General guidance and processes include consideration of CBRN/TIM, medical, and operational threats to the force and operations.</p> <p><b>R:</b> Doctrine, policy, procedures, and TTPs are inadequate or nonexistent requiring the performance of threat and risk assessments by all command levels for their units and operations and/or inclusion of CBRN/TIM, medical, and/or operational threats to the force and/or operations is inadequately addressed or nonexistent.</p>
M2	In-theater forces are protected by medical prophylaxes.	<p><b>G:</b> Medical CBRND countermeasures, encompassing all eligible at-risk populations, exist and are available for all threat CBRN and high-risk TIM agents.</p> <p><b>Y:</b> Medical CBRND countermeasures for U.S. military and eligible civilian members exist and are available for selected high-threat CBRN and high-risk TIM agents.</p> <p><b>R:</b> Medical CBRND countermeasures are inadequate, do not exist, and/or are not available for high-threat CBRN and high-risk TIM agents.</p>
M3	Deploying forces are protected by medical prophylaxes.	<p><b>G:</b> Deploying forces are medically prepared for all operations with CBRN/TIM threat.</p> <p><b>Y:</b> Deploying forces are medically prepared for operations with threat involving all CBRN warfare agents and High Threat TIMs.</p> <p><b>R:</b> Deploying forces medical preparedness for operations with CBRN/TIM threat is inadequate or nonexistent.</p>

M4	Required medical prophylaxes are available for issue/administration.	<p><b>G:</b> Medical prophylaxis is available for issue and administration to all at-risk populations, including military members, eligible civilians, and MWAs.</p> <p><b>Y:</b> Medical prophylaxis is available for issue and administration to military personnel.</p> <p><b>R:</b> Availability of medical prophylaxis is inadequate or nonexistent for issue and administration.</p>
M5	Required medical prophylaxis are issued/administered.	<p><b>G:</b> Medical prophylaxis is issued and administered to all at-risk populations, including military members, eligible civilians, and MWAs.</p> <p><b>Y:</b> Medical prophylaxis is issued and administered to military personnel.</p> <p><b>R:</b> Medical prophylaxis issuance and/or administration is inadequate or nonexistent.</p>
M6	Force is screened for potential adverse reaction to medical prophylaxes.	<p><b>G:</b> Forces are predeployed screened for potential potential of adverse reaction to medical prophylaxis for operations with threat.</p> <p><b>Y:</b> Selected forces generally are predeployment screened for potential of adverse reactions to medical prophylaxis for operations with threat.</p> <p><b>R:</b> Forces predeployment screening for potential of adverse reactions to medical prophylaxis for operations with threat is inadequate or nonexistent.</p>
M7	Force members do not exhibit adverse reactions to medical prophylaxes.	<p><b>G:</b> Forces administered medical prophylaxis do not exhibit adverse reactions from the prophylaxis.</p> <p><b>Y:</b> Adverse reactions to administered medical prophylaxis are present, but are within the maximum percentage of the targeted population for adverse reactions and do not seriously impact.</p> <p><b>R:</b> Adverse reactions to administered medical prophylaxis exceeds the maximum percentage of the targeted population for adverse reactions and/or seriously impacts operations.</p>
M8	Joint Operations Area (JOA) medical facilities are able to treat contaminated/exposed casualties.	<p><b>G:</b> All JOA medical facilities are equipped and exercised for the reception, decontamination, and treatment of contaminated/exposed casualties. All assigned medical practitioners and medical support personnel (including emergency medical services [EMS], medical aides, etc.) are formally trained, and receive recurring training, for the evaluation and care of contaminated/exposed casualties. Medical provider based medical treatment is provided, when needed, throughout the process from reception to post-decontamination.</p> <p><b>Y:</b> JOA medical facilities are equipped and exercised for the reception, decontamination, and treatment of contaminated/exposed casualties. Formal training is available to for the evaluation and treatment of contaminated/exposed casualties. Medical support personnel (including EMS, medical aides, etc.) are trained, on the evaluation, decontamination, and care of contaminated/exposed casualties.</p> <p><b>R:</b> The ability of JOA medical facilities to treat contaminated/exposed casualties is inadequate or nonexistent.</p>
M9	Identified threat CBRN/TIM capabilities are defended against.	<p><b>G:</b> Effective medical prophylaxis is available for all CBRN warfare agents and high-risk TIM agents for the protection of the force.</p> <p><b>Y:</b> Medical prophylaxis is available for all CBRN warfare agents and selected high-risk TIM agents for the protection of the force.</p> <p><b>R:</b> Medical prophylaxis in nonexistent or inadequate for protection of the force against all CBRN warfare and selected high-risk TIM agents.</p>

M10	Preventive medicine policy and countermeasures are established for identified medical threats in the JOA (after deployment).	<p><b>G:</b> Detailed plans and policies exist and are coordinated between JTF and Medical Services staffs for the effective application of preventative medicine activities and countermeasures addressing the health and well-being of the entire force and includes large-scale medical activities addressing both the force and non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).</p> <p><b>Y:</b> Plans exist and are coordinated between JTF and Medical Services staffs for preventative medicine activities and countermeasures for support of operations and the general health and well-being of the force.</p> <p><b>R:</b> Preventative medicine activities and/or countermeasures plans and/or policies are inadequate or nonexistent for support of operations and/or the general health and well-being of the force.</p>
M11	MWAs are prepared for operation in CBRN/TIM environment.	<p><b>G:</b> JOA MWA forces are fully equipped, trained, and prepared for survival while performing operations involving CBRN/TIM threat.</p> <p><b>Y:</b> Selected JOA MWA forces are fully equipped, trained, and prepared for survival while performing operations involving CBRN/TIM threat.</p> <p><b>R:</b> JOA MWA forces are inadequately equipped, trained, and/or prepared for survival while performing operations involving CBRN/TIM threat.</p>

<sup>1</sup> Existing doctrine, policy, and procedures require all command levels perform threat and risk assessments for their units and operations. The threat assessment includes CBRN/TIM, TIM, medical, and operational threats and their associated risks for the force.

<sup>2</sup> Forces are not protected against all identified threat CBRN/TIM capabilities. Medical prophylaxis does not exist for all threat CBRN/TIM and TIM agents. Current prophylaxis and supporting doctrine, policy, and procedures to not address presymptomatic medical CBRND protective countermeasures by other than U.S. forces, excluding MWAs and eligible civilians. Prophylaxis against most high-threat TIMs are not currently available due to the relatively recent consideration of these agents as a potential threat. Additionally, the efficacy of existing prophylaxis, particularly vaccines, widely varies. National policies of the coalition/non-U.S. forces regarding medical prophylaxis is a factor the JTF Commander and supporting staff must consider during planning and operations. Religious considerations may also impact the use of medical prophylaxis. The JTF staff, in coordination with coalition/non-U.S. forces partner staff, develop and address requirements and commitments by each partner. Although the provision of CBRND resources to national forces ultimately resides with their nations, mutual support among partners is planned to complement partners' capabilities and to minimize weaknesses. ACSAs between partners enables acquisition and cross-servicing support between the partners. The IA provides for a wide range of support exchange, including sheltering, medical care, and other support activities. Indigenous forces supporting operations may not be equipped or have access to medical prophylaxis. The JTF staff, in coordination with partners, determines the need for medical prophylaxis based upon the threat. A determination is made on the provision of medical prophylaxis to these forces.

<sup>3</sup> Forces are not protected against all identified threat CBRN/TIM capabilities. Medical prophylaxis does not exist for all threat CBRN/TIM and TIM agents. Current prophylaxis and supporting doctrine, policy, and procedures to not address presymptomatic medical CBRND protective countermeasures by other than U.S. forces, excluding MWAs and eligible civilians. Prophylaxis against most high-threat TIMs are not currently available due to the relatively recent consideration of these agents as a potential threat. Additionally, the efficacy of existing prophylaxis, particularly vaccines, widely varies. The availability of medical prophylaxis to military force members is dependent upon identification of the threat, preplanning for a threat, positioning of stocks for issue and administration, timing of notification to administer/issue prophylaxis, availability of medical personnel to perform administration (if required), and the available quantity of sufficient medical prophylaxis to meet requirements. Short-notice operations and reallocated taskings impact the administration and issue of prophylaxis for the threat. Forces have, and may in the future, require medical prophylaxis administration/issue upon arrival in the AOR. However, the administration of many vaccines requires multiple administrations over a period of time for acquired immunity. The JTF staff plans generally include provisions for medical preparation of the force.

<sup>4</sup> Medical prophylaxes are developed for the military force. Prophylaxis for MWAs is virtually nonexistent. Prophylaxis for eligible civilians is not addressed. Availability of prophylaxis is questionable for issue and administration to eligible civilians. The issue and administration of prophylaxis to eligible civilians requires review due to questions regarding applicability to the range of body types, ages, and physical/medical factors inherent within a potential population, as well as possible long-term health issues and legal implications. The availability of medical prophylaxis to military force members is dependent upon identification of the threat, preplanning for a threat, positioning of stocks for issue and administration, timing of notification to administer/issue prophylaxis, availability of medical personnel to perform administration (if required), and the available quantity of sufficient medical prophylaxis to meet requirements. Short-notice operations and reallocated taskings impact the administration and issue of prophylaxis for the threat. Forces have, and may in the future, require medical prophylaxis administration/issue upon arrival in the AOR. However, the administration of many vaccines requires multiple administrations over a period of time for acquired immunity. The JTF staff plans generally include provisions for medical preparation of the force.

<sup>5</sup> Medical prophylaxis is issued/administered for identified CBRN/TIM threats to the military force. The administration and issuance of prophylaxis is addressed by the JTF staff during the planning and support for operations. Prophylaxis for MWAs is virtually nonexistent. Prophylaxis for eligible civilians is not adequately addressed in current doctrine, policy, and procedures.

<sup>6</sup> JTF plans include the medical review of personnel identified against deployment taskings. Screenings of deployable personnel are periodically performed for potential limitations. Often, these are associated with annual medical physicals. However, predeployment medical screenings do not consider prior presymptomatic low-dose CBRND exposures, associated potential cumulative long-term effects, and the potential threat. The routine rotation and movement of personnel to and from units. Timing of notice of deployment and the availability of medical personnel impact the conduct of predeployment screenings. Short-notice operations and reallocated taskings may also impact the conduct of predeployment medical screenings. The JTF staff plans attempt to provide for early (prior to deployment notice) and continued medical screening of tasked forces. Plans also include provisions for the conduct of predeployment screenings by medical personnel upon notification of deployment. However, annual physicals, when used to meet deployment screening requirements, may be conducted several months before a deployment. Often, a record review is conducted of the period following the physical for indications of issues precluding deployment.

<sup>7</sup> Medical prophylaxes seek to protect the largest percentage of the force possible. Allergic or adverse reactions to a prophylaxis are annotated into an individual's medical record upon evaluation and treatment. However, reactions may not occur until after a number of administrations or applications are made in an individual's lifetime. Minimization of adverse reactions is part of the R&D process, and a very small percentage without major reaction is considered acceptable.

<sup>8</sup> Existing medical facilities within a high-threat area (HTA) exercise the reception of contaminated/exposed casualties. All Services have mandated CBRN basic training, but it is not fully implemented at this time. The ability of the JTF staff to ensure medical capabilities for CBRND is limited by routine medical operations and requirements. Periodic exercises are performed with medical activities, but on a limited basis, to provide training opportunities and to assess capabilities. Treatment of casualties is currently performed following completion of casualty decontamination. Generally, casualty care until completion of decontamination is performed by medical corpsmen, not medical practitioners.

<sup>9</sup> Forces are not protected against all identified threat CBRN/TIM capabilities. Medical prophylaxis does not exist for all threat CBRN/TIM and TIM agents. Current prophylaxis and supporting doctrine, policy, and procedures do not address presymptomatic medical CBRND protective countermeasures by other than U.S. forces, excluding MWAs and eligible civilians. Prophylaxis against most high-threat TIMs are not currently available due to the relatively recent consideration of these agents as a potential threat. Additionally, the efficacy of existing prophylaxis, particularly vaccines, widely varies. National policies of the coalition/non-U.S. forces regarding medical prophylaxis is a factor the JTF Commander and supporting staff must consider during planning and operations. Religious considerations may also impact the use of medical prophylaxis. The JTF staff, in coordination with coalition/non-U.S. forces partner staff, develop and address requirements and commitments by each partner. Although the provision of CBRND resources to national forces ultimately resides with their nations, mutual support among partners is planned to complement partners' capabilities and to minimize weaknesses. ACSAs between partners enable acquisition and cross-servicing support between the partners. The IA provides for a wide range of support exchange, including sheltering, medical care, and other support activities. Indigenous forces supporting operations may not be equipped or have access to medical prophylaxis. The JTF staff, in coordination with partners, determines the need for medical prophylaxis based upon the threat. A determination is made on the provision of medical prophylaxis to these forces.

<sup>10</sup> The Medical Services staff plans and associated policies address medical activities and procedures, including Preventative Medicine. Medical surveillance and the implementation of medical countermeasures are within the purview of medical authorities and are a consideration for medical planning for operations with a CBRN/TIM threat. The Medical Services staff coordinates with the JTF staff for Preventive Medicine support requirements, associated taskings, and their inclusion in JTF staff planning. Large-scale medical activities and actions are not adequately addressed in DOTMLPF; especially those involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>11</sup> MWAs are not equipped, trained, and prepared for survival in a CBRN/TIM environment.

<sup>12</sup> Existing doctrine, policy, and procedures require all command levels perform threat and risk assessments for their units and operations. The threat assessment includes CBRN/TIM, TIM, medical, and operational threats and their associated risks for the force. Medical information and associated threats for the operating area is provided to the JTF staffs.

<sup>13</sup> Forces are not protected against all identified threat CBRN/TIM capabilities. Medical prophylaxis does not exist for all threat CBRN/TIM and TIM agents. Current prophylaxis and supporting doctrine, policy, and procedures do not address presymptomatic medical CBRND protective countermeasures by other than U.S. forces, excluding MWAs and eligible civilians. Prophylaxis against most high-threat TIMs are not currently available due to the relatively recent consideration of these agents as a potential threat. Additionally, the efficacy of existing prophylaxis, particularly vaccines, widely varies. National policies of the coalition/non-U.S. forces regarding medical prophylaxis is a factor the JTF Commander, Medical Services, and supporting staff must consider during planning and operations. Religious considerations may also impact the use of medical prophylaxis. The JTF Medical Services staff, in coordination with the JTF staff and coalition/non-U.S. forces partner staff, develop and address requirements and commitments by each partner. Although the provision of CBRND resources to national forces ultimately resides with their nations, mutual support among partners is planned to complement partners' capabilities and to minimize weaknesses. ACSAs between partners enables acquisition and cross-servicing support between the partners. The IA provides for a wide range of support exchange, including medical care. Indigenous forces supporting operations may not be equipped or have access to medical prophylaxis. The JTF Medical Services staff, in coordination with the JTF staff and partners, determines the need for medical prophylaxis based upon the threat. A recommendation is made to the JTF Commander on the provision of medical prophylaxis to these forces.

<sup>14</sup> Forces are not protected against all identified threat CBRN/TIM capabilities. Medical prophylaxis does not exist for all threat CBRN/TIM and TIM agents. Current prophylaxis and supporting doctrine, policy, and procedures do not address presymptomatic medical CBRND protective countermeasures by other than U.S. forces, excluding MWAs and eligible civilians. Prophylaxis against most high-threat TIMs are not currently available due to the relatively recent consideration of these agents as a potential threat. Additionally, the efficacy of existing prophylaxis, particularly vaccines, widely varies. The availability of medical prophylaxis to military force members is dependent upon identification of the threat, preplanning for a threat, positioning of stocks for issue and administration, timing of notification to administer/issue prophylaxis, availability of medical personnel to perform administration (if required), and the available quantity of sufficient medical prophylaxis to meet requirements. Short-notice operations and reallocated taskings impact the administration and issue of prophylaxis for the threat. Forces have, and may in the future, require medical prophylaxis administration/issue upon arrival in the AOR. However, the administration of many vaccines requires multiple administrations over a period of time for acquired immunity. The JTF Medical Services staff plans detail provisions for medical preparation of the force.

<sup>15</sup> Medical prophylaxes are developed for the military force. Prophylaxis for MWAs is virtually nonexistent. Prophylaxis for eligible civilians is not addressed. Availability of prophylaxis is questionable for issue and administration to eligible civilians. The issue and administration of prophylaxis to eligible civilians requires review due to questions regarding applicability to the range of body types, ages, and physical/medical factors inherent within a potential population, as well as possible long-term health issues and legal implications. The availability of medical prophylaxis to military force members is dependent upon identification of the threat, preplanning for a threat, positioning of stocks for issue and administration, timing of notification to administer/issue prophylaxis, availability of medical personnel to perform administration (if required), and the available quantity of sufficient medical prophylaxis to meet requirements. Short-notice operations and reallocated taskings impact the administration and issue of prophylaxis for the threat. Forces have, and may in the future, require medical prophylaxis administration/issue upon arrival in the AOR. However, the administration of many vaccines requires multiple administrations over a period of time for acquired immunity. The JTF Medical Services staff plans detail provisions for medical preparation of the force.

<sup>16</sup> Medical prophylaxis is issued/administered for identified CBRN/TIM threats to the military force. The administration and issuance of prophylaxis is addressed by the JTF Medical Services staff during the planning and support for operations. Prophylaxis for MWAs is virtually nonexistent. Prophylaxis for eligible civilians is not adequately addressed in current doctrine, policy, and procedures.

<sup>17</sup> JTF supporting Medical Services plans include the medical review of personnel identified against deployment taskings. Screenings of deployable personnel are periodically performed for potential limitations. Often, these are associated with annual medical physicals. However, predeployment medical screenings do not consider prior presymptomatic low-dose CBRND exposures, associated potential cumulative long-term effects, and the potential threat. The routine rotation and movement of personnel to and from units. Timing of notice of deployment and the availability of medical personnel impact the conduct of predeployment screenings. Short-notice operations and reallocated taskings may also impact the conduct of predeployment medical screenings. The JTF Medical Services staff plans attempt to provide for early (prior to deployment notice) and continued medical screening of tasked forces. Plans also include provisions for the conduct of predeployment screenings by medical personnel upon notification of deployment. However, annual physicals, when used to meet deployment screening requirements, may be conducted several months before a deployment. Often, a record review is conducted of the period following the physical for indications of issues precluding deployment.

<sup>18</sup> Medical prophylaxes seek to protect the largest percentage of the force possible. Allergic or adverse reactions to a prophylaxis are annotated into an individual's medical record upon evaluation and treatment. However, reactions may not occur until after a number of administrations or applications are made in an individual's lifetime. Minimizations of adverse reactions are part of the R&D process and a very small percentage without major reaction is considered acceptable.

<sup>19</sup> Existing medical facilities within an HTA exercise the reception of contaminated/exposed casualties. Training for the treatment of contaminated/exposed casualties is available through Army Medical Department (AMEDD), but is not mandatory for medical practitioners identified for deployment or assignment where there exists a CBRN/TIM threat. The ability of the JTF Medical Services staff to ensure medical capabilities for CBRND is limited by routine medical operations and requirements. Periodic exercises are performed by medical activities, but on a limited basis, to provide training opportunities and to assess capabilities. Treatment of casualties is currently performed following completion of casualty decontamination. Generally, casualty care until completion of decontamination is performed by medical corpsmen, not medical practitioners.

<sup>20</sup> Forces are not protected against all identified threat CBRN/TIM capabilities. Medical prophylaxis does not exist for all threat CBRN/TIM and TIM agents. Current prophylaxis and supporting doctrine, policy, and procedures do not address presymptomatic medical CBRND protective countermeasures by other than U.S. forces, excluding MWAs and eligible civilians. Prophylaxis against most high-threat TIMs are not currently available due to the relatively recent consideration of these agents as a potential threat. Additionally, the efficacy of existing prophylaxis, particularly vaccines, widely varies. National policies of the coalition/non-U.S. forces regarding medical prophylaxis is a factor the JTF Commander, Medical Services, and supporting staff must consider during planning and operations. Religious considerations may also impact the use of medical prophylaxis. The JTF Medical Services staff, in coordination with the JTF and coalition/non-U.S. forces partner staff, develop and address requirements and commitments by each partner. Although the provision of CBRND resources to national forces ultimately resides with their nations, mutual support among partners is planned to complement partners' capabilities and to minimize weaknesses. ACSAs between partners enable acquisition and cross-servicing support between the partners. The IA provides for a wide range of support exchange, including medical care. Indigenous forces supporting operations may not be equipped or have access to medical prophylaxis. The JTF Medical Services staff, in coordination with the JTF staff and partners, determines the need for medical prophylaxis based upon the threat. A recommendation is made to the JTF Commander on the provision of medical prophylaxis to these forces.

<sup>21</sup> The Medical Services staff plans and associated policies address medical activities and procedures, including Preventative Medicine. Medical surveillance and the implementation of medical countermeasures are within the purview of medical authorities and are a consideration for medical planning for operations with a CBRN/TIM threat. The Medical Services staff coordinates with the JTF staff for Preventive Medicine support requirements, associated taskings, and their inclusion in JTF staff planning. Large-scale medical activities and actions are not adequately addressed in DOTMLPF; especially those involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>22</sup> MWAs are not equipped, trained, and prepared for survival in a CBRN/TIM environment.

### 12.3.3 Functional Solution Analysis

#### 12.3.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** Forces are not protected against all identified threat CBRN/TIM capabilities.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards for prophylactic CBRND protection against all threat agents. *Leadership:* Enforce compliance with established standards (see Footnote 17 above) for prophylactic CBRND protection.
- 2. Deficiency:** Medical prophylaxis does not exist for all threat CBRN/TIM and TIM agents.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards for prophylactic CBRND protection against all threat agents. *Training:* Train, exercise, and evaluate personnel (military and eligible civilians) on the use of prophylactic CBRND protection against threat agents. *Leadership:* Enforce compliance with established standards (see Footnote 1 above) for prophylactic CBRND protection. Implement and ensure training is adequate and conduct exercises and evaluations to ensure readiness.
- 3. Deficiency:** Current prophylaxis and supporting doctrine, policy, and procedures to not address presymptomatic medical CBRND protective countermeasures by other than U.S. forces, excluding eligible civilians.  
**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing eligible civilians during CBRND operations and the provision of CBRND protection, including prophylaxis. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians.
- 4. Deficiency:** Current prophylaxis and supporting doctrine, policy, and procedures to not address presymptomatic medical CBRND protective countermeasures by other than U.S. forces, excluding MWAs.  
**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing MWAs during CBRND operations and the provision of CBRND protection, including prophylaxis. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWAs.
- 5. Deficiency:** Prophylaxis against most high-threat TIMs are not currently available due to the relatively recent consideration of these agents as a potential threat.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards and criteria for protection against all high-threat TIM agents. *Training:* Train, exercise, and evaluate personnel (military and eligible civilians) on the use

of prophylactic CBRND protection against threat agents. *Leadership*: Enforce compliance with established readiness criteria. Implement and ensure training is adequate and conduct exercises and evaluations to ensure readiness.

6. **Deficiency:** The efficacy of existing prophylaxis, particularly vaccines, widely varies. **Non-Materiel Solutions:** *Doctrine*: Establish in doctrine, policy, and procedures the application of baseline standards for prophylactic CBRND protection against all threat agents. *Leadership*: Enforce compliance with established standards (see Footnote 5 above) for prophylactic CBRND protection.
7. **Deficiency:** Short-notice operations and reallocated taskings impact the administration and issue of prophylaxis for the threat. **Non-Materiel Solutions:** *Doctrine*: Establish in doctrine, policy, and procedures the application of baseline standards for prophylactic CBRND protection against all threat agents. *Leadership*: Enforce compliance with established standards (see Footnote 5 above) for prophylactic CBRND protection.
8. **Deficiency:** Forces have, and may in the future, require medical prophylaxis administration/issue upon arrival in the AOR. **Non-Materiel Solutions:** *Doctrine*: Emphasize in doctrine, policies, and procedures for preparation of the force for CBRND protection during throughout deployment, redeployment, relocation, and en route phases of movement. *Organization*: Ensure resources, taskings, and staff are in place or available to perform CBRND operations within a CBRN/TIM environment by deploying, redeploying, relocating, and en route forces. *Training*: Train, exercise, and evaluate the force for CBRND operations within a CBRN/TIM environment while deploying, redeploying, relocating, and en route. *Leadership*: Recognize criticality of readiness of the force for potential CBRND operations within a CBRN/TIM environment while deploying, redeploying, relocation, and en route; training providing the skills to manage the force in these circumstances; and willingness and ability to implement necessary changes and activities to prepare and appropriately protect the force. *Facilities*: Develop supporting infrastructure for CBRND operations of the force while preparing, deploying, redeploying, relocating, and en route.
9. **Deficiency:** The administration of many vaccines requires multiple administrations over a period of time for acquired immunity. **Non-Materiel Solutions:** *Doctrine*: Include in doctrine, policy, and procedures requirement for CBRN/TIM protective prophylaxis protecting the force through the deployment cycle. *Organization*: Establish organizational incentives to address CBRN/TIM protective prophylaxis providing protection of the force throughout the deployment cycle. *Leadership*: Ensure standards, criteria, and metrics for CBRN/TIM medical prophylaxis R&D are concise and adequately protect the force throughout the deployment cycle with a minimum of administrations, preferably one.
10. **Deficiency:** Prophylaxis for MWAs is virtually nonexistent. **Non-Materiel Solutions:** *Doctrine*: Establish doctrine, policy, and procedures CBRND protection of MWAs, particularly MWDs, and training for CBRN/TIM environment survival.

*Organization:* Ensure organizational consideration for maintenance and support of MWA CBRND protective equipment, measures, and activities. *Training:* Provide institutional and unit training of handlers and MWAs for CBRND measures and activities. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for MWA survivability. *Facilities:* Develop supporting infrastructure for MWA CBRND (e.g., logistics, veterinary surveillance, etc.).

**11. Deficiency:** Prophylaxis for eligible civilians is not addressed.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures requirement to address the administration, provision, and application of medical CBRND protective countermeasures by other than U.S. forces (e.g., civilians, non-U.S. forces, etc.).

*Organization:* Address organizational issues (e.g., who provides the equipment, support forces to train and equip, etc.) related to the provision of CBRN/TIM protection to eligible civilians, and non-U.S. forces. *Training:* Include eligible civilians in CBRND training, exercises, and evaluations. Identify training requirements and responsibilities for non-U.S. forces. *Leadership:* Ensure leadership awareness of criticality of increased dependence of military operations upon civilians. *Personnel:* Require eligible civilians supporting the mission to meet minimum standards for safe use of CBRND resources.

**12. Deficiency:** Availability of prophylaxis is questionable for issue and administration to eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of CBRND standards and prophylaxis for protection of eligible civilians addressing the variation within a potential protected population. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRN/TIM training, exercises, and evaluations, where appropriate. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians.

**13. Deficiency:** The issue and administration of prophylaxis to eligible civilians requires review due to questions regarding applicability to the range of body types, ages, and physical/medical factors inherent within a potential population, as well as possible long-term health issues and legal implications.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards and measures for protection of eligible civilians addressing the variation within the potential protected population. *Leadership:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRN/TIM training, exercises, and evaluations.

**14. Deficiency:** Prophylaxis for eligible civilians is not adequately addressed in current doctrine, policy, and procedures.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures requirement to address the administration, provision, and application of medical CBRND protective countermeasures by other than U.S. forces (e.g., civilians, non-U.S. forces, etc.).

*Organization:* Address organizational issues (e.g., who provides the equipment, support forces to train and equip, etc.) related to the provision of CBRN/TIM protection to eligible civilians, and non-U.S. forces. *Training:* Include eligible civilians in CBRND training,

exercises, and evaluations. Identify training requirements and responsibilities for non-U.S. forces. *Leadership*: Ensure leadership awareness of criticality of increased dependence of military operations upon civilians. *Personnel*: Require eligible civilians supporting the mission to meet minimum standards for safe use of CBRND resources.

- 15. Deficiency:** Predeployment medical screenings do not consider prior presymptomatic low-dose CBRND exposures, associated potential cumulative long-term effects, and the potential threat.

**Non-Materiel Solutions:** *Doctrine*: Establish in doctrine, policy, and procedures the application of low-dose exposure limits and cumulative long-term low-dose exposures in predeployment medical screenings. *Leadership*: Enforce compliance with established doctrine, policy, and procedures (see Footnote 10 above) for low-dose exposure limits and cumulative long-term low-dose exposures in predeployment medical screenings.

- 16. Deficiency:** Reactions to a prophylaxis may not occur until after a number of administrations or applications are made in an individual's lifetime.

**Non-Materiel Solutions:** *Doctrine*: Establish in doctrine, policy, and procedures the application of CBRND standards and prophylaxis for protection addressing adverse reactions to a prophylaxis (including long-term) within a potential protected population.

- 17. Deficiency:** The ability of the JTF and Medical Services staff to ensure medical capabilities for CBRND is limited by routine medical operations and requirements.

**Non-Materiel Solutions:** *Doctrine*: Incorporate the safe handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties/MWAs into doctrine, policy and procedures and requires specific exercising and evaluation for these operations and activities that includes all activities and functions conducting these functions including nonmedical activities and functions. *Organization*: Ensure resources, taskings, and trained personnel are in place or available to support the handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties/MWAs by all activities and functions conducting these functions including nonmedical activities and functions. *Training*: Train, exercise, and evaluate the handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties/MWAs by all activities and functions conducting these functions including nonmedical activities and functions, including the prevention of secondary exposure/contamination. *Leadership*: Implement and manage training, equipping, protective measures, and exercising for the safe handling, transport, medical reception and triage, and treatment of contaminated casualties/MWAs by all activities and functions conducting these functions including nonmedical activities and functions.

- 18. Deficiency:** Generally, casualty care until completion of decontamination is performed by medical corpsmen, not medical practitioners.

**Non-Materiel Solutions:** *Doctrine*: Incorporate the safe handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties into doctrine, policy and procedures and requires specific exercising and evaluation for these operations and activities that includes all activities and functions conducting these functions including nonmedical activities and functions. *Organization*: Ensure resources, taskings, and

trained personnel are in place or available to support the handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties by all activities and functions conducting these functions including nonmedical activities and functions. *Training*: Train, exercise, and evaluate the handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties by all activities and functions conducting these functions including nonmedical activities and functions, including the prevention of secondary exposure/contamination. *Leadership*: Implement and manage training, equipping, protective measures, and exercising for the safe handling, transport, medical reception and triage, and treatment of contaminated casualties by all activities and functions conducting these functions including nonmedical activities and functions.

- 19. Deficiency:** Large-scale medical activities and actions are not adequately addressed in DOTMLPF; especially those involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

**Non-Materiel Solutions:** *Doctrine*: Include in doctrine, policy, procedures, and *UJTL* COCOM and Medical Services activities associated with the planning, coordination, implementation, operation, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Organization*: Ensure resources, taskings, and staff are in place or available for operations addressing COCOM and Medical Services actions associated with the planning, coordination, implementation, operation, support, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Training*: Train, exercise, and evaluate the force for COCOM and Medical Services actions associated with the planning, coordination, implementation, operation, support, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Leadership*: Recognize criticality of readiness of the force for potential operations (medical and nonmedical) within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare the force and appropriately support large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Personnel*: Ensure that eligible civilian personnel and operations supporting the mission/military operations (medical and nonmedical) are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities*: Develop supporting infrastructure for operations associated with large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.).

- 20. Deficiency:** MWAs are not equipped, trained, and prepared for survival in a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine*: Establish doctrine, policy, and procedures CBRND protection of MWDs and training for CBRN/TIM environment survival. *Organization*: Ensure organizational consideration for maintenance and support of MWD CBRND

protective equipment, measures, and activities. *Training*: Provide institutional and unit training of handlers and MWDs for CBRND measures and activities. *Leadership*: Ensure awareness and planning for CBRND measures and requirements for MWD survivability. *Facilities*: Develop supporting infrastructure for MWD CBRND (e.g., logistics, veterinary surveillance, etc.).

**21. Deficiency:** Existing DOTMLPF is inadequate, or nonexistent, for eligible civilians.

**Non-Materiel Solutions:** *Doctrine*: Develop doctrine, policy, and procedures addressing eligible civilian personnel for CBRND. *Organization*: Identify organization services and activities necessary to support survivability of eligible civilian personnel within a CBRN/TIM environment. *Training*: Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRND training, exercises, and evaluations. *Leadership*: Implement and manage CBRND training, equipping, and protection of eligible civilian personnel.

**22. Deficiency:** Existing DOTMLPF is inadequate, or nonexistent, for MWAs.

**Non-Materiel Solutions:** *Doctrine*: Develop doctrine, policy, and procedures addressing MWAs, particularly MWDs, for CBRND. *Organization*: Identify organization services and activities necessary to support survivability of MWAs within a CBRN/TIM environment. *Training*: Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations. *Leadership*: Implement and manage CBRND training, equipping, and protection of MWAs.

#### 12.3.3.2 IMA Assessment Summary

N/A

**12.4 Task OPSHLD 4: Ensure that IPE for forces (including patients) and MWAs are ready to minimize casualties and to ensure survivability and effective performance****12.4.1 Functional Area Analysis****12.4.1.1 Definition**

To ensure that IPE provides individual protection from CBRN/TIM hazards by the proper use of masking devices (respiration and ocular) and wear of protective gear and clothing (percutaneous). The gear must ensure survivability by prohibiting agents from entering the body while allowing individuals to perform mission tasks while wearing it. While some performance degradation is inherent because of the physical properties of the protective gear, the goal is to reduce the physical and mental stresses of its wear without substantially degrading mission performance. IPE must be correctly fitted to the individual. These provisions also apply to MWAs.

**12.4.1.2 Derivation**

*Joint Enabling Concept for CBRN/TIM Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (OP 5.3, OP 5.3.9, OP 5.4, OP 5.4.6, OP 5.5.9, OP 7, OP 7.2, OP 7.3, OP 7.4).*

**12.4.1.2.1 Supported Task: N/A****12.4.1.2.2 Lateral Task: OPSHA 4****12.4.1.2.3 Supporting Task: N/A****12.4.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Undeveloped to highly developed land. (C1.1)
2. Riverine to open sea. (C1.2)
3. Natural and induced air. (C1.3)
4. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Partially completed mission preparation. (C2.1.3)
2. Marginal to strong forces assigned. (C2.2.1)
3. Good personnel physical conditioning. (C2.2.4.3)
4. Poor mission-essential government-service civilian physical conditioning. (C2.2.4.3 – NEW)

5. Poor mission-essential contract-service civilian physical conditioning. (C2.2.4.3 – NEW)
6. Negligible personnel experience. (C2.2.4.5)
7. Limited deployed supplies. (C2.8.2)
8. Limited prepositioned materiel. (C2.8.4)
9. Limited host nation support. (C2.8.5)
10. Limited commercial procurement. (C2.8.6)

### Civil

1. TIMs present in the civilian sector. (C3.3.7.5)

## 12.4.2 Functional Needs Analysis

### 12.4.2.1 Capability and Deficiency Assessment Summary

Table 12.4-1 discusses the only capability that exists to perform the task to the designated standard. The JTF HQ Staff conducts planning and preparation of forces deploying to and/or within the JOA for CBRND protection. Adequate doctrine, policy, and procedures exist for the planning and management of resources affording individual protection of the force. Included in the deficiencies is the ability of the force to perform sustained operations within a CBRN/TIM environment and CBRND of eligible civilians and MWAs.

### Current Capability and Deficiency

Adequate doctrine, policies, and procedures exist to guide the JTF staff in planning, allocation, equipping, and preparing the force with CBRND IPE. Training, exercises, and evaluations serve to build individual capability to perform tasks while encumbered by IPE. Specialized IPE and supporting DOTMLPF exists for CBRND of uncontaminated casualties unable to wear standard IPE. Deficiencies include the potential for deploying units not to be equipped for CBRND until after arrival in the JOA; eligible civilians and MWAs are not equipped and trained to survive a CBRN/TIM environment; CBRND systems do not adequately support expeditionary and highly mobile forces; replenishment of CBRND systems may be impacted by non-U.S. manufacturer sources; IPE encumbrances do degrade performance; CBRND is inadequate for TIMs; the designs of specialized IPE (e.g., explosive ordnance disposal [EOD] IPE, firefighter bunker gear, etc.) do not incorporate CBRND qualities and features; the provision of medical treatment to casualties within a CBRN/TIM environment can be performed only within COLPRO; and DOTMLPF is inadequate for sustained operations within a CBRN/TIM environment and for CBRND of eligible civilians and MWDs. The overall current capability is “red.”

### Projected Near/Mid-Term Capability and Deficiency

The fielding of improved joint IPE (Joint Service Lightweight Integrated Suit Technology [JSLIST], Joint Service Aircrew Mask [JSAM], Joint Service General Purpose Mask [JSGPM], and Joint Protective Aircrew Ensemble [JPACE]) provides improved protection for the force. The IPE will provide protection against limited TIMs in addition to the known CBRN warfare agents. National Institute for Occupational Safety and Health review for compliance with

Occupational Safety and Health Administration standards was requested to support joint and DoD requirements. Joint Firefighter's Integrated Response Ensemble (JFIRE), the application of JSLIST capabilities to firefighter bunker gear, provides firefighters with increased CBRND capabilities within a CBRN/TIM environment. Initial operational capability (IOC) fielding of JFIRE is programmed during the mid term. Otherwise, no change from current capabilities is projected.

**Projected Far-Term Capability and Deficiency**

No projected change for this task.

Table 12.4-1. OPSHLD 4: Capability and Deficiency Assessment

Capability: JTF HQ Staff	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10	M11	M12	M13

Far-Term Overall Capability	Y	Y	Y	R	Y	R	G	R	Y	R	R	R	Y

	FAA Measure	Scale
M1	Deploying forces possess CBRN/TIM IPE prior to deployment to the JOA.	<p><b>G:</b> Plan-identified forces (military, eligible civilians, and MWDs) are equipped with CBRND IPE during predeployment and deployment prior to departure to the JOA for survivability and operational readiness throughout deployment into the JOA.</p> <p><b>Y:</b> Plan-identified military forces are equipped with CBRND IPE prior to or immediately upon arrival in the JOA for survivability and operational readiness throughout deployment into the JOA.</p> <p><b>R:</b> Plans are inadequate or nonexistent to equip forces with CBRND IPE prior to conducting operations within the JOA.</p>
M2	Required individual protective assets are available for deploying forces.	<p><b>G:</b> All deploying forces (including military, eligible civilians, and MWAs) are trained and possess adequate and readily available and operational CBRND protective equipment and measures for survivability and operational readiness throughout deployment into the JOA.</p> <p><b>Y:</b> Deploying uniformed forces are trained and possess adequate and readily available and operational CBRND protective equipment and measures for survivability and operational readiness throughout deployment into the JOA.</p> <p><b>R:</b> Training, possession, and/or availability of adequate and operational CBRND protective equipment and/or measures for deploying forces are inadequate or nonexistent.</p>
M3	Theater forces are issued individual protective assets to operate in a CBRN/TIM environment.	<p><b>G:</b> All JTF forces (including military, eligible civilians, and MWAs) are trained and possess adequate and readily available and operational CBRND protective equipment and measures.</p> <p><b>Y:</b> JTF uniformed forces are trained and possess adequate and readily available and operational CBRND protective equipment and measures.</p> <p><b>R:</b> Training, possession, and/or availability of adequate and operational CBRND protective equipment and/or measures for JTF forces are inadequate or nonexistent.</p>
M4	Requirements are on hand, enabling theater forces to sustain operations over multiple CBRN/TIM attacks based upon organic, on-hand, and issued CBRN/TIM protective assets, consumables, and expendables.	<p><b>G:</b> JTF forces (including military, eligible civilians, and MWAs) are adequately equipped and possess ready access to sufficient CBRND resources to support sustained operations through multiple CBRN/TIM attacks across the spectrum of operations and without unplanned and unforecasted resupply.</p> <p><b>Y:</b> JTF forces (including military and eligible civilians) are equipped and possess ready access to sufficient CBRND to support sustained operations through multiple CBRN/TIM attacks involving major operations with planned and forecasted resupply.</p> <p><b>R:</b> JTF forces are inadequately equipped and/or possess limited access to CBRND resources to sustain operations through multiple CBRN/TIM attacks and/or are reliant upon resupply.</p>

M5	Forces achieve CBRN/TIM individual protective capability immediately after initial arrival in the JOA.	<p><b>G:</b> Plan-identified forces (military, eligible civilians, and MWDs) are equipped with CBRND IPE and measures prior to arrival in the JOA for survivability and operational readiness throughout deployment into and upon immediate arrival in the JOA.</p> <p><b>Y:</b> Plan-identified military forces are equipped with CBRND IPE and measures prior to or immediately upon arrival in the JOA for survivability and operational readiness throughout deployment into and/or upon arrival in the JOA.</p> <p><b>R:</b> Plans are inadequate or nonexistent to equip forces with CBRND IPE and/or measures immediately upon arrival in the JOA.</p>
M6	CBRND asset replenishment effectively maintains OPTEMPO and force survivability.	<p><b>G:</b> CBRND resources are stockpiled and prepositioned in plan-identified required quantities and types to support sustained operations against multiple CBRN/TIM attacks upon the JTF. Replenishment of stockpiles and prepositioned stocks maintains plan established and operations-related adjusted stock levels.</p> <p><b>Y:</b> CBRND resources are stockpiled and prepositioned in plan-identified required quantities and types to support sustained operations in a CBRN/TIM environment. Replenishment of stockpiles and prepositioned stocks maintains plan established stock levels.</p> <p><b>R:</b> Stockpiles and/or prepositioned stocks of CBRND resources and/or replenishment of stock levels is inadequate to support sustained operations in a CBRN/TIM environment.</p>
M7	Forces are trained in the effective use of IPE.	<p><b>G:</b> Training, exercising, and evaluation of tasked forces addresses the use, care, and limitations of CBRND IPE.</p> <p><b>Y:</b> Training, exercising, and evaluation of deploying forces addresses the use, care, and limitations of CBRND IPE.</p> <p><b>R:</b> Training, exercising, and/or evaluation of the force on the use, care, and/or limitations of CBRND IPE is inadequate or nonexistent.</p>
M8	MWAs are equipped with IPE.	<p><b>G:</b> All JTF MWA forces are fully equipped, trained, and prepared for survival using CBRND IPE while performing operations involving CBRN/TIM threat</p> <p><b>Y:</b> Selected JTF MWA forces are fully equipped, trained, and prepared to apply CBRND IPE for survival during operations involving CBRN/TIM threat.</p> <p><b>R:</b> JTF MWA forces are inadequately equipped, trained, and/or prepared to apply CBRND IPE for survival during operations involving CBRN/TIM threat.</p>
M9	Forces are fully capable while wearing IPE.	<p><b>G:</b> JTF forces capabilities are not degraded by the wear of CBRND IPE for sustained operations in a CBRN/TIM environment.</p> <p><b>Y:</b> JTF forces capabilities are not significantly degraded by the wear of CBRND IPE in a CBRN/TIM environment.</p> <p><b>R:</b> JTF force capabilities while wearing CBRND IPE is significantly degraded and/or operations are adversely impacted.</p>
M10	Specialized IPE is available for casualties unable to wear standard IPE.	<p><b>G:</b> Specialized casualty IPE is readily available for casualties unable to wear standard IPE and provides safe and full visibility, support, and access to the casualty by Medical Services personnel, equipment, and materiel.</p> <p><b>Y:</b> Specialized casualty IPE is readily available for selected casualties unable to wear standard IPE and provides safe support and access to the casualty by Medical Services personnel, equipment, and materiel.</p> <p><b>R:</b> Specialized casualty IPE is nonexistent or inadequate for the protection of casualties unable to wear standard IPE and/or does not or is inadequate for the safe support and access of Medical Services personnel, equipment, and materiel.</p>

M11	Specialized TIM IPE (e.g., hazardous materials-specific respirators, overgarments, gloves, and boots) is available for specialized protective needs.	<p><b>G:</b> TIM protective assets are readily available or TIM protective capabilities are built into standard IPE for protection of the force against all high-risk TIM agents.</p> <p><b>Y:</b> TIM protective assets are readily available or TIM protective capabilities are built into standard IPE for protection of the force against select high-risk TIM agents.</p> <p><b>R:</b> TIM protective assets or TIM protective capabilities of standard IPE are inadequate or nonexistent.</p>
M11	Specialized EOD IPE (e.g., bomb suits compatible with CBRN/TIM IPE) is available for EOD personnel.	<p><b>G:</b> Specialized EOD IPE incorporates into design and materials operational protection against all CBRN and high-risk TIM agents.</p> <p><b>Y:</b> Specialized EOD IPE incorporates into design and materials operational protection against CBRN warfare agents and selected high-risk TIM agents.</p> <p><b>R:</b> Specialized EOD IPE is inadequate or protection against CBRN and/or TIM agents is not incorporated into design and materials.</p>
M13	Specialized medical IPE is available for medical care providers.	<p><b>G:</b> Medical practitioners and personnel are equipped with specialized CBRN/TIM protective equipment for the handling and treatment of exposed and contaminated CBRN/TIM casualties.</p> <p><b>Y:</b> Medical practitioners and personnel are equipped with CBRN/TIM protective equipment and supplemented using standard protective medical assets.</p> <p><b>R:</b> Equipping of medical practitioners and personnel for the handling and treatment of exposed and contaminated CBRN/TIM casualties is inadequate or nonexistent.</p>

<sup>1</sup> Adequate DOTMLPF exists to address planning and support of the force. However, DOTMLPF is inadequate for nonexistent addressing CBRND of eligible civilians and MWAs. DOTMLPF for CBRND is inadequate for sustained operations within a CBRN/TIM environment and for expeditionary operations with reduced logistical footprint.

<sup>2</sup> The JTF staff plans for operations using the COCOM-identified forces for the potential threat. Equipping the tasked force is an integral part of planning and preparation. The combination of established force organic assets, material acquisitions, prepositioned material, available host-nation/coalition contributions, and movement of identified CBRND resources from stockpiles and reallocation activities are pursued by the JTF staff with the COCOM staff to prepare and support deploying forces as outlined by the appropriate plan. Deploying units may not possess full CBRND resources and capabilities during the initial stages of deployment and until after arrival within the JOA. Additionally, deploying eligible civilians and MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment. JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians and MWAs.

<sup>3</sup> The JTF staff plans for operations using the COCOM-identified forces for the potential threat. Equipping the tasked force is an integral part of planning and preparation. The combination of established force organic assets, material acquisitions, prepositioned material, available host-nation/coalition contributions, and movement of identified CBRND resources from stockpiles and reallocation activities are pursued by the JTF staff with the COCOM staff to prepare and support deploying forces as outlined by the appropriate plan. Deploying units may not possess full CBRND resources and capabilities during the initial stages of deployment and until after arrival within the JOA. Additionally, deploying eligible civilians and MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment. JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians and MWAs.

<sup>4</sup> The JTF staff plans for operations using the COCOM-identified forces for the potential threat. Equipping the tasked force is an integral part of planning and preparation. The combination of established force organic assets, material acquisitions, prepositioned material, available host-nation/coalition contributions, and movement of identified CBRND resources from stockpiles and reallocation activities are pursued by the JTF staff with the COCOM staff to prepare and support deploying forces as outlined by the appropriate plan. Deploying units may not possess full CBRND resources and capabilities during the initial stages of deployment and until after arrival within the JOA. Additionally, deploying eligible civilians and MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment. JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians and MWAs.

<sup>5</sup> The JTF staff plans for operations using the COCOM-identified forces for the potential threat. Equipping the tasked force is an integral part of planning and preparation. The combination of established force organic assets, material acquisitions, prepositioned material, available host-nation/coalition contributions, and movement of identified CBRND resources from stockpiles and reallocation activities are pursued by the JTF staff with the COCOM staff to prepare and support deploying forces as outlined by the appropriate plan. Systems are reallocated, when necessary, from prepositioned and dispersed stocks of units deploying or operating within an JOA. Expeditionary operations are a particular concern. Existing COLPRO systems are not generally designed for a highly mobile force, with a reduced logistical footprint, and the initial period of operations until the theater matures (usually the first 30–90 days). Deploying units may not possess full CBRND resources and capabilities during the initial stages of deployment and until after arrival within the JOA. Additionally, deploying eligible civilians and MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment. JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians and MWAs. Current doctrine and policy does not adequately address sustained operations within a CBRN/TIM environment.

<sup>6</sup> The JTF staff plans for operations using the COCOM-identified forces for the potential threat. Equipping the tasked force is an integral part of planning and preparation. The combination of established force organic assets, material acquisitions, prepositioned material, available host-nation/coalition contributions, and movement of identified CBRND resources from stockpiles and reallocation activities are pursued by the JTF staff with the COCOM staff to prepare and support deploying forces as outlined by the appropriate plan. Deploying units may not possess full CBRND resources and capabilities during the initial stages of deployment and until after arrival within the JOA. Additionally, deploying eligible civilians and MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment. JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians and MWAs.

<sup>7</sup> Available CBRND systems are not prepositioned in sufficient quantities to support concurrent military operations. Timing for replenishment of systems is dependent upon manufacturing capabilities, system age, and funding availability. Production for replenishment by industry may require a period to expand or establish manufacturing capabilities which could exceed the necessary replenishment timeline. This is particularly applicable when components or systems are dependent upon non-U.S. manufacturing capabilities.

<sup>8</sup> Doctrine, policy, and procedures exist for the training, exercising, and evaluation of forces for the application of IPE against CBRN/TIM agents.

<sup>9</sup> MWAs are not equipped, trained, and prepared for survival in a CBRN/TIM environment.

<sup>10</sup> Doctrine, policy, procedures, training, exercises, and evaluations serve to build the capability of individuals to perform tasks while wearing IPE. However, the encumbrances associated with IPE do degrade performance and limit the conduct of certain tasks (especially those associated with the repair and maintenance of delicate and intricate assets). Doctrine, policy, and procedures are inadequate for sustained operations within a CBRN/TIM environment, especially forces conducting expeditionary operations in austere environments and possessing reduced logistical footprints.

<sup>11</sup> Specialized IPE is available for uncontaminated casualties unable to wear standard IPE. The preference is to use COLPRO to protect these casualties against the effects of CBRN/TIM agents. DOTMLPF exists for the application of specialized IPE for uncontaminated casualties.

<sup>12</sup> Doctrine, policy, and procedures for specialized TIM IPE are generally limited to specialized operations and functions such as hazardous materials teams. TIM protective assets are not commonly available and provided to the general force. TIM is not adequately addressed by current doctrine, policy, and procedures. Current and near-term standard IPE provides varying degrees of protection from selected TIMs with no protection against a number of TICs.

<sup>13</sup> The design and application of EOD IPE does not consider compatibility with CBRND IPE, nor incorporate CBRND features.

<sup>14</sup> Medical Services doctrine, policy, and procedures are inadequate for the provision of medical care by medical providers in a CBRN/TIM environment. Casualties are decontaminated before treatment is rendered by medical providers. Medical assessment and emergency stabilization is provided during the triage and decontamination process. The standard IPE is supplemented using standard medical protective assets (e.g., surgical gloves, drapes, etc.) to reduce the potential for cross-contamination and contact with body fluids.

### 12.4.3 Functional Solution Analysis

#### 12.4.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** Deploying units may not possess full CBRND resources and capabilities during the initial stages of deployment and until after arrival within the JOA.

**Non-Materiel Solutions:** *Doctrine:* Emphasize in doctrine, policies, and procedures for preparation of the force for CBRND protection during throughout deployment, redeployment, relocation, and en route phases of movement. *Organization:* Ensure resources, taskings, and staff are in place or available to perform CBRND operations within a CBRN/TIM environment by deploying, redeploying, relocating, and en route forces. *Training:* Train, exercise, and evaluate the force for CBRND operations within a CBRN/TIM environment while deploying, redeploying, relocating, and en route. *Leadership:* Recognize criticality of readiness of the force for potential CBRND operations within a CBRN/TIM environment while deploying, redeploying, relocation, and en route; training providing the skills to manage the force in these circumstances; and willingness and ability to implement necessary changes and activities to prepare and appropriately protect the force. *Facilities:* Develop supporting infrastructure for CBRND operations of the force while preparing, deploying, redeploying, relocating, and en route.
- 2. Deficiency:** Deploying eligible civilians are not equipped and trained to survive a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of eligible civilians and training for CBRN/TIM environment survival. *Organization:* Ensure organizational consideration for maintenance and support of eligible civilians CBRND protective equipment, measures, and activities. *Training:* Provide institutional and unit training of eligible civilians for CBRND measures and activities. Integrate into CBRND exercises and evaluations. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for eligible civilians. *Facilities:* Develop supporting infrastructure for eligible civilians CBRND (e.g., logistics, medical, veterinary surveillance, communications, training, etc.).
- 3. Deficiency:** Deploying MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of MWAs, particularly MWDs, and training for CBRN/TIM environment survival. *Organization:* Ensure organizational consideration for maintenance and support of MWAs, particularly MWDs, CBRND protective equipment, measures, and activities. *Training:* Provide institutional and unit training of MWA handlers and MWAs for CBRND measures and activities. Integrate into CBRND exercises and evaluations. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for MWA survivability.

*Facilities:* Develop supporting infrastructure for MWA CBRND (e.g., logistics, medical, veterinary surveillance, communications, training, etc.).

4. **Deficiency:** JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing civilian personnel and operations for CBRND. *Organization:* Identify organizational services and activities supporting the mission performed by civilian personnel and operations.

*Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRND training, exercises, and evaluations. *Leadership:*

Implement and manage CBRND training, equipping, and protection of eligible civilians.

*Personnel:* Ensure that eligible civilians supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment.

*Facilities:* Develop supporting infrastructure for eligible civilian CBRND (e.g., logistics, medical, veterinary surveillance, training, communications, etc.).

5. **Deficiency:** JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying MWAs.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing MWAs, particularly MWDs, and operations for CBRND. *Organization:* Identify organizational services and activities supporting CBRN/TIM survivability of MWAs and mission operations.

*Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations.

*Leadership:* Implement and manage CBRND training, equipping, and protection of MWAs.

*Facilities:* Develop supporting infrastructure for MWD CBRND (e.g., logistics, medical, veterinary surveillance, training, communications, etc.).

6. **Deficiency:** Existing COLPRO systems are not generally designed for a highly mobile force, with a reduced logistical footprint, and the initial period of operations until the theater matures (usually the first 30–90 days).

**Non-Materiel Solutions:** *Doctrine:* Complete the JCIDS process and central correlation/comparison of national and strategic plans to identify CBRND resources necessary and available to support expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct expeditionary operations while possessing reduced logistical footprint and during the first 30–90 days of operations following commencement of hostilities. *Training:* Train, exercise, and evaluate expeditionary capabilities of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operations using CBRND resources supporting expeditionary operations. *Leadership:* Recognize differences and challenges associated with expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint; training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for

expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.

7. **Deficiency:** Current doctrine and policy does not adequately address sustained operations within a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, procedures, and *UJTL* sustained operations within a CBRN/TIM environment. *Organization:* Ensure resources, taskings, and staff are in place or available to plan and perform sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.

8. **Deficiency:** Production for replenishment by industry may require a period to expand or establish manufacturing capabilities which could exceed the necessary replenishment timeline. This statement is particularly applicable when components or systems are dependent upon non-U.S. manufacturing capabilities.

**Non-Materiel Solutions:** *Doctrine:* Incorporate into doctrine, policy, and procedures the identification of critical CBRND components and systems; to include the identification of alternatives (e.g., other sources of supply, stockpiling, manufacturing incentives, etc.).

*Leadership:* Ensure awareness of vulnerabilities associated with procurement of non-U.S.-manufactured critical CBRND components and planning for vulnerability mitigation.

9. **Deficiency:** MWAs are not equipped, trained, and prepared for survival in a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of MWAs, particularly MWDs, and training for CBRN/TIM environment survival.

*Organization:* Ensure organizational consideration for maintenance and support of MWA CBRND protective equipment, measures, and activities. *Training:* Provide institutional and unit training of handlers and MWAs for CBRND measures and activities. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for MWA survivability.

*Facilities:* Develop supporting infrastructure for MWA CBRND (e.g., logistics, veterinary surveillance, etc.).

10. **Deficiency:** The encumbrances associated with IPE do degrade performance and limit the conduct of certain tasks (especially those associated with the repair and maintenance of delicate and intricate assets).

**Non-Materiel Solutions:** *Doctrine:* Consider implications of IP encumbrances upon task performance within a CBRN/TIM environment for training and task development.

*Organization:* Consider limitations of IP encumbered personnel within a CBRN/TIM environment for task structuring. *Training:* Include task performance within a CBRN/TIM environment during formal and unit training and as an essential requirement element.

*Leadership:* Leadership training and awareness of limitations and restrictions associated with task performance within a CBRN/TIM environment. *Personnel:* Ensure personnel are both

psychologically and physiologically matched with specialty for task completion requirements within a CBRN/TIM environment.

- 11. Deficiency:** TIM protective assets are not commonly available and provided to the general force.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, procedures, and TTPs CBRND protection of the force against threat TIM agents. *Organization:* Address organizational issues associated with CBRND for TIM threats. *Training:* Train, exercise, and evaluate the force for CBRND operations within threat CBRN/TIM and TIM environments. *Leadership:* Recognize criticality of readiness and survivability of the force for potential CBRND operations within threat CBRN/TIM and TIM environments; training providing the skills to manage the force in these circumstances; and willingness and ability to implement necessary changes and activities to prepare and appropriately protect the force. *Personnel:* Require eligible civilians supporting the mission to meet minimum standards for safe use of CBRND resources.

- 12. Deficiency:** TIM is not adequately addressed by current doctrine, policy, and procedures.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, procedures, and TTPs CBRND protection of the force against threat TIM agents.

- 13. Deficiency:** Current and near-term standard IPE provides varying degrees of protection from selected TIMs with no protection against a number of TICs.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures standards, criteria, and metrics for CBRND materiel for protection of the force against threat TIM agents. *Leadership:* Enforce compliance with established readiness criteria for CBRND protective materiel.

- 14. Deficiency:** The design and application of EOD IPE does not consider compatibility with CBRND IPE, nor incorporate CBRND features.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures standards, criteria, and metrics for the inclusion of CBRND protective qualities and features into specialized protective garments and equipment (e.g., EOD IPE, firefighter bunker gear, etc.). *Leadership:* Enforce compliance with established readiness criteria for inclusion of CBRND protective qualities and features in specialized garments and equipment.

- 15. Deficiency:** Medical Services doctrine, policy, and procedures are inadequate for the provision of medical care by medical providers in a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing the provision of medical care by medical providers within a CBRN/TIM environment (both with and without CPSs). *Organization:* Identify organization services and activities necessary to support the provision of medical care by medical providers within a CBRN/TIM environment (both with and without CPSs). *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for medical care by medical providers within a CBRN/TIM environment (both with and without CPSs); and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection

of medical providers and supporting medical staff. *Personnel*: Require eligible civilians supporting the mission to meet minimum standards for safe use of CBRND resources.

**16. Deficiency:** DOTMLPF is inadequate for nonexistent addressing CBRND of eligible civilians.

**Non-Materiel Solutions:** *Doctrine*: Develop doctrine, policy, and procedures addressing eligible civilian personnel for CBRND. *Organization*: Identify organization services and activities necessary to support survivability of eligible civilian personnel within a CBRN/TIM environment. *Training*: Establish CBRND training, exercise, and evaluation criteria and programs for MWDs and eligible civilians and conduct CBRND training, exercises, and evaluations. *Leadership*: Implement and manage CBRND training, equipping, and protection of eligible civilian personnel and MWDs.

**17. Deficiency:** DOTMLPF is inadequate for nonexistent addressing CBRND of MWAs.

**Non-Materiel Solutions:** *Doctrine*: Develop doctrine, policy, and procedures addressing MWAs, particularly MWDs, for CBRND. *Organization*: Identify organization services and activities necessary to support survivability of MWAs within a CBRN/TIM environment. *Training*: Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations. *Leadership*: Implement and manage CBRND training, equipping, and protection of MWAs.

#### 12.4.3.2 IMA Assessment Summary

N/A

## **12.5 Task OPSHLD 5: Ensure adequate protective measures and resources are available to coalition partners and other designated non-U.S. forces**

### **12.5.1 Functional Area Analysis**

#### **12.5.1.1 Definition**

To ensure that CBRN/TIM protective measures and resources are available to coalition/non-U.S. forces. The availability of CBRN/TIM protective measures and resources is both a joint and coalition/non-U.S. force concern. This task includes IPE, COLPRO, CBRND equipment and supplies, protection of equipment and supplies, and medical resources. The joint forces must integrate coalition/non-U.S. forces to maximize capability and minimize vulnerability. U.S. forces may be required to provide protective assets (especially IPE, detection and warning devices, medical support, and decontaminants) to coalition/non-U.S. partners, depending on local threats and/or actual adversary use of CBRN/TIM weapons. Joint forces NBC personnel should offer to review coalition/non-U.S. force CBRN/TIM protection plans and assist as necessary. U.S. forces may be required to train coalition/non-U.S. forces in CBRND.

#### **12.5.1.2 Derivation**

*Joint Enabling Concept for CBRN/TIM Operations, Protection Joint Functional Concept, UJTL (OP 1.3.1, OP 2.2, OP 2.2.1, OP 2.4.1.1, OP 2.4.1.2, OP 2.4.2.1, OP 5, OP 5.1.1, OP 5.2, OP 5.2.1, OP 5.2.2, OP 5.3, OP 5.3.2, OP 5.3.4, OP 5.3.5, OP 5.3.6, OP 5.3.7, OP 5.3.8, OP 5.3.9, OP 5.4, OP 5.4.2, OP 5.4.4, OP 5.4.5, OP 5.5, OP 5.5.1, OP 5.5.2, OP 5.5.7, OP 5.5.8, OP 5.7, OP 5.7.3, OP 5.7.4, OP 5.7.5, OP 5.7.6, OP 6.2.1, OP 7, OP 7.1, OP 7.2, OP 7.3, OP 7.4).*

##### **12.5.1.2.1 Supported Task: STSHLD 8**

##### **12.5.1.2.2 Lateral Task: OPSHA 4**

##### **12.5.1.2.3 Supporting Task: N/A**

#### **12.5.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Undeveloped to highly developed land. (C1.1)
2. Riverine to open sea. (C1.2)
3. Natural and induced air. (C1.3)
4. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

##### **Military**

1. Partially completed mission preparation. (C2.1.3)

2. Marginal to strong forces assigned. (C2.2.1)
3. Negligible personnel experience. (C2.2.4.5)
4. Some interoperability. (C2.2.6)
5. Partial Joint Staff integration. (C2.3.1.1)
6. Partial multinational integration. (C2.3.1.2)
7. Limited staff expertise. (C2.3.1.3)
8. Limited deployed supplies. (C2.8.2)
9. Sufficient CONUS resupply. (C2.8.3)
10. Limited prepositioned materiel. (C2.8.4)
11. Limited host nation support. (C2.8.5)
12. Limited commercial procurement. (C2.8.6)

### Civil

1. Correct interdepartmental/interagency relationships. (C3.1.1.3)
2. Limited foreign government support. (C3.1.2.3)
3. Moderately opposed foreign public opinion. (C3.1.2.4)
4. TIMs present in the civilian sector. (C3.3.7.5)

## 12.5.2 Functional Needs Analysis

### 12.5.2.1 Capability and Deficiency Assessment Summary

Table 12.5-1 discusses the only capability that exists to perform the task to the designated standard. Adequate doctrine, policy, and procedures exist for ensuring the adequacy of protective measures and resources of coalition partners and other designed non-U.S. forces. Structures for mutual support can be applied in cases where necessary to complement capabilities and minimize weaknesses within the Joint Task Force. Included in the deficiencies is the ability of the force to maintain OPTEMPO within a sustained CBRN/TIM environment.

### Current Capability and Deficiency

JTF HQ staffs conduct planning and coordination with coalition partners to determine resources, requirements, and taskings best accomplishing mission and CBRND preparedness of partner forces. They track readiness of forces and equipment for operations. They also adjust plans and resources as necessary to meet changing operational needs and conditions. Adequate doctrine, policy, and procedures exist to guide commanders and staffs with coalition and non-U.S. force participation in joint operations. Planning, tracking, and monitoring is performed in coordination with partner staffs under a negotiated plan outlining requirements, taskings, training, reporting, information sharing, standards, and operational certifications for participation. Although the provision of CBRND equipment to national forces ultimately resides with their nations, mutual support among partners is planned to complement capabilities and to minimize weaknesses. ACSAs between partners enables acquisition and cross-servicing support between the partners. IAs provide for a wide range of support including sheltering, medical care, and other support activities. The JTF Commander, JTF staff, and combined staff monitor, track, and assess the readiness of the Joint Coalition Force and addresses issues and concerns as they arise.

Deficiencies include the limited availability of COLPRO systems in each of the COLPRO categories, and the protection of eligible civilians and MWDs.

**Projected Near/Mid-Term Capability and Deficiency**

No projected change for this task.

**Projected Far-Term Capability and Deficiency**

No projected change for this task.

Table 12.5-1. OPSHLD 5: Capability and Deficiency Assessment

Capability: JTF HQ Staff	M1	M2	M3	M4	M5
Current Overall Capability <sup>1</sup>	G <sup>2</sup>	G <sup>3</sup>	G <sup>4</sup>	G <sup>5</sup>	R <sup>6</sup>
Near/Mid-Term Overall Capability	G	G	G	G	R
Far-Term Overall Capability	G	G	G	G	R

	FAA Measure	Scale
M1	Coalition/non-U.S. forces are protected by medical prophylaxes.	<b>G:</b> Planning and coordination is conducted to address partner forces readiness and preparations for operations with CBRN/TIM threat and includes all CBRND protective measures. <b>Y:</b> Partner forces CBRND capabilities are considered when planning operations with CBRN/TIM threat. <b>R:</b> Partner force CBRND capabilities are not considered or is inadequately considered when planning operations with CBRN/TIM threat.
M2	Coalition/non-U.S. forces are equipped with or possess access to CBRN/TIM COLPRO.	<b>G:</b> Planning and coordination is conducted to address partner forces equipping or access to COLPRO. <b>Y:</b> Partner force equipping or access to COLPRO is considered when planning operations with threat. <b>R:</b> Partner force equipping or access to COLPRO is not considered or is inadequately considered when planning operations with threat.
M3	Coalition/non-U.S. forces are trained to operate in CBRN/TIM hazards.	<b>G:</b> Processes and means exist to monitor, track, and assess coalition/non-U.S. forces training, readiness, and preparations status against COCOM and JTF requirements. <b>Y:</b> Processes exist to identify coalition/non-U.S. forces training meeting COCOM and JTF requirements. <b>R:</b> Process and/or means are inadequate or nonexistent to identify coalition/non-U.S. forces training meeting COCOM and/or JTF requirements.
M4	Coalition/non-U.S. forces are equipped with CBRN/TIM IPE.	<b>G:</b> Processes and means exist to monitor, track, and assess coalition/non-U.S. forces equipping, readiness, and preparations status against COCOM and JTF requirements. <b>Y:</b> Processes exist to identify coalition/non-U.S. forces equipping meeting COCOM and JTF requirements. <b>R:</b> Process and/or means are inadequate or nonexistent to identify coalition/non-U.S. forces equipping meeting COCOM and/or JTF requirements.
M5	Coalition/non-U.S. forces can perform sustained CBRN/TIM operations.	<b>G:</b> Processes and means exist to monitor, track, and assess coalition/non-U.S. forces equipping, readiness, and preparations status for sustained CBRN/TIM operations against COCOM and JTF requirements. <b>Y:</b> Processes exist to identify coalition/non-U.S. forces equipping meeting sustained CBRN/TIM operations COCOM and JTF requirements. <b>R:</b> Process and/or means are inadequate or nonexistent to identify coalition/non-U.S. forces equipping for sustained CBRN/TIM operations meeting COCOM and/or JTF requirements.

<sup>1</sup> DOTMLPF is adequate for the coordination and integration of coalition forces. Adequate DOTMLPF exists to address and support these forces. However, DOTMLPF is inadequate or nonexistent addressing CBRND of eligible civilians and MWAs. DOTMLPF does not adequately address sustained operations within a CBRN/TIM environment.

<sup>2</sup> National policies of the coalition/non-U.S. forces regarding medical prophylaxis is a factor the JTF Commander and supporting staff must consider during planning and operations. Religious considerations may also impact the use of medical prophylaxis. The JTF staff, in coordination with coalition/non-U.S. forces partner staff, develop and address requirements and commitments by each partner. Specific tasks, based upon the guidance and restrictions identified by the COCOM, are assigned to elements of the coalition force most capable of completing the task. Although the provision of CBRND resources to national forces ultimately resides with their nations, mutual support among partners is planned to complement partners' capabilities and to minimize weaknesses. ACSAs between partners enable acquisition and cross-servicing support between the partners. The IA provides for a wide range of support exchange, including sheltering, medical care, and other support activities. Indigenous forces supporting operations may not be equipped or have access to medical prophylaxis. The JTF staff, in coordination with partners, determines the need for medical prophylaxis based upon the threat. A determination is made on the provision of medical prophylaxis to these forces.

<sup>3</sup> The JTF staff, in coordination with the COCOM and coalition partner staffs, develops a comprehensive plan for successful achievement of the desired end states. Force requirements and commitments are obtained from each coalition participant and identified to the JTF by the COCOM. Minimum capability standards for participation and a certification process covering areas of concern (e.g., training level competence, logistics capabilities, deployment, sustainment, and redeployment readiness, etc.) are established and applied by all participants. Specific tasks are assigned to elements of the coalition force most capable of completing the task. Although the provision of CBRND equipment to national forces ultimately resides with their nations, mutual logistics support among coalition partners is planned to complement partners' capabilities and to minimize weaknesses. For example, U.S. Marine Corps forces were equipped with lightweight CBRN/TIM IPE by the United Kingdom during Operation Desert Storm. The U.S. installed COLPRO capabilities in Saudi critical command and control facilities for the same operation. The JTF Commander, JTF staff, and the combined staff monitor, tracks, and assess the readiness of the joint coalition force.

<sup>4</sup> The JTF staff, in coordination with the COCOM and coalition partner staffs, develops a comprehensive plan for successful achievement of the desired end states. Force requirements and commitments are obtained from each coalition participant and identified to the JTF by the COCOM. Minimum capability standards for participation and a certification process covering areas of concern (e.g., training level competence, logistics capabilities, deployment, sustainment, and redeployment readiness, etc.) are established and applied by all participants. Specific tasks are assigned to elements of the coalition force most capable of completing the task. Minimum capability standards for participation and a certification process covering areas of concern (e.g., training level competence, logistics capabilities, deployment, sustainment, and redeployment readiness, etc.) are established and applied by all participants. The COCOM and the combined staff monitor, track, and assess the readiness of the joint coalition force. Indigenous forces supporting operations may not be equipped and prepared for CBRND operations. The COCOM staff, in coordination with partners, determines the need for CBRND capabilities of these forces based upon the threat. A determination is made on the provision of CBRND capabilities and training to these forces.

<sup>5</sup> The JTF staff, in coordination with the COCOM and coalition partner staffs, develops a comprehensive plan for successful achievement of the desired end states. Force requirements and commitments are obtained from each coalition participant and identified to the JTF by the COCOM. Minimum capability standards for participation and a certification process covering areas of concern (e.g., training level competence, logistics capabilities, deployment, sustainment, and redeployment readiness, etc.) are established and applied by all participants. Although the provision of CBRND resources to national forces ultimately resides with their nations, mutual support among partners is planned to complement partners' capabilities and to minimize weaknesses. ACSAs between partners enable acquisition and cross-servicing support between the partners. The IA provides for a wide range of support exchange, including sheltering, medical care, and other support activities. Indigenous forces supporting operations may not be equipped or have access to CBRND IPE. The JTF staff, in coordination with COCOM and partners, determines the need for IPE based upon the threat. A determination is made on the provision of IPE to these forces.

<sup>6</sup> Sustained operations in a CBRN/TIM environment are not adequately addressed in DOTMLPF. Coalition partner DOTMLPF may or may not support operations in these conditions for sustained performance but is not addressed in existing U.S. DOTMLPF for planning consideration.

### 12.5.3 Functional Solution Analysis

#### 12.5.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Coalition partner DOTMLPF may or may not support sustained operations in a CBRN/TIM environment, but is not addressed in existing U.S. DOTMLPF for planning consideration.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, and procedures sustained operations within a CBRN/TIM environment. *Organization:* Ensure resources, taskings, and staff are in place or available to perform sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.

2. **Deficiency:** DOTMLPF is inadequate or nonexistent addressing CBRND of eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing eligible civilian personnel for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of eligible civilian personnel within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilian personnel.

3. **Deficiency:** DOTMLPF is inadequate or nonexistent addressing CBRND of MWAs.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing MWAs, particularly MWDs, for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of MWAs within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWAs.

4. **Deficiency:** DOTMLPF does not adequately address sustained operations within a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, procedures, and *UJTL* sustained operations within a CBRN/TIM environment. *Organization:* Ensure resources, taskings, and staff are in place or available to plan and perform sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training

providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.

**12.5.3.2 IMA Assessment Summary**

N/A

**12.6 Task OPSHLD 6: Ensure adequate individual protection for eligible civilians****12.6.1 Functional Area Analysis****12.6.1.1 Definition**

To afford protection against CBRN/TIM agents for survival for eligible civilians (including evacuees, host-nation personnel, contractors, displaced persons, detainees, and other designated nonmilitary personnel as defined and designated by strategic and national authorities). Protection may be afforded singly or in combination by IPE, COLPRO, and medical prophylaxes. The afforded protection is commensurate with the mission and performed task and may require protection to the same level as military counterparts.

**12.6.1.2 Derivation**

*Joint Enabling Concept for CBRN/TIM Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (OP 1.3.1, OP 2.4.1.1, OP 5.2, OP 5.2.1, OP 5.2.2, OP 5.3, OP 5.3.1, OP 5.3.2, OP 5.4.4, OP 5.4.5, OP 5.3.9, OP 5.4.2, OP 5.5.7, OP 5.5.8, OP 5.7, OP 5.7.4, OP 5.7.5, OP 5.7.6, OP 7, OP 7.1, OP 7.3, OP 7.4).*

Perform this task under conditions of:

**Physical**

1. Undeveloped to highly developed land. (C1.1)
2. Riverine to open sea. (C1.2)
3. Natural and induced air. (C1.3)
4. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Partially completed mission preparation. (C2.1.3)
2. Marginal to strong forces assigned. (C2.2.1)
3. Fair (civilian) personnel nutrition and health. (C2.2.4.1)
4. Good personnel physical conditioning. (C2.2.4.3)
5. Poor mission-essential government-service civilian physical conditioning. (C2.2.4.3 – NEW)
6. Poor mission-essential contract-service civilian physical conditioning. (C2.2.4.3 – NEW)

7. Negligible personnel experience. (C2.2.4.5)
8. Limited deployed supplies. (C2.8.2)
9. Limited prepositioned materiel. (C2.8.4)
10. Limited host nation support. (C2.8.5)
11. Limited commercial procurement. (C2.8.6)

### Civil

1. Limited foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)
3. Uncertain international organization support. (C3.1.2.5)
4. Poor civil health. (C3.3.1.4)
5. TIMs present in the civilian sector. (C3.3.7.5)

## 12.6.2 Functional Needs Analysis

### 12.6.2.1 Capability and Deficiency Assessment Summary

Table 12.6-1 discusses the only capability that currently exists to perform the task to the designated standard. Procedures exist for the selected provisioning of specific eligible civilians with protective equipment. Current noncombatant evacuation operations (NEO) plans include the provisioning of non-mission support civilians (primarily military dependents at HTA fixed-site locations) with minimal protective equipment generally drawn from mission stocks or obtained commercially off-the-shelf (COTS). Some government civilians are provided and equipped with IPE as part of their primary function (e.g., hazardous materials, fire response, readiness flight (Air Force), and selected others. Deficiencies include inadequate doctrine, policy, procedures, standards, equipment, prophylaxes, training, exercising, and evaluation for CBRND for eligible civilians.

### Current Capability and Deficiency

JTF HQ taffs plan, stock, equip, and train eligible civilians as necessary and appropriate for survival within a CBRN/TIM environment, including the full range of CBRN/TIM defense, including prophylaxis and IPE. The only identified individual capabilities are the existing NEO procedures addressing primarily military dependents at HTA fixed-site locations that provide for the provisioning of minimal protective equipment drawn from mission stocks or obtained COTS and the limited number of eligible civilians provided and equipped with IPE as part of their primary function. Deficiencies include the lack of a clear definition of eligible civilians; inadequate doctrine, policy, and procedures addressing CBRND of eligible civilians; the lack of IPE and medical prophylaxes addressing the variations within the population (e.g., babies, young children, disabled, tall, short, thin, obese, pregnant, etc.); and the absence of training, exercising, and evaluation of these personnel. The overall current assessment is “red.”

### Projected Near/Mid-Term Capability and Deficiency

No change is projected for this task.

**Projected Far-Term Capability and Deficiency**

No change is projected for this task.

Table 12.6-1. OPSHLD 6: Capability and Deficiency Assessment

Capability: JTF HQ Staff	M1	M2	M3	M4	M5	M6	M7	M8	M9
Current Overall Capability <sup>1</sup>	R <sup>2</sup>	R <sup>3</sup>	R <sup>4</sup>	R <sup>5</sup>	R <sup>6</sup>	R <sup>7</sup>	R <sup>8</sup>	R <sup>9</sup>	Y <sup>10</sup>
Near/Mid-Term Overall Capability	R	R	R	R	R	R	R	R	Y
Far-Term Overall Capability	R	R	R	R	R	R	R	R	Y

	FAA Measure	Scale
M1	Policy and plans address CBRN/TIM protection of eligible civilians.	<p><b>G:</b> Policies define and provide clear and specific guidance for planning and the provision of CBRND protective measures, equipment, and training to eligible civilians.</p> <p><b>Y:</b> Policies provide general guidance and information for planning and the provision of CBRND protective measures, equipment, and training to eligible civilians.</p> <p><b>R:</b> Clear definition and guidance for planning and provision of CBRND protective measures, equipment, and training to eligible civilians is inadequate or nonexistent.</p>
M2	Eligible civilians supporting military operations are equipped with IPE.	<p><b>G:</b> All eligible civilians are trained, equipped, and possess ready access to CBRND protective measures and equipment.</p> <p><b>Y:</b> All mission support eligible civilians and at-risk eligible civilians are trained, equipped, and possess ready access to CBRND protective measures and equipment.</p> <p><b>R:</b> The training, equipping, and ready access to CBRND protective measures and equipment is limited to a select group, is nonexistent, or is inadequate to support operations.</p>
M3	Eligible civilians not supporting the mission are issued IPE.	<p><b>G:</b> All eligible civilians are trained, equipped, and possess ready access to CBRND protective measures and equipment.</p> <p><b>Y:</b> All mission support eligible civilians and at-risk eligible civilians are trained, equipped, and possess ready access to CBRND protective measures and equipment.</p> <p><b>R:</b> The training, equipping, and ready access to CBRND protective measures and equipment is limited to a select group, is nonexistent, or is inadequate to support operations.</p>
M4	Eligible civilians are protected by medical prophylaxes.	<p><b>G:</b> Medical prophylaxis is issued and administered to all eligible civilians.</p> <p><b>Y:</b> All mission support eligible civilians and at-risk eligible civilians are issued and administered medical prophylaxis.</p> <p><b>R:</b> Issuance and/or administration of prophylaxis is limited to a select group, is nonexistent, or is inadequate to support operations.</p>
M5	Eligible civilians are trained to operate in a CBRN/TIM environment.	<p><b>G:</b> All eligible civilians are trained to survive and, if appropriate, operate within a CBRN/TIM environment.</p> <p><b>Y:</b> All mission support eligible civilians and at-risk eligible civilians are trained to survive and, if appropriate, operate within a CBRN/TIM environment.</p> <p><b>R:</b> Eligible civilian training to survive and, if appropriate, operate within a CBRN/TIM environment is limited to a select group, nonexistent, or inadequate to support operations.</p>
M6	Eligible civilian workforce requiring military force–level protection is equivalently equipped.	<p><b>G:</b> All eligible civilians supporting operations are equipped with military force–level protection minimally equivalent to protection afforded military personnel performing the same function.</p> <p><b>Y:</b> All eligible civilians performing mission critical functions which cannot or are not performed by uniformed personnel are provided military force–level protective equipment and measures.</p> <p><b>R:</b> Protection of eligible civilians enabling the performance of functions necessary to operations is inadequate or nonexistent.</p>

M7	Eligible civilian work force requiring military force–level protection is appropriately immunized.	<p><b>G:</b> All eligible civilians supporting operations are equipped with military force–level protection minimally equivalent to protection afforded military personnel performing the same function.</p> <p><b>Y:</b> All eligible civilians performing mission critical functions which cannot or are not performed by uniformed personnel are provided military force–level protective equipment and measures.</p> <p><b>R:</b> Protection of eligible civilians enabling the performance of functions necessary to operations is inadequate or nonexistent.</p>
M8	Protective equipment for eligible civilians covers both genders and the range of body types, ages, and disabilities of the population to be protected.	<p><b>G:</b> Evacuee protective equipment is stocked, prepositioned, and readily available to cover the range of body types, genders, ages, and disabilities.</p> <p><b>Y:</b> Evacuee protective equipment and measures are stocked and readily available for a target population.</p> <p><b>R:</b> Evacuee protective equipment and measures are inadequate or nonexistent.</p>
M9	Required evacuee IPE (e.g., overgarment, gloves, boots, and masks) is available.	<p><b>G:</b> Evacuee protective equipment is stocked, prepositioned, and readily available to cover the range of body types, genders, ages, and disabilities.</p> <p><b>Y:</b> Evacuee protective equipment and measures are stocked and readily available for a target population.</p> <p><b>R:</b> Evacuee protective equipment and measures are inadequate or nonexistent.</p>

<sup>1</sup> DOTMLPF is inadequate or nonexistent for protection of eligible civilians within a CBRN/TIM environment.

<sup>2</sup> Policies and plans do not adequately address the protection of eligible civilians from CBRN/TIM. The definition of “eligible civilians” is not clear. JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection of eligible civilians.

<sup>3</sup> Some government civilians are equivalently equipped as part of their primary function (e.g., hazardous materials, fire response, readiness flight [Air Force], and selected others). However, most civilians performing essential activities supporting operations are not equipped to survive a CBRN/TIM environment and accomplish their tasks. This statement is particularly true of contractors. JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection of eligible civilians.

<sup>4</sup> Protective equipment for non-mission support civilians is not generally stocked for the full range of body types, ages, and physical capabilities inherent within a potential population. JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection of eligible civilians. Protective equipment drawn from mission stocks or obtained in advance COTS is considered in NEO plans for selected areas.

<sup>5</sup> Prophylaxis of eligible civilians is not addressed. The issuance of CBRN/TIM prophylaxis to eligible civilians requires review due to questions regarding applicability to the range of body types, ages, and physical/medical factors inherent within a potential population, as well as possible long-term health issues and legal implications. Some government civilians may be issued medical prophylactic countermeasures as part of their primary function (e.g., hazardous materials, readiness flight [Air Force]), and selected others). However, civilians (e.g., general government employees, contractors, dependents, etc.) are not issued prophylaxis. JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection of eligible civilians.

<sup>6</sup> Eligible civilians are not generally trained to operate in CBRN/TIM hazards. Some government civilians are trained as part of their primary function (e.g., hazardous materials, fire response, readiness flight [Air Force], and selected others). However, civilians (e.g., general government employees, contractors, dependents, etc.) generally do not receive training to survive a CBRN/TIM environment. JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection of eligible civilians.

<sup>7</sup> Some government civilians are equivalently equipped as part of their primary function (e.g., hazardous materials, fire response, readiness flight [Air Force], and selected others). However, most civilians performing essential activities supporting operations are not equivalently equipped to their military counterparts. This statement is particularly true of contractors. JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection of eligible civilians.

<sup>8</sup> Prophylaxis (CBRN/TIM vaccination) of eligible civilians is not addressed. The administration of CBRN/TIM prophylaxis to eligible civilians requires review due to questions regarding applicability to the range of body types, ages, and physical/medical factors inherent within a potential population, as well as possible long-term health issues and legal implications. Selected medical prophylaxis may be administered based upon medical judgment. JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection of eligible civilians.

<sup>9</sup> Protective equipment for non-mission support civilians is not generally stocked for the full range of body types, ages, and physical capabilities inherent within a potential population. JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection of eligible civilians. Protective equipment drawn from mission stocks or obtained in advance COTS is considered in NEO plans for selected areas.

<sup>10</sup> NEO plans for selected areas include the provisioning of non-mission support civilians with minimal protective equipment; generally drawn from mission stocks or obtained in advance COTS. However, protective equipment for non-mission support civilians is not generally stocked for the full range of body types, ages, and physical capabilities inherent within a potential population. Short-notice NEO evacuation operations for other than existing areas prepared in advance for NEO activities, are likely to necessitate the use of military force assets which may provide inadequate protection for segments of the potential population (e.g., babies, young children, disabled, etc.). JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection of eligible civilians.

### 12.6.3 Functional Solution Analysis

#### 12.6.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** Policies and plans do not adequately address the protection of eligible civilians from CBRN/TIM.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing civilian personnel and operations for CBRND. *Organization:* Identify organizational services and activities supporting the mission performed by civilian personnel and operations. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for civilian personnel and operations supporting the mission; and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of civilian personnel and operations supporting the mission. *Personnel:* Civilian personnel and operations supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment.
- 2. Deficiency:** The definition of “eligible civilians” is not clear.

**Non-Materiel Solutions:** *Doctrine:* Define eligible civilians supporting the mission/military operations for CBRND and establish their inclusion in the force within doctrine, policy, procedures, and TTPs. *Organization:* Identify organizational services dependent upon civilians for mission/military operations success. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians supporting the mission/military operations and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians supporting the mission/military operations. *Personnel:* Personnel meeting the definition of eligible civilians supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment.
- 3. Deficiency:** JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection of eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing civilian personnel and operations for CBRND. *Organization:* Identify organizational services and activities supporting the mission performed by civilian personnel and operations. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for civilian personnel and operations supporting the mission; and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of civilian personnel and operations supporting the mission. *Personnel:* Civilian personnel and operations supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment.
- 4. Deficiency:** Most civilians are not equipped or have access to IPE for survival within a CBRN/TIM environment. This statement is particularly true of contractors.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the provisioning of civilians addressing the variation within a potential population. Institute in doctrine, policy, and procedures the central correlation of national and strategic plans and taskings to identify eligible civilian CBRND support requirements for two or more concurrent operations with threat with comparison to existing and programmed quantities and types of CBRND systems and resources, to include replenishment and prepositioning of CBRND assets for civilians. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRND training, exercises, and evaluations, as appropriate. *Leadership:* Implement planning and management of CBRND training, equipping, stockpiling, prepositioning, and protection of eligible civilians. *Facilities:* Develop supporting infrastructure for the acquisition, stockpiling, prepositioning, maintenance, and movement of eligible civilian CBRND resources.

5. **Deficiency:** Prophylaxis of eligible civilians is not addressed.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing eligible civilians during CBRND operations and the provision of CBRND protection, including prophylaxis. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians.

6. **Deficiency:** The issuance of CBRN/TIM prophylaxis to eligible civilians requires review due to questions regarding applicability to the range of body types, ages, and physical/medical factors inherent within a potential population, as well as possible long-term health issues and legal implications.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards and measures for protection of eligible civilians addressing the variation within the potential protected population. *Leadership:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRN/TIM training, exercises, and evaluations.

7. **Deficiency:** Eligible civilians are not generally trained to operate in CBRN/TIM hazards.

**Non-Materiel Solutions:** *Doctrine:* Establish CBRND training, exercise, and evaluation standards and criteria for eligible civilians. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRN/TIM training, exercises, and evaluations, where appropriate. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians. *Personnel:* Establish CBRND training, exercise, and evaluation standards and criteria for eligible civilians.

8. **Deficiency:** Most civilians performing essential activities supporting operations are not equivalently equipped to their military counterparts. This statement is particularly true of contractors.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards for protection of eligible civilians supporting the mission/military operations addressing the variation within the potential protected working population. *Leadership:* Establish CBRND training, exercise, and evaluation criteria and programs for

eligible civilians supporting the mission/military operations and conduct CBRN/TIM training, exercises, and evaluations.

- 9. Deficiency:** Protective equipment for non-mission support civilians is not generally stocked for the full range of body types, ages, and physical capabilities inherent within a potential population.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards for protection of eligible civilians not supporting the mission/military operations addressing the variation within a potential protected population.

*Leadership:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians not support the mission/military operations and conduct CBRN/TIM training, exercises, and evaluations, where appropriate.

- 10. Deficiency:** Short-notice NEO evacuation operations for other than existing areas prepared in advance for NEO activities are likely to necessitate the use of military force assets which may provide inadequate protection for segments of the potential population (e.g., babies, young children, disabled, etc.).

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards for protection of eligible civilians not supporting the mission/military operations addressing the variation within a potential protected population.

*Leadership:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians not support the mission/military operations and conduct CBRN/TIM training, exercises, and evaluations, where appropriate.

- 11. Deficiency:** DOTMLPF is inadequate or nonexistent for protection of eligible civilians within a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing eligible civilian personnel and operations for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of eligible civilian personnel within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for civilian personnel and operations ; and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilian personnel.

#### 12.6.3.2 IMA Assessment Summary

N/A

## **12.7 Task OPSHLD 7: Provide COLPRO for all critical activities/functions, rest, and relief**

### **12.7.1 Functional Area Analysis**

#### **12.7.1.1 Definition**

To provide COLPRO by CPSs, which provide protection against CBRN/TIM hazards in particulate, liquid, or vapor forms. *JP 1-02* defines COLPRO as “protection provided to a group of individuals in a nuclear, biological, and chemical environment which permits relaxation of individual nuclear, biological, and chemical protection.” COLPRO provides a contamination-free environment where critical activities (e.g., command and control, communication, and maintenance of low-density assets) can be performed and provides Mission-Oriented Protective Posture (MOPP) relief for individuals, units, and MWAs. A CPS is a complete and integrated system of protection. The components are designed to function in concert to successfully protect the occupants. COLPRO may be incorporated in or an additive component to a fixed facility, transportable shelter, mobile mounted shelter, vehicle, aircraft, ship, or an expedient shelter. Prior to an actual attack, CPSs may be activated and the following tasks performed:

- CPSs are assessed and prepared for use. The commander may place a CPS into operation or on standby for an anticipated attack.
- Facilities, vehicles, vessels, and aircraft are prepared wherever possible against infiltration of a CBRN/TIM agent.
- Expedient shelters are established in facilities, vehicles, vessels, aircraft, etc., for protection of resources. Expedient shelters also may be constructed using available materials.

#### **12.7.1.2 Derivation**

*Joint Enabling Concept for CBRN/TIM Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (OP 1.3.1, OP 5, OP 5.3, OP 5.3.9, OP 5.4.2, OP 5.5, OP 5.5.8, OP 5.5.9, OP 6.2.1, OP 7, OP 7.3, OP 7.4).*

##### **12.7.1.2.1 Supported Task: STSHLD 9**

##### **12.7.1.2.2 Lateral Task: OPSHA 4**

##### **12.7.1.2.3 Supporting Tasks: TASHLD 6, TASHLD 7, TASHLD 9**

#### **12.7.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Undeveloped to highly developed land. (C1.1)
2. Riverine to open sea. (C1.2)
3. Natural and induced air. (C1.3)

4. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

### **Military**

1. Partially completed mission preparation. (C2.1.3)
2. Marginal to strong forces assigned. (C2.2.1)
3. Negligible personnel experience. (C2.2.4.5)
4. Partial interoperability. (C2.2.6)
5. Partial Joint Staff integration. (C2.3.1.1)
6. Limited staff expertise. (C2.3.1.3)
7. Mobile facility survivability. (C2.7.6)
8. Limited deployed supplies. (C2.8.2)
9. Limited prepositioned materiel. (C2.8.4)
10. Limited host nation support. (C2.8.5)
11. Limited commercial procurement. (C2.8.6)

### **Civil**

1. TIMs present in the civilian sector. (C3.3.7.5)

## **12.7.2 Functional Needs Analysis**

### **12.7.2.1 Capability and Deficiency Assessment Summary**

Table 12.7-1 discusses the only capability that exists to perform the task to the designated standard. Doctrine, policy, and procedures exist to provide CBRND COLPRO for critical activities, functions, and to enable rest and relief of the force. Deficiencies include limitations in types, quantities, and application of existing COLPRO; and the establishment and operation of COLPRO within a CBRN/TIM environment by IPE-encumbered personnel.

### **Current Capability and Deficiency**

JTF HQ staffs conduct planning, coordination, and allocation of COLPRO resources and taskings for protection and support of critical and operational activities and functions within a CBRN/TIM environment. They prioritize requirements for allocation of available resources based upon assessments of the threat, risk, and vulnerabilities of tasked forces; criticality of associated activities and functions; mission requirements; and the appropriateness, encumbrances, and limitations associated with alternative measures. They also direct and manage COLPRO allocation and preparedness for CBRND. Radiological (fallout) COLPRO does exist at outside the Continental United States (OCONUS) fixed sites. The combination of individual protection, contamination avoidance, and available COLPRO provides critical activities and functions with a level of capability. Allocation of limited COLPRO resources is made based upon the threat, mission, criticality of performed activity, and availability of COLPRO for the function. Planning and prioritization of COLPRO resources is performed during operational planning. Fixed-site operations within a mature theater may possess sufficient

COLPRO to provide access to personnel within a 24-hour period. The current concept for CBRN/TIM environment operations is contamination avoidance or withdrawal. Mobile COLPRO does exist in selected tactical combat mobile assets (air, ground, and sea) and support vehicles. Mature theater transportable CPSs are available in limited quantities and inclusion of Service-specific systems provides additional COLPRO capabilities to the force. Transportable CPS as an expansion of existing fixed-site capabilities is planned, as appropriate and necessary. Deficiencies include inadequate quantities and types of COLPRO, lack of COLPRO in tactical/strategic airframes (particularly airlift) and supporting vessels (e.g., hospital ships, cargo vessels, etc.); critical facility COLPRO; COLPRO systems (designs, quantities, and types) supporting highly mobile and expeditionary forces; and the lack of doctrine, policy, and procedures for the implementation and application of expedient COLPRO and the erection, maintenance, operation, and striking of COLPRO within a CBRN/TIM environment. The overall current capability is assessed as “red.”

**Projected Near/Mid-Term Capability and Deficiency**

No change is projected for this task.

**Projected Far-Term Capability and Deficiency**

No change is projected for this task.

Table 12.7-1. OPSHLD 7: Capability and Deficiency Assessment

Capability: JTF HQ Staff	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10	M11	M12
Current Overall Capability <sup>1</sup>	R <sup>2</sup>	Y <sup>3</sup>	Y <sup>4</sup>	R <sup>5</sup>	R <sup>6</sup>	R <sup>7</sup>	Y <sup>8</sup>	R <sup>9</sup>	G <sup>10</sup>	R <sup>11</sup>	Y <sup>12</sup>	R <sup>13</sup>
Near/Mid-Term Overall Capability	R	Y	Y	R	R	R	Y	R	G	R	Y	R
Far-Term Overall Capability	R	Y	Y	R	R	R	Y	R	G	R	Y	R

	FAA Measure	Scale
M1	Critical activities and functions are collectively protected.	<b>G:</b> All critical facilities and activities are equipped with operational COLPRO. <b>Y:</b> All identified critical facilities and activities possess or are programmed to be equipped with COLPRO. <b>R:</b> COLPRO is inadequate or nonexistent to support operations.
M2	Operational activities and functions are not degraded/unavailable due to CBRN/TIM attacks.	<b>G:</b> All operational activities and functions are protected and are not degraded and/or unavailable as a result of CBRN/TIM attacks. <b>Y:</b> All operational activities and functions are afforded protection and are not seriously degraded and/or unavailable as a result of CBRN/TIM attacks. <b>R:</b> Protection of operational activities and/or functions is inadequate or nonexistent and may result in serious degradation or nonavailability resulting from CBRN/TIM attacks.
M3	Operational capability is achievable with COLPRO.	<b>G:</b> Sufficient and adequate COLPRO is available and operational to sustain operational capabilities in a CBRN/TIM environment. <b>Y:</b> Adequate operational capabilities for selected functions and activities are achievable with available and operational COLPRO. <b>R:</b> Operational capabilities are not achievable with available and operational COLPRO.
M4	CPSs are erectable and maintainable in contaminated environment by personnel encumbered by IPE.	<b>G:</b> COLPRO is rapidly and safely erectable/striking, placed in operation, and maintained within a CBRN/TIM environment by personnel encumbered by IPE and with minimal resources. <b>Y:</b> COLPRO is safely erectable/striking, placed in operation, and maintained within a CBRN/TIM environment by IPE-encumbered personnel. <b>R:</b> COLPRO that is safely erectable/striking, placed in operation, and maintained within a CBRN/TIM environment by IPE-encumbered personnel is nonexistent and does not exist in adequate quantities to support operations.
M5	Forces are trained to apply and use expedient COLPRO.	<b>G:</b> Forces are trained and routinely exercised and evaluated on the effective application of expedient COLPRO measures and equipment. <b>Y:</b> Forces are trained and exercised and evaluated on the application of expedient COLPRO measures and equipment upon predeployment notification for operations with threat. <b>R:</b> Training, exercising, and evaluation of forces on the application of expedient COLPRO measures and equipment is inadequate or nonexistent.
M6	Required expedient collective protective kits and materials (e.g., adaptation kits, plywood, sprays, gel packs, tape, etc.) are readily available.	<b>G:</b> The full range of expedient COLPRO kits and materials are readily available for application by forces in the field. <b>Y:</b> Expedient COLPRO kits and materials are generally available for force application in selected field environments. <b>R:</b> Expedient COLPRO kits are inadequate, unavailable, or nonexistent.

M7	COLPRO is available for in-place forces.	<b>G:</b> COLPRO is available in required quantities and types to support the full range of envisioned and planned operations. <b>Y:</b> COLPRO is available in sufficient types and quantities to support major operations. <b>R:</b> COLPRO is inadequate or nonexistent to support operations.
M8	COLPRO is available for deploying forces.	<b>G:</b> COLPRO is available in required quantities and types to support the full range of envisioned and planned operations. <b>Y:</b> COLPRO is available in sufficient types and quantities to support major operations. <b>R:</b> COLPRO is inadequate or nonexistent to support operations.
M9	COLPRO is prepared (i.e., supplied, equipped, and crewed) for operation.	<b>G:</b> Manning, equipping, supplying, and other functional considerations for the preparation, operation, maintenance, and application of COLPRO are addressed in JTF and tasked unit plans. <b>Y:</b> The preparation, operation, maintenance, and application of COLPRO are generally addressed in JTF and tasked unit plans. <b>R:</b> JTF and tasked unit plans inadequately, or do not, address the preparation and/or application of COLPRO for operations.
M10	Required mobile CPSs are available.	<b>G:</b> Operational mobile CPS is available in required quantities and types to support the full range of envisioned and planned operations. <b>Y:</b> Operational mobile CPS is available in sufficient types and quantities to support major operations <b>R:</b> Operational mobile CPS is inadequate or nonexistent to support operations.
M11	Required transportable CPSs are available.	<b>G:</b> Operational transportable CPS is available in required quantities and types to support the full range of envisioned and planned operations. <b>Y:</b> Operational transportable CPS is available in sufficient types and quantities to support major operations. <b>R:</b> Operational transportable CPS is inadequate or nonexistent to support operations.
M12	Required CPSs for fixed facilities are installed and available.	<b>G:</b> All fixed facilities and activities are equipped with operational COLPRO. <b>Y:</b> All critical fixed facilities and activities are equipped with operational COLPRO. <b>R:</b> COLPRO within fixed facilities and activities is inadequate or nonexistent to support operations.

<sup>1</sup> DOTMLPF is inadequate to support sustained operations within a CBRN/TIM environment, particularly expeditionary operations, during the first 30–60 days. Current DOTMLPF does not adequately address the establishment and operation of expedient COLPRO activities and measures.

<sup>2</sup> Not all critical facilities and activities are equipped with COLPRO. COLPRO within some OCONUS locations does exist for radiological (fallout). However, COLPRO for other than radiological is almost nonexistent, including critical facilities, outside HTA OCONUS. Expeditionary operations are a particular concern. Existing COLPRO systems are not generally designed for a highly mobile force, with a reduced logistical footprint, and the initial period of operations until the theater matures (usually the first 30–90 days). The combination of individual protection, contamination avoidance, and available COLPRO provides critical activities and functions with a level of capability. However, the encumbrances and limitations associated with these measures are considerations in the planning and conduct of operations to assure mission success.

<sup>3</sup> The limited availability of COLPRO systems requires careful planning and prioritization of resources. The JTF staff allocate COLPRO resources based upon the threat, risk, and vulnerability assessments. Operational activities and functions are prioritized based upon mission, criticality, assessments, and available resources. The combination of individual protection, contamination avoidance, and available COLPRO provides operational activities and functions with a level of capability. However, the encumbrances and limitations associated with these measures are considerations in the planning and conduct of operations to assure mission success.

<sup>4</sup> Not all critical facilities and activities are equipped with COLPRO. The limited availability of COLPRO systems requires careful planning and prioritization of resources. The JTF staff allocate COLPRO resources based upon the threat, risk, and vulnerability assessments. Operational activities and functions are prioritized based upon mission, criticality, assessments, and available resources. The combination of individual protection, contamination avoidance, and available COLPRO provides operational activities and functions with a level of capability.

<sup>5</sup> The encumbrances and limitations associated with IPE are considerations in the planning and conduct of operations to ensure mission success. However, current DOTMLPF does not adequately address the erection, maintenance, operations, and striking of CPS within a CBRN/TIM environment.

<sup>6</sup> ECP kits, procedures, and training do not currently exist.

<sup>7</sup> ECP kits, procedures, and training do not currently exist. Identification, development and/or acquisition of assets for Joint Expeditionary Collective Protection (JECF) include ECP assets for adaptation of tentage and structures to support expeditionary operations. The JECF effort is currently proceeding through the JCIDS process.

<sup>8</sup> COLPRO within some OCONUS locations does exist for radiological (fallout). However, COLPRO for other than radiological is almost nonexistent, including critical facilities, outside HTA OCONUS. The limited availability of COLPRO systems requires careful planning and prioritization of resources. The JTF staff allocates COLPRO resources based upon the threat, risk, and vulnerability assessments. Operational activities and functions are prioritized based upon mission, criticality, assessments, and available resources. The combination of individual protection, contamination avoidance, and available COLPRO provides operational activities and functions with a level of capability. However, the encumbrances and limitations associated with these measures are considerations in the planning and conduct of operations to assure mission success.

<sup>9</sup> COLPRO within some OCONUS locations does exist for radiological (fallout). However, COLPRO for other than radiological is almost nonexistent, including critical facilities, outside HTA OCONUS. Maneuvering forces are inadequately equipped with COLPRO capabilities. Insufficient COLPRO is available to support rest and resupply activities for all personnel within a 24-hour period necessary to support sustained operations within a contaminated environment. This statement is particularly true of forward-operating light forces. Fixed-site operations within a mature theater may possess sufficient COLPRO to provide access to personnel within a 24-hour period. Current doctrine, policies, plans, and TTPs do not adequately address sustained operations within a CBRN/TIM environment. Current concept is contamination avoidance or withdrawal.

<sup>10</sup> The JTF staff allocates COLPRO resources based upon the threat, risk, and vulnerability assessments. Planning for CBRND includes allocation of supporting services, materiel, and consumables. Manning, operation, and maintenance of the COLPRO resource is the responsibility of the allocated unit. JTF planning includes preparation of the force for CBRND. COLPRO is integral to CBRND and included in the plan.

<sup>11</sup> Quantities and availability of mobile COLPRO is inadequate. Mobile COLPRO exists in selected tactical combat and support vehicles. The quantities and types of these vehicles are limited and dedicated to specific missions. Current mobile COLPRO is inadequate to support operations by highly mobile forces. Airframe COLPRO is limited to tactical combat airframes. Airlift (both tactical and strategic) are not equipped with COLPRO. Sea-based COLPRO (the CITADEL System) is available in specific classes of naval warfare vessels (e.g., LHA, destroyer, etc.). Most naval vessels (including supply and transport vessels, carriers, and others) do not possess COLPRO.

<sup>12</sup> Mature theater CPS is available in limited quantities. These include JTCOPS, CP-DEPMEDS, TEMPER systems, and Service-designed systems. Integration of Service-specific systems into joint plans provides additional COLPRO capabilities. These, however, are not generally integrated in JTF plans. Current CPSs are inadequate to support expeditionary operations, particularly in austere environments by highly mobile forces and possessing reduced logistical footprint.

<sup>13</sup> COLPRO within some OCONUS locations does exist for radiological (fallout). However, COLPRO for other than radiological is almost nonexistent, including critical facilities, outside HTA OCONUS. COLPRO within HTA is installed and available for selected critical facilities and operations. The JTF staff allocates resources based upon the threat, risk, and vulnerability assessments. Expansion of existing COLPRO capabilities is planned, as appropriate and necessary, using transportable COLPRO systems.

### 12.7.3 Functional Solution Analysis

#### 12.7.3.1 DOTLFP Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Not all critical facilities and activities are equipped with COLPRO.  
**Non-Materiel Solutions:** *Doctrine:* Enforce existing doctrine and policy.
2. **Deficiency:** CPSs for other than radiological are almost nonexistent, including critical facilities, outside HTA OCONUS.  
**Non-Materiel Solutions:** *Doctrine:* Enforce existing doctrine and policy.
3. **Deficiency:** Current DOTMLFP does not adequately address the erection, maintenance, operations, and striking of CPSs within a CBRN/TIM environment.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, procedures, and TTPs the erection, maintenance, operation, and striking of CPSs within a CBRN/TIM environment for CBRND. *Organization:* Develop organizational structures supporting the erection, maintenance, operation, and striking of CPSs within a CBRN/TIM environment for CBRND. *Training:* Institutional and unit-level training on the erection, maintenance, operation, and striking of CPSs within a CBRN/TIM environment to support operations and provide for CBRND of the force. *Leadership:* Ensure awareness and knowledge of establishing CPSs within a CBRN/TIM environment for operations within a CBRN/TIM environment. *Facilities:* Develop infrastructure to support erection, maintenance, operation, and striking of CPS within a CBRN/TIM environment (e.g., logistics, training, etc.).
4. **Deficiency:** Expedient COLPRO (ECP) kits, procedures, and training do not currently exist.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, procedures, and TTPs the use and application of ECP for CBRND. *Organization:* Develop organizational structures supporting the application of ECP for CBRND. *Training:* Institutional and unit-level training on the application of ECP to support operations and provide for CBRND of the force. *Leadership:* Ensure awareness and knowledge of versatility and application of ECP for operations within a CBRN/TIM environment. *Facilities:* Develop infrastructure to support ECP (e.g., logistics, training, etc.).
5. **Deficiency:** Maneuvering forces are inadequately equipped with COLPRO capabilities.  
**Non-Materiel Solutions:** *Doctrine:* Complete the JCIDS process and central correlation/ comparison of national and strategic plans to identify CBRND resources necessary and available to support maneuver operations, particularly expeditionary operations during the first 30–90 days following commencement of hostilities, with a reduced logistical footprint. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct maneuver operations, particularly expeditionary operations during the first 30–90 days of operations following commencement of hostilities, while possessing reduced logistical footprint. *Training:* Train, exercise, and evaluate maneuver capabilities

(particularly expeditionary capabilities) of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operations using organic, prepositioned, and planned CBRND resources supporting operations. *Leadership*: Recognize differences and challenges associated with maneuver operations, particularly expeditionary operations during the first 30–90 days following commencement of hostilities, with a reduced logistical footprint; training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities*: Develop supporting infrastructure for expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.

6. **Deficiency**: Insufficient COLPRO is available to support rest and resupply activities for all personnel within a 24-hour period necessary to support sustained operations within a contaminated environment. This statement is particularly true of forward-operating light forces.

**Non-Materiel Solutions**: *Doctrine*: Enforce existing doctrine and policies.

7. **Deficiency**: Quantities and availability of mobile COLPRO is inadequate.

**Non-Materiel Solutions**: *Doctrine*: Completion of analysis and central correlation/ comparison of national and strategic plans to identify quantities and types of mobile COLPRO (and supporting consumables) necessary and available to support highly mobile forces for envisioned plans and taskings. *Organization*: Develop organizational structures, resources, staffing, and capabilities to conduct CBRND, including mobile COLPRO, of highly mobile forces. *Training*: Train, exercise, and evaluate CBRND, including mobile COLPRO, capabilities of the force in a CBRN/TIM threat during highly mobile force operations. *Leadership*: Recognize differences and challenges associated with CBRND operations by highly mobile forces, training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities*: Develop supporting infrastructure for CBRND of highly mobile forces.

8. **Deficiency**: Current mobile COLPRO is inadequate to support operations by highly mobile forces.

**Non-Materiel Solutions**: *Doctrine*: Completion of analysis and central correlation/ comparison of national and strategic plans to identify quantities and types of mobile COLPRO (and supporting consumables) necessary and available to support highly mobile forces for envisioned plans and taskings. *Organization*: Develop organizational structures, resources, staffing, and capabilities to conduct CBRND, including mobile COLPRO, of highly mobile forces. *Training*: Train, exercise, and evaluate CBRND, including mobile COLPRO, capabilities of the force in a CBRN/TIM threat during highly mobile force operations. *Leadership*: Recognize differences and challenges associated with CBRND operations by highly mobile forces; training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a

CBRN/TIM threat. *Facilities*: Develop supporting infrastructure for CBRND of highly mobile forces

**9. Deficiency:** Airlift (both tactical and strategic) are not equipped with COLPRO.

**Non-Materiel Solutions:** *Doctrine*: Incorporate into doctrine, policy, and procedures the provision of COLPRO to aircrew and passengers in appropriate airframes (military and civilian). *Training*: Train, exercise, and evaluate aircrews and supporting entities for airframe COLPRO operations for CBRND. *Leadership*: Recognize criticality of protecting aircrew and passengers of appropriate tactical and strategic airframes from the effects of CBRN/TIM agents. *Facilities*: Develop supporting infrastructure (e.g., logistics, aircraft maintenance, etc.) for airframe COLPRO.

**10. Deficiency:** Most naval vessels (including supply and transport vessels, carriers, and others) do not possess COLPRO.

**Non-Materiel Solutions:** *Doctrine*: Incorporate into doctrine, policy, and procedures the provision of COLPRO for at-risk vessels (civilian contract and military). *Organization*: Develop organizational structures, resources, staffing, and capabilities to support COLPRO operations on vessels supporting operations and at-risk. *Training*: Train, exercise, and evaluate crews for vessel COLPRO operations for CBRND. *Leadership*: Recognize differences and challenges associated with CBRND operations by at-risk vessels (both military and contract civilian) supporting operations. *Facilities*: Develop supporting infrastructure (e.g., logistics, maintenance, power systems, etc.) for vessel COLPRO.

**11. Deficiency:** Service-specific systems are not generally integrated in JTF plans.

**Non-Materiel Solutions:** *Doctrine*: Emphasize in doctrine, policy, and procedures the central correlation of national and strategic theater plans and taskings to identify CBRN/TIM support requirements for two or more concurrent operations with threat with comparison to existing and programmed quantities and types of CBRND systems and resources, joint and Service-specific, to include replenishment. *Leadership*: Implement development of plans and taskings consistent joint and Service-specific CBRND support capabilities.

**12. Deficiency:** Current CPS is inadequate to support expeditionary operations, particularly in austere environments by highly mobile forces and possessing reduced logistical footprint.

**Non-Materiel Solutions:** *Doctrine*: Incorporate into doctrine, policy, and procedures standards for expeditionary forces possessing reduced logistical footprint during the first 30–90 days of operations following commencement of hostilities. *Organization*: Develop organizational structures, resources, staffing, and capabilities to conduct expeditionary operations while possessing reduced logistical footprint and during the first 30–90 days of operations following commencement of hostilities. *Training*: Train, exercise, and evaluate expeditionary capabilities of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operation using CBRND resources supporting expeditionary operations. *Leadership*: Recognize differences and challenges associated with expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint, training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a

CBRN/TIM threat. *Facilities*: Develop supporting infrastructure for expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.

**13. Deficiency:** DOTMLPF is inadequate to support sustained operations within a CBRN/TIM environment, particularly expeditionary operations, during the first 30–60 days.

**Non-Materiel Solutions:** *Doctrine*: Include in doctrine, policy, and procedures sustained operations (medical and nonmedical) within a CBRN/TIM environment. *Organization*: Ensure resources, taskings, and staff are in place or available to perform sustained operations (medical and nonmedical) within a CBRN/TIM environment. *Training*: Train, exercise, and evaluate the force (military and eligible civilians) for sustained operations (medical and nonmedical) within a CBRN/TIM environment. *Leadership*: Recognize criticality of readiness of the force for potential sustained operations (medical and nonmedical) within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.

**14. Deficiency:** Current DOTMLPF does not adequately address the establishment and operation of expedient COLPRO activities and measures.

**Non-Materiel Solutions:** *Doctrine*: Establish in doctrine, policy, procedures, and TTPs the use and application of ECP for CBRND. *Organization*: Develop organizational structures supporting the application of ECP for CBRND. *Training*: Develop institutional and unit-level training on the application of ECP to support operations and provide for CBRND of the force. *Leadership*: Ensure awareness and knowledge of versatility and application of ECP for operations within a CBRN/TIM environment. *Facilities*: Develop infrastructure to support ECP (e.g., logistics, training, etc.)

#### 12.7.3.2 IMA Assessment Summary

N/A

## **12.8 Task OPSHLD 8: Supply protective measure consumables, expendables, and replacements**

### **12.8.1 Functional Area Analysis**

#### **12.8.1.1 Definition**

To ensure the supply of CBRND stocks in both medical and nonmedical categories. Items are transported and positioned in anticipation of need. Especially critical are consumables such as filters and extra sets of protective overgarments. NBC staff personnel work closely with logisticians and medical service personnel to ensure required stocks are on hand or readily available. Refer to individual Service documents for specifics.

#### **12.8.1.2 Derivation**

*Joint Enabling Concept for CBRN/TIM Operations, Protection Joint Functional Concept, UJTL (OP 5.3.9, OP 5.4.2, OP 5.4.5, OP 5.5.9, OP 6.2.1, OP 7, OP 7.2, OP 7.3, OP 7.4).*

##### **12.8.1.2.1 Supported Task: STSHLD 2**

##### **12.8.1.2.2 Lateral Task: OPSHA 4**

##### **12.8.1.2.3 Supporting Task: TASHLD 8**

#### **12.8.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Undeveloped to highly developed land. (C1.1)
2. Riverine to open sea. (C1.2)
3. Natural and induced air. (C1.3)
4. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

##### **Military**

1. Partially completed mission preparation. (C2.1.3)
2. Marginal to strong forces assigned. (C2.2.1)
3. Negligible personnel experience. (C2.2.4.5)
4. Some interoperability. (C2.2.6)
5. Partial Joint Staff integration. (C2.3.1.1)
6. Limited staff expertise. (C2.3.1.3)
7. Limited deployed supplies. (C2.8.2)
8. Limited CONUS resupply. (C2.8.3)
9. No prepositioned materiel. (C2.8.4)

10. No host nation support. (C2.8.5)
11. Limited commercial procurement. (C2.8.6)

### **Civil**

1. TIMs present in the civilian sector. (C3.3.7.5)

## **12.8.2 Functional Needs Analysis**

### **12.8.2.1 Capability and Deficiency Assessment Summary**

Table 12.8-1 discusses the only capability that exists to perform the task to the designated standard. Doctrine, policy, and procedures address operational planning integrating all tasked functions, activities, and staff agencies. This task includes the planning, movement, management, and positioning of CBRND materiel, including consumables, necessary to support operations. Deficiencies include the lack of CBRND systems in sufficient quantities and types to support envisioned and published plans, inadequate DOTMLPF addressing sustained operations within a CBRN/TIM environment, and CBRND of highly mobile and/or expeditionary forces with reduced logistical footprints.

### **Current Capability and Deficiency**

JTF HQ staffs identify CBRND resource requirements and availability and conduct prepositioning, allocation, movement, distribution, reallocation, and management of resources to protect the force against the effects of CBRN/TIM agents for planned and current operations. This task includes integration of provided coalition partner and host-nation CBRND resources into CBRND plans and operations. General logistics DOTMLPF exists addressing the planning, movement, management and positioning of materiel for support of operations. Reallocation of resources and integration of coalition partner and/or host-nation contributions are addressed in existing DOTMLPF. Deficiencies include inadequate quantities and types of COLPRO, insufficient DOTMLPF for sustained operations within a CBRN/TIM environment, individual combat loads restricting available weight and space for CBRND materiel, and the absence of CBRND for MWDs. Expeditionary and highly mobile force operations, both with reduced and limited logistical support, are not adequately addressed in DOTMLPF, and the design of most CBRND systems and associated logistics do not adequately support these types of operations. Deploying eligible civilians and MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment; nor does the JTF staff possess clear guidance for planning and providing CBRND of these personnel and JTF elements. The overall current capability is assessed as “red.”

### **Projected Near/Mid-Term Capability and Deficiency**

The IOC fielding of Joint Operational Effects Federation (JOEF) and Joint Effects Model (JEM) in the mid term provides increased capabilities for planning and resource determination. Otherwise, no changes from current capabilities are identified.

**Projected Far-Term Capability and Deficiency**

No change projected for this task.

Table 12.8-1. OPSHLD 8: Capability and Deficiency Assessment

Capability: JTF HQ Staff	M1	M2	M3	M4	M5	M6	M7	M8
Current Overall Capability <sup>1</sup>	R <sup>2</sup>	R <sup>3</sup>	R <sup>4</sup>	Y <sup>5</sup>	Y <sup>6</sup>	R <sup>7</sup>	R <sup>8</sup>	G <sup>9</sup>
Near/Mid-Term Overall Capability	R	R	Y	Y	Y	R	R	G
Far-Term Overall Capability	R	R	Y	Y	Y	R	R	G

	FAA Measure	Scale
M1	Operational plans establish integrated support requirements (NBC, medical, logistics, etc.) for sustained CBRND operations.	<p><b>G:</b> Joint operational plans establish detailed integrated JTF support requirements to support sustained operations through multiple CBRN/TIM attacks across the spectrum of operations and without unplanned and unforecasted support requirements.</p> <p><b>Y:</b> Joint operational plans establish adequate integrated JTF support requirements to support sustained operations through multiple CBRN/TIM attacks involving major operations with planned and forecasted support requirements.</p> <p><b>R:</b> Joint operational plans inadequately establish integrated JTF support requirements to sustain operations through multiple CBRN/TIM attacks.</p>
M2	Adequate resources are available to implement and sustain the required protective measures.	<p><b>G:</b> CBRND systems and materiel are available in plan-identified required quantities and types to support multiple concurrent operations with threat.</p> <p><b>Y:</b> CBRND systems and materiel are available in sufficient quantities and types to support concurrent operations with threat. Adjustments to plan requirements are made to adjust to limitations in quantities and types of CBRND systems.</p> <p><b>R:</b> CBRND systems and/or materiel are not available in sufficient quantities and types to support concurrent operations with threat.</p>
M3	Forces are equipped to operate in a CBRN/TIM environment.	<p><b>G:</b> Forces are adequately equipped and possess ready access to CBRND resources to conduct sustained operations in a CBRN/TIM environment.</p> <p><b>Y:</b> Forces are equipped and possess access to CBRND resources to conduct operations in a CBRN/TIM environment.</p> <p><b>R:</b> Forces are inadequately equipped or possess inadequate access to CBRND resources to operate in a CBRN/TIM environment.</p>
M4	Medical CBRND consumables and expendables are on hand.	<p><b>G:</b> CBRND systems, components, and consumables are available in plan-identified quantities and types to support sustained operations within a CBRN/TIM environment.</p> <p><b>Y:</b> CBRND systems, components, and consumables are identified in plans and are adjusted to limitations in quantities and types to support operations involving CBRN/TIM threat.</p> <p><b>R:</b> CBRND systems, components, and consumables are inadequate or insufficient to support medical operations involving CBRN/TIM threat.</p>
M5	Nonmedical CBRND consumables and expendables are on hand.	<p><b>G:</b> CBRND systems, components, and consumables are available in plan-identified quantities and types to support sustained operations within a CBRN/TIM environment.</p> <p><b>Y:</b> CBRND systems, components, and consumables are identified in plans and are adjusted to limitations in quantities and types to support operations involving CBRN/TIM threat.</p> <p><b>R:</b> CBRND systems, components, and consumables are inadequate or insufficient to support medical operations involving CBRN/TIM threat.</p>

M6	Operations are sustainable over multiple CBRN/TIM attacks based upon organic, on-hand, and issued CBRN/TIM protective assets, consumables, and expendables.	<p><b>G:</b> JTF forces (including military, eligible civilians, and MWAs) are adequately equipped and possess ready access to sufficient CBRND resources to support sustained operations through multiple CBRN/TIM attacks across the spectrum of operations and without unplanned and unforecasted resupply.</p> <p><b>Y:</b> JTF forces (including military and eligible civilians) are equipped and possess ready access to sufficient CBRND to support sustained operations through multiple CBRN/TIM attacks involving major operations with planned and forecasted resupply.</p> <p><b>R:</b> JTF forces are inadequately equipped and/or possess limited access to CBRND resources to sustain operations through multiple CBRN/TIM attacks and/or are reliant upon resupply.</p>
M7	Support spares of equipment and supplies are available to sustain protective measures.	<p><b>G:</b> CBRND systems, components, and consumables are available in plan-identified quantities and types to support sustained operations within a CBRN/TIM environment.</p> <p><b>Y:</b> CBRND systems, components, and consumables are identified in plans and are adjusted to limitations in quantities and types to support sustained operations involving CBRN/TIM threat.</p> <p><b>R:</b> CBRND systems, components, and consumables are inadequate or insufficient to support medical operations involving CBRN/TIM threat.</p>
M8	Staff efforts (NBC, medical, logistics) are integrated to prepare plan.	<p><b>G:</b> JTF staff functions act cohesively and as a highly integrated advisory and expert body to the JTF Commander for the accurate and timely situational analysis, course of action (COA) development, and decisioning for JTF response, actions, and activities to a CBRN/TIM event.</p> <p><b>Y:</b> JTF staff functions act as an integrated advisory body to the JTF Commander for situational analysis, COA development, and decisioning for JTF response, actions, and activities resulting from a CBRN/TIM event.</p> <p><b>R:</b> JTF staff functions inadequately integrate with each other or predominantly operate autonomously of each other in support of the JTF Commander for CBRN/TIM event management and/or decisioning.</p>

<sup>1</sup> DOTMLPF is adequate for the planning, movement, management, and positioning of CBRND materiel in support of operations. However, DOTMLPF is inadequate for sustained operations within a CBRN/TIM environment and for expeditionary and highly mobile force operations with reduced logistical footprints. DOTMLPF is also inadequate or nonexistent addressing CBRND of eligible civilians and MWAs.

<sup>2</sup> Doctrine, policy, and procedures for operational planning require the involvement and integration of all core and supporting functions and activities. Support requirements for CBRND are addressed in planning when there exists a CBRN/TIM threat. However, sustained operations within a CBRN/TIM environment are not adequately addressed in DOTMLPF and, subsequently, in planning.

<sup>3</sup> The allocation, placement and reallocation of protective assets is a function of the planning and operational control of the JTF Commander, JTF staff, and combined staff. ACSAs between coalition partners and/or host-nation enables acquisition and cross-servicing support between the partners. IAs provide for a wide range of support exchange including consumables, sheltering, medical care, and other support activities. However, sustained operations within a CBRN/TIM environment are not adequately addressed in DOTMLPF and, subsequently, in planning. Quantities, types, and availability of CPSs are limited. Current CPSs are inadequate to support expeditionary operations, particularly in austere environments by highly mobile forces and possessing reduced logistical footprints. The individual combat load places limitations upon weight and type of equipment and consumables. Protective equipment may be reduced or eliminated despite threat level.

<sup>4</sup> The JTF staff reviews identified forces and the potential threat for planned operations. Specified forces, time permitting, train and prepare for operations involving the potential threat. Equipping the tasked force is an integral part of planning and preparation. The JTF staff tracks force readiness for planned operations. Readiness issues are addressed by the staff. The combination of established force organic assets, material acquisitions, prepositioned material, available host-nation/coalition contributions, and movement of identified CBRND resources from stockpiles and reallocation activities are pursued by the JTF staff to prepare and support deploying forces as outlined by the appropriate plan. Expeditionary operations are a particular concern as most CBRND systems and associated logistics are not designed for a highly mobile force, with a reduced logistical footprint, and for the initial period of operations until the theater matures (usually the first 30–90 days). Deploying units may not possess full CBRND resources and capabilities during the initial stages of deployment and until after arrival within the JOA. The individual combat load places limitations upon weight and type of equipment and consumables. Protective equipment may be reduced or eliminated despite threat level. Additionally, deploying eligible civilians and MWAs (particularly MWDs) are not equipped and trained to survive a

CBRN/TIM environment. The JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians and MWAs. Sustained operations within a CBRN/TIM environment are not adequately addressed in DOTMLPF and, subsequently, in planning.

<sup>5</sup> Medical CBRND materiel, including consumables and expendables, are administered, issued, and prepositioned for identified CBRN/TIM threats. The types, quantities, movement, administration, issuance, and positioning of medical CBRND materiel is addressed by the JTF staff and supporting staffs during the planning and support for operations and is addressed in doctrine, policy, and procedures. Expeditionary and highly mobile force operations are particular concerns. Availability of spares and resupply will be limited for expeditionary forces during the period until the theater matures (usually the first 30–90 days). Highly mobile forces maneuvering and operating in austere environments, behind adversary lines, and possessing reduced logistical footprints are similarly constrained. The individual combat load also places limitations upon weight and type of equipment and consumables. Protective materiel may be reduced or eliminated despite threat level. Medical CBRND materiel for MWAs is virtually nonexistent. The application of presymptomatic medical CBRND materiel to eligible civilians is not addressed in current doctrine, policy, and procedures. Sustained operations within a CBRN/TIM environment are not adequately addressed in DOTMLPF and, subsequently, in planning.

<sup>6</sup> Doctrine, policy, and procedures are adequate for planning, movement, management, and positioning of materiel (including CBRND materiel) in support of operations. CBRND materiel for an operation addresses the identified CBRN/TIM threat. The allocation of CBRND materiel is managed by the JTF staff. Expeditionary operations are a particular concern. Availability of spares and resupply will be limited during the period until the theater matures (usually the first 30–90 days). Maneuvering highly mobile forces operating in austere environments, behind adversary lines, and possessing reduced logistical footprints are similarly constrained. The individual combat load also places limitations upon weight and type of equipment and consumables. Protective equipment may be reduced or eliminated despite threat level. Sustained operations within a CBRN/TIM environment are not adequately addressed in DOTMLPF and, subsequently, in planning.

<sup>7</sup> The JTF staff plans for operations using the COCOM-identified forces for the potential threat. Equipping the tasked force is an integral part of planning and preparation. The combination of established force organic assets, material acquisitions, prepositioned material, available host-nation/coalition contributions, and movement of identified CBRND resources from stockpiles and reallocation activities are pursued by the JTF staff with the COCOM staff to prepare and support deploying forces as outlined by the appropriate plan. Systems are reallocated, when necessary, from prepositioned and dispersed stocks of units deploying or operating within an JOA. Expeditionary operations are a particular concern. Existing COLPRO systems are not generally designed for a highly mobile force, with a reduced logistical footprint, and the initial period of operations until the theater matures (usually the first 30–90 days). Deploying units may not possess full CBRND resources and capabilities during the initial stages of deployment and until after arrival within the JOA. Additionally, deploying eligible civilians and MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment. JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians and MWAs. Current doctrine and policy does not adequately address sustained operations within a CBRN/TIM environment. The individual combat load places limitations upon weight and type of equipment and consumables. Protective equipment may be reduced or eliminated despite threat level.

<sup>8</sup> Doctrine, policy, and procedures are adequate for planning, movement, management, and positioning of materiel (including CBRND materiel) in support of operations. CBRND materiel for an operation addresses the identified CBRN/TIM threat. The allocation of CBRND materiel is managed by the JTF staff. The individual combat load places limitations upon weight and type of equipment and consumables. Expeditionary operations are a particular concern. Existing COLPRO systems are not generally designed for a highly mobile force, with a reduced logistical footprint, and the initial period of operations until the theater matures (usually the first 30–90 days). Availability of spares and resupply will be limited during this period. Protective equipment may be reduced or eliminated despite threat level. Sustained operations within a CBRN/TIM environment are not adequately addressed in DOTMLPF and, subsequently, in planning.

<sup>9</sup> Doctrine, policy, and procedures for operational planning and operations management require the involvement and integration of all core and supporting functions and activities. Support requirements for CBRND are addressed in planning when there exists a CBRN/TIM threat. The JTF staff collects, processes, interprets, and acts upon information obtained from all applicable resources. This requires a fully integrated staff effort for accurate and timely decision-making. However, sustained operations within a CBRN/TIM environment are not adequately addressed in DOTMLPF and, subsequently, in planning.

### 12.8.3 Functional Solution Analysis

#### 12.8.3.1 DOTLFP Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** Sustained operations within a CBRN/TIM environment are not adequately addressed in DOTMLPF and, subsequently, in planning.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, and procedures sustained operations within a CBRN/TIM environment. *Organization:* Ensure resources, taskings, and staff are in place or available to perform sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.
- 2. Deficiency:** Quantities, types, and availability of CPS are limited.

**Non-Materiel Solutions:** *Doctrine:* Institute in doctrine, policy, and procedures the central correlation of operational plans and taskings to identify CBRND support requirements for two or more concurrent operations with CBRN/TIM threat with comparison to existing and programmed quantities and types of CBRND systems and resources. *Leadership:* Implement development of plans and taskings consistent with available CBRND capabilities as determined by central correlation and comparison of strategic tactical plans and taskings.
- 3. Deficiency:** The individual combat load places limitations upon weight and type of equipment and consumables. Protective equipment may be reduced or eliminated despite threat level.

**Non-Materiel Solutions:** *Leadership:* Implement development of plans and taskings consistent with stockpile and prepositioning support capabilities.
- 4. Deficiency:** A particular concern is most CBRND systems and associated logistics are not designed for expeditionary operations and/or a highly mobile force, with a reduced logistical footprint, and for the initial period of operations until the theater matures (usually the first 30–90 days).

**Non-Materiel Solutions:** *Doctrine:* Complete the JCIDS process and central correlation/ comparison of operations plans to identify CBRND resources necessary and available to support expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct expeditionary operations while possessing reduced logistical footprint and during the first 30–90 days of operations following commencement of hostilities. *Training:* Train, exercise, and evaluate expeditionary capabilities of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operations using CBRND resources supporting expeditionary operations. *Leadership:* Recognize differences and challenges associated with expeditionary

operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint, training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat.

*Facilities:* Develop supporting infrastructure for expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.

5. **Deficiency:** Deploying units may not possess full CBRND resources and capabilities during the initial stages of deployment and until after arrival within the JOA.

**Non-Materiel Solutions:** *Doctrine:* Emphasize in doctrine, policies, and procedures for preparation of the force for CBRND protection during throughout deployment, redeployment, relocation, and en route phases of movement. *Organization:* Ensure resources, taskings, and staff are in place or available to perform CBRND operations within a CBRN/TIM environment by deploying, redeploying, relocating, and en route forces.

*Training:* Train, exercise, and evaluate the force for CBRND operations within a CBRN/TIM environment while deploying, redeploying, relocating, and en route. *Leadership:* Recognize criticality of readiness of the force for potential CBRND operations within a CBRN/TIM environment while deploying, redeploying, relocation, and en route; training providing the skills to manage the force in these circumstances; and willingness and ability to implement necessary changes and activities to prepare and appropriately protect the force. *Facilities:* Develop supporting infrastructure for CBRND operations of the force while preparing, deploying, redeploying, relocating, and en route.

6. **Deficiency:** Deploying eligible civilians are not equipped and trained to survive a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of eligible civilians and training for CBRN/TIM environment survival.

*Organization:* Ensure organizational consideration for maintenance and support of eligible civilians CBRND protective equipment, measures, and activities. *Training:* Provide institutional and unit training of eligible civilians for CBRND measures and activities. Integrate into CBRND exercises and evaluations. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for eligible civilians. *Facilities:* Develop supporting infrastructure for eligible civilians CBRND (e.g., logistics, medical, veterinary surveillance, communications, training, etc.).

7. **Deficiency:** Deploying MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of MWAs, particularly MWDs, and training for CBRN/TIM environment survival.

*Organization:* Ensure organizational consideration for maintenance and support of MWA CBRND protective equipment, measures, and activities. *Training:* Provide institutional and unit training of MWA handlers and MWAs for CBRND measures and activities. Integrate into CBRND exercises and evaluations. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for MWD survivability. *Facilities:* Develop supporting infrastructure for MWD CBRND (e.g., logistics, medical, veterinary surveillance, communications, training, etc.).

8. **Deficiency:** The JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing civilian personnel and operations for CBRND. *Organization:* Identify organizational services and activities supporting the mission performed by civilian personnel and operations. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians. *Personnel:* Ensure that eligible civilians supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities:* Develop supporting infrastructure for eligible civilian CBRND (e.g., logistics, medical, training, communications, etc.).

9. **Deficiency:** The JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying MWAs.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing MWAs, particularly MWDs, and operations for CBRND. *Organization:* Identify organizational services and activities supporting survivability of MWAs and MWA mission operations. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWAs. *Facilities:* Develop supporting infrastructure for MWA CBRND (e.g., logistics, medical, veterinary surveillance, training, communications, etc.).

10. **Deficiency:** Availability of spares and resupply will be limited for highly mobile forces maneuvering and operating in austere environments, behind adversary lines, and possessing reduced logistical footprints.

**Non-Materiel Solutions:** *Doctrine:* Complete the JCIDS process and central correlation/ comparison of national and strategic plans to identify CBRND resources necessary and available to support maneuvering highly mobile force operations with a reduced logistical footprint. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct maneuvering highly mobile force operations while possessing reduced logistical footprint. *Training:* Train, exercise, and evaluate expeditionary capabilities of the force in a CBRN/TIM threat with reduced logistical footprint using CBRND resources supporting maneuvering highly mobile force operations. *Leadership:* Recognize differences and challenges associated with maneuvering highly mobile force operations with a reduced logistical footprint, training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct maneuvering highly mobile force operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for maneuvering highly mobile force operations with a reduced logistical footprint and with a CBRN/TIM threat.

**11. Deficiency:** Medical CBRND materiel for MWAs is virtually nonexistent.

**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of MWAs, particularly MWDs, and training for CBRN/TIM environment survival. *Organization:* Ensure organizational consideration for maintenance and support of MWA CBRND protective equipment, measures, and activities. *Training:* Provide institutional and unit training of handlers and MWAs for CBRND measures and activities. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for MWA survivability. *Facilities:* Develop supporting infrastructure for MWA CBRND (e.g., logistics, veterinary surveillance, etc.).

**12. Deficiency:** The application of presymptomatic medical CBRND materiel to eligible civilians is not addressed in current doctrine, policy, and procedures.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing eligible civilians during CBRND operations and the provision of CBRND protection, including prophylaxis. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians.

**13. Deficiency:** DOTMLPF is inadequate for expeditionary and highly mobile force operations with reduced logistical footprints.

**Non-Materiel Solutions:** *Doctrine:* Incorporate into doctrine, policy, and procedures CBRND standards for expeditionary and highly mobile forces possessing reduced logistical footprint. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct expeditionary and highly mobile force operations while possessing reduced logistical footprint. *Training:* Train, exercise, and evaluate expeditionary capabilities of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operation using CBRND resources supporting expeditionary operations. *Leadership:* Recognize differences and challenges associated with expeditionary and highly mobile force operations with a reduced logistical footprint; training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary and highly mobile force operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for expeditionary and highly mobile force operations with a reduced logistical footprint.

**14. Deficiency:** DOTMLPF is inadequate or nonexistent addressing CBRND of eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing eligible civilian personnel for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of eligible civilian personnel within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilian personnel.

**15. Deficiency:** DOTMLPF is inadequate or nonexistent addressing CBRND of MWAs.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing MWAs, particularly MWDs, for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of MWAs within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWAs.

#### **12.8.3.2 IMA Assessment Summary**

**12.9 Task OPSHLD 9: Ensure safety of water/food supplies to protect forces****12.9.1 Functional Area Analysis****12.9.1.1 Definition**

To ensure that food and water vulnerability assessments identify potential contamination points and critical monitoring points/sites and outline protective measures. This area requires support and cooperation from medical personnel, logistics, environmental personnel, and the CBRND staff.

**12.9.1.2 Derivation**

*Joint Enabling Concept for CBRN Operations, Protection Joint Functional Concept, UJTL (OP 1.3.1, OP 2.2.1, OP 2.2.3, OP 2.4.1.1, OP 2.4.2.1, OP 5.2, OP 5.2.1, OP 5.2.2, OP 5.3.9, OP 5.4.2, OP 5.5.9, OP 6.2.10, OP 7, OP 7.3, OP 7.4)*

**12.9.1.2.1 Supported Task:** N/A

**12.9.1.2.2 Lateral Task:** N/A

**12.9.1.2.3 Supporting Task:** N/A

**12.9.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Undeveloped to highly developed land. (C1.1)
2. Riverine to open sea. (C1.2)
3. Natural and induced air. (C1.3)
4. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Partially completed mission preparation. (C2.1.3)
2. Normal personnel experience. (C2.2.4.5)
3. Negligible staff expertise. (C2.3.1.3)
4. Limited deployed supplies. (C2.8.2)
5. Sufficient CONUS resupply. (C2.8.3)
6. Limited prepositioned materiel. (C2.8.4)
7. Limited host nation support. (C2.8.5)
8. Limited commercial procurement. (C2.8.6)

**Civil**

1. Poor civil health. (C3.3.1.4)
2. High health risk. (C3.3.1.5)
3. Low economic self-sufficiency. (C3.3.4.1).
4. TIMs present in the civilian sector. (C3.3.7.5)

**12.9.2 Functional Needs Analysis****12.9.2.1 Capability and Deficiency Assessment Summary**

Table 12.9-1 discusses the only capability that currently exists to perform the task to the designated standard. Doctrine, policy, procedures, and training exist for the conduct of this task. Veterinary, Bio-Environmental, and Public Health personnel are trained and perform medical intelligence analysis to assess the threat and conduct health vulnerability and risk analysis throughout the operations from preparation through post-operations to ensure the health and well-being of the force. Water and food stock safety and protection from contaminants is a function performed by elements of the Medical Services. Sources are selected and evaluated. Sampling is performed to ensure consistency of supplied edibles and potable water in the field. CBRN/TIM protection of stocks is outlined in existing doctrine, policy, and procedures. Force units are provided guidance and assistance in protecting issued stocks and for the restoration/replacement of contaminated food and potable water.

**Current Capability and Deficiency**

JTF Medical Services staffs identify CBRN/TIM threats to health of the force, perform and disseminate health vulnerability and risk assessments, and ensure the safety of food and water. This task includes evaluation and determination of safety of sources, protection of food and water stocks, medical surveillance for indications of CBRN/TIM contamination of food and water, and the restoration or replacement of contaminated food and water stocks. Existing doctrine, policies, and procedures address the conduct of health threat analysis, vulnerability and risk analysis, medical surveillance, the protection of food and potable water stocks, and the restoration or replacement of contaminated food and potable water stocks. No deficiencies were noted. The overall current assessment is “green.”

**Projected Near/Mid-Term Capability and Deficiency**

No change projected for this task.

**Projected Far-Term Capability and Deficiency**

No change projected for this task.

Table 12.9-1. OPSHLD 9: Capability and Deficiency Assessment

Capability/Measure	M1	M2	M3	M4	M5	M6	M7
<b>Current Overall Capability<sup>1</sup></b>	G <sup>2</sup>	Y <sup>3</sup>	G <sup>4</sup>	G <sup>5</sup>	G <sup>6</sup>	G <sup>7</sup>	G <sup>8</sup>

M3	Veterinary/Bio-Environmental/Public Health personnel are trained in food and water vulnerability assessments for CBRN/TIM environment.	<p><b>G:</b> Veterinary/Bio-Environmental/Public Health personnel receive formal and recurring training on the conduct of food and water risk and vulnerability assessments and addresses CBRN/TIM threats.</p> <p><b>Y:</b> Veterinary/Bio-Environmental/Public Health personnel receive training on the conduct of food and water risk and vulnerability assessments and is adequate to address CBRN/TIM threats.</p> <p><b>R:</b> Training of Veterinary/Bio-Environmental/Public Health personnel is inadequate or nonexistent for the conduct of food and/or water risk and/or vulnerability assessments and/or is inadequate to assess CBRN/TIM threats.</p>
M4	Uncontaminated food and potable water supplies are available in sufficient quantities.	<p><b>G:</b> Doctrine, policy, procedures, and TTPs exist and provide clear guidance and requirements for the approval of sources and sourcing of potable water and food supplies; testing of suspected contaminated supplies, and the replacement of contaminated or unsafe food and water supplies.</p> <p><b>Y:</b> Doctrine, policy, procedures, and TTPs exist and provide general guidance and requirements for the sourcing of potable water and food supplies and replacement of suspected or confirmed contaminated or unsafe supplies.</p> <p><b>R:</b> Doctrine, policy, procedures, and TTPs are nonexistent or inadequate to provide guidance and/or requirements for sourcing of food and/or water supplies, and/or the replacement of suspected or confirmed contaminated or unsafe supplies.</p>

M5	Units possess plans and procedures to protect food and water supplies from CBRN/TIM contamination and restore safe food and water supplies following an attack/incident.	<p><b>G:</b> Doctrine, policies, procedures, and TTPs exist and provide clear guidance and requirements for the protection of food and water supplies from contamination, inspection and testing of suspected food and water supplies, and actions to ensure the continued safe provisioning of the force.</p> <p><b>Y:</b> Doctrine, policies, procedures, and TTPs exist and provide general guidance and requirements for the protection of food and water supplies from contamination, and actions to enable the safe provisioning/reprovisioning of the force.</p> <p><b>R:</b> Doctrine, policies, procedures, and TTPs are nonexistent or inadequate for the protection of food and/or water supplies from contamination, and/or actions supporting the safe reprovisioning of the force.</p>
M6	Required materials and equipment are available to implement protective and restoration measures for food and water supplies.	<p><b>G:</b> Doctrine, policies, procedures, and TTPs exist and provide clear guidance and requirements for the protection of food and water supplies from contamination, inspection and testing of suspected food and water supplies, and actions to ensure the continued safe provisioning of the force.</p> <p><b>Y:</b> Doctrine, policies, procedures, and TTPs exist and provide general guidance and requirements for the protection of food and water supplies from contamination, and actions to enable the safe provisioning/reprovisioning of the force.</p> <p><b>R:</b> Doctrine, policies, procedures, and TTPs are nonexistent or inadequate for the protection of food and/or water supplies from contamination, and/or actions supporting the safe reprovisioning of the force.</p>
M7	Forces are trained in procedures to protect and restore food and water supplies.	<p><b>G:</b> Doctrine, policies, procedures, and TTPs exist and provide clear guidance and requirements for the protection of food and water supplies from contamination, inspection and testing of suspected food and water supplies, and actions to ensure the continued safe provisioning of the force.</p> <p><b>Y:</b> Doctrine, policies, procedures, and TTPs exist and provide general guidance and requirements for the protection of food and water supplies from contamination, and actions to enable the safe provisioning/reprovisioning of the force.</p> <p><b>R:</b> Doctrine, policies, procedures, and TTPs are nonexistent or inadequate for the protection of food and/or water supplies from contamination, and/or actions supporting the safe reprovisioning of the force.</p>

<sup>1</sup> Adequate doctrine, policy, and procedures exist to conduct this task.

<sup>2</sup> Adequate doctrine, policy, and procedures exist for performing and reporting food, water, and vector CBRN/TIM vulnerability assessments.

<sup>3</sup> Adequate doctrine, policy, and procedures exist for the formulation and dissemination of health risk assessments.

<sup>4</sup> Veterinary/Bio-Environmental/Public Health personnel are trained in the conduct of food and water vulnerability assessments to include CBRN/TIM threats.

<sup>5</sup> Approved sourcing for potable water and food supplies are used to supply the force. Replacement of contaminated food and water supplies is addressed in existing doctrine, policy, and procedures. The availability and time to perform replacement is a function of the type of unit, location, and logistical requirements.

<sup>6</sup> Adequate doctrine, policy, and procedures exist for the protection of food and water supplies from contamination and the restoration or replacement of these supplies following a CBRN/TIM attack/incident. Encapsulated field meals (e.g., meals ready to eat [MREs], etc.) and appropriately sealed containers of potable water are decontaminated and used pending restoration/replacement of contaminated edibles and potable water.

<sup>7</sup> Protection of food and water supplies are dependent upon containering, location, type of contamination, and a number of other factors. Adequate doctrine, policy, and procedures exist for the protection of these supplies from contamination when possible.

<sup>8</sup> Adequate doctrine, policy, and procedures exist addressing measures and requirements for the appropriate protection and restoration of food and water supplies. Encapsulated field meals (e.g., MREs, etc.) and appropriately sealed containers of potable water are decontaminated and used pending restoration/replacement of contaminated edibles and potable water.

### **12.9.3 Functional Solution Analysis**

#### **12.9.3.1 DOTLPF Assessment Summary**

No deficiencies were noted for this task.

#### **12.9.3.2 IMA Assessment Summary**

N/A

## **12.10 Task OPSHLD 10: Protect equipment and supplies through coatings, coverings, and packaging to reduce contamination of contents and to contain contamination**

### **12.10.1 Functional Area Analysis**

#### **12.10.1.1 Definition**

To protect equipment and supplies against CBRN/TIM agents through the use of protective coatings such as conformal coatings for electronics, chemical agent-resistant paints for equipment, and chemical-resistant packaging for supplies. Most equipment and supplies will not be permanently protected; therefore, staging and field units will be required to employ battlespace methods to prevent contamination. Coating materials (e.g., sprays, dips), coverings (e.g., tarps, overhead cover), and packaging (e.g., boxes, bags, cans, plastic bottles) can be used to protect mission-essential items and/or prevent/reduce contamination. Unit plans and procedures should include provisions for protecting equipment and supplies from contamination. Equipment and supplies should be placed in a structure or moved from the threatened or contaminated area if possible. Exposed equipment and supplies are covered and protected upon notification of an attack. Contaminated equipment and supplies are identified and marked for decontamination.

Containment of contamination and movement and/or storage of contaminated material and samples are directed as necessary. Containment assets provide and support the ability to perform safe storage, movement, and handling of contaminated materiel. Coatings and packaging designed to preclude exfiltration of contained contaminants prevent subsequent secondary exposure of personnel and equipment.

#### **12.10.1.2 Derivation**

*Joint Enabling Concept for CBRN/TIM Operations, Protection Joint Functional Concept, UJTL (OP 5.3, OP 5.3.9, OP 5.4, OP 5.4.6, OP 5.5.9, OP 7, OP 7.2, OP 7.3, OP 7.4).*

##### **12.10.1.2.1 Supported Task: N/A**

##### **12.10.1.2.2 Lateral Task: OPSHA 4**

##### **12.10.1.2.3 Supporting Task: TASHLD 9**

#### **12.10.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Undeveloped to highly developed land. (C1.1)
2. Riverine to open sea. (C1.2)
3. Natural and induced air. (C1.3)

4. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

8. Limited host nation support. (C2.8.5)
9. Limited commercial procurement. (C2.8.6)

**Civil.** N/A

## **12.10.2 Functional Needs Analysis**

### **12.10.2.1 Capability and Deficiency Assessment Summary**

Table 12.10-1 discusses the only capability that exists to perform the task to the designated standard. Protection policies, standards, and criteria exist for CBRND protection of equipment and supplies but are generally limited to the housing of materiel in structures, two protective coatings designed for combat vehicles, the application of layers of plastic wrap for cargo in transit, and limited specific-purpose packagings. Deficiencies include inadequate or nonexistent interoperable standards, criteria, and procedures for the protection of all classes of supply.

### **Current Capability and Deficiency**

JTF HQ staffs identify CBRND requirements for protection of supplies and equipment and develop plans and procedures to protect these resources from CBRN/TIM contamination. They also identify materiel and actions to afford resource protection and identify requirements, materiel, resources, and taskings to accomplish the containment of contaminated resources for storage, handling, and movement. The only identified capabilities are policies, standards, and criteria addressing the housing of materiel in structures, two protective coatings (volatile and nonvolatile chemical agent-resistant coating [CARC]), the application of layers of plastic wrap for in-transit cargo, and limited specific-purpose packagings. Deficiencies include knowledge of the protective capabilities of commonly available materials, capabilities and procedures for handling exposed/contaminated equipment/supplies other than decontamination, protection of open stored materiel, and training to preclude contamination of assets. There is an absence of doctrine, policy, and procedures establishing protective pack, containerization, packaging, coverings, and coatings for equipment and supplies that conceivably may encounter contamination within a CBRN/TIM environment and address protection of all classes of supply within a CBRN/TIM environment. Further, there is a finite and limited ability to perform

containment of contaminated material for storage, handling, and movement. The overall current assessment is “red.”

**Projected Near/Mid-Term Capability and Deficiency**

No change projected for this task.

**Projected Far-Term Capability and Deficiency**

No change projected for this task.

M8	Appropriate CBRN/TIM contaminated materiel containment resources are available.	<p><b>G:</b> Adequate types and quantities of CBRN/TIM contaminated material containment resources are readily available to the force for the containment of requiring CBRN/TIM contaminated and/or exposed equipment and supplies.</p> <p><b>Y:</b> CBRN/TIM contaminated material containment resources are readily available to the force and doctrine, policies, procedures, and TTPs exist for the containment of selected CBRN/TIM contaminated and/or exposed equipment and supplies.</p> <p><b>R:</b> Doctrine, policy, procedures, TTPs, and CBRN/TIM contaminated material containment resources are inadequate or nonexistent for application by the force to CBRN/TIM contaminated and/or exposed equipment and supplies.</p>
M9	Units process plans and procedures to apply CBRN/TIM contaminated materiel containment resources.	<p><b>G:</b> Plans and procedures address the conduct of containment activities and application of readily available CBRN/TIM contaminated material containment resources to all classes of supplies and equipment contaminated and/or exposed to CBRN/TIM agents for their safe handling, storage, and transport.</p> <p><b>Y:</b> Plans and procedures address the conduct of containment activities and application of commonly available containment resources to selected classes of supplies and equipment contaminated and/or exposed to CBRN/TIM agents for their safe handling, storage, and transport.</p> <p><b>R:</b> Doctrine, policy, procedures, and TTPs are inadequate or nonexistent for the conduct of containment activities and/or application of containment resources to contaminated supplies and/or equipment for their safe handling, storage, and/or transport.</p>
M10	Resources are protected against secondary contamination/exposure by contained CBRN/TIM contaminated material.	<p><b>G:</b> Doctrine, policy, procedures, and TTPs address the safe identification, handling, storage, and transport of contained CBRN/TIM contaminated/exposed material and measures for the prevention of secondary exposure/contamination of resources.</p> <p><b>Y:</b> Doctrine, policy, procedures, and TTPs provide limited guidance and requirements for the safe identification, handling, storage, and transport of contained CBRN/TIM contaminated/exposed material and measures for the prevention of secondary exposure/contamination of resources.</p> <p><b>R:</b> Doctrine, policy, procedures, and TTPs are inadequate or nonexistent for the safe identification, handling, storage, and/or transport of contained CBRN/TIM contaminated/exposed material and/or measures for the prevention of secondary exposure/contamination of resources.</p>

<sup>1</sup> There is inadequate DOTMLPF to protect equipment and supplies from CBRN/TIM contamination.

<sup>2</sup> Not all supplies and equipment are inherently protected or packaged to protect against CBRN/TIM contamination. Specific assets may include CBRN/TIM protection through deliberate requirements for acquisition or the nature of the enclosing packaging. Doctrine, policy, procedures for application of commonly available materials for CBRN/TIM protection are limited or nonexistent.

<sup>3</sup> Protection of equipment and supplies is generally viewed as placement under coverings (e.g., buildings, tents, tarps, etc.) Open stored material is not adequately addressed. CBRN/TIM protective coverings are limited in coverage and quantities. CBRN/TIM protective coatings are limited to two. CBRN/TIM protective packagings are limited or not identified. Doctrine, policy, procedures for application of commonly available materials for CBRN/TIM protection are limited or nonexistent.

<sup>4</sup> Unit-level protection of equipment and supplies is generally viewed as placement under coverings (e.g., buildings, tents, tarps, etc.) Open stored material is not adequately addressed. CBRN/TIM protective coverings are limited in coverage and quantities. CBRN/TIM protective coatings are limited to two. CBRN/TIM protective packagings are limited or not identified. Doctrine, policy, procedures for application of commonly available materials for CBRN/TIM protection are limited or nonexistent.

<sup>5</sup> Equipment and supplies protection is generally seen as placement under coverings (e.g., buildings, tents, tarps, etc.). Unit-level training for protection of equipment and supplies is generally a short briefing on covering, and not adequate to preclude unnecessary loss of assets.

<sup>6</sup> Doctrine, policy, and procedures exist for the identification, marking, and segregation of contaminated material.

<sup>7</sup> Protection of equipment and supplies is generally viewed as placement under coverings (e.g., buildings, tents, tarps, etc.) . Potential quantities may exceed available coverings. Open stored material is not adequately addressed. CBRN/TIM protective coverings are limited in coverage and quantities. CBRN/TIM protective coatings are limited to two. CBRN/TIM protective packagings are limited or not identified. Doctrine, policy, procedures for application of commonly available materials for CBRN/TIM protection are limited or nonexistent.

<sup>8</sup> Segregation of contaminated material until decontamination or remediation disposal action is currently performed by the force. Protective packing, containers, and packaging for hazardous or contaminated material is generally available to those whose primary function includes the preparation and storage of this material. CBRN/TIM protective packagings are limited or not identified for other than specialized functions. Doctrine, policy, procedures for application of commonly available materials for CBRN/TIM protection are limited or nonexistent.

<sup>9</sup> Segregation of contaminated material until decontamination or remediation disposal action is currently performed by the force. Doctrine, policy, and procedures exist for the identification, marking, and segregation of contaminated material. Existing standards and procedures provide adequate protection of personnel against secondary exposure/contamination. Standards and procedures require the application of protective equipment and measures if the potential exists for contamination/exposure. Protective packing, containers, and packaging for hazardous or contaminated material is generally available to those whose primary function includes the preparation and storage of this material. CBRN/TIM protective packagings are limited or not identified for other than specialized functions. Doctrine, policy, procedures for application of commonly available materials for CBRN/TIM protection are limited or nonexistent. Protection of support equipment is inadequate. Movement of CBRN/TIM contaminated material is generally limited initially to tactical transport. The availability of air transport (tactical rotary and intratheater fixed-wing) may be restricted due to concerns about asset contamination. Intertheater (strategic) fixed-wing air transport will likely be severely restricted unless/until TRANSCOM has implemented transload operations to the theater and even then may remain very limited. The predominant means of protecting transportation assets is by decontaminating the cargo prior to loading and wrapping or containing the cargo to eliminate (if possible) or limit the contact hazard and the impact of off-gassing while on board the transporter.

### 12.10.3 Functional Solution Analysis

#### 12.10.3.1 DOTLPE Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** Inherent protection or packaging to protect supplies and equipment against CBRN/TIM contaminations is limited.  
**Non-Materiel Solutions:** *Doctrine:* Integrate protective measures, assets, and activities for CBRND of all classes of supplies into doctrine, policy, and procedures. *Leadership:* Implement, manage, and enforce the application of CBRND protective measures, assets, and activities for all classes of supplies. Also, awareness of need for materiel protection is critical.
- 2. Deficiency:** Doctrine, policy, procedures for application of commonly available materials for CBRN/TIM protection are limited or nonexistent.  
**Non-Materiel Solutions:** *Doctrine:* Include the application of commonly available materials with CBRN/TIM protective capabilities into doctrine, policy, and procedures. *Training:* Include the application of commonly available materials with CBRN/TIM protective capabilities in institutional and unit-level training, exercises, and evaluations.
- 3. Deficiency:** Doctrine addressing protection of open stored materiel is limited.  
**Non-Materiel Solutions:** *Doctrine:* Establish and enforce doctrine, policies, procedures, and standards for CBRND protection of open stored materiel.
- 4. Deficiency:** CBRN/TIM protective coatings are limited to two.  
**Non-Materiel Solutions:** *Doctrine:* Develop research, development, test, evaluation and acquisition (RDTE&A) plan for protection of equipment and supplies against CBRN/TIM contamination.
- 5. Deficiency:** CBRN/TIM protective coverings are limited in coverage and quantities.  
**Non-Materiel Solutions:** *Doctrine:* Develop RDTE&A plan for protection of equipment and supplies against CBRN/TIM contamination.
- 6. Deficiency:** Potential quantities of supplies and equipment may exceed available coverings.  
**Non-Materiel Solutions:** *Doctrine:* Establish and enforce doctrine, policies, procedures, and standards for CBRND protection of open stored materiel.
- 7. Deficiency:** Unit-level training for protection of equipment and supplies is generally a short briefing on coverings, and is limited or inadequate to preclude unnecessary loss of assets.  
**Non-Materiel Solutions:** *Training:* Train, exercise, and evaluate the force against the standards (see Footnotes 1, 2, and 5 above) for protection of materiel, identification of contaminated materiel, and the handling of CBRN/TIM contaminated resources. *Leadership:*

Enforce compliance with established standards (see Footnote 6 above) for CBRN/TIM protective measures and activities for all classes of materiel.

8. **Deficiency:** CBRN/TIM protective packagings are limited or not identified for other than specialized functions.

**Non-Materiel Solutions:** *Doctrine:* Include the application of CBRN/TIM containment packaging/systems designed to contain contamination and prevent secondary exposure/contamination during handling, storage, and transport. *Training:* Identify organizational resources and support requirements for the application of CBRN/TIM containment packaging/systems. *Organization:* Train, exercise, and evaluate the application of CBRN/TIM containment packaging/systems. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe application of CBRN/TIM containment packaging/systems.

9. **Deficiency:** Protection of support equipment is inadequate or limited.

**Non-Materiel Solutions:** *Doctrine:* Include the application of CBRN/TIM containment packaging/systems and other alternative methods to preclude secondary exposure/contamination in doctrine, policy, and procedures. *Training:* Train, exercise, and evaluate the application of CBRN/TIM containment packaging/systems and other alternatives precluding secondary exposure/contamination. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe application of CBRN/TIM containment packaging/systems and other alternatives to contain contamination and preclude secondary exposure/contamination.

10. **Deficiency:** Movement of CBRN/TIM contaminated material is generally limited initially to tactical transport. The availability of air transport (tactical rotary and intratheater fixed-wing) may be restricted due to concerns about asset contamination. Intertheater (strategic) fixed-wing air transport will likely be severely restricted unless/until Transporation Command has implemented transload operations to the theater and even then may remain very limited.

**Non-Materiel Solutions:** *Doctrine:* Include the application of CBRN/TIM containment packaging/systems and other alternative methods to preclude secondary exposure/contamination in doctrine, policy, and procedures. *Training:* Train, exercise, and evaluate the application of CBRN/TIM containment packaging/systems and other alternatives precluding secondary exposure/contamination. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe application of CBRN/TIM containment packaging/systems and other alternatives to contain contamination and preclude secondary exposure/contamination.

11. **Deficiency:** The predominant means of protection of supporting assets is generally limited to decontamination of the assets following secondary exposure/contamination.

**Non-Materiel Solutions:** *Doctrine:* Include the application of CBRN/TIM containment packaging/systems and other alternative methods to preclude secondary exposure/contamination of resources in doctrine, policy, and procedures. *Training:* Train, exercise, and evaluate the application of CBRN/TIM containment packaging/systems and other alternatives precluding secondary exposure/contamination. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe application of

CBRN/TIM containment packaging/systems and other alternatives to contain contamination and preclude secondary exposure/contamination.

**12. Deficiency:** CBRN/TIM protective packagings are limited or not identified for other than specialized functions.

**Non-Materiel Solutions:** *Doctrine:* Integrate protective measures, assets, and activities for CBRND of all classes of supplies into doctrine, policy, and procedures. *Leadership:* Implement, manage, and enforce the application of CBRND protective measures, assets, and activities for all classes of supplies. Also, includes awareness of need for materiel protection.

**13. Deficiency:** There is inadequate or limited DOTMLPF to protect equipment and supplies from CBRN/TIM contamination.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing protection of materiel and supplies from CBRN/TIM contamination and the operational application of contaminated resources. *Organization:* Establish CBRND training, exercise, and evaluation criteria and programs for protection of all classes of supply; and conduct CBRND training, exercises, and evaluations. *Training:* Identify organization services and activities necessary to provide CBRND protection of equipment and supplies. *Leadership:* Implement and manage CBRND training, equipping, protective measures, and exercising.

#### 12.10.3.2 IMA Assessment Summary

N/A

## **12.11 Task OPSHLD 11: Provide protective measures for forced-entry forces operating in antiaccess and area-denial CBRN/TIM environments**

### **12.11.1 Functional Area Analysis**

#### **12.11.1.1 Definition**

To provide CBRN/TIM protection for forced-entry operations consisting of airborne, air assault, and amphibious operations. All Services will be involved. Forces may be deployed by fixed-/rotary-/tilt-wing aircraft or by amphibious assault vehicles and landing craft. CBRN/TIM protection must be provided throughout the entire operation: surveillance/reconnaissance throughout the actual assault and then resupply and refit. From the adversary's position, contaminating landing/drop zones and beach landing areas with CBRN/TIM agents or weapons is a combat multiplier. Forces must be provided total FP during these operations, with CBRND readiness being an integral part. Protection includes

- CBRN/TIM sensors and detectors and warning and predictive systems,
- IPE,
- COLPRO equipment (when available and required), and
- medical protection and treatments.

The mix and types of protective resources balance operational requirements with optimal CBRN/TIM protection. The mix seeks to minimize hazards, physical encumbrances, performance limitations, and adverse impacts on force mission capabilities. Commanders must establish MOPP levels. Forces must be protected and trained to counter antiaccess and area-denial efforts by the adversary, including rapid mitigation of TIM releases.

#### **12.11.1.4 Derivation**

*Joint Enabling Concept for CBRN/TIM Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (OP 1.3.1, OP 2.2.1, OP 2.2.3, OP 2.4.1.1, OP 2.4.1.2, OP 2.4.2.1, OP 5, OP 5.2.2, OP 5.4, OP 5.4.4, OP 6.2.1, OP 7, OP 7.1, OP 7.2, OP 7.3).*

**12.11.1.2.1 Supported Task:** N/A

**12.11.1.2.2 Lateral Task:** N/A

**12.11.1.2.3 Supporting Task:** TASHLD 10

#### **12.11.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Undeveloped to highly developed land. (C1.1)

2. Riverine to open sea. (C1.2)
3. Natural and induced air. (C1.3)
4. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

### **Military**

1. Partially completed mission preparation. (C2.1.3)
2. Weak to marginal forces assigned. (C2.2.1)
3. Negligible personnel experience. (C2.2.4.5)
4. Some interoperability. (C2.2.6)
5. Partial Joint Staff integration. (C2.3.1.1)
6. Limited staff expertise. (C2.3.1.3)
7. Limited deployed supplies. (C2.8.2)
8. No prepositioned materiel. (C2.8.4)
9. No host nation support. (C2.8.5)

### **Civil**

1. Negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)
3. Negligible to few language translators. (C3.2.1.2)
4. TIMs present in the civilian sector. (C3.3.7.5)

## **12.11.2 Functional Needs Analysis**

### **12.11.2.1 Capability and Deficiency Assessment Summary**

Table 12.11-1 discusses the only capability that exists to perform the task to the designated standard. Doctrine, policy, and procedures address operational planning, training, equipping, and assessment of the force. Protective Posture Protocols are addressed during the planning and retain flexibility for adjustment by the subordinate commanders. Deficiencies include the lack of CBRND systems designed for and supporting forced-entry forces, particularly in area-denial CBRN/TIM environments.

### **Current Capability and Deficiency**

JTF HQ staffs conduct planning, coordination, and allocation of CBRND resources and taskings for protection and support of forced-entry force operations, activities, and functions within a CBRN/TIM environment resulting from adversary antiaccess and area-denial activities. They prioritize requirements for allocation of available resources based upon assessments of the threat, risk, and vulnerabilities of tasked forces; criticality of associated activities and functions, mission requirements; and the appropriateness, encumbrances, and limitations associated with alternative measures. They also direct and manage CBRND resource allocation and preparedness for conduct of CBRND supporting mission accomplishment and force survival. Doctrine, policy, and procedures provide for the development of Protective Posture Protocols, their inclusion in

JTF plans, and subsequent implementation for the protection of the force. The allocation, placement, and reallocation of protective CBRND assets are also addressed by the JTF Commander and staff. The JTF staff reviews the identified forces and the potential threat to allocate CBRND assets appropriately to support operations. Equipping the tasked forces is an integral part of the JTF planning and preparation. Deficiencies include inadequate quantities and types of COLPRO, insufficient DOTMLPF for sustained operations within a CBRN/TIM environment for forces with reduced logistical footprint, individual combat loads restricting available weight and space for CBRND materiel, the absence of CBRND for MWDs, and the potential for forced-entry forces to be exposed to CBRN/TIM agents without warning, particularly during insertion by air or sea. The overall current capability is “yellow.”

**Projected Near/Mid-Term Capability and Deficiency**

No change projected for this task.

**Projected Far-Term Capability and Deficiency**

No change projected for this task.

Table 12.11-1. OPSHLD 11: Capability and Deficiency Assessment

Capability: JTF HQ Staff	M1	M2	M3	M4	M5	M6	M7
Current Overall Capability <sup>1</sup>	G <sup>2</sup>	G <sup>3</sup>	Y <sup>4</sup>	R <sup>5</sup>	R <sup>6</sup>	Y <sup>7</sup>	Y <sup>8</sup>
Near/Mid-Term Overall Capability	G	G	Y	R	R	Y	Y
Far-Term Overall Capability	G	G	Y	R	R	Y	Y

	FAA Measure	Scale
M1	Operational plans establish CBRN/TIM protective measures and operating procedures.	<p><b>G:</b> Threat-based, specific, flexible Protective Posture Protocols (including measures and procedures) are incorporated into plans and disseminated to all units in the force. All personnel are trained and ready to perform the associated protective actions.</p> <p><b>Y:</b> General Protective Posture Protocols are incorporated into plans and disseminated to force units. Unit personnel are trained and ready to perform protective actions.</p> <p><b>R:</b> Protective Posture Protocols are inadequate, not widely disseminated, and/or force personnel are not trained and/or ready to perform protective actions.</p>
M2	Protective measures account for specific potential threats.	<p><b>G:</b> Threat-based, specific, flexible Protective Posture Protocols (including measures and procedures) are incorporated into plans and disseminated to all units in the force. All personnel are trained and ready to perform the associated protective actions.</p> <p><b>Y:</b> General Protective Posture Protocols are incorporated into plans and disseminated to force units. Unit personnel are trained and ready to perform protective actions.</p> <p><b>R:</b> Protective Posture Protocols are inadequate, not widely disseminated, and/or force personnel are not trained and/or ready to perform protective actions.</p>
M3	Adequate resources are available to implement the required protective measures.	<p><b>G:</b> CBRND systems and resources are available in plan-identified quantities and types to implement identified protective actions.</p> <p><b>Y:</b> CBRND systems and resources are available in sufficient quantities and types to support protective measures. Adjustments are made to adjust to limitations in quantities and types of specific CBRND systems.</p> <p><b>R:</b> CBRND systems and/or resources are inadequate or not available to implement protective measures.</p>
M4	Forces trained and equipped to operate in a CBRN/TIM environment under expeditionary/forced-entry conditions.	<p><b>G:</b> Forces are fully trained, exercised, evaluated, and equipped to conduct sustained operations within a CBRN/TIM environment under expeditionary/forced-entry conditions.</p> <p><b>Y:</b> Forces are trained, exercised, evaluated, and equipped to conduct operations within a CBRN/TIM environment under expeditionary/forced-entry conditions.</p> <p><b>R:</b> Training, exercising, evaluation, and/or equipping of forces to conduct operations within a CBRN/TIM environment under expeditionary and/or forced-entry conditions is inadequate or nonexistent.</p>

M5	Operations in CBRN/TIM environment can be sustained based upon organic and issued CBRN/TIM protective assets.	<p><b>G:</b> JTF expeditionary/forced-entry forces (including military, eligible civilians, and MWAs) are adequately equipped and possess ready access to sufficient CBRND resources to support sustained operations through multiple CBRN/TIM attacks across the spectrum of operations and without unplanned and unforecasted resupply.</p> <p><b>Y:</b> JTF expeditionary/forced-entry forces (including military and eligible civilians) are equipped and possess ready access to sufficient CBRND to support sustained operations through multiple CBRN/TIM attacks involving major operations with planned and forecasted resupply.</p> <p><b>R:</b> JTF expeditionary/forced-entry forces are inadequately equipped and/or possess limited access to CBRND resources to sustain operations through multiple CBRN/TIM attacks and/or are reliant upon resupply.</p>
M6	COLPRO is established and operational for forces.	<p><b>G:</b> Operational CPSs are available in required quantities and types to support the full range of envisioned and planned operations.</p> <p><b>Y:</b> Operational CPSs are available in sufficient types and quantities to support major operations.</p> <p><b>R:</b> Operational CPSs are inadequate or nonexistent to support operations.</p>
M7	Forces are trained to rapidly mitigate CBRN/TIM releases in or near areas that could adversely affect forced-entry operations.	<p><b>G:</b> Doctrine, policy, procedures, TTPs, and training adequately address the rapid mitigation of CBRN/TIM releases affecting the force. Detection and warning of a release are sufficient to permit attainment of appropriate Protective Posture Protocol.</p> <p><b>Y:</b> Doctrine, policy, procedures, TTPs, and training address the mitigation of CBRN/TIM releases affecting the force. Protective Posture Protocol is performed upon detection and warning.</p> <p><b>R:</b> Doctrine, policy, procedures, TTPs, and/or training for mitigation of CBRN/TIM releases and/or detection and/or warning of a release is inadequate or nonexistent.</p>

<sup>1</sup> DOTMLPF exists for the planning, movement, and positioning of CBRND materiel in support of operations. However, DOTMLPF is inadequate for sustained operations within a CBRN/TIM environment and for expeditionary and forced-entry operations with reduced logistical footprints. DOTMLPF is also inadequate or nonexistent addressing CBRND of MWAs.

<sup>2</sup> The JTF staff planning incorporates Protective Posture Protocols developed and disseminated by the COCOM. The protocols are adjusted based upon the potential threat and the JTF staff's assessment of force vulnerabilities, risks, mission, and the CBRN/TIM threat. Flexibility for JTF elements to further adjust the protocols for their conditions, functions, missions, and local threats are incorporated into the plan. However, the DOTMLPF for Protective Posture Protocols is inadequate or nonexistent addressing CBRND of MWAs.

<sup>3</sup> The JTF staff planning incorporates Protective Posture Protocols developed and disseminated by the COCOM. The protocols are adjusted based upon the potential threat and the JTF staff's assessment of force vulnerabilities, risks, mission, and the CBRN/TIM threat. Flexibility for JTF elements to further adjust the protocols for their conditions, functions, missions, and local threats are incorporated into the plan. However, the DOTMLPF for Protective Posture Protocols is inadequate or nonexistent addressing CBRND of MWAs.

<sup>4</sup> The allocation, placement and reallocation of protective assets is a function of the planning and operational control of the JTF Commander and JTF staff. Quantities, types, and availability of CPSs are limited. Current CPSs are inadequate to support expeditionary and forced-entry operations, particularly in austere environments by highly mobile forces and possessing reduced logistical footprints. The individual combat load places limitations upon weight and type of equipment and consumables. Protective equipment may be reduced or eliminated despite threat level.

<sup>5</sup> The JTF staff reviews identified forces and the potential threat for planned operations. Specified forces, time permitting, train and prepare for operations involving the potential threat. Equipping the tasked force is an integral part of planning and preparation. The JTF staff tracks force readiness for planned operations. Readiness issues are addressed by the staff. The combination of established force organic assets, material acquisitions, prepositioned material, available host-nation/coalition contributions, and movement of identified CBRND resources from stockpiles and reallocation activities are pursued by the JTF staff to prepare and support deploying forces as outlined by the appropriate plan.

Expeditionary and forced-entry operations are a particular concern as most CBRND systems and associated logistics are not designed for a highly mobile force, with a reduced logistical footprint, and for the initial period of operations until the theater matures (usually the first 30–90 days). Deploying units may not possess full CBRND resources and capabilities during the initial stages of deployment and until after arrival within the AOR. Additionally, deploying MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment. The JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying MWAs.

<sup>6</sup> The JTF staff plans for operations using the COCOM-identified forces for the potential threat. Equipping the tasked force is an integral part of planning and preparation. The combination of established force organic assets, material acquisitions, prepositioned material, available host-nation/coalition contributions, and movement of identified CBRND resources from stockpiles and reallocation activities are pursued by the JTF staff with the COCOM staff to prepare and support deploying forces as outlined by the appropriate plan. Systems are reallocated, when necessary, from prepositioned and dispersed stocks of units deploying or operating within an JOA. Expeditionary and forced-entry operations are a particular concern. Existing COLPRO systems are not generally designed for a highly mobile force, with a reduced logistical footprint, and the initial period of operations until the theater matures (usually the first 30–90 days). Deploying units may not possess full CBRND resources and capabilities during the initial stages of deployment and until after arrival within the JOA. Additionally, deploying MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment. JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying MWAs. Current doctrine and policy does not adequately address sustained operations within a CBRN/TIM environment. The individual combat load places limitations upon weight and type of equipment and consumables. Protective equipment may be reduced or eliminated despite threat level.

<sup>7</sup> The JTF staff allocates COLPRO resources based upon the threat, risk, and vulnerability assessments. Planning for CBRND includes allocation of supporting services, materiel, and consumables. Manning, operation, and maintenance of the COLPRO resource is the responsibility of the allocated unit. JTF planning includes preparation of the force for CBRND. COLPRO is integral to CBRND and included in the plan. Expeditionary operations are a particular concern. Existing COLPRO systems are not generally designed for a highly mobile/expeditionary force, with a reduced logistical footprint, and the initial period of operations until the theater matures (usually the first 30–90 days). The combination of individual protection, contamination avoidance, and available COLPRO provides a level of capability. However, the encumbrances and limitations associated with these measures are considerations in the planning and conduct of operations to assure mission success. Identification, development and/or acquisition of assets for JECP include ECP assets for adaptation of tentage and structures to support expeditionary operations. The JECP effort is currently proceeding through the JCIDS process.

<sup>8</sup> Doctrine, policy, and procedures address mitigation of CBRN/TIM releases against the force. However, mitigation requires knowledge of the release in time to assume the appropriate Protective Posture Protocol. Forced-entry forces, particularly forces performing insertion by air and sea, may not be aware of the release until exposed to the CBRN/TIM agent.

### 12.11.3. Functional Solution Analysis

#### 12.11.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** The DOTMLPF for Protective Posture Protocols is inadequate or nonexistent addressing CBRND of MWAs.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, and procedures sustained operations within a CBRN/TIM environment. *Organization:* Ensure resources, taskings, and staff are in place or available to perform sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.

2. **Deficiency:** Quantities, types, and availability of CPSs are limited.

**Non-Materiel Solutions:** *Doctrine:* Institute in doctrine, policy, and procedures the central correlation of operational plans and taskings to identify CBRND support requirements for two or more concurrent operations with CBRN/TIM threat with comparison to existing and programmed quantities and types of CBRND systems and resources. *Leadership:* Implement development of plans and taskings consistent with available CBRND capabilities as determined by central correlation and comparison of strategic tactical plans and taskings.

3. **Deficiency:** Current CPSs are inadequate to support expeditionary and forced-entry operations, particularly in austere environments by highly mobile forces and possessing reduced logistical footprints.

**Non-Materiel Solutions:** *Doctrine:* Complete the JCIDS process and central correlation/comparison of operations plans to identify CBRND resources necessary and available to support expeditionary and forced-entry operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct expeditionary operations while possessing reduced logistical footprint and during the first 30–90 days of operations following commencement of hostilities. *Training:* Train, exercise, and evaluate expeditionary/forced-entry capabilities of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operations using CBRND resources supporting expeditionary operations. *Leadership:* Recognize differences and challenges associated with expeditionary/forced-entry operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint, training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for expeditionary/forced-entry operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.

4. **Deficiency:** The individual combat load places limitations upon weight and type of equipment and consumables. Protective equipment may be reduced or eliminated despite threat level.

**Non-Materiel Solutions:** *Leadership:* Implement development of plans and taskings consistent with stockpile and repositioning support capabilities.

5. **Deficiency:** Expeditionary and forced-entry operations are a particular concern as most CBRND systems and associated logistics are not designed for a highly mobile force, with a reduced logistical footprint, and for the initial period of operations until the theater matures (usually the first 30–90 days).

**Non-Materiel Solutions:** *Doctrine:* Complete the JCIDS process and central correlation/ comparison of operations plans to identify CBRND resources necessary and available to support expeditionary and forced-entry operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct expeditionary operations while possessing reduced logistical footprint and during the first 30–90 days of operations following commencement of hostilities. *Training:* Train, exercise, and evaluate expeditionary/forced-entry capabilities of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operations using CBRND resources supporting expeditionary operations. *Leadership:* Recognize differences and challenges associated with expeditionary/forced-entry operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint, training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for expeditionary/forced-entry operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.

6. **Deficiency:** Deploying units may not possess full CBRND resources and capabilities during the initial stages of deployment and until after arrival within the AOR.

**Non-Materiel Solutions:** *Doctrine:* Emphasize in doctrine, policies, and procedures for preparation of the force for CBRND protection during throughout deployment, redeployment, relocation, and en route phases of movement. *Organization:* Ensure resources, taskings, and staff are in place or available to perform CBRND operations within a CBRN/TIM environment by deploying, redeploying, relocating, and en route forces. *Training:* Train, exercise, and evaluate the force for CBRND operations within a CBRN/TIM environment while deploying, redeploying, relocating, and en route. *Leadership:* Recognize criticality of readiness of the force for potential CBRND operations within a CBRN/TIM environment while deploying, redeploying, relocation, and en route; training providing the skills to manage the force in these circumstances; and willingness and ability to implement necessary changes and activities to prepare and appropriately protect the force. *Facilities:* Develop supporting infrastructure for CBRND operations of the force while preparing, deploying, redeploying, relocating, and en route.

- 7. Deficiency:** Deploying MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment.  
**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of MWAs, particularly MWDs, and training for CBRN/TIM environment survival. *Organization:* Ensure organizational consideration for maintenance and support of MWA CBRND protective equipment, measures, and activities. *Training:* Provide institutional and unit training of MWA handlers and MWAs for CBRND measures and activities. Integrate into CBRND exercises and evaluations. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for MWA survivability. *Facilities:* Develop supporting infrastructure for MWA CBRND (e.g., logistics, veterinary surveillance, training, etc.).
- 8. Deficiency:** The JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying MWAs.  
**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of MWAs, particularly MWDs, and training for CBRN/TIM environment survival. *Organization:* Ensure organizational consideration for maintenance and support of MWA CBRND protective equipment, measures, and activities. *Training:* Provide institutional and unit training of MWA handlers and MWAs for CBRND measures and activities. Integrate into CBRND exercises and evaluations. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for MWA survivability. *Facilities:* Develop supporting infrastructure for MWA CBRND (e.g., logistics, veterinary surveillance, training, etc.).
- 9. Deficiency:** Mitigation requires knowledge of the release in time to assume the appropriate Protective Posture Protocol. Forced-entry forces, particularly forces performing insertion by air and sea, may not be aware of the release until exposed to the CBRN/TIM agent.  
**Non-Materiel Solutions:** *Doctrine:* Complete JCIDS and incorporate into doctrine, policy, and procedures detection of CBRN/TIM agents upon release by adversary and subsequent presence on ground for expeditionary/forced-entry operations. *Organization:* Ensure resources, taskings, and staff are available to perform detection and warning of force. *Training:* Train, exercise, and evaluate the force for force entry and expeditionary operations involving area-denial activities and CBRND releases by an adversary. *Leadership:* Recognize criticality of readiness of the force for potential operations involving CBRND releases and area-denial activities by an adversary, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.
- 10. Deficiency:** DOTMLPF is inadequate for sustained operations within a CBRN/TIM environment and for expeditionary and forced-entry operations with reduced logistical footprints.  
**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, and procedures sustained operations (medical and nonmedical) for expeditionary/forced-entry operations within a CBRN/TIM environment. *Organization:* Ensure resources, taskings, and staff are in place or available to perform sustained operations (medical and nonmedical) for expeditionary/forced-entry operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force (military and eligible civilians) for sustained operations (medical and nonmedical) for expeditionary/forced-entry operations within a CBRN/TIM environment.

*Leadership:* Recognize criticality of readiness of the force for potential sustained operations (medical and nonmedical) for expeditionary/forced-entry operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.

**11. Deficiency:** DOTMLPF is inadequate or nonexistent addressing CBRND of MWAs.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing MWAs, particularly MWDs, for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of MWAs within a CBRN/TIM environment.

*Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWAs.

**12.11.3.2 IMA Assessment Summary**

N/A

## **12.12 Task OPSHLD 12: Employ protective measures to minimize effects of adversary use of CBRN weapons and TIM exposure**

### **12.12.1 Functional Area Analysis**

To protect resources (with an emphasis on people) from the effects of CBRN/TIM weapons/exposure and permit friendly forces to continue operations with minimum performance degradation. Staffs normally direct planned general protective actions and adjust actions to the situation and circumstances based upon the instructions or intent of the commander.

Commanders must balance protection against the need to perform the mission and maintain personnel in a fit-to-fight status. The results of not performing protective tasks adequately are degradation of mission or task performance as well as casualties/fatalities from CBRN/TIM exposure or contamination.

#### **12.12.1.2 Derivation**

*Joint Enabling Concept for CBRN Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (OP 1.3.1, OP 2.4.1.1, OP 2.4.1.2, OP 2.4.2.1, OP 5.1.1, OP 5.2, OP 5.2.1, OP 5.2.2, OP 5.3, OP 5.3.7, OP 5.4, OP 5.4.2, OP 5.4.4, OP 5.4.5, OP 5.5.8, OP 5.7.5, OP 5.7.6, OP 6.1.6, OP 6.2.1, OP 6.2.10, OP 7, OP 7.1, OP 7.2, OP 7.3, OP 7.4).*

#### **12.12.1.2.1 Supported Task: STSHLD 10**

#### **12.12.1.2.2 Lateral Task: N/A**

#### **12.12.1.2.3 Supporting Task: TASHLD 9**

#### **12.12.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Undeveloped to highly developed land. (C1.1)
2. Riverine to open sea. (C1.2)
3. Natural and induced air. (C1.3)
4. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

##### **Military**

1. Partially completed mission preparation. (C2.1.3)
2. Marginal to strong forces assigned. (C2.2.1)
3. Low personnel capability. (C2.2.4)
4. Some interoperability. (C2.2.6)
5. Partial Joint Staff integration. (C2.3.1.1)

6. Limited staff expertise. (C2.3.1.3)
7. Limited deployed supplies. (C2.8.2)
8. Limited CONUS resupply. (C2.8.3)
9. Limited prepositioned materiel. (C2.8.4)
10. No host nation support. (C2.8.5)

## Civil

1. TIMs present in the civilian sector. (C3.3.7.5)

## 12.12.2 Functional Needs Analysis

### 12.12.2.1 Capability and Deficiency Assessment Summary

Table 12.12-1 discusses the only capability that exists to perform the task to the designated standard. Doctrine, policy, and procedures exist for the implementation, adjustment, and direction of planned CBRND measures for the protection of deploying military forces against the effects of adversary employment of CBRN/TIM. Deficiencies include the lack of prophylaxis against all threat CBRN/TIM agents, lack of CBRND systems in sufficient quantities and types to support envisioned and published plans, CBRND of highly mobile and/or expeditionary forces with reduced logistical footprints, eligible civilian and MWA readiness for CBRND, and sustained operations within a CBRN/TIM environment.

### Current Capability and Deficiency

JTF HQ staffs develop, plan, disseminate, and direct actions and activities to prepare and manage the force for CBRND operations minimizing the effects of adversary use of CBRN/TIM agents. Predeployment planning and preparation includes the vaccination of the force to an adequate level of acquired immunity against threat CBRN/TIM agents. JMETLs are developed based upon the *UJTL*, COCOM JMETLs, and identified essential tasks for mission accomplishment. Plan-identified forces are trained and assessed against the JMETLs for readiness to perform the outlined tasks. The combination of established force organic assets, materiel acquisitions, prepositioned materiel, available host-nation/coalition contributions, and movement of identified CBRND resources from stockpiles and relocation activities are performed as outlined in the plan and adjusted as necessary. Planning and plan execution seeks to balance mission requirements with CBRND protection of the force. DOTMLPF is adequate for planning, training, equipping, and deploying military forces. The combination of individual protection, contamination avoidance, and available COLPRO provides critical activities and functions with a level of capability. Allocation of limited COLPRO resources is made based upon the threat, mission, criticality of performed activity, and availability of COLPRO for the function. Planning and prioritization of COLPRO resources is performed during operational planning. Deficiencies include inadequate quantities and types of COLPRO, insufficient DOTMLPF for sustained operations within a CBRN/TIM environment, individual combat loads restricting available weight and space for CBRND materiel, the absence of CBRND for MWDs, lack of medical prophylaxis against all threat CBRN/TIM agents, and the efficacy of existing prophylaxis (particularly vaccines) widely varies. Current prophylaxis and supporting CBRND doctrine,

policy, and procedures fail to adequately address the application of prophylactic protection by eligible civilians and MWDs. Expeditionary and highly mobile force operations, both with reduced and limited logistical support, are not adequately addressed in DOTMLPF and the design of most CBRND systems and associated logistics do not adequately support these type of operations. Further, eligible civilians and MWDs are not adequately equipped, trained, and prepared to survive a CBRN/TIM environment; nor does the JTF staff possess clear guidance for planning and providing CBRND of these personnel and JTF elements. Current doctrine, policy, *UJTL*, procedures, and TTPs fail to address sustained operations within a CBRN/TIM environment and exercises/evaluations fail to emphasize and assess task performance (including JMETLs) in these conditions.

**Projected Near/Mid-Term Capability and Deficiency**

No change projected for this task.

**Projected Far-Term Capability and Deficiency**

No change projected for this task.

Table 12.12-1. OPSHLD 12: Capability and Deficiency Assessment

Capability: JTF HQ Staff	M1	M2	M3	M4	M5	M6
Current Overall Capability <sup>1</sup>	R <sup>2</sup>	R <sup>3</sup>	Y <sup>4</sup>	Y <sup>5</sup>	Y <sup>6</sup>	G <sup>7</sup>
Near/Mid-Term Overall Capability	R	R	Y	Y	Y	G
Far-Term Overall Capability	R	R	Y	Y	Y	G

	FAA Measure	Scale
M1	Forces are protected by medical prophylaxes.	<p><b>G:</b> Medical CBRND countermeasures exist for all theat CBRN and high-risk TIM agents and encompass all eligible at-risk populations.</p> <p><b>Y:</b> Medical CBRND countermeasures exist for selected high-threat CBRN and high-risk TIM agents for U.S. military and eligible civilian members.</p> <p><b>R:</b> Medical CBRND countermeasures are inadequate or do not exist for high-threat CBRN and/or high-risk TIM agents and/or application by U.S. military and/or eligible civilian members.</p>
M2	Forces are trained and equipped to operate in a CBRN/TIM environment.	<p><b>G:</b> All JTF forces (military, eligible civilians, and MWAs) are adequately trained, exercised, evaluated, equipped, and prepared to perform their functions and conduct sustained operations within a CBRN/TIM environment.</p> <p><b>Y:</b> JTF forces (military and eligible civilians) are trained, equipped, and prepared to perform their functions and conduct operations within a CBRN/TIM environment.</p> <p><b>R:</b> Training, equipping, and/or preparation of the JTF forces(including military, eligible civilians, and/or MWAs) to perform their functions and/or conduct operations within a CBRN/TIM environment are inadequate or nonexistent.</p>
M3	All units that perform JMETs are fully capable of successfully performing the tasks in a CBRN/TIM environment.	<p><b>G:</b> All units performing JMETLs are fully prepared and ready to successfully conduct their tasks within a CBRN/TIM environment.</p> <p><b>Y:</b> Units performing JMETLs are generally prepared and ready to successfully conduct their tasks within a CBRN/TIM environment.</p> <p><b>R:</b> Units performing JMETLs are inadequately prepared and/or ready to successfully conduct their tasks within a CBRN/TIM environment.</p>
M4	Deploying forces meet CBRN/TIM protection standards.	<p><b>G:</b> All JTF (military, eligible civilians, and MWAs) meet CBRN/TIM protection requirements to perform their functions and conduct operations within a CBRN/TIM environment.</p> <p><b>Y:</b> Military personnel and eligible civilians supporting the mission meet CBRN/TIM protection requirements to perform their functions and conduct operations within a CBRN/TIM environment.</p> <p><b>R:</b> JTF forces (including military, eligible civilians, and/or MWAs) meeting CBRN/TIM protection requirements to perform functions and/or conduct operations within a CBRN/TIM environment are inadequate or nonexistent.</p>
M5	Warfighting capability is not degraded as result of enemy CBRN/TIM attacks.	<p><b>G:</b> Warfighting capabilities are protected and are not degraded and/or unavailable as a result of CBRN/TIM attacks.</p> <p><b>Y:</b> Warfighting activities and functions are afforded protection and are not seriously degraded and/or unavailable as a result of CBRN/TIM attacks.</p> <p><b>R:</b> Protection of warfighting capabilities is inadequate or nonexistent and may result in serious degradation or nonavailability resulting from CBRN/TIM attacks.</p>

M6	Adequate resources are available to implement the required protective measures.	<p><b>G:</b> CBRND systems and resources are available in plan-identified quantities and types to implement identified protective measures.</p> <p><b>Y:</b> CBRND systems and resources are available in sufficient quantities and types to support protective measures. Adjustments are made to adjust to limitations in quantities and types of specific CBRND systems.</p> <p><b>R:</b> CBRND systems and/or resources are inadequate or not available to implement protective measures.</p>
----	---	--

<sup>1</sup> DOTMLPF is adequate for the planning, movement, management, and positioning of CBRND materiel in support of operations. DOTMLPF is also adequate for planning, training, equipping, and deploying forces. However, DOTMLPF is inadequate for sustained operations within a CBRN/TIM environment and for expeditionary and highly mobile force operations with reduced logistical footprints. Current DOTMLPF does not fully address the unique aspects of CBRND and the impact upon operations within a CBRN/TIM environment. DOTMLPF is also inadequate or nonexistent addressing CBRND of eligible civilians and MWAs.

<sup>2</sup> Medical prophylaxes are developed for the military force. Medical prophylaxis, if available, is issued/administered for identified CBRN/TIM threats to the military force. The availability of medical prophylaxis to military force members is dependent upon identification of the threat, preplanning for a threat, positioning of stocks for issue and administration, timing of notification to administer/issue prophylaxis, availability of medical personnel to perform administration (if required), and the available quantity of sufficient medical prophylaxis to meet requirements. Short-notice operations and reallocated taskings impact the administration and issue of prophylaxis for the threat. Forces have, and may in the future, require medical prophylaxis administration/issue upon arrival in the AOR. However, the administration of many vaccines requires multiple administrations over a period of time for acquired immunity. Current prophylaxis and supporting doctrine, policy, and procedures do not address presymptomatic medical CBRND protective countermeasures by other than U.S. forces, excluding MWAs and eligible civilians. Prophylaxis for MWAs is virtually nonexistent. Prophylaxis for eligible civilians is not addressed. Availability of prophylaxis is questionable for issue and administration to eligible civilians. The issue and administration of prophylaxis to eligible civilians requires review due to questions regarding applicability to the range of body types, ages, and physical/medical factors inherent within a potential population, as well as possible long-term health issues and legal implications. Prophylaxis against most high-threat TIMs are not currently available due to the relatively recent consideration of these agents as a potential threat. Additionally, the efficacy of existing prophylaxis, particularly vaccines, widely varies. National policies of the coalition/non-U.S. forces regarding medical prophylaxis is a factor the JTF Commander and supporting staff must consider during planning and operations. Religious considerations may also impact the use of medical prophylaxis. The JTF staff, in coordination with coalition/non-U.S. forces partner staff, develop and address requirements and commitments by each partner. Although the provision of CBRND resources to national forces ultimately resides with their nations, mutual support among partners is planned to complement partners' capabilities and to minimize weaknesses. ACSAs between partners enable acquisition and cross-servicing support between the partners. The IA provides for a wide range of support exchange, including sheltering, medical care, and other support activities. The administration and issuance of prophylaxis is addressed by the JTF staff during the planning and support for operations. Indigenous forces supporting operations may not be equipped or have access to medical prophylaxis. The JTF staff, in coordination with partners, determines the need for medical prophylaxis based upon the threat. A determination is made on the provision of medical prophylaxis to these forces.

<sup>3</sup> The JTF staff reviews identified forces and the potential threat for planned operations. Specified forces, time permitting, train and prepare for operations involving the potential threat. Equipping the tasked force is an integral part of planning and preparation. The JTF staff tracks force readiness for planned operations. Readiness issues are addressed by the staff. The combination of established force organic assets, material acquisitions, prepositioned material, available host-nation/coalition contributions, and movement of identified CBRND resources from stockpiles and reallocation activities are pursued by the JTF staff to prepare and support deploying forces as outlined by the appropriate plan. Expeditionary operations are a particular concern as most CBRND systems and associated logistics are not designed for a highly mobile force, with a reduced logistical footprint, and for the initial period of operations until the theater matures (usually the first 30–90 days). Deploying units may not possess full CBRND resources and capabilities during the initial stages of deployment and until after arrival within the AOR. Additionally, deploying eligible civilians and MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment. The JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians and MWAs.

<sup>4</sup> The JTF staff adjusts the COCOM-developed JMETLs to reflect the tasks essential to the accomplishment of the planned mission(s). The JMETLs provides the ability to develop joint training requirements, planning and executing joint training, and assessing joint proficiency. Plan-identified forces are trained and assessed against the JMETLs for readiness to perform the tasks successfully. Assessment is performed through a variety of means including inspections, exercises, and reporting. However, current doctrine the UJTL, and operational planning do not adequately address sustained operations within a CBRN/TIM environment. JMETL development generally does not specify these circumstances as an execution condition. Exercises and training do not emphasize task performance and operations in these conditions.

<sup>5</sup> The JTF staff, in coordination with coalition partner staff, develops plans supporting and implementing the COCOM comprehensive campaign plan for successful achievement of the desired end states. Coordination for the planned operations conducted between partners ensures the capabilities of each partner within the full spectrum of support. Force

requirements and commitments are confirmed with each coalition participant. The COCOM and partner established minimum capability standards for participation and certification process covering areas of concern (e.g., training level competence, logistics capabilities, deployment, sustainment, and redeployment readiness, etc.) are applied by all participants. The JTF Commander, JTF staff, and the combined staff monitor, track, and assess the readiness of the joint coalition force. However, deploying units may not possess full CBRND resources and capabilities during the initial stages of deployment and until after arrival within the AOR. Additionally, deploying eligible civilians and MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment. The JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians and MWAs.

<sup>6</sup> The JTF staff planning and plan execution seeks to balance mission requirements with protection of the force against CBRN/TIM threat(s). Planning considers the impact of operations within CBRN/TIM environments and provide for adjustments to ensure successful retention of warfighting capabilities. Operations within a CBRN/TIM environment will degrade individual and unit capabilities. The combination of training, readiness, and flexibility to adjust and maintain operational capabilities provides the basis for maintenance of mission capability. However, current DOTMLPF and operational planning do not adequately address sustained operations within a CBRN/TIM environment. Additionally, deploying eligible civilians and MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment. The JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians and MWAs.

<sup>7</sup> The allocation, placement, and reallocation of protective assets is a function of the planning and operational control of the JTF Commander, JTF staff, and combined staff. ACSAs between coalition partners and/or host-nation enables acquisition and cross-servicing support between the partners. IAs provides for a wide range of support exchange including consumables, sheltering, medical care, and other support activities. However, sustained operations within a CBRN/TIM environment are not adequately addressed in DOTMLPF and, subsequently, in planning. Quantities, types, and availability of CPSs are limited. Current CPSs is inadequate to support expeditionary operations, particularly in austere environments by highly mobile forces and possessing reduced logistical footprints. The individual combat load places limitations upon weight and type of equipment and consumables. Protective equipment may be reduced or eliminated despite threat level.

### 12.12.3 Functional Solution Analysis

#### 12.12.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** Forces are not protected against all identified threat CBRN/TIM capabilities.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards for prophylactic CBRND protection against all threat agents. *Leadership:* Enforce compliance with established standards (see Footnote 17 above) for prophylactic CBRND protection.
- 2. Deficiency:** Medical prophylaxis does not exist for all threat CBRN and TIM agents.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards for prophylactic CBRND protection against all threat agents. *Training:* Train, exercise, and evaluate personnel (military and eligible civilians) on the use of prophylactic CBRND protection against threat agents. *Leadership:* Enforce compliance with established standards for prophylactic CBRND protection. Implement and ensure training is adequate and conduct exercises and evaluations to ensure readiness.
- 3. Deficiency:** Short-notice operations and reallocated taskings impact the administration and issue of prophylaxis for the threat.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of baseline standards for prophylactic CBRND protection against all threat agents. *Leadership:* Enforce compliance with established standards for prophylactic CBRND protection.
- 4. Deficiency:** Forces have, and may in the future, require medical prophylaxis administration/issue upon arrival in the AOR.  
**Non-Materiel Solutions:** *Doctrine:* Emphasize in doctrine, policies, and procedures for preparation of the force for CBRND protection during throughout deployment, redeployment, relocation, and en route phases of movement. *Organization:* Ensure resources, taskings, and staff are in place or available to perform CBRND operations within a CBRN/TIM environment by deploying, redeploying, relocating, and en route forces. *Training:* Train, exercise, and evaluate the force for CBRND operations within a CBRN/TIM environment while deploying, redeploying, relocating, and en route. *Leadership:* Recognize criticality of readiness of the force for potential CBRND operations within a CBRN/TIM environment while deploying, redeploying, relocation, and en route; training providing the skills to manage the force in these circumstances; and willingness and ability to implement necessary changes and activities to prepare and appropriately protect the force. *Facilities:* Develop supporting infrastructure for CBRND operations of the force while preparing, deploying, redeploying, relocating, and en route.

- 5. Deficiency:** The administration of many vaccines requires multiple administrations over a period of time for acquired immunity.  
**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, and procedures requirement for CBRN/TIM protective prophylaxis protecting the force through the deployment cycle. *Organization:* Establish organizational incentives to address CBRN/TIM protective prophylaxis providing protection of the force throughout the deployment cycle. *Leadership:* Ensure standards, criteria, and metrics for CBRN/TIM medical prophylaxis R&D are concise and adequately protect the force throughout the deployment cycle with a minimum of administrations, preferably one.
- 6. Deficiency:** Current prophylaxis and supporting doctrine, policy, and procedures to not address presymptomatic medical CBRND protective countermeasures by other than U.S. forces, excluding MWAs and eligible civilians.  
**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing MWAs and eligible civilians during CBRND operations and the provision of CBRND protection, including prophylaxis. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and eligible civilians and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWDs and eligible civilians.
- 7. Deficiency:** Prophylaxis for MWAs is virtually nonexistent.  
**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of MWAs, particularly MWDs, and training for CBRN/TIM environment survival. *Organization:* Ensure organizational consideration for maintenance and support of MWA CBRND protective equipment, measures, and activities. *Training:* Provide institutional and unit training of handlers and MWAs for CBRND measures and activities. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for MWA survivability. *Facilities:* Develop supporting infrastructure for MWA CBRND (e.g., logistics, veterinary surveillance, etc.).
- 8. Deficiency:** Prophylaxis for eligible civilians is not addressed.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures requirement to address the administration, provision, and application of medical CBRND protective countermeasures by other than U.S. forces (e.g., civilians, non-U.S. forces, etc.). *Organization:* Address organizational issues (e.g., who provides the equipment, support forces to train and equip, etc.) related to the provision of CBRN/TIM protection to eligible civilians, and non-U.S. forces. *Training:* Include eligible civilians in CBRND training, exercises, and evaluations. Identify training requirements and responsibilities for non-U.S. forces. *Leadership:* Ensure leadership awareness of criticality of increased dependence of military operations upon civilians. *Personnel:* Require eligible civilians supporting the mission to meet minimum standards for safe use of CBRND resources.
- 9. Deficiency:** Availability of prophylaxis is questionable for issue and administration to eligible civilians.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of CBRND standards and prophylaxis for protection of eligible civilians

addressing the variation within a potential protected population. *Training*: Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRN/TIM training, exercises, and evaluations, where appropriate. *Leadership*: Implement and manage CBRND training, equipping, and protection of eligible civilians.

- 10. Deficiency:** The issue and administration of prophylaxis to eligible civilians requires review due to questions regarding applicability to the range of body types, ages, and physical/medical factors inherent within a potential population, as well as possible long-term health issues and legal implications.

**Non-Materiel Solutions:** *Doctrine*: Establish in doctrine, policy, and procedures the application of standards and measures for protection of eligible civilians addressing the variation within the potential protected population. *Leadership*: Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRN/TIM training, exercises, and evaluations.

- 11. Deficiency:** Prophylaxis against most high-threat TIMs are not currently available.

**Non-Materiel Solutions:** *Doctrine*: Establish in doctrine, policy, and procedures the application of metrics for standards and criteria for protection against all high-threat TIM agents. *Training*: Train, exercise, and evaluate personnel (military and eligible civilians) on the use of prophylactic CBRND protection against threat agents. *Leadership*: Enforce compliance with established metrics (see Footnote 7 above) for standards and criteria. Implement and ensure training is adequate and conduct exercises and evaluations to ensure readiness.

- 12. Deficiency:** The efficacy of existing prophylaxis, particularly vaccines, widely varies.

**Non-Materiel Solutions:** *Doctrine*: Establish in doctrine, policy, and procedures the application of baseline standards for prophylactic CBRND protection against all threat agents. *Leadership*: Enforce compliance with established standards (see Footnote 5 above) for prophylactic CBRND protection.

- 13. Deficiency:** Expeditionary operations are a particular concern as most CBRND systems and associated logistics are not designed for a highly mobile force, with a reduced logistical footprint, and for the initial period of operations until the theater matures (usually the first 30–90 days).

**Non-Materiel Solutions:** *Doctrine*: Complete the JCIDS process and central correlation/comparison of national and strategic plans to identify CBRND resources necessary and available to support expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint. *Organization*: Develop organizational structures, resources, staffing, and capabilities to conduct expeditionary operations while possessing reduced logistical footprint and during the first 30–90 days of operations following commencement of hostilities. *Training*: Train, exercise, and evaluate expeditionary capabilities of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operations using CBRND resources supporting expeditionary operations. *Leadership*: Recognize differences and challenges associated with expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint; training providing skills and knowledge to manage

operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities*: Develop supporting infrastructure for expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.

- 14. Deficiency:** Deploying units may not possess full CBRND resources and capabilities during the initial stages of deployment and until after arrival within the AOR.

**Non-Materiel Solutions:** *Doctrine*: Emphasize in doctrine, policies, and procedures for preparation of the force for CBRND protection during throughout deployment, redeployment, relocation, and en route phases of movement. *Organization*: Ensure resources, taskings, and staff are in place or available to perform CBRND operations within a CBRN/TIM environment by deploying, redeploying, relocating, and en route forces. *Training*: Train, exercise, and evaluate the force for CBRND operations within a CBRN/TIM environment while deploying, redeploying, relocating, and en route. *Leadership*: Recognize criticality of readiness of the force for potential CBRND operations within a CBRN/TIM environment while deploying, redeploying, relocation, and en route; training providing the skills to manage the force in these circumstances; and willingness and ability to implement necessary changes and activities to prepare and appropriately protect the force. *Facilities*: Develop supporting infrastructure for CBRND operations of the force while preparing, deploying, redeploying, relocating, and en route.

- 15. Deficiency:** Deploying eligible civilians are not equipped and trained to survive a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine*: Establish doctrine, policy, and procedures CBRND protection of eligible civilians and training for CBRN/TIM environment survival. *Organization*: Ensure organizational consideration for maintenance and support of eligible civilians CBRND protective equipment, measures, and activities. *Training*: Provide institutional and unit training of eligible civilians for CBRND measures and activities. Integrate into CBRND exercises and evaluations. *Leadership*: Ensure awareness and planning for CBRND measures and requirements for eligible civilians survivability. *Personnel*: Ensure that eligible civilian personnel and operations supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities*: Develop supporting infrastructure for eligible civilians CBRND (e.g., logistics, medical, veterinary surveillance, communications, training, etc.).

- 16. Deficiency:** Deploying MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine*: Establish doctrine, policy, and procedures CBRND protection of MWAs, particularly MWDs, and training for CBRN/TIM environment survival. *Organization*: Ensure organizational consideration for maintenance and support of MWA CBRND protective equipment, measures, and activities. *Training*: Provide institutional and unit training of MWA handlers and MWAs for CBRND measures and activities. Integrate into CBRND exercises and evaluations. *Leadership*: Ensure awareness and planning for CBRND measures and requirements for MWA survivability. *Facilities*: Develop supporting

infrastructure for MWA CBRND (e.g., logistics, medical, veterinary surveillance, communications, training, etc.).

- 17. Deficiency:** The JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing civilian personnel and operations for CBRND. *Organization:* Identify organizational services and activities supporting the mission performed by civilian personnel and operations.

*Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians.

*Personnel:* Ensure that eligible civilians supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities:* Develop supporting infrastructure for eligible civilian CBRND (e.g., logistics, medical, training, communications, etc.).

- 18. Deficiency:** The JTF staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying MWAs.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing MWAs, particularly MWDs, and operations for CBRND. *Organization:* Identify organizational services and activities supporting survivability of MWAs and MWA mission operations. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWAs. *Facilities:* Develop supporting infrastructure for MWA CBRND (e.g., logistics, medical, veterinary surveillance, training, communications, etc.).

- 19. Deficiency:** Current doctrine, the *UJTL*, and operational planning do not adequately address sustained operations within a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, procedures, and *UJTL* sustained operations within a CBRN/TIM environment. *Organization:* Ensure resources, taskings, and staff are in place or available to plan and perform sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.

- 20. Deficiency:** JMETL development generally does not specify sustained operations within a CBRN/TIM environment as an execution condition.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, procedures, and *UJTL* sustained operations within a CBRN/TIM environment. *Organization:* Ensure resources, taskings, and staff are in place or available to plan and perform sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness

of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.

- 21. Deficiency:** Exercises and training do not emphasize sustained task performance and operations in a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, *UJTL*, and procedures sustained operations within a CBRN/TIM environment. *Organization:* Ensure resources, taskings, and staff are in place or available to plan and perform sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.

- 22. Deficiency:** Sustained operations within a CBRN/TIM environment are not adequately addressed in DOTMLPF and, subsequently, in planning.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, and procedures sustained operations within a CBRN/TIM environment. *Organization:* Ensure resources, taskings, and staff are in place or available to perform sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.

- 23. Deficiency:** Quantities, types, and availability of CPSs are limited.

**Non-Materiel Solutions:** *Doctrine:* Institute in doctrine, policy, and procedures the central correlation of operational plans and taskings to identify CBRND support requirements for two or more concurrent operations with CBRN/TIM threat with comparison to existing and programmed quantities and types of CBRND systems and resources. *Leadership:* Implement development of plans and taskings consistent with available CBRND capabilities as determined by central correlation and comparison of strategic tactical plans and taskings.

- 24. Deficiency:** Current CPS is inadequate to support expeditionary operations, particularly in austere environments by highly mobile forces and possessing reduced logistical footprints.

**Non-Materiel Solutions:** *Doctrine:* Incorporate into doctrine, policy, and procedures standards for expeditionary forces possessing reduced logistical footprint during the first 30–90 days of operations following commencement of hostilities. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct expeditionary operations while possessing reduced logistical footprint and during the first 30–90 days of operations following commencement of hostilities. *Training:* Train, exercise, and evaluate expeditionary capabilities of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operation using CBRND resources supporting expeditionary operations. *Leadership:* Recognize differences and challenges associated with expeditionary operations during the first 30–90 days following commencement of hostilities

and with a reduced logistical footprint; training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities*: Develop supporting infrastructure for expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.

- 25. Deficiency:** The individual combat load places limitations upon weight and type of equipment and consumables. Protective equipment may be reduced or eliminated despite threat level.

**Non-Materiel Solutions:** *Leadership*: Implement development of plans and taskings consistent with stockpile and prepositioning support capabilities.

- 26. Deficiency:** DOTMLPF is inadequate for sustained operations within a CBRN/TIM environment and for expeditionary and highly mobile force operations with reduced logistical footprints.

**Non-Materiel Solutions:** *Doctrine*: Incorporate into doctrine, policy, and procedures CBRND standards for expeditionary and highly mobile forces possessing reduced logistical footprint. *Organization*: Develop organizational structures, resources, staffing, and capabilities to conduct expeditionary and highly mobile force operations while possessing reduced logistical footprint. *Training*: Train, exercise, and evaluate expeditionary capabilities of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operation using CBRND resources supporting expeditionary operations. *Leadership*: Recognize differences and challenges associated with expeditionary and highly mobile force operations with a reduced logistical footprint; training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary and highly mobile force operations with a CBRN/TIM threat. *Facilities*: Develop supporting infrastructure for expeditionary and highly mobile force operations with a reduced logistical footprint.

- 27. Deficiency:** Current DOTMLPF does not fully address the unique aspects of CBRND and the impact upon operations within a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine*: Include in doctrine, policy, procedures, and *UJTL* sustained operations within a CBRN/TIM environment. *Organization*: Ensure resources, taskings, and staff are in place or available to plan and perform sustained operations within a CBRN/TIM environment. *Training*: Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership*: Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force. *Personnel*: Ensure that eligible civilian personnel and operations supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment.

- 28. Deficiency:** DOTMLPF is inadequate or nonexistent addressing CBRND of eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing eligible civilian personnel for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of eligible civilian personnel within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilian personnel.

**29. Deficiency:** DOTMLPF is inadequate or nonexistent addressing CBRND of MWAs.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing MWAs for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of MWAs within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWAs.

#### 12.12.3.2 IMA Assessment Summary

N/A

**12.13 Task OPSHLD 13: Establish large-scale medical CBRND operations****12.13.1 Functional Area Analysis****12.13.1.1 Definition**

To establish and implement the timely, efficient, and consistent application of medical care and measures preparing and protecting the force against the debilitating effects of CBRN/TIM hazards (threat or actual). This task includes the identification, movement, application, and management of resources to perform immunizations of the force and eligible civilians, isolate infected or contaminated personnel and/or MWAs until risk is resolved, and conduct quarantine to prevent the spread of infectious disease. The task addresses the full range of necessary resources required to attend to and resolve the circumstances.

**12.13.1.2 Derivation**

*Joint Enabling Concept for CBRN Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (OP 1.3.1, OP 2.4.1.2, OP 2.4.1.1, OP 5.1.1, OP 5.2, OP 5.2.1, OP 5.2.2, OP 5.3, OP 5.3.9, OP 5.4, OP 5.5.9, OP 5.7, OP 5.7.4, OP 5.7.5, OP 5.7.6, OP 6.2.10, OP 5.4.4, OP 7, OP 7.3, OP 7.4).*

**12.13.1.2.1 Supported Task:** N/A

**12.13.1.2.2 Lateral Task:** OPSHA 7

**12.13.1.2.3 Supporting Task:** TASHLD 12

**12.13.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Undeveloped to highly developed land. (C1.1)
2. Riverine to open sea. (C1.2)
3. Natural and induced air. (C1.3)
4. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Partially completed mission preparation. (C2.1.3)
2. Marginal to strong forces assigned. (C2.2.1)
3. Multiple competing apportionments. (C2.2.2)
4. Marginal forces allocated. (C2.2.3)
5. Fair personnel nutrition and health. (C2.2.4.1)
6. Good personnel physical conditioning. (C2.2.4.3)

7. Poor mission-essential government-service civilian physical conditioning. (C2.2.4.3 – NEW)
8. Poor mission-essential contract-service civilian physical conditioning. (C2.2.4.3 – NEW)
9. Limited personnel experience. (C2.2.4.5)
10. Severe personnel fatigue. (C2.2.4.6)
11. Some interoperability. (C2.2.6)
12. Partial Joint Staff integration. (C2.3.1.1)
13. Limited staff expertise. (C2.3.1.3)
14. Limited deployed supplies. (C2.8.2)
15. Limited CONUS resupply. (C2.8.3)
16. Limited prepositioned materiel. (C2.8.4)
17. Limited host nation support. (C2.8.5)
18. Limited commercial procurement. (C2.8.6)

### Civil

1. Negative foreign government support. (C3.1.2.3)
2. Uncertain international organization support. (C3.1.2.5)
3. Severe restraints on action. (C3.1.3.4)
4. Poor civil health. (C3.3.1.4)
5. High health risk. (C3.3.1.5)
6. Severe refugee impact. (C3.3.2)

## 12.13.2 Functional Needs Analysis

### 12.13.2.1 Capability and Deficiency Assessment Summary

Table 12.13-1 discusses the two capabilities existing to perform the task to the designated standard. The JTF Commander and staff identify the required capabilities and conduct planning and coordination to identify CBRND resources, requirements, and taskings for CBRND. This task includes the integration of medical operations and support requirements for CBRND as well as the direction for development of supporting medical plans and procedures. Doctrine, policy, and procedures exist for the planning, equipping, and deployment of forces and coordination of Medical Services support for CBRND operations. Deficiencies include inadequacies in DOTMLPF addressing eligible civilians and MWDs for CBRND and sustained medical operations within a CBRN/TIM environment. The second capability is within Medical Services and the Medical Services staffs. They coordinate with the JTF and COCOM staff to address medical aspects and support requirements for JTF planning and operations. The Medical Services staff(s) prepares medical plans to support JTF plans and include CBRND considerations and requirements in the plans. The staff further identifies required capabilities, conducts planning and coordination to identify medical and support resources to ensure medical care and measures to prepare and protect the force, including the identification, movement, application, and management of Medical Service and medical CBRND resources. Adequate DOTMLPF exists for planning, equipping, and deploying of forces, and for coordination of Medical Services support. Deficiencies include inadequacies in DOTMLPF for preparing and equipping deploying eligible civilians and MWDs; sustained operations in CBRN/TIM environments; and addressing large-

scale medical operations, especially quarantine operations potentially involving non-U.S. personnel.

### **Current Capability and Deficiency**

The JTF and Medical Services staff planning includes predeployment medical screening and the prepositioning, allocation, and distribution of medical prophylaxis. JTF plans generally address medical measures in generic terms and refer to implementing or topic medical plans. The Medical Services staff planning addresses the specifics to perform medical activities and procedures in support of the COCOM plans. The invocation of quarantine and enforcement of medical isolation are Medical Services decisions, coordinated with the JTF Commander and JTF staff, and supported by the JTF. The prevention of the need for stringent mass medical activity includes predeployment screening, the provision of medical prophylaxis, and medical surveillance. Coordination between the JTF and Medical Services staffs provides for an integrated and rapid response to an event. Should large-scale medical operations be required (e.g., mass immunizations, quarantine, etc.), both staffs respond applying their resources as appropriate. However, plans and policies addressing the tracking and/or reporting of implementation and/or conduct of large-scale medical operations within the JOA are inadequate, nonexistent, and/or are not coordinated between the JTF and Medical Services staffs. Deficiencies also include inadequate DOTMLPF to address large-scale medical CBRN/TIM operations, particularly sustained medical operations within a CBRN/TIM environment. JTF and Medical Services actions associated with large-scale medical operations (especially those involving non-U.S. personnel such as indigenous civilians, third-party nations, and others) is not adequately discussed and outlined in DOTMLPF. Medical prophylaxis does not exist for all threat CBRN/TIM agents. Efficacy of the medical prophylaxis that does exist widely varies. Their application to eligible civilians and MWAs is inadequately addressed in existing DOTMLPF. DOTMLPF is also inadequate for large-scale medical quarantine and/or enforcement of medical isolation by both Medical Services and the JTF.

### **Projected Near/Mid-Term Capability and Deficiency**

Standards for CBRND medical training of deployable medical personnel will continue to provide a basis for improved medical capabilities. However, these standards are not established in joint doctrine and provide basic capabilities. The IOC fielding of JOEF and JEM provide capabilities for planning and CBRND needs determination. The potential does exist for assistance with planning and response determination for mass-CBRN casualties. Otherwise, no change projected for this task.

### **Projected Far-Term Capability and Deficiency**

JOEF and JEM are fully fielded. Otherwise, no change is projected from the mid term.

	FAA Measure	Scale
M1	Plans are modified for the area to address large-scale medical operations resulting from CBRN/TIM exposure/contamination.	<p><b>G:</b> Detailed plans exist and are coordinated between JTF and Medical Services staffs for large-scale CBRN/TIM medical operations within the JOA involving the forces and non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).</p> <p><b>Y:</b> Plans exist and are coordinated between JTF and Medical Services staffs for Medical Services support of operations within the JOA involving CBRN/TIM threat and address large-scale medical operations the forces and non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).</p> <p><b>R:</b> Plans addressing large-scale medical operations within the JOA are inadequate, nonexistent, not coordinated between the COCOM and Medical Services staffs, and/or do not address the forces and/or non-U.S. personnel (e.g., indigenous civilians, third-party nations, etc.).</p>

M2	Plans are prepared for implementation of the establishment and operation of mass quarantine, including conditions and authorities required to invoke quarantine and/or enforce medical isolation.	<p><b>G:</b> Detailed policies and plans exist and are coordinated between JTF and Medical Services staffs specifying the conditions and appropriate authorities and actions/activities to invoke quarantine and/or enforce medical isolation for large-scale CBRN/TIM medical operations within the JOA involving forces and non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).</p> <p><b>Y:</b> Policies and plans exist and are coordinated between JTF and Medical Services staffs for large-scale Medical Services operations within the JOA involving quarantine and/or enforcement of medical isolation.</p> <p><b>R:</b> Plans and policies addressing large-scale medical quarantine and/or medical isolation operations within the JOA are inadequate, nonexistent, and/or are not coordinated between the JTF and Medical Services staffs.</p>
M3	All JOA medical facilities are able to treat and isolate contaminated/infectious casualties.	<p><b>G:</b> All JOA medical facilities are equipped and exercised for the reception, decontamination, and treatment of contaminated/exposed casualties. All assigned medical practitioners and medical support personnel (including EMS, medical aides, etc.) are formally trained, and receive recurring training, for the evaluation and care of contaminated/exposed casualties. Medical provider-based medical treatment is provided, when needed, throughout the process from reception to post-decontamination.</p> <p><b>Y:</b> JOA medical facilities are equipped and exercised for the reception, decontamination, and treatment of contaminated/exposed casualties. Formal training is available to for the evaluation and treatment of contaminated/exposed casualties. Medical support personnel (including EMS, medical aides, etc.) are trained, on the evaluation, decontamination, and care of contaminated/exposed casualties.</p> <p><b>R:</b> The ability of JOA medical facilities to treat contaminated/exposed casualties is inadequate or nonexistent.</p>
M4	Forces are immunized for biological threats.	<p><b>G:</b> Medical CBRND countermeasures exist and are administered for all threat biological agents and encompass all eligible at-risk populations.</p> <p><b>Y:</b> Medical CBRND countermeasures exist and are administered to U.S. military and eligible civilian members for threat biological agents.</p> <p><b>R:</b> Medical CBRND countermeasures are inadequate or do not exist for threat biological agents.</p>
M5	Preventive medicine policy and countermeasures are implemented for identified medical threats for the JOA (after deployment).	<p><b>G:</b> Detailed plans and policies exist and are coordinated between JTF and Medical Services staffs for the effective application of preventative medicine activities and countermeasures addressing the health and well-being of the entire force and includes large-scale medical activities addressing both the force and non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).</p> <p><b>Y:</b> Plans exist and are coordinated between JTF and Medical Services staffs for preventative medicine activities and countermeasures for support of operations and the general health and well-being of the force.</p> <p><b>R:</b> Preventative medicine activities and/or countermeasures plans and/or policies are inadequate or nonexistent for support of operations and/or the general health and well-being of the force.</p>
M6	Force has completed deployment medical preparation.	<p><b>G:</b> JTF forces are medically prepared for operations with threat.</p> <p><b>Y:</b> Selected JTF forces generally are generally medically prepared for operations with threat.</p> <p><b>R:</b> JTF forces medical preparedness for operations with threat is inadequate or nonexistent.</p>
M7	JOA-wide system is in-place and operational for tracking status of U.S. personnel and MWA vaccines, antidotes, and medical treatment provided.	<p><b>G:</b> JOA medical information systems incorporate automated tracking of the status and administration of vaccines, antidotes, and medical treatment for U.S. personnel and MWAs.</p> <p><b>Y:</b> JOA medical information systems incorporate automated tracking of the status and administration of vaccines, antidotes, and medical treatment for U.S. personnel.</p> <p><b>R:</b> JOA medical information systems incorporating automated tracking of the status and/or administration of vaccines, antidotes, and medical treatment is inadequate or nonexistent.</p>

M8	Disease and CBRN/TIM medical protective countermeasures are issued.	<p><b>G:</b> Medical disease preventatives and CBRN/TIM countermeasures are available for issue and administration to all at-risk populations, including military members, eligible civilians, and MWAs.</p> <p><b>Y:</b> Medical disease preventatives and CBRN/TIM countermeasures are issued and administered to military personnel.</p> <p><b>R:</b> Medical disease preventatives and CBRN/TIM issuance and/or administration is inadequate or nonexistent.</p>
M9	Procedures are implemented to track and follow up on CBRN/TIM infectious/contaminated personnel and MWAs.	<p><b>G:</b> Medical information systems incorporate automated tracking of personnel exposed to, affected by, and/or treated for CBRN/TIM exposure from system entry until release from service. Systems incorporate ability to identify potential related issues and problems with medical treatment and care for tracked personnel.</p> <p><b>Y:</b> Tracking of personnel exposed to, affected by, and/or treated for CBRN/TIM exposure is performed by a combination of manual and automated processes and systems.</p> <p><b>R:</b> Tracking of personnel exposed to, affected by, and/or treated for CBRN/TIM exposure is inadequate or nonexistent.</p>
M10	Potentially exposed personnel are identified and in treatment or treated and released.	<p><b>G:</b> Medical information systems incorporate automated tracking of personnel exposed to, affected by, and/or treated for CBRN/TIM exposure from system entry until release from service. Systems incorporate ability to identify potential related issues and problems with medical treatment and care for tracked personnel.</p> <p><b>Y:</b> Tracking of personnel exposed to, affected by, and/or treated for CBRN/TIM exposure is performed by a combination of manual and automated processes and systems.</p> <p><b>R:</b> Tracking of personnel exposed to, affected by, and/or treated for CBRN/TIM exposure is inadequate or nonexistent.</p>
M11	Large-scale quarantine sheltering and treatment operations are established and operating in accordance with medical plans.	<p><b>G:</b> Detailed policies and plans exist and are coordinated between JTF and Medical Services staffs to track and report the implementation and conduct of large-scale CBRN/TIM medical operations within the JOA involving forces and non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).</p> <p><b>Y:</b> Policies and plans exist and are coordinated between JTF and Medical Services staffs for the tracking and reporting of implementation and conduct of large-scale Medical Services operations within the JOA.</p> <p><b>R:</b> Plans and policies addressing the tracking and/or reporting of implementation and/or conduct of large-scale medical operations within the JOA are inadequate, nonexistent, and/or are not coordinated between the JTF and Medical Services staffs.</p>
M12	Large-scale quarantine sheltering and treatment operations meeting actual needs.	<p><b>G:</b> The JTF and Medical Services staffs maintain ongoing relationship to track and coordinate adjustments to plans, policies, and resource taskings to ensure large-scale quarantine sheltering and treatment operations within the JOA meet actual needs.</p> <p><b>Y:</b> The JTF and Medical Services staffs coordinate adjustments to plans and taskings to address large-scale quarantine sheltering and treatment operations needs.</p> <p><b>R:</b> JTF and Medical Service coordination is inadequate or nonexistent to address large-scale quarantine sheltering and/or treatment operations needs.</p>

M13	Contaminated/infectious casualties (US, host nation), both human and MWA, are safely transported to large-scale quarantine sheltering and treatment operations.	<p><b>G:</b> Doctrine, policy, procedures, TTPs, training, and plans address the application of protective assets and the safe handling and transport of exposed or contaminated casualties/MWAs, including those medically unable to wear IPE, and specify requirements and measures for the protection of personnel, activities, and resources performing the handling and transport.</p> <p><b>Y:</b> Doctrine, policy, procedures, TTPs, training, and plans address the safe handling and transport of exposed or contaminated casualties and identify general measures for the protection of personnel, activities, and resources performing the handling and transport.</p> <p><b>R:</b> Doctrine, policy, procedures, TTPs, training, and/or plans are nonexistent or inadequate to address the safe handling and/or transport of exposed or contaminated casualties and/or identification of general measures for the protection of personnel, activities, and/or resources performing the handling and/or transport.</p>
M14	Required resources are available to perform mass medical operations.	<p><b>G:</b> Detailed policies and plans exist and are coordinated between JTF and Medical Services staffs identifying and tasking resources for the implementation and support of large-scale CBRN/TIM medical operations within the JOA involving forces and non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).</p> <p><b>Y:</b> Policies and plans exist and are coordinated between JTF and Medical Services staffs for the identification and tasking of resources to implement and support large-scale Medical Services operations within the JOA.</p> <p><b>R:</b> Plans and policies addressing the identification and/or tasking of resources implementing and/or supporting large-scale medical operations within the JOA are inadequate, nonexistent, and/or are not coordinated between the JTF and Medical Services staffs.</p>

<sup>1</sup> JTF staff plans include predeployment medical screening and the stockpiling, allocation, and distribution of medical prophylaxis. Specific implementation for the application of prophylactic immunizations is address in medical support plans. Planning for large-scale medical operations are based upon COCOM and Strategic Theater Medical Services plans and coordinated by the Medical Services staffs with the JTF staff for JTF support and appropriate resourcing. However, DOTMLPF is inadequate to address large-scale medical CBRN/TIM operations, particularly sustained operations within a CBRN/TIM environment and/or JTF actions associated with large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>2</sup> JTF plans address medical activities by referring to appropriate medical plans, policies, and procedures. The invocation of quarantine and enforcement of medical isolation are within the purview of medical authorities. The JTF staff provides support as defined in the coordinated and appropriate medical plans. However, DOTMLPF is inadequate to address JTF actions associated with medical quarantine and/or enforcement of medical isolation involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>3</sup> Existing medical facilities within a HTA exercise the reception of contaminated/exposed casualties. Training for the treatment of contaminated/exposed casualties is available through AMEDD but is not mandatory for medical practitioners identified for deployment or assignment where there exists a CBRN/TIM threat. The ability of the JTF staff to ensure medical capabilities for CBRND is limited by routine medical operations and requirements. Periodic exercises are performed with medical activities, but on a limited basis, to provide training opportunities and to assess capabilities. Treatment of casualties is currently performed following completion of casualty decontamination. Generally, casualty care until completion of decontamination is performed by medical corpsmen, not medical practitioners. Isolation of large-scale numbers of contaminated/infectious casualties is not adequately addressed in DOTMLPF and current medical operations are limited in their isolation abilities.

<sup>4</sup> Medical prophylaxis does not exist for all threat biological agents. Current prophylaxis and supporting doctrine, policy, and procedures do not address presymptomatic medical CBRND protective countermeasures by other than U.S. forces, excluding MWAs and eligible civilians. Additionally, the efficacy of existing prophylaxis, particularly vaccines, widely varies. Force protection using medical prophylaxis is dependent upon identification of the threat, preplanning for a threat, positioning of stocks for issue and administration, timing of notification to administer/issue prophylaxis, availability of medical personnel to perform administration (if required), on-going operational requirements, and the available quantity of sufficient medical prophylaxis to meet requirements. Vaccination to achieve acquired immunity by force personnel prior to entry into the theater or completion of an adequate level of acquired immunity prior to adversary biological agent employment is a function of the preplanning and deployment operations. The JTF staff directs the implementation of these measures when and as appropriate based upon established plans and Medical Services guidance. However, the application of medical prophylaxis is not adequately addressed for eligible civilians and MWA within the force.

<sup>5</sup> The Medical Services staff plans and associated policies address medical activities and procedures, including Preventative Medicine. Medical surveillance and the implementation of medical countermeasures are within the purview of medical authorities and are a consideration for medical planning for operations with a CBRN/TIM threat. The Medical Services staff coordinates with the JTF staff for Preventive Medicine support requirements, associated taskings, and their inclusion in JTF staff planning. Large-scale medical activities and actions are not adequately addressed in DOTMLPF; especially those involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>6</sup> COCOM and JTF plans include the medical review of personnel identified against deployment taskings. Screenings of deployable personnel are periodically performed for potential limitations. Often, these are associated with annual medical physicals. However, predeployment medical screenings do not consider prior presymptomatic low-dose CBRN/TIM exposures, associated potential cumulative long-term effects, and the potential threat. The routine rotation and movement of personnel to and from units. Timing of notice of deployment and the availability of medical personnel impact the conduct of predeployment screenings. Short-notice operations and reallocated taskings may also impact the conduct of predeployment medical screenings. The JTF staff plans attempt to provide for early (prior to deployment notice) and continued medical screening of tasked forces. Plans also include provisions for the conduct of predeployment screenings by medical personnel upon notification of deployment. However, annual physicals, when used to meet deployment screening requirements, may be conducted several months before a deployment. Often, a record review is conducted of the period following the physical for indications of issues precluding deployment.

<sup>7</sup> Current medical systems are stovepiped and require manual intervention to share information. Automated systems to track medical treatment and the movement of casualties exist at Echelon 3 and higher levels of care. Medical treatment recording below Echelon 3 is limited and not linked to higher-echelon systems. Outpatient care is not generally recorded and aggregate information is reported. Unit reporting includes CBRND readiness but is not linked to medical information systems. Reliance is placed upon the individual's vaccination record and health record (both manual records) to reflect the most recent status of the individual. However, these records are not always available or complete.

<sup>8</sup> Medical prophylaxis is issued/administered for identified CBRN/TIM threats to the military force. The administration and issuance of prophylaxis is addressed by the JTF and Medical Services staff during the planning and support for operations. Prophylaxis for MWAs is virtually nonexistent. Prophylaxis for eligible civilians is not adequately addressed in current doctrine, policy, and procedures.

<sup>9</sup> Doctrine, policy, and procedures exist to identify potentially exposed units and personnel for treatment and medical surveillance. Potentially affected units are identified to the JTF staff and appropriate medical actions are taken. However, current medical systems are stovepiped and require manual intervention to share information. Automated systems to track medical treatment and the movement of casualties exist at Echelon 3 and higher levels of care. Medical treatment recording below Echelon 3 is limited and not linked to higher-echelon systems. Outpatient care is not generally recorded and aggregate information is reported.

<sup>10</sup> Doctrine, policy, and procedures exist to identify potentially exposed units and personnel for treatment and medical surveillance. Potentially affected units are identified to the JTF staff and appropriate medical actions are taken. However, current medical systems are stovepiped and require manual intervention to share information. Automated systems to track medical treatment and the movement of casualties exist at Echelon 3 and higher levels of care. Medical treatment recording below Echelon 3 is limited and not linked to higher-echelon systems. Outpatient care is not generally recorded and aggregate information is reported.

<sup>11</sup> JTF plans address medical activities by referring to appropriate medical plans, policies, and procedures. The implementation and operation of large-scale quarantine sheltering and treatment operations are with purview of medical authorities. The JTF staff provides support and resources as defined in the coordinated and appropriate medical plans and as adjusted to meet specific circumstances and as requested by appropriate medical authorities. Large-scale medical activities and actions are not adequately addressed in DOTMLPF; especially those involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>12</sup> JTF plan support planning by Medical Services staff includes predeployment medical screening and the stockpiling, allocation, and administration/ distribution of medical prophylaxis. Specific implementation for the application of prophylactic immunizations is addressed in the Medical Services plans. Planning for large-scale medical operations are based upon COCOM and Strategic Theater Medical Services plans and coordinated by the Medical Services staffs with the JTF staff for JTF support and appropriate resourcing. However, DOTMLPF is inadequate to address large-scale medical CBRN/TIM operations, particularly sustained operations within a CBRN/TIM environment and/or Medical Services actions associated with large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>13</sup> The Medical Services staff plans and develops associated policies addressing medical activities and procedures to support JTF operations. The invocation of quarantine and enforcement of medical isolation are within the purview of medical authorities and are a consideration for medical planning for operations with a CBRN/TIM threat. The Medical Services staff coordinates with the JTF staff for Medical Services support requirements and associated taskings and their inclusion in JTF staff planning. However, DOTMLPF is inadequate to address Medical Services actions associated with medical quarantine and/or enforcement of medical isolation involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>14</sup> Existing medical facilities within an HTA exercise the reception of contaminated/exposed casualties. Training for the treatment of contaminated/exposed casualties is available through AMEDD but is not mandatory for medical practitioners identified for deployment or assignment where there exists a CBRN/TIM threat. The ability of the Medical Services staff to ensure medical capabilities for CBRND is limited by routine medical operations and requirements. Periodic exercises are performed with medical activities, but on a limited basis, to provide training opportunities and to assess capabilities. Treatment of casualties is currently performed following completion of casualty decontamination. Generally, casualty care until completion of decontamination is performed by medical corpsmen, not medical practitioners. Isolation of large-scale numbers of contaminated/infectious casualties is not adequately addressed in DOTMLPF and current medical operations are limited in their isolation abilities.

<sup>15</sup> The Medical Services staff plans and associated policies address medical activities and procedures, including Preventative Medicine. Medical surveillance and the implementation of medical countermeasures are within the purview of medical authorities and are a consideration for medical planning for operations with a CBRN/TIM threat. The Medical Services staff coordinates with the JTF staff for Preventive Medicine support requirements, associated taskings, and their inclusion in JTF staff planning. Large-scale medical activities and actions are not adequately addressed in DOTMLPF; especially those involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>16</sup> COCOM and JTF plans include the medical review of personnel identified against deployment taskings. Screenings of deployable personnel are periodically performed for potential limitations. Often, these are associated with annual medical physicals. However, predeployment medical screenings do not consider prior presymptomatic low-dose CBRN/TIM exposures, associated potential cumulative long-term effects, and the potential threat. The routine rotation and movement of personnel to and from units. Timing of notice of deployment and the availability of medical personnel impact the conduct of predeployment screenings. Short-notice operations and reallocated taskings may also impact the conduct of predeployment medical screenings. The Medical Services staff plans attempt to provide for early (prior to deployment notice) and continued medical screening of tasked forces. Plans also include provisions for the conduct of predeployment screenings by medical personnel upon notification of deployment. However, annual physicals, when used to meet deployment screening requirements, may be conducted several months before a deployment. Often, a record review is conducted of the period following the physical for indications of issues precluding deployment.

<sup>17</sup> Current medical systems are stovepiped and require manual intervention to share information. Automated systems to track medical treatment and the movement of casualties exist at Echelon 3 and higher levels of care. Medical treatment recording below Echelon 3 is limited and not linked to higher-echelon systems. Outpatient care is not generally recorded and aggregate information is reported. Unit reporting includes CBRND readiness but is not linked to medical information systems. Reliance is placed upon the individual's vaccination record and health record (both manual records) to reflect the most recent status of the individual. However, these records are not always available or complete.

<sup>18</sup> Medical prophylaxis is issued/administered for identified CBRN/TIM threats to the military force. The administration and issuance of prophylaxis is addressed by the JTF and Medical Services staff during the planning and support for operations. Prophylaxis for MWAs is virtually nonexistent. Prophylaxis for eligible civilians is not adequately addressed in current doctrine, policy, and procedures.

<sup>19</sup> Doctrine, policy, and procedures exist to identify potentially exposed units and personnel for treatment and medical surveillance. Potentially affected units are identified by Medical Services to the JTF staff and appropriate medical actions are taken. However, current medical systems are stovepiped and require manual intervention to share information. Automated systems to track medical treatment and the movement of casualties exist at Echelon 3 and higher levels of care. Medical treatment recording below Echelon 3 is limited and not linked to higher-echelon systems. Outpatient care is not generally recorded and aggregate information is reported.

<sup>20</sup> The Medical Services staff plans and associated policies address medical activities and procedures. The invocation of quarantine and enforcement of medical isolation are within the purview of medical authorities and are a consideration for medical planning for operations with a CBRN/TIM threat. The Medical Services staff coordinates with the JTF staff for Medical Services support requirements and associated taskings and their inclusion in JTF staff planning. However, DOTMLPF is inadequate to address Medical Services actions associated with medical quarantine and/or enforcement of medical isolation involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>21</sup> Existing standards and procedures provide adequate protection of handling and transporting personnel against secondary exposure/contamination and require the application of protective equipment and measures if the potential exists for contamination/exposure. Unit-level training is limited to the movement of casualties to the medical facility and is predominantly reliant upon tactical ground transport. Air transport (tactical rotary-wing) is a last resort due to concerns about asset contamination. Tactical and strategic fixed-wing air transport is not considered an acceptable means of transport. Air and sea transport resources are inadequately equipped and prepared to transport exposed and contaminated human and MWA casualties. Exposed and contaminated casualties (human and MWA) unable to wear IPE are not adequately addressed in doctrine, policy, and standards. Protective equipment is not available for these casualties. Casualties able to wear standard IPE are required to apply the equipment outside of CPSs. However, medical units are not provided stocks of standard IPE for use by patients. Medical policy is the patient's unit is responsible for providing the equipment to the medical unit for use by the patient.

Operationally involved units may be delayed, at best, in providing the equipment. Large-scale medical activities and actions are not adequately addressed in DOTMLPF; especially those involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>22</sup> The JTF and Medical Services staff conduct coordinated planning for operations using the COCOM-identified forces for the potential threat. Equipping the tasked Medical Services elements is an integral part of planning and preparation. The combination of established element organic assets, material acquisitions, prepositioned material, available host-nation/coalition contributions, and movement of identified CBRND resources from stockpiles and reallocation activities are pursued by the Medical Services staff with the JTF staff and COCOM staff to prepare and support deploying forces as outlined by the appropriate plan. Medical resources and systems are reallocated, when necessary and in coordination with the JTF staff, from prepositioned and dispersed stocks of Medical Services elements deploying or operating within an JOA. Expeditionary operations are a particular concern. Mass medical operations may not be possible until the theater matures or additional resources are allocated to the JTF. Additionally, deploying eligible civilians and MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment. JTF Medical Services staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians and MWAs. Current doctrine and policy does not adequately address sustained operations within a CBRN/TIM environment. Large-scale medical activities and actions are not adequately addressed in DOTMLPF; especially those involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>23</sup> DOTLPF is adequate for planning, equipping, deployment of forces, and coordination of Medical Services support. DOTLPF is inadequate to support sustained operations within a CBRN/TIM environment, particularly expeditionary operations, during the first 30–60 days. Current DOTLPF does not fully address the unique aspects of CBRND and the impact upon operations within a CBRN/TIM environment. Current DOTLPF is inadequate for preparing and equipping deploying eligible civilians and MWAs. DOTLPF is also inadequate to address large-scale medical CBRN/TIM operations, particularly sustained operations within a CBRN/TIM environment and/or COCOM actions associated with large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.). DOTLPF is, further, inadequate for medical quarantine and/or enforcement of medical isolation involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nations, etc.).

<sup>24</sup> JTF staff plans and supporting JTF Medical Services plans include predeployment medical screening and the stockpiling, allocation, and distribution of medical prophylaxis. Specific implementation for the application of prophylactic immunizations is addressed in Medical Services support plans. Planning for large-scale medical operations are based upon COCOM and Strategic Theater Medical Services plans and coordinated by the Medical Services staffs with the JTF staff for JTF support and appropriate resourcing. DOTLPF is inadequate to address large-scale medical CBRN/TIM operations, particularly sustained operations within a CBRN/TIM environment and/or JTF staff and Medical Services actions associated with large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>25</sup> JTF plans address medical activities by referring to appropriate medical plans, policies, and procedures. The Medical Services staff plans and develops associated policies addressing medical activities and procedures to support JTF operations. The invocation of quarantine and enforcement of medical isolation are within the purview of medical authorities. The JTF staff provides support as defined in the coordinated and appropriate medical plans. The Medical Services staff coordinates with the JTF staff for Medical Services support requirements and associated taskings and their inclusion in JTF staff planning. DOTLPF is inadequate to address large-scale medical CBRN/TIM operations, particularly sustained operations within a CBRN/TIM environment and/or JTF staff and Medical Services actions associated with large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>26</sup> Existing medical facilities within an HTA exercise the reception of contaminated/exposed casualties. Voluntary institutional training for the treatment of contaminated/exposed casualties is available through AMEDD. Periodic exercises are performed with medical activities, but on a limited basis, to provide training opportunities and to assess capabilities. Treatment of casualties is currently performed following completion of casualty decontamination. AMEDD institutional training for the treatment of contaminated/exposed casualties is not mandatory for medical practitioners identified for deployment or assignment where there exists a CBRN/TIM threat. The ability of the JTF staff to ensure medical capabilities for CBRND is limited by routine medical operations and requirements. Generally, casualty care until completion of decontamination is performed by medical corpsmen, not medical practitioners. Isolation of large-scale numbers of contaminated/infectious casualties is not adequately addressed in DOTLPF and current medical operations are limited in their isolation abilities.

<sup>27</sup> Force protection using medical prophylaxis is dependent upon identification of the threat, preplanning for a threat, positioning of stocks for issue and administration, timing of notification to administer/issue prophylaxis, availability of medical personnel to perform administration (if required), ongoing operational requirements, and the available quantity of sufficient medical prophylaxis to meet requirements. Vaccination to achieve acquired immunity by force personnel prior to entry into the theater or completion of an adequate level of acquired immunity prior to adversary biological agent employment is a function of the preplanning and deployment operations. The JTF staff directs the implementation of these measures when and as appropriate based upon established plans and Medical Services guidance. Medical prophylaxis does not exist for all threat biological agents. Current prophylaxis and supporting doctrine, policy, and procedures do not address presymptomatic medical CBRND protective countermeasures by other than U.S. forces, excluding

MWAs and eligible civilians. Additionally, the efficacy of existing prophylaxis, particularly vaccines, widely varies. The application of medical prophylaxis is not adequately addressed for eligible civilians and MWAs within the force.

<sup>28</sup> The Medical Services staff plans and associated policies address medical activities and procedures, including Preventative Medicine. Medical surveillance and the implementation of medical countermeasures are within the purview of medical authorities and are a consideration for medical planning for operations with a CBRN/TIM threat. The Medical Services staff coordinates with the JTF staff for Preventive Medicine support requirements, associated taskings, and their inclusion in JTF staff planning. DOTLPP is inadequate to address large-scale medical CBRN/TIM operations, particularly sustained operations within a CBRN/TIM environment and/or JTF staff and Medical Services actions associated with large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>29</sup> COCOM and JTF plans include the medical review of personnel identified against deployment taskings. Screenings of deployable personnel are periodically performed for potential limitations. Often, these are associated with annual medical physicals. The routine rotation and movement of personnel to and from units. The JTF and Medical Services staff plans attempt to provide for early (prior to deployment notice) and continued medical screening of tasked forces. Plans also include provisions for the conduct of predeployment screenings by medical personnel upon notification of deployment. Often, a record review is conducted of the period following the physical for indications of issues precluding deployment. Predeployment medical screenings do not consider prior presymptomatic low-dose CBRN/TIM exposures, associated potential cumulative long-term effects, and the potential threat. Timing of notice of deployment and the availability of medical personnel impact the conduct of predeployment screenings. Short-notice operations and reallocated taskings may also impact the conduct of predeployment medical screenings. However, annual physicals, when used to meet deployment screening requirements, may be conducted several months before a deployment.

<sup>30</sup> Automated systems to track medical treatment and the movement of casualties exist at Echelon 3 and higher levels of care. Unit reporting includes CBRND readiness. Reliance is placed upon the individual's vaccination record and health record (both manual records) to reflect the most recent status of the individual. Current medical systems are stovepiped and require manual intervention to share information. Medical treatment recording below Echelon 3 is limited and not linked to higher-echelon systems. Outpatient care is not generally recorded and aggregate information is reported. Unit reporting is not linked to medical information systems. Individual manual vaccination and health records are not always available or complete.

<sup>31</sup> Medical prophylaxis is issued/administered for identified CBRN/TIM threats to the military force. The administration and issuance of prophylaxis is addressed by the JTF and Medical Services staffs during the planning and support for operations. Prophylaxis for MWAs is virtually nonexistent. Prophylaxis for eligible civilians is not adequately addressed in current doctrine, policy, and procedures.

<sup>32</sup> Doctrine, policy, and procedures exist to identify potentially exposed units and personnel for treatment and medical surveillance. Potentially affected units are identified by Medical Services to the JTF staff and appropriate medical actions are taken. Automated systems to track medical treatment and the movement of casualties exist at Echelon 3 and higher levels of care. Current medical systems are stovepiped and require manual intervention to share information. Medical treatment recording below Echelon 3 is limited and not linked to higher-echelon systems. Outpatient care is not generally recorded and aggregate information is reported.

<sup>33</sup> JTF plans address medical activities by referring to appropriate medical plans, policies, and procedures. The Medical Services staff plans and develops associated policies addressing medical activities and procedures to support JTF operations. The invocation of quarantine and enforcement of medical isolation are within the purview of medical authorities. The JTF staff provides support as defined in the coordinated and appropriate medical plans. The Medical Services staff coordinates with the JTF staff for Medical Services support requirements and associated taskings and their inclusion in JTF staff planning. DOTLPP is inadequate to address JTF actions associated with medical quarantine and/or enforcement of medical isolation involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>34</sup> JTF plans address medical activities by referring to appropriate medical plans, policies, and procedures. The Medical Services staff plans and develops associated policies addressing medical activities and procedures to support JTF operations. The implementation and operation of large-scale quarantine sheltering and treatment operations are within the purview of medical authorities. The JTF staff provides support and resources as defined in the coordinated and appropriate medical plans and as adjusted as requested by appropriate medical authorities to meet specific circumstances. Large-scale medical activities and actions are not adequately addressed in DOTLPP; especially those involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>35</sup> Existing standards and procedures provide adequate protection of handling and transporting personnel against secondary exposure/contamination and require the application of protective equipment and measures if the potential exists for contamination/exposure. Casualties able to wear standard IPE are required to apply the equipment outside of CPSS. Medical policy is the patient's unit is responsible for providing the equipment to the medical unit for use by the patient. Unit-level training is limited to the movement of casualties to the medical facility and is predominantly reliant upon tactical ground transport. Air transport (tactical rotary-wing) is a last resort due to concerns about asset contamination. Tactical and strategic fixed-wing air transport is not considered an acceptable means of transport. Air and sea transport resources are inadequately equipped and prepared to transport exposed and contaminated human and MWA casualties. Exposed and contaminated casualties (human and MWA) unable to wear IPE are not adequately addressed in

doctrine, policy, and standards. Protective equipment is not available for these casualties. However, medical units are not provided stocks of standard IPE for use by patients. Operationally involved units may be delayed, at best, in providing the equipment. Large-scale medical activities and actions are not adequately addressed in DOTLPPF; especially those involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>36</sup> The JTF and Medical Services staff conduct coordinated planning for operations using the COCOM-identified forces for the potential threat. Equipping the tasked force and Medical Services elements are an integral part of planning and preparation. The combination of established force and Medical Services elements organic assets, material acquisitions, prepositioned material, available host-nation/coalition contributions, and movement of identified CBRND resources from stockpiles and reallocation activities are pursued by the JTF and Medical Services staffs with the COCOM staff to prepare and support deploying forces as outlined by the appropriate plan. Medical and CBRND resources and systems are reallocated, when necessary, from prepositioned and dispersed stocks of units/Medical Services elements deploying or operating within an JOA. Expeditionary operations are a particular concern. Mass medical operations may not be possible until the theater matures or additional resources are allocated to the JTF. Additionally, deploying eligible civilians and MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment. JTF and Medical Services staffs do not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians and MWAs. Current doctrine and policy does not adequately address sustained operations within a CBRN/TIM environment. Large-scale medical activities and actions are not adequately addressed in DOTLPPF; especially those involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

### 12.13.3 Functional Solution Analysis

#### 12.13.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** DOTLPF is inadequate to address large-scale medical CBRN/TIM operations, particularly sustained operations within a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, procedures, and *UJTL* sustained operations (medical and nonmedical) within a CBRN/TIM environment. Include COCOM and Medical Services activities associated with the planning, coordination, implementation, operation, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Organization:* Ensure resources, taskings, and staff are in place or available to plan and perform sustained operations (medical and nonmedical) within a CBRN/TIM environment and/or operations addressing COCOM and Medical Services actions associated with the planning, coordination, implementation, operation, support, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Training:* Train, exercise, and evaluate the force for sustained operations (medical and nonmedical) within a CBRN/TIM environment and/or operations addressing COCOM and Medical Services actions associated with the planning, coordination, implementation, operation, support, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Leadership:* Recognize criticality of readiness of the force for potential sustained operations (medical and nonmedical) within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare the force and appropriately support large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Personnel:* Ensure that eligible civilian personnel and operations supporting the mission/military operations (medical and nonmedical) are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities:* Develop supporting infrastructure for sustained operations within a CBRN/TIM environment and operations associated with large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.).
- 2. Deficiency:** Joint medical training for the treatment of contaminated/exposed casualties is not mandatory for medical practitioners identified for deployment or assignment where there exists a CBRN/TIM threat.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures the application of institutional and unit training standards for the handling of exposed and contaminated casualties. *Training:* Establish training, exercise, and evaluation standards for

the safe handling of exposed and contaminated casualties. *Leadership*: Implement and manage training and equipping of functions and activities handling exposed and contaminated casualties.

3. **Deficiency**: Joint medical training for the treatment of contaminated/exposed MWA casualties is not mandatory for medical/veterinary practitioners identified for deployment or assignment where there exists a CBRN/TIM threat.

**Non-Materiel Solutions**: *Doctrine*: Promulgate doctrine, policy, and procedures the application of institutional and unit training standards for the handling of exposed and contaminated MWA casualties. *Training*: Establish training, exercise, and evaluation standards for the safe handling of exposed and contaminated MWA casualties. *Leadership*: Implement and manage training and equipping of functions and activities handling exposed and contaminated MWA casualties.

4. **Deficiency**: The ability of the JTF and Medical Services staffs to ensure medical capabilities for CBRND is limited by routine medical operations and requirements.

**Non-Materiel Solutions**: *Doctrine*: Develop doctrine, policy, and procedures requiring comprehensive participation and integration of all potentially affected personnel and activities in CBRND exercises. *Organization*: All affected entities are aware of and participate in comprehensive exercises. *Training*: All personnel (military and nonmilitary) are trained in appropriate CBRND protective measures. *Leadership*: Recognize importance of medical services and balance with criticality for readiness to rapidly and accurately perform CBRND and conduct medical operations associated with CBRN/TIM environments and hazards. Recognition of the value of comprehensive exercises to enhance readiness, survival, and promote interaction between activities.

5. **Deficiency**: Generally, casualty care until completion of decontamination is performed by medical corpsmen, not medical practitioners.

**Non-Materiel Solutions**: *Doctrine*: Incorporate the safe handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties into doctrine, policy and procedures and requires specific exercising and evaluation for these operations and activities that includes all activities and functions conducting these functions including nonmedical activities and functions. *Organization*: Ensure resources, taskings, and trained personnel are in place or available to support the handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties by all activities and functions conducting these functions including nonmedical activities and functions. *Training*: Train, exercise, and evaluate the handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties by all activities and functions conducting these functions including nonmedical activities and functions, including the prevention of secondary exposure/contamination. *Leadership*: Implement and manage training, equipping, protective measures, and exercising for the safe handling, transport, medical reception and triage, and treatment of contaminated casualties by all activities and functions conducting these functions including nonmedical activities and functions.

6. **Deficiency:** Generally, MWA casualty care until completion of decontamination is performed by medical corpsmen, not medical/veterinary practitioners.

**Non-Materiel Solutions:** *Doctrine:* Incorporate the safe handling, transport, protective measures, medical reception and triage, and treatment of contaminated MWA casualties into doctrine, policy and procedures and requires specific exercising and evaluation for these operations and activities that includes all activities and functions conducting these functions including nonmedical activities and functions. *Organization:* Ensure resources, taskings, and trained personnel are in place or available to support the handling, transport, protective measures, medical reception and triage, and treatment of contaminated MWA casualties by all activities and functions conducting these functions including nonmedical activities and functions. *Training:* Train, exercise, and evaluate the handling, transport, protective measures, medical reception and triage, and treatment of contaminated MWA casualties by all activities and functions conducting these functions including nonmedical activities and functions, including the prevention of secondary exposure/contamination. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe handling, transport, medical reception and triage, and treatment of contaminated MWA casualties by all activities and functions conducting these functions including nonmedical activities and functions.

7. **Deficiency:** Isolation of large-scale numbers of contaminated/infectious casualties is not adequately addressed in DOTMLPF and current medical operations are limited in their isolation abilities.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, procedures, and *UJTL* COCOM and Medical Services activities associated with the planning, coordination, implementation, operation, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Organization:* Ensure resources, taskings, and staff are in place or available for operations addressing COCOM and Medical Services actions associated with the planning, coordination, implementation, operation, support, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Training:* Train, exercise, and evaluate the force for COCOM and Medical Services actions associated with the planning, coordination, implementation, operation, support, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Leadership:* Recognize criticality of readiness of the force for potential operations (medical and nonmedical) within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare the force and appropriately support large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Personnel:* Ensure that eligible civilian personnel and operations supporting the mission/military operations (medical and nonmedical) are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities:* Develop supporting infrastructure for operations associated with large-scale medical operations involving non-U.S. personnel (e.g.,

indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.).

8. **Deficiency:** Medical prophylaxis does not exist for all threat biological agents.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards for prophylactic CBRND protection against all threat agents.

*Training:* Train, exercise, and evaluate personnel (military and eligible civilians) on the use of prophylactic CBRND protection against threat agents. *Leadership:* Enforce compliance with established standards (see Footnote 1 above) for prophylactic CBRND protection.

Implement and ensure training is adequate and conduct exercises and evaluations to ensure readiness.

9. **Deficiency:** Current prophylaxis and supporting doctrine, policy, and procedures do not address presymptomatic medical CBRND protective countermeasures by other than U.S. forces, excluding eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing eligible civilians during CBRND operations and the provision of CBRND protection, including prophylaxis.

*Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRND training, exercises, and evaluations.

*Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians.

10. **Deficiency:** Current prophylaxis and supporting doctrine, policy, and procedures do not address presymptomatic medical CBRND protective countermeasures by other than U.S. forces, excluding MWAs.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing MWAs during CBRND operations and the provision of CBRND protection, including prophylaxis.

*Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations.

*Leadership:* Implement and manage CBRND training, equipping, and protection of MWAs.

11. **Deficiency:** The efficacy of existing prophylaxis, particularly vaccines, widely varies.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of baseline standards for prophylactic CBRND protection against all threat agents.

*Leadership:* Enforce compliance with established standards (see Footnote 5 above) for prophylactic CBRND protection.

12. **Deficiency:** The application of medical prophylaxis is not adequately addressed for eligible civilians within the force.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures requirement to address the administration, provision, and application of medical CBRND protective countermeasures by eligible civilians. *Organization:* Address organizational issues (e.g., who provides the equipment, support forces to train and equip, etc.) related to the provision of CBRN/TIM protection to eligible civilians.

*Training:* Include eligible civilians in CBRND training, exercises, and evaluations. Identify training requirements and responsibilities for non-U.S. forces. *Leadership:* Ensure leadership awareness of criticality of

increased dependence of military operations upon civilians. *Personnel*: Require eligible civilians supporting the mission to meet minimum standards for safe use of CBRND resources. *Facilities*: Develop supporting infrastructure for eligible civilian CBRND (e.g., logistics, medical services, veterinary surveillance, etc.).

- 13. Deficiency:** The application of medical prophylaxis is not adequately addressed for MWAs within the force.

**Non-Materiel Solutions:** *Doctrine*: Establish in doctrine, policy, and procedures requirement to address the administration, provision, and application of medical CBRND protective countermeasures by MWAs, particularly MWDs. *Organization*: Address organizational issues (e.g., who provides the equipment, support forces to train and equip, etc.) related to the provision of CBRN/TIM protection to MWAs. *Training*: Include MWAs in CBRND training, exercises, and evaluations. *Leadership*: Ensure leadership awareness of criticality of MWD resources. *Facilities*: Develop supporting infrastructure for MWA CBRND (e.g., logistics, medical services, veterinary surveillance, etc.).

- 14. Deficiency:** Predeployment medical screenings do not consider prior presymptomatic low-dose CBRN/TIM exposures, associated potential cumulative long-term effects, and the potential threat.

**Non-Materiel Solutions:** *Doctrine*: Establish in doctrine, policy, and procedures the application of low-dose exposure limits and cumulative long-term low-dose exposures in predeployment medical screenings. *Leadership*: Enforce compliance with established doctrine, policy, and procedures (see Footnote 10 above) for low-dose exposure limits and cumulative long-term low-dose exposures in predeployment medical screenings.

- 15. Deficiency:** Timing of notice of deployment and the availability of medical personnel impact the conduct of predeployment screenings.

**Non-Materiel Solutions:** *Doctrine*: Establish in doctrine, policy, and procedures the application of baseline standards for prophylactic CBRND protection against all threat agents. *Leadership*: Enforce compliance with established standards (see Footnote 5 above) for prophylactic CBRND protection.

- 16. Deficiency:** Short-notice operations and reallocated taskings may also impact the conduct of predeployment medical screenings.

**Non-Materiel Solutions:** *Doctrine*: Establish in doctrine, policy, and procedures the application of baseline standards for prophylactic CBRND protection against all threat agents. *Leadership*: Enforce compliance with established standards for prophylactic CBRND protection.

- 17. Deficiency:** Annual physicals, when used to meet deployment screening requirements, may be conducted several months before a deployment.

**Non-Materiel Solutions:** *Doctrine*: Establish in doctrine, policy, and procedures the application of baseline standards for prophylactic CBRND protection against all threat agents. *Leadership*: Enforce compliance with established standards (see Footnote 5 above) for prophylactic CBRND protection.

**18. Deficiency:** Current medical systems are stovepiped and require manual intervention to share information.

**Non-Materiel Solutions:** *Doctrine:* Enforce doctrine, policy, and procedures for integrated automated systems and application of data systems standards.

**19. Deficiency:** Medical treatment recording below Echelon 3 is limited and not linked to higher-echelon systems.

**Non-Materiel Solutions:** *Doctrine:* Enforce doctrine, policy, and procedures for integrated automated systems and application of data systems standards.

**20. Deficiency:** Outpatient care is not generally recorded and aggregate information is reported.

**Non-Materiel Solutions:** *Doctrine:* Enforce doctrine, policy, and procedures for integrated automated systems, application of data systems standards, and the timely and accurate reporting of medical treatment information.

**21. Deficiency:** Unit reporting is not linked to medical information systems.

**Non-Materiel Solutions:** *Doctrine:* Enforce doctrine, policy, and procedures for integrated automated systems and application of data systems standards.

**22. Deficiency:** Individual manual vaccination and health records are not always available or complete.

**Non-Materiel Solutions:** *Doctrine:* Enforce doctrine, policy, and procedures for integrated automated systems, application of data systems standards, and the timely and accurate reporting of medical treatment information.

**23. Deficiency:** Prophylaxis for MWAs is virtually nonexistent.

**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of MWAs, particularly MWDs, and training for CBRN/TIM environment survival. *Organization:* Ensure organizational consideration for maintenance and support of MWA CBRND protective equipment, measures, and activities. *Training:* Provide institutional and unit training of handlers and MWAs for CBRND measures and activities. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for MWA survivability. *Facilities:* Develop supporting infrastructure for MWA CBRND (e.g., logistics, veterinary surveillance, etc.).

**24. Deficiency:** DOTMLPF is inadequate to address JTF actions associated with medical quarantine and/or enforcement of medical isolation involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, procedures, and *UJTL* sustained operations (medical and nonmedical) within a CBRN/TIM environment. Include COCOM and Medical Services activities associated with the planning, coordination, implementation, operation, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Organization:* Ensure resources, taskings, and staff are in place or available to plan and perform sustained operations (medical and nonmedical) within a CBRN/TIM environment and/or operations addressing COCOM and Medical

Services actions associated with the planning, coordination, implementation, operation, support, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Training*: Train, exercise, and evaluate the force for sustained operations (medical and nonmedical) within a CBRN/TIM environment and/or operations addressing COCOM and Medical Services actions associated with the planning, coordination, implementation, operation, support, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Leadership*: Recognize criticality of readiness of the force for potential sustained operations (medical and nonmedical) within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare the force and appropriately support large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Personnel*: Ensure that eligible civilian personnel and operations supporting the mission/military operations (medical and nonmedical) are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities*: Develop supporting infrastructure for sustained operations within a CBRN/TIM environment and operations associated with large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.).

- 25. Deficiency:** Large-scale medical activities and actions are not adequately addressed in DOTMLPF; especially those involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

**Non-Materiel Solutions:** *Doctrine*: Include in doctrine, policy, procedures, and *UJTL* COCOM and Medical Services activities associated with the planning, coordination, implementation, operation, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Organization*: Ensure resources, taskings, and staff are in place or available for operations addressing COCOM and Medical Services actions associated with the planning, coordination, implementation, operation, support, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Training*: Train, exercise, and evaluate the force for COCOM and Medical Services actions associated with the planning, coordination, implementation, operation, support, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Leadership*: Recognize criticality of readiness of the force for potential operations (medical and nonmedical) within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare the force and appropriately support large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Personnel*: Ensure that eligible civilian personnel and operations supporting the mission/military operations (medical and nonmedical) are qualified in CBRND and capable of performing their responsibilities in

a CBRN/TIM environment. *Facilities*: Develop supporting infrastructure for operations associated with large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.).

- 26. Deficiency:** Air transport (tactical rotary-wing) is a last resort due to concerns about asset contamination. Tactical and strategic fixed-wing air transport is not considered an acceptable means of transport. Air and sea transport resources are inadequately equipped and prepared to transport exposed and contaminated casualties.

**Non-Materiel Solutions:** *Doctrine*: Promulgate and implement doctrine, policy, standards, and procedures for the safe transport by air and sea of exposed and contaminated casualties, including the prevention of secondary exposure/contamination of the airframe and aircrew.

*Organization*: Organizational resources, taskings, and trained personnel are in place or available to support the safe air and sea transport of exposed and contaminated casualties, including the prevention of secondary exposure/contamination of the airframe and aircrew.

*Training*: Institutional and unit-level training for application of standards for the safe transport by air and sea of exposed and contaminated casualties. Exercising and evaluations to assess capabilities and prepare for the conduct of safe transport by air of exposed and contaminated casualties. Training, exercising, and evaluation include measures to prevent secondary exposure/contamination of the airframe and aircrew. *Leadership*: Recognize criticality for the protection of air transport resources from secondary contamination/exposure to CBRN/TIM agents while providing safe air/sea transport of exposed and contaminated casualties. *Facilities*: Develop supporting infrastructure for the safe air transport of contaminated casualties, including the prevention of secondary exposure/contamination to airframe/vessel and crews.

- 27. Deficiency:** Air transport (tactical rotary-wing) is a last resort due to concerns about asset contamination. Tactical and strategic fixed-wing air transport is not considered an acceptable means of transport. Air and sea transport resources are inadequately equipped and prepared to transport exposed and contaminated MWA casualties.

**Non-Materiel Solutions:** *Doctrine*: Promulgate and implement doctrine, policy, standards, and procedures for the safe transport by air and sea of exposed and contaminated MWA casualties, including the prevention of secondary exposure/contamination of the airframe and aircrew. *Organization*: Organizational resources, taskings, and trained personnel are in place or available to support the safe air and sea transport of exposed and contaminated MWA casualties, including the prevention of secondary exposure/contamination of the airframe and aircrew. *Training*: Institutional and unit-level training for application of standards for the safe transport by air and sea of exposed and contaminated MWA casualties. Exercising and evaluations to assess capabilities and prepare for the conduct of safe transport by air of exposed and contaminated MWA casualties. Training, exercising, and evaluation include measures to prevent secondary exposure/contamination of the airframe and aircrew.

*Leadership*: Recognize criticality for the protection of air transport resources from secondary contamination/exposure to CBRN/TIM agents while providing safe air/sea transport of exposed and contaminated MWA casualties. *Facilities*: Develop supporting infrastructure for the safe air transport of contaminated MWA casualties, including the prevention of secondary exposure/contamination to airframe/vessel and crews.

**28. Deficiency:** Exposed and contaminated casualties unable to wear IPE are not adequately addressed in doctrine, policy, and standards.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures for the application of CBRND standards for the protection of casualties who cannot be adequately protected by standard IPE, including prevention of secondary exposure/contamination.

*Organization:* Ensure organizational considerations for the protection of casualties who cannot be adequately protected by standard IPE, including prevention of secondary exposure/contamination. Includes ensuring resources, taskings, and trained personnel are in place or available. *Training:* Establish training, exercise, and evaluation standards/criteria involving exposed and contaminated casualties. *Leadership:* Recognize criticality for the protection of casualties who cannot be adequately protected by standard IPE, training providing skills to manage operations of these types, and willingness to implement necessary changes and activities to prepare to perform and support protective operations/activities.

**29. Deficiency:** Exposed and contaminated MWA casualties unable to wear IPE are not adequately addressed in doctrine, policy, and standards.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures for the application of CBRND standards for the protection of MWA casualties who cannot be adequately protected by standard IPE, including prevention of secondary exposure/contamination. *Organization:* Ensure organizational considerations for the protection of MWA casualties who cannot be adequately protected by standard IPE, including prevention of secondary exposure/contamination. Includes ensuring resources, taskings, and trained personnel are in place or available. *Training:* Establish training, exercise, and evaluation standards/criteria involving exposed and contaminated MWA casualties. *Leadership:* Recognize criticality for the protection of MWA casualties who cannot be adequately protected by standard IPE, training providing skills to manage operations of these types, and willingness to implement necessary changes and activities to prepare to perform and support protective operations/activities.

**30. Deficiency:** Protective equipment is not available for exposed and contaminated casualties unable to wear IPE.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures for the application of CBRND standards for the protection of casualties who cannot be adequately protected by standard IPE, including prevention of secondary exposure/contamination.

*Organization:* Ensure organizational considerations for the protection of casualties who cannot be adequately protected by standard IPE, including prevention of secondary exposure/contamination. Includes ensuring resources, taskings, and trained personnel are in place or available. *Training:* Establish training, exercise, and evaluation standards/criteria involving exposed and contaminated casualties. *Leadership:* Recognize criticality for the protection of casualties who cannot be adequately protected by standard IPE, training providing skills to manage operations of these types, and willingness to implement necessary changes and activities to prepare to perform and support protective operations/activities.

**31. Deficiency:** Protective equipment is not available for exposed and contaminated MWA casualties unable to wear IPE.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures for the application of CBRND standards for the protection of MWA casualties who cannot be adequately protected by standard IPE, including prevention of secondary exposure/contamination. *Organization:* Ensure organizational considerations for the protection of MWA casualties who cannot be adequately protected by standard IPE, including prevention of secondary exposure/contamination. Includes ensuring resources, taskings, and trained personnel are in place or available. *Training:* Establish training, exercise, and evaluation standards/criteria involving exposed and contaminated MWA casualties. *Leadership:* Recognize criticality for the protection of MWA casualties who cannot be adequately protected by standard IPE, training providing skills to manage operations of these types, and willingness to implement necessary changes and activities to prepare to perform and support protective operations/activities.

- 32. Deficiency:** Medical units are not provided stocks of standard IPE for use by patients.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures for the provisioning of Medical Services elements with standard IPE for the protection of human and appropriate MWA casualties who can be adequately protected by standard IPE.

- 33. Deficiency:** Expeditionary operations are a particular concern. Mass medical operations may not be possible until the theater matures or additional resources are allocated to the JTF.

**Non-Materiel Solutions:** *Doctrine:* Complete the JCIDS process and central correlation/comparison of operations plans to identify CBRND resources necessary and available to support expeditionary medical operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct expeditionary medical operations while possessing reduced logistical footprint and during the first 30–90 days of operations following commencement of hostilities. *Training:* Train, exercise, and evaluate expeditionary capabilities of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operations using CBRND resources supporting expeditionary medical operations. *Leadership:* Recognize differences and challenges associated with expeditionary medical operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint; training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary medical operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for expeditionary medical operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.

- 34. Deficiency:** Deploying eligible civilians are not equipped and trained to survive a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of eligible civilians and training for CBRN/TIM environment survival. *Organization:* Ensure organizational consideration for maintenance and support of eligible civilians CBRND protective equipment, measures, and activities. *Training:* Provide institutional and unit training of eligible civilians for CBRND measures and activities. Integrate into CBRND exercises and evaluations. *Leadership:* Ensure awareness and

planning for CBRND measures and requirements for eligible civilians survivability.

*Facilities:* Develop supporting infrastructure for eligible civilians CBRND (e.g., logistics, medical, communications, training, etc.).

- 35. Deficiency:** Deploying MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of MWAs, particularly MWDs, and training for CBRN/TIM environment survival.

*Organization:* Ensure organizational consideration for maintenance and support of MWA CBRND protective equipment, measures, and activities. *Training:* Provide institutional and unit training of eligible civilians, MWA handlers, and MWAs for CBRND measures and activities. Integrate into CBRND exercises and evaluations. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for MWD survivability. *Facilities:* Develop supporting infrastructure for MWD CBRND (e.g., logistics, medical, veterinary surveillance, communications, training, etc.).

- 36. Deficiency:** JTF and Medical Services Staffs do not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing civilian personnel and operations for CBRND. *Organization:* Identify organizational services and activities supporting the mission performed by civilian personnel and operations.

*Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians.

*Personnel:* Ensure that eligible civilians supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities:* Develop supporting infrastructure for eligible civilian CBRND (e.g., logistics, medical, training, communications, etc.).

- 37. Deficiency:** JTF and Medical Services Staffs do not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying MWAs.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing MWAs, particularly MWDs, and MWA operations for CBRND. *Organization:* Identify organizational services and activities supporting CBRN/TIM survival by MWAs and mission operations. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWDs; and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWAs. *Facilities:* Develop supporting infrastructure for MWD CBRND (e.g., logistics, medical, veterinary surveillance, training, communications, etc.).

- 38. Deficiency:** Current DOTMLPF does not fully address the unique aspects of CBRND and the impact upon operations within a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, procedures, and *UJTL* sustained operations (medical and nonmedical) within a CBRN/TIM environment.

*Organization:* Ensure resources, taskings, and staff are in place or available to plan and perform sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations (medical and nonmedical) within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations (medical and nonmedical) within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force. *Personnel:* Ensure that eligible civilian personnel and operations supporting the mission/military operations (medical and nonmedical) are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment.

- 39. Deficiency:** Current DOTMLPF is inadequate for preparing and equipping deploying eligible civilians and MWAs.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing eligible civilian personnel and MWDs for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of MWD and eligible civilian personnel within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWDs and eligible civilians and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilian personnel and MWDs.

- 40. Deficiency:** DOTMLPF is inadequate for medical quarantine and/or enforcement of medical isolation involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nations, etc.).

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, procedures, and *UJTL* COCOM and Medical Services activities associated with the planning, coordination, implementation, operation, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Organization:* Ensure resources, taskings, and staff are in place or available for operations addressing COCOM and Medical Services actions associated with the planning, coordination, implementation, operation, support, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Training:* Train, exercise, and evaluate the force for COCOM and Medical Services actions associated with the planning, coordination, implementation, operation, support, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Leadership:* Recognize criticality of readiness of the force for potential operations (medical and nonmedical) within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare the force and appropriately support large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Personnel:* Ensure that eligible civilian personnel and operations supporting the mission/military operations (medical and nonmedical) are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities:* Develop supporting infrastructure for operations

associated with large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.).

**12.13.3.2 IMA Assessment Summary**

N/A

**12.14 Task OPSHLD 14: Establish mortuary process to handle contaminated remains****12.14.1 Functional Area Analysis****12.14.1.1 Definition**

To establish the mortuary process to ensure the safe handling, storage, and transport of contaminated remains. Contaminated human and MWA remains may require storage and transport to another location. The safe handling, storage, and transport of contaminated human and MWA remains may require that they be fully and completely contained and sealed to minimize the potential for release of contaminants. Contaminated remains IPE must be impermeable and not permit release of contaminants. The design must be functional and easy to transport, store, support, and dispose. Decontamination of the remains and container will be required. When operational conditions and mission requirements allow, remains' decontamination, handling processes, disposition, and containers should be compatible with the appropriate religious practices.

**12.14.1.2 Derivation**

*Joint Enabling Concept for CBRN Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (OP 2.4.1.1, OP 5.4.4, OP 5.3, OP 5.4, OP 5.4.6, OP 5.5.9, OP 5.7.2, OP 5.7.4, OP 5.7.5, OP 5.7.6, OP 6.2.10, OP 7, OP 7.3, OP 7.4).*

**12.14.1.2.1 Supported Task: N/A****12.14.1.2.2 Lateral Task: OPSHA 7****12.14.1.2.3 Supporting Task: TASHLD 13****12.14.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Partially completed mission preparation. (C2.1.3)
2. Weak to marginal forces assigned. (C2.2.1)
3. Negligible personnel experience. (C2.2.4.5)
4. Limited staff expertise. (C2.3.1.3)
5. Limited deployed supplies. (C2.8.2)
6. Limited prepositioned materiel. (C2.8.4)

**Civil**

1. Opposed international politics. (C3.1.2)
2. Severe restraints on action. (C3.1.3.4)

**12.14.2 Functional Needs Analysis****12.14.2.1 Capability and Deficiency Assessment Summary**

Table 12.14-1 summarizes the capability and deficiencies that currently exist addressing standards, criteria, and procedures for the safe handling and transport of CBRN/TIM exposed or contaminated human and MWA remains.

**Current Capability and Deficiency**

Mortuary Affairs plans, equips, trains, and prepares for the conduct of Mortuary Affairs activities and processes of remains exposed to or contaminated by CBRN/TIM agents. This task includes actions, notices, and materials necessary to preclude potential for secondary exposure by handling, storing, and transporting resources from collection to interment. This also encompasses necessary coordination activities to transport contaminated/exposed remains. CBRN/TIM contaminated remains are handled as hazardous or infectious materials when crossing international borders and are under auspices of international treaties and standards. Nations conforming to United Nations treaties, regulations, and codes with impact upon international transport of remains are identified. However, these treaties and standards do not specifically address exposed and contaminated human and MWA remains resulting from a CBRN/TIM agent, nor do they address mortuary activities. Each nation establishes standards and requirements for mortuary activities as well as requirements for interment within their borders. U.S. national standards also exist for the movement of remains but do not extend to CBRN/TIM exposed and contaminated remains. Individual state regulations and requirements vary but are based upon U.S. national standards. However, these regulations and requirements may impact interment requirements. Centers for Disease Control (CDC) guidelines for movement of highly infectious remains exist and are applied to specific cases for epidemiological investigation and apply only to CDC activities. Deficiencies also include the lack of containment packaging for CBRN/TIM agent exposed and contaminated remains; adequate standards for the marking and safe transport of CBRN/TIM agent exposed and contaminated remains; and the provision of detection and monitoring capabilities for CBRN/TIM contamination/exposure of remains. The overall current capability is “green.”

**Projected Near/Mid-Term Capability and Deficiency**

No change projected for this task.

**Projected Far-Term Capability and Deficiency**

No change projected for this task.

Table 12.14-1. OPSHLD 14: Capability and Deficiency Assessment

Mortuary Affairs	M1	M2	M3	M4	M5	M6	M7	M8
<b>Current Overall Capability<sup>1</sup></b>	G <sup>2</sup>	Y <sup>3</sup>	G <sup>4</sup>	R <sup>3</sup>	Y <sup>5</sup>	G <sup>6</sup>	R <sup>7</sup>	G <sup>8</sup>
<b>Near/Mid-Term Overall Capability</b>	G	Y	G	R	Y	G	R	G
<b>Far-Term Overall Capability</b>	G	Y	G	R	Y	G	R	G

	FAA Measure	Scale
M1	Coordination is performed with Mortuary Affairs for handling, decontaminating, and transporting human and MWA remains.	<p><b>G:</b> Mortuary Affairs units/activities coordinate with the JTF and Medical Services staffs to facilitate the recovery, handling, decontamination, and interment of human remains.</p> <p><b>Y:</b> Mortuary Affairs units/activities coordinate with the JTF and Medical Services staffs to facilitate the recovery and interment of human remains.</p> <p><b>R:</b> Coordination with the JTF and/or Medical Services staffs is inadequate or nonexistent for the recovery and interment of human remains.</p>
M2	Mortuary Affairs plans and procedures address the receipt, handling, decontamination, identification, marking, and transportation of CBRN/TIM exposed/contaminated remains.	<p><b>G:</b> Doctrine, policies, procedures, TTPs, and plans address the receipt, handling, decontamination, identification, marking, and transport of CBRN/TIM exposed/contaminated remains.</p> <p><b>Y:</b> Doctrine, policies, procedures, TTPs, and plans address the receipt, handling, decontamination, and identification of CBRN/TIM exposed/contaminated remains.</p> <p><b>R:</b> Doctrine, policies, procedures, TTPs, and/or plans are inadequate or nonexistent for the receipt, handling, decontamination, and/or identification of CBRN/TIM exposed/contaminated remains.</p>
M3	Mortuary Affairs personnel are trained to handle CBRN/TIM exposed/contaminated remains.	<p><b>G:</b> Detailed doctrine, policy, procedures, and training exist for the safe handling of CBRN/TIM exposed/contaminated remains by Mortuary Affairs personnel and activities.</p> <p><b>Y:</b> General doctrine, policy, procedures, and training exist for the handling of CBRN/TIM exposed/contaminated remains by Mortuary Affairs personnel.</p> <p><b>R:</b> Doctrine, policy, procedures, and training are inadequate or nonexistent for the handling of CBRN/TIM exposed/contaminated remains by Mortuary Affairs personnel.</p>
M4	Contaminated/infectious human and MWA remains are safely processed, transported, and disposition completed.	<p><b>G:</b> Doctrine, policy, procedures, TTPs, training, and plans address the application of protective assets and the safe handling and transport of exposed or contaminated human/MWA remains and specify requirements and measures for the protection of personnel, activities, and resources performing the handling and transport.</p> <p><b>Y:</b> Doctrine, policy, procedures, TTPs, training, and plans address the safe handling and transport of exposed or contaminated remains and identify general measures for the protection of personnel, activities, and resources performing the handling and transport.</p> <p><b>R:</b> Doctrine, policy, procedures, TTPs, training, and/or plans are nonexistent or inadequate to address the safe handling and/or transport of exposed or contaminated remains and/or identification of general measures for the protection of personnel, activities, and/or resources performing the handling and/or transport.</p>

M5	Mortuary Affairs units/activities are trained and equipped to operate CBRN/TIM detection and monitoring devices.	<p><b>G:</b> Mortuary Affairs units and activities are equipped and trained to operate CBRN/TIM detection devices and sensors for application to remains.</p> <p><b>Y:</b> Mortuary Affairs units and activities are trained and equipped to apply standard individual CBRN detection and monitoring devices for application to remains.</p> <p><b>R:</b> Training and/or equipping of Mortuary Affairs units and/or activities is inadequate or nonexistent detection and monitoring of CBRN/TIM in remains.</p>
M6	Mortuary Affairs personnel possess IPE and splash-protective coverings.	<p><b>G:</b> Mortuary Affairs personnel are equipped with adequate splash and CBRN/TIM IPE protection.</p> <p><b>Y:</b> Mortuary Affairs personnel are equipped with CBRN/TIM IPE protection and limited splash protection.</p> <p><b>R:</b> Splash and/or IPE protection is inadequate or nonexistent.</p>
M7	Required remains CBRN/TIM containment, IPE, storage and transport containers for contaminated remains are on hand.	<p><b>G:</b> Adequate types and quantities of CBRN/TIM containment IPE, storage, and transport containers for contaminated remains are readily available for the sealed containment of CBRN/TIM exposed/contaminated remains.</p> <p><b>Y:</b> CBRN/TIM exposed/contaminated remains containment IPE, storage, and transport containers are readily available, and doctrine, policies, procedures, and TTPs exist for the containment and transport of CBRN/TIM contaminated/exposed remains.</p> <p><b>R:</b> Doctrine, policy, procedures, TTPs, and/or CBRN/TIM exposed/contaminated remains containment IPE, storage, and/or transport containers are inadequate or nonexistent.</p>
M8	Required decontamination supplies and equipment are on hand.	<p><b>G:</b> Detailed plans and procedures exist addressing the recovery, preparation, and interment of remains include the identification and allocation of resources and consumables for the effective conduct of remains decontamination.</p> <p><b>Y:</b> Plans and procedures addressing remains recovery, preparation, and interment identify general requirements for resources and consumables for adequate decontamination of remains.</p> <p><b>R:</b> Plans and procedures addressing remains recovery, preparation, and/or interment are nonexistent or inadequately identify types and quantities of resources and materials necessary to decontaminate remains.</p>

<sup>1</sup> Existing DOTMLPF is adequate for the reception, processing, and temporary interment of contaminated remains within the JOA. However, DOTMLPF is inadequate for the containment and transport of contaminated remains for final interment outside the JOA.

<sup>2</sup> Mortuary Affairs units/activities coordinate with the JTF staff to facilitate the recovery, preparation, and final interment of human remains. MWA remains are not processed by these units; rather they are managed by the respective Service's veterinary support elements. However, DOTMLPF is inadequate for the processing of non-U.S. personnel (e.g., indigenous civilians, third-party nations, etc.)

<sup>3</sup> Primary duty mortuary personnel possess adequate doctrine, policy, and procedures to reduce the potential for secondary exposure/contamination. Existing doctrine, policy, and procedures provide adequate protection of personnel against secondary exposure/contamination. Doctrine, policy, and procedures require the application of protective equipment and measures if the potential exists for contamination/exposure. Prior decontamination of exposed/contaminated remains is the only identified means for protecting transportation assets against secondary contamination. The predominant means is decontamination of the asset following secondary exposure/contamination. Protection of support equipment is inadequate. Movement of remains is generally limited initially to tactical ground transport. Air transport (tactical rotary-wing) is a last resort due to concerns about asset contamination. Tactical and strategic fixed-wing air transport is not considered an acceptable means of transport. Decontaminated and contained remains may not be considered a secondary risk by air asset managers. Contaminated remains are handled as hazardous or infectious materials when crossing international borders and are under the treaty auspices of the U.N. The primary applicable codes are under the World Health Organization (WHO) and promulgated under the International Health Regulations of 1969 (as amended). Transport requirements are also governed by the international Civil Aviation Organization Technical Instructions on the Safe Transport of Dangerous Goods By Air (ICAO TI); International Maritime Dangerous Goods (IMDG) Code, and the International Atomic Energy Agency (IAEA) Internal Atomic Energy Regulations for the Safe Transport of Radioactive Materials. However, these standards do not specifically address exposed or contaminated human and MWA remains as the result of a CBRN/TIM agent. National standards and procedures for the movement of human and MWA remains do exist. The extension of these standards and procedures to exposed and contaminated remains does not currently exist. CDC guidelines for movement of highly infectious remains do exist and are applied for specific cases of epidemiological investigation. It is also noted each state

possess unique requirements for the movement and interment of remains. However, DOTMLPF is inadequate for the processing of non-U.S. personnel (e.g., indigenous civilians, third-party nations, etc.). Standardized international markings for contaminated/exposed remains do not exist.

<sup>4</sup> Primary duty mortuary personnel possess adequate doctrine, policy, procedures, and training to reduce the potential for secondary exposure/contamination. Existing doctrine, policy, and procedures provide adequate protection of personnel against secondary exposure/contamination. Doctrine, policy, and procedures require the application of protective equipment and measures if the potential exists for contamination/exposure.

<sup>5</sup> Mortuary Affairs units/activities are not equipped and trained to operate and apply CBRN/TIM detection and monitoring devices other than standard individual warfighter detection devices (e.g., M9 paper, etc.).

<sup>6</sup> Existing protective equipment provides adequate protection of personnel against secondary exposure/contamination. The application of protective equipment and measures if the potential exists for contamination/ exposure is a standard practice. Mortuary personnel performing decontamination and remains preparation additionally require splash protection against decontaminants and body fluids.

<sup>7</sup> Protective containment systems are inadequate or nonexistent.

<sup>8</sup> Mortuary Affairs develops plans to support JTF operations and to facilitate the recovery, preparation, and final interment of human remains. Included in the planning is the identification of decontamination supplies and equipment to process contaminated remains. These plans are coordinated with the JTF staff and required support requirements are identified for inclusion in the JTF plans.

### 12.14.3 Functional Solution Analysis

#### 12.14.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** DOTMLPF is inadequate for the processing of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.)

**Non-Materiel Solutions:** *Doctrine:* Address in doctrine, policy, and procedures Mortuary Affairs operations and activities involving CBRN/TIM contaminated or exposed remains of non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Organization:* Ensure resources, taskings, and staff are in place or available for Mortuary Affairs operations and activities addressing CBRN/TIM contaminated or exposed remains of non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Training:* Train, exercise, and evaluate Mortuary Affairs activities and supporting force elements addressing CBRN/TIM contaminated or exposed remains of non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Leadership:* Ensure awareness of international and national implications of transport of contaminated or exposed remains and the public desire for final interment in homeland. *Facilities:* Develop supporting infrastructure for operations associated with Mortuary Affairs involving CBRN/TIM contaminated or exposed remains of non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.).
- 2. Deficiency:** Prior decontamination of exposed/contaminated remains is the only identified means for protecting transportation assets against secondary contamination.

**Non-Materiel Solutions:** *Doctrine:* Include the application of CBRN/TIM containment packaging/systems designed for exposed/contaminated remains (as well as other alternative methods to preclude secondary exposure/contamination of resources) in doctrine, policy, and procedures. *Training:* Train, exercise, and evaluate the application of CBRN/TIM containment packaging/systems and other alternatives for exposed/contaminated remains. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe application of CBRN/TIM containment packaging/systems and other alternatives for exposed/contaminated remains.
- 3. Deficiency:** Air transport is limited to tactical rotary-wing as a last resort. Tactical and strategic fixed-wing is generally not considered an acceptable means of transport. These are due to concerns about asset contamination.

**Non-Materiel Solutions:** *Doctrine:* Include the application of CBRN/TIM containment packaging/systems designed for exposed/contaminated remains (as well as other alternative methods to preclude secondary exposure/contamination of resources) in doctrine, policy, and procedures. *Training:* Train, exercise, and evaluate the application of CBRN/TIM containment packaging/systems and other alternatives for exposed/contaminated remains to

preclude secondary exposure/contamination of airframes and aircrew. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe application of CBRN/TIM containment packaging/systems and other alternatives for exposed/contaminated remains to preclude secondary exposure/contamination of airframe and aircrew.

4. **Deficiency:** International standards do not specifically address exposed or contaminated remains as the result of a CBRN/TIM agent.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of identified international standards and requirements for mortuary activities as applied to exposed and contaminated remains resulting from a CBRN/TIM agent. *Training:* Include identified international standards and requirements for mortuary activities as applied to exposed/contaminated remains resulting from a CBRN/TIM agent as an essential element of formal and unit training, as well as exercise and evaluation standards and criteria. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe movement of exposed/contaminated remains resulting from a CBRN/TIM agent.

5. **Deficiency:** The extension of national standards and procedures to exposed and contaminated remains do not currently exist.

**Non-Materiel Solutions:** *Doctrine:* Coordinate with appropriate national agencies and authorities to establish in doctrine, policy, and procedures national standards and requirements for the movement of exposed/contaminated remains resulting from a CBRN/TIM agent. *Training:* Establish and implement training, exercise, and evaluation standards and criteria for the safe movement of exposed/contaminated remains resulting from a CBRN/TIM agent. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe movement of exposed/contaminated remains resulting from a CBRN/TIM agent. *Facilities:* Develop supporting infrastructure for the handling, movement, storage, and final disposition of exposed/contaminated remains resulting from a CBRN/TIM agent.

6. **Deficiency:** Mortuary Affairs units/activities are not equipped and trained to operate and apply CBRN/TIM detection and monitoring devices other than standard individual warfighter detection devices (e.g., M9 paper, etc.)

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing CBRN/TIM detection and monitoring of human remains. *Training:* Establish CBRN/TIM detection/monitoring training, exercise, and evaluation criteria and programs for Mortuary Affairs and conduct training, exercises, and evaluations. *Leadership:* Implement and manage CBRN/TIM detection/monitoring training, equipping, and protection of Mortuary Affairs personnel.

7. **Deficiency:** Protective containment systems are inadequate or nonexistent.

**Non-Materiel Solutions:** *Doctrine:* Include the application of CBRN/TIM containment packaging/systems and other alternatives designed for exposed/contaminated remains in doctrine, policy, and procedures. *Training:* Train, exercise, and evaluate the application of CBRN/TIM containment packaging/systems and other alternatives for exposed/contaminated remains. *Leadership:* Implement and manage training, equipping, protective measures, and

exercising for the safe application of CBRN/TIM containment packaging/systems for exposed/contaminated remains.

**8. Deficiency:** Containment marking standards do not exist.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of identified international and national standards and marking requirements exposed and contaminated remains resulting from a CBRN/TIM agent. *Training:* Include identified international and national standards and marking requirements as applied to exposed/contaminated remains resulting from a CBRN/TIM agent as an essential element of formal and unit training, as well as exercise and evaluation standards and criteria.

*Leadership:* Implement and manage training, equipping, protective measures, and exercising for the marking of exposed/contaminated remains resulting from a CBRN/TIM agent.

**9. Deficiency:** DOTMLPF is inadequate for the containment and transport of contaminated remains for final interment outside the JOA.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policy, and procedures addressing the safe handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM exposed/contaminated casualties. *Organization:*

Organization structures, resources, taskings, and trained staff availability to enable and support the safe handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM exposed/contaminated casualties. *Training:* Institutional and unit-level training for the safe handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM exposed/contaminated casualties. *Leadership:* Recognize importance of the safe handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM exposed/contaminated casualties and ensure personnel are properly equipped, adequately trained, fully comply with requirements, and are prepared and ready to perform the necessary tasks and activities. *Facilities:* Develop supporting infrastructure for the handling, movement, storage, and final disposition of exposed/contaminated remains resulting from a CBRN/TIM agent.

### 12.14.3.2 IMA Assessment Summary

N/A

## **CHAPTER 13. TACTICAL SHIELD TASKS**

## Table of Contents

List of Acronyms .....	ii
13.0 Tactical Shield .....	1
13.1 Task TASHLD 1: Ensure proper MOPP level to minimize casualties and maximize mission performance .....	9
13.2 Task TASHLD 2: Initiate medical prophylactic measures to counter CBRN/TIM effects .....	37
13.3 Task TASHLD 3: Protect casualties unable to wear standard individual protection equipment .....	52
13.4 Task TASHLD 4: Protect MWDs against CBRN/TIM contamination/exposure .....	80
13.5 Task TASHLD 5: Protect evacuees, detainees, civilians, and other identified groups from CBRN/TIM effects .....	93
13.6 Task TASHLD 6: Provide safe, collectively protected environment for critical and essential mission tasks and activities and for rest and relief .....	109
13.7 Task TASHLD 7: Provide COLPRO for repairing critical assets .....	132
13.8 Task TASHLD 8: Prelocate consumables to COLPRO and units .....	149
13.9 Task TASHLD 9: Perform protective measures to prevent or mitigate CBRN/TIM contamination of equipment and supplies .....	179
13.10 Task TASHLD 10: Employ expedient and improvised CBRN/TIM protective resources and measures .....	189
13.11 Task TASHLD 11: Protect decontaminating personnel from decontaminants, contamination, and off-gassing .....	203
13.12 Task TASHLD 12: Implement large-scale medical CBRN operations .....	213
13.13 Task TASHLD 13: Perform mortuary activities for CBRN/TIM contaminated remains .....	251
13.14 Task TASHLD 14: Ensure containment of samples and residues to prevent spread of contamination .....	276

## 13.0 Tactical Shield

### 13.0.1 Introduction

At the Tactical (TA) level of war, battles and engagements are planned and executed to accomplish military objectives assigned to tactical units or task forces. Activities at this level focus on the ordered arrangement and maneuver of combat elements in relation to each other and to the enemy to achieve combat objectives. Fourteen Tactical Shield (SHLD) tasks were identified in the chemical, biological, radiological, and nuclear defense (CBRND) Functional Area Analysis (FAA).

This chapter, detailing the TASHLD area, restates relevant information from the CBRND FAA including a description of each of the 14 TASHLD tasks, derivation of the task, an indication of other linked tasks, and the pertinent conditions. The Functional Needs Analysis (FNA) section addresses the capability and deficiency analysis and a brief description of potential near-term changes. Once all the capabilities are considered, the assessment concludes with a separate, overarching look at the entire capability spectrum to identify remaining gaps and/or synergies. The Functional Solutions Analysis (FSA) section addresses possible solutions for the deficiencies identified in the FNA section. These are categorized into materiel or non-materiel. The non-materiel solutions are addressed first and reflect one or more of the six areas of DOTLPPF: doctrine, organization, training, leadership, personnel, and facilities. If there is no non-materiel solution to the deficiencies, then materiel solutions are considered. These encompass broad approaches that are not system-specific. These potential materiel approaches are addressed and evaluated in the Ideas for Material Approaches (IMA) section. The IMAs provide a possible near- to far-term resolution to identified deficiencies within the individual capabilities.

The TASHLD tasks are separated into individual protection, including military working animals (MWAs), specifically military working dogs (MWDs), collective protection (COLPRO), and medical intervention/prevention. Several animal species are used as MWAs; however, MWDs are the predominant species and are most likely to be deployed with military personnel.

### 13.0.2 FNA Summary

Table 13.0-1 summarizes the overall current and projected capability to perform TASHLD tasks identified in the CBRND FAA. The overall capability to conduct these tasks in the current time frame is assessed as “yellow,” while the MWD, enemy prisoner of war (EPW), detainee, and civilian situation is assessed as “red.” There are key deficiencies in our ability to provide individual protective equipment (IPE) (medical and nonmedical) and collective protection equipment (CPE) for nonwarfighter requirements and shortage in CPE to meet all requirements. Additional procurements of CPE, along with using current CPE for other than stated purpose, and IPE will significantly improve the MWD, EPW, detainee, and civilian situation if additional procurement is possible. Improvements and advancements in technology to reduce the impact of IPE constraints on mission capabilities and CPE on mission performance. However, although improvements are identified for specific capabilities supporting the TASHLD tasks and are reflected in the assessment, the improved capabilities are not sufficient to change the overall assessed color ratings for Shield for the current, near/mid, and far terms.

Table 13.0-1. Tactical Shield Summary FNA Findings

CBRN Tactical Shield Task Number	CBRN Tactical Shield Task Title	Capability		
		Current	Near/Mid Term	Far Term
TASHLD 1	Ensure proper MOPP level to minimize casualties and maximize mission performance.	●	●	●
TASHLD 2	Initiate medical prophylactic measures to counter CBRN/TIM effects.	●	●	●
TASHLD 3	Protect casualties unable to wear standard IPE.	●	●	●
TASHLD 4	Protect MWDs against CBRN/TIM contamination/exposure.	●	●	●
TASHLD 5	Protect evacuees, detainees, civilians and other identified groups from CBRN/TIM effects.	●	●	●
TASHLD 6	Provide safe collectively protected environment for critical and essential mission tasks and activities, and rest and relief.	●	●	●
TASHLD 7	Provide COLPRO for repairing critical assets.	●	●	●
TASHLD 8	Prelocate consumables to COLPRO and units.	●	●	●
TASHLD 9.	Perform protective measures to prevent or mitigate CBRN/TIM contamination of supplies and equipment.	●	●	●
TASHLD 10	Employ expedient or improvised CBRN/TIM protective resources and measures.	●	●	●
TASHLD 11	Protect decontaminating personnel from decontamination, contamination and off-gassing	●	●	●
TASHLD 12	Implement large-scale medical CBRN operations.	●	●	●
TASHLD 13	Perform mortuary activities for CBRN/TIM contaminated remains.	●	●	●
TASHLD 14	Ensure containment of samples and residues to prevent spread of contamination.	●	●	●
OVERALL		●	●	●

Metrics are applied to the identified measures within each task and are value scaled. Capabilities are evaluated against the metric scale and assigned an appropriate value for the appropriate defined time period. The value “0,” the lowest value of the scale, generally means the measure is nonexistent or absent and is “red” on the color scale. Inadequate or insufficient, depending upon the metric, is usually assigned a value ranging 1–3 for the measure and also is “red.” Partially capable, as defined by the metric, is 4–7 and “yellow” on the scale; while fully capable ranges 8–10 and “green.” Where separate components make up an area of inquiry (e.g., COLPRO comprises mobile and fixed-site COLPRO, etc.), the separate component scores are totaled and divided by the number of components. The averaged score is displayed as appropriate in the table, but is not color-coded. The score is applied in calculations for the overall valuation rather than the individual component scores. The values for each capability within the determined time period (current, near/mid term, and far term) are averaged for the number of measures assessed. The values are rounded off with half a point or higher rounded to the next higher number, and less than half a point rounded down. Colors are then applied using “red” for 0–3, “yellow” for 4–7, and “green” for 8–10. This process is reapplied for each task in the current and far term to determine the overall task capability in Table 3.0-1. The overall TA-level SHLD capability is determined by assigning 0 to “red,” 1 to “yellow,” and 2 to “green” codes. The values for each of the tasks, by time period, are summed and divided by the total number of tasks. The values are rounded off with half a point or higher rounded to the next higher number, and less than half a point rounded down.

### **13.0.3 FSA Summary**

The paragraphs below summarize the assessment of all potential doctrine, organization, training, leadership and education, personnel, and facilities (DOTMLPF) (non-materiel and materiel) solutions for the capability gaps identified in the FNA section. The materiel approaches address both current and nondeveloped technologies for possible material solutions.

#### **13.0.3.1 DOTMLPF**

DOTMLPF solutions identified in this chapter are focused primarily with individual (medical and nonmedical) and collective protection, not only for the warfighter, but also for MWDs, EPW, detainees, and civilians. Some of the deficiencies can be partially solved with non-materiel solutions, while others require a materiel solution. Non-materiel solutions include the need for personnel to be trained and recognize the hazard and take appropriate actions. Commanders must also ensure necessary protective systems/equipment and resources are available and prepared for rapid operation. In addition, commanders must look at available resources and determine how they can be best utilized to meet operational requirements. Existing doctrine needs to be implemented and updated where applicable. Leaders need to train force elements on observation and reporting indicators to include the training of staff to ensure information is relayed. Doctrine, policy and, in turn, future leaders need to be trained on assets and capabilities. Changes may impact on the structure of military units (organizations) and personnel qualifications.

### 13.0.3.2 IMA

Materiel solutions include the development of pre- and post-exposure prophylaxis for threat agents, to include high-threat toxic industrial materials (TIMs). Establish minimum standards for all immunizations and prophylaxis to include efficacy, number of administrations to acquire immunity, booster period, and a period of acquired immunity that covers a minimum operational period from predeployment to redeployment. Nonmedical solutions include additional procurement of current CPE to meet not only their stated mission but also additional missions. The potential for the force to be exposed to concentrations of toxic TIM agents, whether deliberately released by an adversary or release other than attack (ROTA), is a recognized battlefield hazard that must be addressed to ensure survivability and mission success. CPE also needs to be modular and employed rapidly. Additional quantities of IPE need to be procured to address EPW, detainee and civilian requirements.

Table 13.0-2 summarizes possible material approaches that address the remaining materiel requirements of the DOTMLPF assessment. These approaches are in various stages of development; therefore, some are more readily applicable than others. There are 38 IMAs in the TASHLD area. In the area of COLPRO, the focus varies from increasing procurements and using for other than intended missions, to developing a modular and inflatable system. For individual protection (medical) the emphasis is on vaccines to address future agents and TIMs, plus ways to improve patient handling and care. Individual protection (nonmedical) is focused on development and procurements to address civilians, EPW, detainee, and MWDs. Though a number of the IMAs focus procurements and modifications to current mission of some systems, this will have major impact on program objective memorandum (POM) decisions and require setting priorities as they relate to military personnel, versus MWAs, EPW, detainees, and civilians, in these programs and others.

The following are the Key Attributes for Shield. Near- to mid-term chemical, biological, radiological, and nuclear (CBRN) IPE and contaminated IPE removal tactics, techniques, and procedures (TTPs) will be designed to allow the wearer to safely remove the equipment without assistance or processing through slow, logistically intense operational and thorough decontamination procedures. The far-term goal is to develop a combat uniform that possesses CBRN protective capabilities and IPE tailored towards specific user communities that require additional protection. Near- to mid-term tactical COLPRO will provide an option for a complete transportable collective protection capability without the reliance upon other shelters or equipment to provide power, climate, and filtered air. Far-term COLPRO will become a standard capability of all tactical shelters and climate control systems.

**Table 13.0-2. Tactical Shield Ideas for Materiel Approaches**

<b>Materiel Approach</b>	<b>Description</b>
Assess CBRND materiel	Test and assess all CBRND materiel for protective abilities against future threat agents, including TIMs. If existing data are incomplete, test materiel to characterize efficacy.
Broad-application, above-the-neck respiratory protection	Develop above-the-neck respiratory protection with broad application for the general population, including MWAs.
Casualty protective system with integrated pseudomask	Develop a new-generation patient protective wrap (PPW) with an integrated mask area that is contact-free of the face area and applies positive air flow.
Chemical air generation	Integrated compounds within warfighter's IPE applying chemical reaction to generate oxygen without reliance upon external sources.
Chemical treatment	Develop a treatment for existing Mission-Oriented Protective Posture (MOPP) suit and warfighter clothing textiles that enhance protective capability.
Combinatorial prophylaxes	Develop prophylaxes affording protection or minimizing the impact from a broad range of CBRN/TIM agents.
Contaminated casualty transport system	Develop/adapt clear, head-to-toe view of casualty, medical systems supporting, airtight and self-flushing system with positive/negative pressure capabilities and access ports for medical treatment.
Contaminated material/equipment protective packaging and containment systems	Investigate and develop CBRN/TIM protective packaging and containment systems for contamination/exposed material and equipment which must be stored, handled, and/or transported in a contaminated/exposed state.
Contaminated remains containment systems	Investigate and develop sealable containment system for CBRN/TIM remains permitting their safe handling, storage, transport, and internment by unprotected personnel and equipment.
COTS CBRND IPE materiel for MWD protection	Adapt commercial off-the-shelf (COTS) protective equipment, where necessary and desirable, for CBRND of MWDs.
COTS sample containers and equipment	Adapt/modify (as necessary) COTS sample containers and equipment for the containment of CBRN/TIM samples and material for their safe handling, storage, and transport.
Current prophylaxes	There currently exists a variety of prophylaxes used for protection against CBRN. Food and Drug Administration (FDA) testing and necessary modifications of prophylactics must be made to obtain FDA approval. Review available medical material and prophylaxes for application to high-risk TIMs.
Develop and establish generic unit CBRND kits	Develop, preposition, and maintain reserve stocks of generic CBRND kits for a standard unit. Components are adjusted as necessary for specific operations involving threat.

<b>Materiel Approach</b>	<b>Description</b>
Develop CBRN/TIM samples and material containment packaging/systems	Investigate and develop CBRN/TIM containment packaging and systems for the safe containment, handling, storage, and transport of CBRN/TIM samples and material.
Develop COLPRO kits	Develop COLPRO kits that contain all necessary supplies to construct field-expedient COLPRO and are easily stored and maintained in ready condition, easily and safely erected, operated, maintained, and struck within a CBRN/TIM environment by IPE-encumbered personnel using minimal resources and that support COLPRO requirements.
Develop MWD COLPRO	Develop or adapt joint-level MWD transport and field kenneling systems for COLPRO function as transporter, field shelter, and COLPRO.
Develop/adapt MWA transport system with pressure/filtration	Develop or adapt MWA transport systems to provide COLPRO protection from CBRN/TIM agents.
Disposable COLPRO	Develop one-time-use COLPRO that is rapidly erected with little instruction, training, and effort and affords term protection for critical activities and functions, maintenance and repair activities, prelocated consumables, as well as personnel associated with this task.
Disposable IPE	Develop low-cost, disposable IPE providing protection for transport aircrew members and/or determine available COTS protection to support air operations in a contaminated environment or while carrying contaminated cargo.
Equipment and supplies protective packaging and containment systems	Investigate and develop standardized CBRN/TIM protective packaging and containment systems (includes sprays, boxes, envelopes, drapes, etc.) for the protection of equipment and supplies from contact with CBRN/TIM agents
Field-expedient COLPRO kits	Develop field-expedient COLPRO kits designed to adapt existing structures, tentage, etc., for the expansion of COLPRO field capabilities and mission support and the provision of collective protection to the force, critical functions and activities, maintenance and repair activities and functions, resources, etc.
Field-expedient COLPRO materials	Identify commonly available materials (duct tape, plastic sheeting, wooden crate, plywood, tarps, coverings, wraps, caulk, sealant gels/sprays, etc.) for application in the construction of expedient COLPRO needed to construct field-expedient COLPRO when COLPRO availability is limited or not advantageous.
Filtration system lowering inhalation pressure requirement	Improve current mask systems by reducing the inhalation effort required. Options may include air streaming into the mask from a contained system that either has a stored supply or generates air flow.

Materiel Approach	Description
Future prophylaxes	Some preexposure prophylaxes for biological agents require several administrations, immunity attainment is time-consuming, or the period of coverage does not address the full operational period. Future prophylaxes should provide immunity against all known threat CBRN and high-risk TIM agents, as well as potential future threat agents, and be FDA-approved. CBRND medical countermeasures are needed providing a sustained level of protection over an extended period of time (minimally the operational period), do not require multiple administrations, are easily disseminated and administered, support a minimum level of protection, protect against a broad range of agents, cover the range of preexposure to post-exposure/presymptomatic application needs, and are applicable to the protected population (including eligible civilians).
GOTS CBRND IPE materiel for MWD protection	Adapt existing government off-the-shelf (GOTS) CBRND materiel (e.g., PPW, etc.) for application to CBRND of MWDs.
Improved IPE garments and accessories	Develop new generation of IPE garments and accessories (e.g., boots/boot covers, gloves, hoods, etc.) using modern materials permitting greater range of motion, longer wear without performance degradation, increased durability, integrated into warfighter personal equipment, and protective against all threat CBRN and high-risk TIM agents.
Integrate CBRN/TIM protective features into functional garments	Develop materials integrating CBRN/TIM protective capabilities and design standard functional garments using these materials for protection of the force.
Integrated mobile COLPRO	Develop warfighting platforms (air, land, and sea) with COLPRO that is an integral part of the operational system and protects against current and future/advanced agents.
Modular COLPRO	Develop modular COLPRO that can be erected in various configurations to protect various groups of people separately by their designation (EPW, civilian, etc.); accommodates small to large numbers of people; protects all critical activities and functions, MWAs, prelocated consumables, and maintenance/repair activities; and addresses the commander's intent.
MWA prophylaxes	Develop or adapt CBRND medical countermeasures and veterinary medicine for preexposure and post-exposure/presymptomatic protection of MWD from CBRN/TIM. Develop topical that is easy to apply and provides shielding from CBRN/TIM, preventing agent absorption through hair or skin.
Prepositioned/reserve CBRN medical resources	Establish and maintain sufficient stocks of prepositioned and reserve CBRND medical resources identified in plans and required to support multiple operations with threat and ensure availability for expeditious movement to the and within the area of operations in the event of a CBRN event.

Materiel Approach	Description
Procure additional COLPRO	Procure additional COLPRO of required types and in needed quantities to meet the increased operational requirements.
Procure/develop field-expedient COLPRO kits	Procure COLPRO kits similar to those used for the Chemical Stockpile Emergency Preparedness Program for appropriate activities and requirements. This protective measure is currently provided to populations located in the vicinity of chemical demilitarization sites. Other materials may be adaptable and procured to establish COLPRO in existing structures. Develop field-expedient COLPRO kits designed to adapt existing structures, tentage, etc., for the expansion of COLPRO field capabilities and mission support and the provision of collective protection to the force, critical functions and activities, maintenance and repair activities and functions, resources, etc.
Prophylactic administration to diverse groups	Prophylaxes address dosage range for eligible civilians (e.g., children, elderly, overweight, underweight subjects, etc.). Stabilize prophylactic effects over a wide range of dosages to address diverse applications of targeted populations.
Rebreathing	Closed-circuit mechanism to permit an individual's exhaled air to be filtered, CO <sub>2</sub> removed, and recirculated for breathing, allowing user to make use of all available oxygen in a closed environment.
Regenerative filtration	CBRN regenerative filters able to flush retained agent, neutralize agent, or by other inherent means affords extended period of protection.
Respiratory protection for MWAs	Modify existing technology for application by MWAs to provide some protection from CBRN/TIM.
Topical	Develop topical barrier that is easily applied (i.e., sprayed), acts as a contact hazard barrier, affords protection from CBRN/TIM, and does not create a health hazard for the user.

### **13.1 Task TASHLD 1: Ensure proper MOPP level to minimize casualties and maximize mission performance**

#### **13.1.1 Functional Area Analysis**

##### **13.1.1.1 Definition**

To ensure the proper MOPP level (determined by the commander) providing IPE to protect the individual against chemical, biological, and radiological warfare agents and many TIMs in various forms (vapor, liquid/solid aerosols, and liquid/solid surface contamination) and reducing performance degradation. Performance degradation resulting from wearing IPE will be at its maximum during an actual contamination situation. Upon actual attacks, the individual's IPE is brought to full protective posture.

The handler of an MWA, upon donning his or her protective mask, places the animal's protective respirator (if one is available) on the MWA. The MWA is evacuated from the contamination hazard area if possible. If evacuation is not feasible, the MWA is placed within a collective protection shelter (CPS). The individual protection level is adjusted based upon the environment and mission. Degradation in the performance of most tasks is inherent because of the physical properties of the protective gear—the lower the MOPP level, the less the degradation and the higher the risk from contamination exposure. The commander must consider all friendly and enemy factors to ensure that he protects the fighting force while continuing the mission with minimum performance degradation. Degradation will be at its peak during actual enemy CBRN/TIM attacks/ROTA when IPE is brought to full protective posture. The protection level will be modified by the commander as soon as possible while balancing risk with mission performance.

##### **13.1.1.2 Derivation**

*Joint Enabling Concept for CBRN Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (TA 2.4, TA 7, TA 7.1).*

##### **13.1.1.2.1 Supported Task: N/A**

##### **13.1.1.2.2 Lateral Task: TASHA 24**

##### **13.1.1.2.3 Supporting Task: N/A**

##### **13.1.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Undeveloped to highly developed land. (C1.1.1)
2. Riverine to open sea. (C1.2)
3. Natural and induced air. (C1.3)

4. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

### **Military**

1. Partially completed mission preparation. (C2.1.3)
2. Marginal forces. (C2.2)
3. Marginal to adequate forces allocated. (C2.2.3)
4. Good personnel physical conditioning. (C2.2.4.3)
5. Poor mission-essential government-service civilian physical conditioning. (C2.2.4.3 – NEW)
6. Poor mission-essential contract-service civilian physical conditioning. (C2.2.4.3 – NEW)
7. Negligible personnel experience. ( 2.2.4.5)
8. Limited staff expertise. (C2.3.1.3)
9. Limited deployed supplies. (C2.8.2)
10. Limited prepositioned materiel. (C2.8.4)
11. No host-nation support. (C2.8.5)

### **Civil**

1. TIMs present in the civilian sector. (C3.3.7.5)

## **13.1.2 Functional Needs Analysis**

### **13.1.2.1 Capability and Deficiency Assessment Summary**

Table 13.1-1 discusses current and projected capabilities used to accomplish this task. The capabilities include all aspects of CBRND equipment and measures, including individual protection, collective protection, and non-materiel aspects of CBRND. The overall capabilities for current, near/mid, and far term are rated “yellow.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

### **Current Capability and Deficiency**

The Services currently field a variety of CBRND assets providing respiratory/ocular, percutaneous, and COLPRO protection. This diversity of assets complicates the logistical support of operations with threat for joint operations. Existing Service-specific IPE is limited in the period and scope of protection afforded the warfighter. Respiratory/ocular and percutaneous CBRND assets protect against known chemical and biological warfare agents and particulate radiologicals. Current IPE provides limited protection against TIMs. Physiological and psychological encumbrances increase with prolonged wear and workload. Regular exercising and wear to acclimate and adjust the wearer to enable performance of assigned functions and activities is necessary and performed to reduce the impact of encumbrances and subsequent degradation of performance. Current site COLPRO generally requires extensive site preparation and resources to erect, operate, and strike but cannot be erected/striking in a CBRN/TIM

environment. Mobile COLPRO is a diversity of systems ranging from forced clean air systems to full COLPRO. However, their application is limited. In general, current COLPRO is limited in quantity and does not adequately support expeditionary and highly mobile maneuver operations, particularly those in an austere environment with reduced logistical footprints. Mission capability would be greatly improved by integrating COLPRO into specific land, sea and air platforms. However, most mobile platforms do not have COLPRO, and this reality requires prioritization of available IPE assets for CBRND applications. COTS protective assets are applied for selected eligible civilians such as hazardous materials, firefighters, emergency medical services [EMS], etc. However, eligible civilians (in general) and MWAs are not adequately addressed by DOTLPF for CBRND. Clear DOTLPF addressing the CBRND provisioning and training of eligible civilians is inadequate. MWAs are not afforded protection against the effects of CBRN/TIM agents, including COLPRO. MOPP DOTLPF is adequate for military personnel and operations. The establishment of adjustable MOPP levels, reflective of local operations and threat, are well defined, as are continuing evaluation for change/adjustments. However, operations increasingly involve U.S. and non-U.S. civilians. MOPP DOTLPF does not adequately address their presence and inclusion into MOPP methodologies and levels, particularly when these personnel may (or may not) be equipped with nonstandard IPE. Further, the largely manual current nature of command operations inherently delays protective actions versus automation, further complicated by the current stovepipe reporting and information flow as information flows vertically without a corresponding horizontal flow for alerting/warning of CBRN/TIM agents.

### **Projected Near/Mid-Term Capability and Deficiency**

Future configurations focus on reducing psychological and physiological stresses associated with the wearing of IPE, as well as striving for commonality of form factor among all services to reducing the logistics burden, development cost, and improved availability. The Joint Protective Aircrew Ensemble (JPACE), Joint Service Lightweight Integrated Suit Technology (JSLIST), Joint Service Aircrew Mask (JSAM), and Joint Service General Purpose Mask (JSGPM) are projected to be initially fielded during the mid term. The JSLIST is under review for National Institute for Occupational Safety and Health (NIOSH) certification for compliance with Occupational Safety and Health Administration (OSHA) protective standards. The certification will permit application of the garment for antiterrorism/force protection (AT/FP) installation activities within the continental United States (CONUS) and selected facilities outside the Continental United States (OCONUS). The possibility exists for potential application by requiring eligible civilians. Legacy Service-specific IPE will remain in the inventory throughout the mid term and into the far term during the transition to the joint IPE systems. Joint Expeditionary Collective Protection (JECOP) is projected to initially field during the mid term with three COLPRO systems primarily addressing expeditionary operations. The P3I upgraded Chemically and Biologically Protected Shelter (CBPS), Joint Transportable Collective Protection System (JTCOPS), Chemically Protected Deployable Medical System (CP-DEPMEDS), fielding of the Joint Services Lightweight NBC Reconnaissance System (JSLNBCRS) variants, and backfit of LHA/LHD vessels are projected to include COLPRO in the mid term. These systems, depending upon the quantity fielded, may provide additional COLPRO to address critical needs. Otherwise, changes from current capabilities and deficiencies are not projected.

## Projected Far-Term Capability and Deficiency

Future configurations focus upon reducing psychological and physiological stresses associated with the wearing of IPE, as well as striving for commonality of form factor among all Services. The standardization of CBRND respiratory/ocular and percutaneous protection will reduce the logistics burden and development cost and subsequently improve availability. Legacy Service-specific IPE will continue to be replaced by the joint systems of CBRND protective equipment until fielding is complete to all Service units, including Guard and Reserve, early in the far term. Next-generation IPE assets are in research and development (R&D) and are expected to be fielded sometime in the far term. However, specifics of design, characteristics, and protective capabilities are not as yet determined for these systems. The potential for COLPRO in the Future Tactical Lift Option builds upon the mid-term COLPRO capabilities. Additional changes in capabilities from the mid term are not projected.

### 13.1.2.2 Resource Systems

#### Individual Protection

##### 1. Respiratory/Ocular Protection:

**COTS:** Commercially available systems of protection, manufactured and tested meeting OSHA standards for the United States or equivalent organization in other nations.

**M17 Series Masks w/M13 Series Filters:** Obsolescent warfighter system of protection. Retained in selected high-threat areas (HTA) for noncombatant evacuation operations (NEO) application. Designed for adults.

**MBU-19/P Chemical-Biological Aircrew Eye/Respiratory Protection (AERP):** U.S. Air Force (USAF) combat aircrew protection. Includes protective hood, MBU-12/P mask, C-2 canister, intercom for ground communications, and blower assembly.

**A/P22P-14(V) Respirator Assembly:** U.S. Navy (USN)/U.S. Marine Corps (USMC) system for rotary-wing (Version 1 for USN) and fixed-wing (Versions 2–4 for USN/USMC) aircrews. Includes chemical and biological (CB) filter, dual air/oxygen supply, and crossover manifold for dual protective capabilities in air or on ground. Version 1 is not compatible with aircraft oxygen supply systems; Version 2 applied to EA-6B and F18A airframes; Version 3 to AV-8B and F-18C/D aircraft; and Version 4 is used for C-130 airframes.

**M40/M42 CB Protective Mask:** U.S. Army mask system designed for military standard profile and uses standard C-2 canister. M42 integrates with combat vehicle clean air supply system and has a connectable dynamic microphone for combat vehicle intercom system.

**M45 Aircrew Aviator Mask:** Replaces M42 and M49 systems for U.S. Army. Available with a canister-compatible hose assembly and a valve cassette that enables use of supplied air (from aircraft, self-contained breathing apparatus [SCBA] or powered air-purifying respirator [PAPR]). The M45 is used by military personnel who cannot fit the M40A1, M42A2, or MCU-2/P masks.

**M48 CB Apache Aviator Mask:** Used by Apache aviator and flight support personnel. Replaced M43 Type 1 mask system and uses blower assembly with C-2 filter canister.

**MCU-2/P:** USAF and USN chemical protective mask for ground operations and aircrew personnel not performing flight operations. Uses a single C-2 series filter canister.

**Joint Service Aviator Mask (JSAM):** Initial fielding projected in the mid term replacing Service-specific aviator respiratory/ocular protective systems. Provides CBRN protection under high-G conditions, compatible with existing and projected aviator CBRN IPE, flame and thermal protective, reduces stress associated with existing aviator IPE, and may be donned/doffed during flight.

**Joint Service General Purpose Mask (JSGPM):** Initial fielding projected in the mid term replacing Service-specific standard respiratory/ocular protective systems. Provides respiratory/ocular protection from CBRN agents and selected TIMs. Reduces wear encumbrances associated with existing systems. The JSGPM will be OSHA-approved for use by U.S. Department of Defense (DoD) civilians and military personnel in nonmilitary unique operations.

**Joint Service Chemical Environment Survival Mask (JCESM):** COTS one-time use, one-size-fits-all, respiratory/ocular protective system affording two hours of protection in low-level CBRN vapor, aerosol, and particulate environments. Selected force element application only.

## 2. Percutaneous Protection:

**COTS:** Commercially available systems of protection, manufactured and tested meeting OSHA standards for the United States or equivalent organization in other nations.

**Battle Dress Overgarment (BDO):** U.S. Army/USAF two-piece camouflage-patterned garment (top and trousers) providing 24-hour protection against CBRN agents in vapor, liquid, droplet, and particulate forms.

**Saratoga:** USMC two-piece camouflage-patterned garment (top and trousers) providing 24-hour protection against CBRN agents in vapor, liquid, droplet, and particulate forms. Launderable for hygiene.

**Chemical Protective Over-Garment (CPOG):** Legacy two-piece green garment currently in use with USN providing limited-term protection against CBRN agents in vapor, liquid, droplet, and particulate forms.

**Chemical Protective Undergarment (CPU):** Worn under standard IPE as additional layer of protection against contact with CBRN agents.

**CWU-66/P:** One-piece USAF green flightsuit providing 24-hour protection against CBRN agents in vapor, liquid, droplet, and particulate forms. Available in tan as CWU-77/P flightsuit.

**Disposal Aircrew Protective Cape:** Transparent disposable cape covering head and shoulders of aviator during periods between aircraft mounting/dismounting and shelter.

**BVO/GVO:** Vinyl overboots (VO) worn over wearer's standard footwear and protects against contact with CBRN agents. Available in black (BVO) and green (GVO).

**Chemical Protective Footwear Cover (CPFC):** Legacy system of CBRN protective footwear cover in use by USN. Requires wearer to pull protective sole tabs up and wrap/tie laces around cover to secure over footwear.

**Disposable Aircrew Footwear Cover:** Transparent disposable footwear covers worn over aviator footwear to protect aviator during periods between aircraft mounting/dismounting and shelter.

**Chemical Protective Glove (CPG):** Standard CBRN protective glove. Available in 7-, 14-, and 25-mil thicknesses addressing functional requirements for durability, dexterity, and tactile sensitivity.

**Disposable Aircrew Hand Protection:** Transparent disposable hand coverings applied by USAF, USN, and USMC over aviator gloves during periods between aircraft mounting/dismounting and shelter. Also applied as between aviator inner and outer gloves enabling essential functional requirements for dexterity and tactile sensitivity.

**Chemical Protective Helmet System (CPHS):** CBRN protective camouflage-patterned helmet cover to protect helmet from contact with CBRN contaminants.

**SCALP:** Disposable, lightweight, impermeable overgarment designed for wear over IPE for additional protection in grossly contaminated environments. Applied by personnel required to leave protective sheltering in these environments to perform mission-critical tasks. Also applied by decontamination units/teams and medical personnel performing decontamination or potentially at risk for prolonged contact with liquids.

**Wet-Weather Gear: Includes Severe-Weather Gear (USN).** Provides barrier against contact with liquids potentially damaging to protective abilities of IPE.

**M-2 Apron:** Butyl rubber-coated sleeved apron worn over IPE and applied by decontamination units/teams and other designated personnel performing decontamination or potentially at risk for contact with liquids. Provides barrier against contact with liquids potentially damaging to protective abilities of IPE. Decontaminable.

**Medical Barrier Assets:** Standard barrier assets applied by Medical Services personnel against contact with biohazards. May provide a degree of additional barrier protection against CBRN hazards when applied with IPE.

**Joint Service Lightweight Integrated Suit Technology (JSLIST):** Two-piece (jacket and trousers) CBRN risk-taking protective garment with integrated hood. Affords protection against selected TIM agents. Reduces physiological and psychological encumbrances associated with existing Service-specific systems it replaces with initial fielding in the mid term. Under review for NIOSH certification for OSHA protection standards.

**Joint Protective Aircrew Ensemble (JPACE):** CBRN protective aviator flightsuit projected for initial fielding in the mid term and replacing Service-specific CBRN protective flightsuits. Provides JSLIST equivalent protection and provides protection when subject to rotor, propeller, and jetwash. Flame-retardant and self-extinguishing properties. Supports escape and evasion requirements.

**Joint Block I/II Glove Upgrade (JB1/2GU):** Available in two configurations, one flame resistant for use by aviators and combat vehicle crewmen, and one not flame resistant for ground applications. The JB1GU is currently fielded and the JB2GU is to be fielded in FY2006.

**Joint Firefighter Integrated Response Ensemble (JFIRE):** Incorporates JSLIST into firefighter bunker gear, permitting firefighters to conduct firefighting operations within a CBRN/TIM environment.

**Multi-purpose Overboot (MULO):** Projected initial fielding in mid term and replacing legacy CBRN footwear covers.

## Collective Protection

### 1. Mobile COLPRO

**CBPS:** M1113 HMMWV-mounted COLPRO system consisting of a hardshell filtration, power, and transport and expandable softshell tentage with contamination control area/entry. The COLPRO unit is designated the Lightweight Multipurpose Shelter (LMS).

**Crewed Combat Vehicles (Ground):** Two types of COLPRO. The first supplies filter air using forced clean air supply system. Requires wear of IPE and connection to crew mask. This is the type of system in the M1A1 Abrams MBT. Second system is incorporates full COLPRO and permits reduction of IPE during operation. JSLNBCRS is an example of the second type of system.

**Airframe Air Supply System:** Provides clean air from compressed air storage system either until aircraft is outside of contamination and airframe interior is flushed of vapor contaminants or throughout flight operations.

**CITADEL:** System of protection installed with USN vessels to afford protection to selected connected spaces including Command, Control, Communications, Computers, Intelligence, Surveillance, and Reconnaissance (C4ISR), medical, and rest and recuperation (R2).

### 2. Fixed-Site COLPRO

**MGPTS:** USMC Medium General Purpose Tent System (MGPTS) with CB Protective Liner System designed for support of USMC operational C4ISR and R2.

**CP-DEPMEDS:** Component-based system of tentage, connective corridors, ISO containers, etc., with COLPRO liners for configuration into field hospitals and includes supporting power and utility systems, lighting, engine control units, and filtration systems. Large system requiring extensive use of resources to prepare location, erect/strike, operate, and maintain.

**JTCOPS:** Similar to CP-DEPMEDS, but for critical functions and activities of the force (e.g., staff operations, aircrew housing and briefing, etc.).

**CP-EMEDS:** USAF air-transportable system similar to CP-DEPMEDS on a smaller scale and configurable from one medical shelter to a 25-bed field hospital.

**CP-SSS:** USAF small-scale COLPRO transportable system designed to support C2 functions.

**JECP:** Projected program of COLPRO designed for application in highly mobile operations, expeditionary operations, forced-entry operations, and/or to supplement larger-scale COLPRO systems in support of operations. Consists of building/room and tentage insert kits and small-unit stand-alone COLPRO kits.

**M20/M20A1 SCPE:** Lightweight and modular COLPRO system consisting of an inflatable liner for insert into rooms or buildings.

**Building integrated COLPRO systems:** COLPRO systems designed and installed into buildings as integral systems, usually facility construction. Post-construction installation is based upon building design and COLPRO requirements. Varies between buildings based upon applied technology, date of construction/installation, system engineering,

facility function, etc. Most existing facility COLPRO was established during Cold War period.

**MOPP Methodology:** Stepped level of CBRND protective measures. Standardized levels permit the rapid increase or decrease of unit MOPP level.

**Unit Staff:** The application of DOTLPF for all phases of operations with threat from preplanning to post-force return to home stations. Includes all aspects of C2 and supporting staff activities/functions (e.g., logistics, intelligence, etc.) enabling mission and task accomplishment.

	FAA Measure	Scale
M1	Plans exist for determining proper MOPP level based upon function/activity and threat.	<p><b>8–10:</b> Plans incorporate specific, flexible, protective posture protocols that are adjustable to address requirements and needs such as mission, function, conditions, and threat. All personnel are trained and ready to perform the associated protective actions.</p> <p><b>4–7:</b> General protective posture protocols are incorporated into plans and disseminated to subordinate units. Unit personnel are trained and ready to perform protective actions.</p> <p><b>1–3:</b> General protective posture protocols are referenced by plans disseminated to subordinate units. Unit personnel are trained to perform protective actions.</p> <p><b>0:</b> General protective posture protocols are not identified in plans and disseminated to subordinate units for implementation and training of unit personnel.</p>
M2	Individuals and MWAs are equipped with IPE.	<p><b>8–10:</b> All force personnel (military and eligible civilians supporting the mission) and MWAs are adequately equipped with IPE to perform their functions and survive a CBRN/TIM environment.</p> <p><b>4–7:</b> Military personnel and eligible civilians supporting the mission are equipped with IPE to perform their functions and survive a CBRN/TIM environment.</p> <p><b>1–3:</b> Military personnel are equipped with IPE to perform their functions and survive a CBRN/TIM environment.</p> <p><b>0:</b> Force personnel and MWAs are not equipped to perform their functions and survive a CBRN/TIM environment.</p>
M3	Protection is afforded by IPE against employed CBRN/TIM agent.	<p><b>8–10:</b> Issued IPE affords protection against all CBRN agents and high-risk TIM agents.</p> <p><b>4–7:</b> Issued IPE affords protection against all CBRN warfare agents and selected TIM agents.</p> <p><b>1–3:</b> Issued IPE affords protection against all CBRN warfare agents.</p> <p><b>0:</b> Issued IPE does not afford protection against all CBRN warfare agents.</p>

M4	Plans exist for evacuating MWA or providing CPSs for them.	<p><b>8–10:</b> Plans identify and allocate resources for the provision of dedicated COLPRO for sheltering and survival of MWAs.</p> <p><b>4–7:</b> Plans identify and task resources for the evacuation of MWA from impending CBRN/TIM hazard zones or the provision of COLPRO for MWA sheltering and survival.</p> <p><b>1–3:</b> Plans identify and task resources for the evacuation of MWA from impending CBRN/TIM hazard zones.</p> <p><b>0:</b> Plans do not address the evacuation and provision of COLPRO sheltering for MWAs.</p>
M5	Force operational capabilities are not degraded by encumbrances of IPE.	<p><b>8–10:</b> IPE possesses little or no encumbrances impacting the operational effectiveness and safety of the wearer nor the wearer's psychological and physiological health and well-being when worn for extended periods.</p> <p><b>4–7:</b> IPE imposes encumbrances upon the wearer and require acclimation and training to perform necessary tasks and operations. Encumbrances impact psychological and physiological well-being of wearer over time and varies with individual, activity, and conditioning.</p> <p><b>1–3:</b> IPE imposes encumbrances upon the wearer and impact the psychological and physiological well-being of wearer impacting performance of operational requirements. Acclimation, training, and conditioning have minimal impact upon effective wear time.</p> <p><b>0:</b> IPE encumbrances seriously impair or preclude operational performance and place strenuous impacts upon the psychological and physiological safety and well-being of the wearer.</p>
M6	Warning and alerting is sufficient to permit timely notification of personnel to don IPE.	<p><b>8–10:</b> Plans provide for the rapid and effective notification of all units in the force to increase or don individual protective equipment. Means are available and applied at all levels to disseminate warning and alerting in near-real time. All personnel are trained, equipped, and ready to perform required protective measures.</p> <p><b>4–7:</b> Plans provide for the notification of all units in the force to increase or don individual protective equipment. Means are available to disseminate warning and alerting. Personnel are prepared to perform necessary protective measures.</p> <p><b>1–3:</b> Plans do not adequately address notification of all units in the force to increase or don individual protective equipment, or means are inadequate to disseminate warning and alerting to the force.</p> <p><b>0:</b> Plans do not address warning and alerting of the force.</p>
M7	Procedures exist for reducing MOPP level.	<p><b>8–10:</b> Plans, procedures, and protocols address reduction of required MOPP levels addressing changes in requirements and needs such as mission, function, conditions, and threat. All personnel are trained and ready to perform the associated protective actions.</p> <p><b>4–7:</b> General procedures and protocols for the reduction of MOPP levels are disseminated to subordinate units. Unit personnel are trained and ready to perform protective actions.</p> <p><b>1–3:</b> MOPP level reduction protocols are referenced by procedures disseminated to subordinate units. Unit personnel are trained to perform protective actions.</p> <p><b>0:</b> MOPP level reduction procedures and protocols are not identified and disseminated to subordinate units for implementation and training of unit personnel.</p>
M8	Required CBRN consumables are available to support forces.	<p><b>8–10:</b> CBRND systems, components, and consumables are positioned and available in plan identified quantities and types to support sustained operations within a CBRN/TIM environment.</p> <p><b>4–7:</b> CBRND systems, components, and consumables identified in plans are adjusted to limitations in quantities and types, and positioned and available to support operations involving CBRN/TIM threat.</p> <p><b>1–3:</b> CBRND systems, components, and consumables are adjusted to limitations in quantities and types and are distributed to support operations involving CBRN/TIM threat.</p> <p><b>0:</b> CBRND systems, components, and consumables are not available to support operations.</p>

M9	Unit is operationally capable in a CBRN/TIM environment using collective and individual protection.	<p><b>8–10:</b> Unit operational capabilities are maintained within a CBRN/TIM environment through the application of COLPRO and individual protection.</p> <p><b>4–7:</b> Unit operational capabilities are degraded or limited within a CBRN/TIM environment but are supported by the application of COLPRO and individual protection.</p> <p><b>1–3:</b> Unit operational capabilities are seriously degraded and limited within a CBRN/TIM environment and are not mitigated by the application of COLPRO and individual protection.</p> <p><b>0:</b> Unit operational capability is not supported by COLPRO and individual protection.</p>
M10	Function/activity is operationally capable in a CBRN/TIM environment while encumbered by individual protection.	<p><b>8–10:</b> Operational capability and performance of force functions and activities are not degraded or impacted by IPE encumbrances within a CBRN/TIM environment.</p> <p><b>4–7:</b> Operational capability and performance of force functions and activities are degraded or limited by IPE encumbrances within a CBRN/TIM environment.</p> <p><b>1–3:</b> IPE encumbrances impose serious impacts and limitations upon operational capabilities and performance of force functions and activities within a CBRN/TIM environment.</p> <p><b>0:</b> IPE encumbrances preclude operational capability and performance within a CBRN/TIM environment.</p>
M11	Plan provides the commander with guidance on trade-off analysis to determine the appropriate MOPP level.	<p><b>8–10:</b> Plans include clear guidance on the conduct of trade-off analysis for adjustment of plan-specific, flexible protective posture protocols disseminated to the units of the force. The guidance outlines foundational requirements and provides detailed information critical to the effective performance of trade-off analysis by the unit staff for the adjustment of the protocols.</p> <p><b>4–7:</b> General protective posture protocol trade-off analysis guidance is incorporated into plans or references doctrinal materials. Unit staff expertise, training, knowledge, and access to doctrinal materials are applied, and will vary between staffs, to the determination of trade-off analysis for adjustment of the protocols.</p> <p><b>1–3:</b> Protective posture protocol adjustment trade-off analysis guidance is inadequate to perform the task.</p> <p><b>0:</b> Protective posture protocol adjustment trade-off analysis guidance does not exist.</p>
M12	Plan requires the commander to constantly reevaluate MOPP level.	<p><b>8–10:</b> Plans include clear guidance on the continuing conduct of staff review of current and projected operations, activities, functions, conditions, and threat for recommendations to the commander for adjustment of MOPP levels disseminated to subordinate units of the force.</p> <p><b>4–7:</b> General guidance is incorporated into plans or plan referenced doctrinal materials for the conduct of staff review of current and projected operations, activities, functions, conditions, and threat for recommendations to the commander for adjustment of MOPP levels disseminated to the force. Unit staff expertise, training, knowledge, and access to doctrinal materials are applied, and will vary between staffs, to the determination of recommendations for adjustment of the disseminated MOPP levels.</p> <p><b>1–3:</b> MOPP level continuing evaluation and adjustment guidance for current and projected operations, activities, functions, conditions, and threat is inadequate to perform the task.</p> <p><b>0:</b> MOPP level reevaluation and adjustment planning and guidance does not exist.</p>
M13	There is effective DOTMLPF in place to conduct task.	<p><b>8–10:</b> DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations.</p> <p><b>4–7:</b> Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds.</p> <p><b>1–3:</b> DOTLPF is inadequate for accomplishment of this task.</p> <p><b>0:</b> DOTLPF does not exist for this task.</p>

<sup>1</sup> Plans incorporate MOPP levels and methodologies are adjustable to meet local operations and threat needs. MOPP levels and methodologies apply to military personnel and are generally considered to apply to equipped nonmilitary personnel (although doctrine, policy, procedures, and TTPs do not address application to these personnel). The MOPP levels address respiratory/ocular protection presence and wear.

<sup>2</sup> CBRND IPE is currently Service-specific. Respiratory/ocular protection is diverse across the Services and performed functions. USAF combat aircrews conduction operations within a CBRN environment are equipped with the MBU-19/P Chemical-Biological AERP that includes protective hood, MBU-12/P mask, C-2 filter canister, an intercom for ground communications, and a blower assembly. The AERP provides protection whether or not supplemental oxygen is present. USN and USMC aviators use the A/P22P-14(V) Respirator Assembly that is a self-contained protective system deployed for rotary-wing (Version 1 for USN) and fixed-wing (Versions 2–4 for USN and USMC) aircrews. The system incorporates a CB filter, dual air/oxygen supply, and a crossover manifold with dual protective capabilities for flight and ground protection. The A/P 22P-14(V) 1 is not compatible with aircraft with oxygen delivery systems and supports helicopter crew use. Version 2 is used for the EA-6B and F-18A, Version 3 for AV-8B and F-18C/D, and Version 4 is applied for C-130 aircrews. The M17 series mask is obsolete and is relegated to NEO support in selected HTAs. The mask is designed for the military standard profile (ground) and does not adequately protect all potential nonmilitary populace members for which is retained. The M40/M42 CB Protective Mask is in service with the U.S. Army. The mask uses the C-2 canister for filtration of CBRN contaminants. The M42 integrates with combat vehicle filtration protection system and has a dynamic microphone with cable for connection to vehicle communications systems. The M43 CB Aircraft Mask is applied by U.S. Army aircrew members and applies a motor blower unit with C-2 canister for filtration. The system is a stand-alone system that accompanies the user. The M45 Aircrew Aviator Mask replaced the U.S. Army M43 Type II and M49 Mask Systems. The system uses a low-profile canister compatible hose assembly for both hose and face-mounted configurations. The mask system incorporates selectable filtration for support both during aircraft systems activation and using the connectable filter pack. The mask also is applied to personnel who cannot be fitted with the standard M40A1, M42A2, or MCU-2A/P masks. The M48 CB Apache Aviator Mask protects AH-64 Apache helicopter aviators and flight support personnel. The blower assembly uses the C-2 filter canister to provide filtered, breathable air. The M48 replaces the M43 Type 1 mask. The MCU-2A/P is the mainstay USAF and USN mask employed by personnel not equipped with aircrew masks and by aircrew when not performing flight operations. The MCU-2A/P is also used by aircrew during flight operations who are not equipped with aircrew masks. COTS equipment meeting OSHA requirements (and National Fire Protection Association [NFPA] for firefighters) is applied by selected civilian personnel performing specific functions such as firefighting, EMS, hazardous materials, etc. Limited quantities of COTS may be available within HTAs for known NEO requirements for the protection of populace members unable to wear the M17 series or standard warfighter respiratory/ocular protective devices. MWAs are not afforded respiratory/ocular protection.

<sup>3</sup> Military CBRND respiratory/ocular protective equipment provides protection to the wearer from all known chemical warfare agents, radioactive particulates, and biological agents. The equipment also affords protection against selected TIM agents. However, the equipment does not protect against all high-threat TIM agents and does not support survival in oxygen deficient atmospheres. Further, certain agents cause current filtration to break down or saturate rapidly decreasing the time period of protection.

<sup>4</sup> Approved CBRND respiratory/ocular protection for MWAs does not exist.

<sup>5</sup> Doctrine, policy, procedures, training, exercises, and evaluations serve to build the capability of individuals to perform tasks while wearing respiratory/ocular protection.

However, the encumbrances associated with ocular/respiratory protection do degrade performance and limit the conduct of certain tasks. Prolonged wear places stress upon the individual and will impact performance. Doctrine, policy, and procedures are inadequate for sustained operations within a CBRN/TIM environment, especially forces conducting expeditionary operations in austere environments and possessing reduced logistical footprints.

<sup>6</sup> Operations with threat apply MOPP levels detailing the ready availability of respiratory/ocular protection. Generally, the requirement is nine seconds to don, clear, and seal respiratory/ocular protection upon warning or alerting of a CBRN/TIM agent. Selected systems require the fitting and preparation within COLPRO, such as the AERP and similar systems. Personnel outside COLPRO are required to maintain ready availability of respiratory/ocular protection capable of rapid attainment of protection.

<sup>7</sup> Plans for operations with threat identify adjustable MOPP levels, methodologies, and requirements that are flexible to meet local operational needs and threat. Protocols and processes are identified for determination of appropriate MOPP levels and allowable changes. These are included in unit standard operating procedure (SOPs) and guidelines.

<sup>8</sup> Doctrine, policy, and procedures are adequate for planning, movement, management, and positioning of materiel (including CBRND materiel) in support of operations. CBRND materiel for an operation addresses the identified CBRN/TIM threat. The allocation and dissemination of CBRND materiel is managed by the staff based upon plans, operational requirements, anticipated or experienced threat, and available resources. Expeditionary operations are a particular concern. Availability of spares and resupply will be limited during the period until the theater matures (usually the first 30–90 days). Maneuvering highly mobile forces operating in austere environments, behind adversary lines, and possessing reduced logistical footprints are similarly constrained. The individual combat load also places limitations upon weight and type of equipment and consumables. Protective equipment may be reduced or eliminated despite threat level. Sustained operations within a CBRN/TIM environment are not adequately addressed in DOTLPF and, subsequently, in planning.

<sup>9</sup> Trade-off analysis for MOPP is generally addressed in plans and processes. Staff applies doctrinal materials as foundational guidance for advising the commander and developing instructions to subordinate units. Unit staff expertise, training, knowledge, and access to doctrinal materials are applied, and will vary between staffs, for the determination of trade-off analysis to adjust the protocols.

<sup>10</sup> The commander implements and adjusts MOPP levels and protocols based upon staff-developed information and personal experience, knowledge, training, and operational requirements. Plans provide for the continuing evaluation of MOPP and CBRND measures by the commander and supporting staff. Decisions and instructions are disseminated based upon the commander's evaluation, assessment, and action determination by the supporting staff.

<sup>11</sup> DOTLPF exists for the conduct of this task for military personnel. However, DOTLPF for this task as applies to non-U.S. military personnel and MWAs is inadequate for the protection and survival of these personnel in a CBRN/TIM environment.

<sup>12</sup> Plans incorporate MOPP levels and methodologies and are adjustable to meet local operations and threat needs. MOPP levels and methodologies apply to military personnel and are generally considered to apply to equipped nonmilitary personnel (although doctrine, policy, procedures, and TTPs do not address application to these personnel). The MOPP levels address percutaneous protection presence and wear.

<sup>13</sup> Service-specific CBRND percutaneous protection is currently applied for the protection of the force. The BDO, used by the USAF and U.S. Army, is a two-piece garment providing protection for a 24-hour period against chemical agent vapors, liquids, and droplets; biological agents and toxins and contact with radioactive particles. The BDO's protective abilities are lost if the suit is torn; ripped; splashed with petroleum, oil, or lubricant (POL); or saturated with water and is designed for a one-time use and is worn by ground and most flight personnel (non-high-performance aircraft). The USMC uses the Saratoga COLPRO suit similar in design to the BDO, but launderable for personnel hygiene. The CPOG is a legacy two-piece garment for protection against CBRN agents. The CPOG is in use with the USN. The CPU is designed to provide an additional layer of protection for the warfighter and is worn under standard IPE. The USAF CWU-66/P (and 77/P) is a one-piece flightsuit providing protection for a 24-hour period against standard CBRN agents and is designed for compatibility with aircrew lift support equipment. The USN, USAF, and USMC use the disposable aircrew protective cape to protect aircrew between sheltering and the combat aircraft. The cape drapes over the wearer and is removed during entry into the aircraft to prevent transfer of contamination into the aircraft interior. The BVO/GVO overboots are applied over the wearer's standard footwear to protect against contact with CBRND. The USN uses the CPFC, commonly called the "fishtail" for its design, to protect the wearer's footwear. The CPFC, considered obsolete, does provide a measure of antislip protection shipboard. The disposable aircrew boot cover is worn by USAF, USN, and USMC aviators over aircrew footwear while en route and mounting combat aircraft. The covers are removed during aircraft entry and are designed to prevent contamination transfer into the aircraft. Hand protection is provided by the CPG in 7-, 14-, and 25-mil thicknesses to meet warfighter hand protection and dexterity needs. Disposable aircrew hand protection is applied by the USAF, USMC, and USN for aviators over their gloves (and may be worn between glove layers for additional protection) during movement between shelter and aircraft. When used as an overglove, the gloves are removed during aircraft mounting during aircraft entry to preclude the potential for transfer of contamination into the aircraft interior. Medical Services practitioners performing treatment The CPHS is designed to prevent contact of the warfighter's helmet with liquid contamination which may be absorbed, impact helmet integrity, and/or constitute a potential secondary hazard to the wearer. SCALP provides a disposable, lightweight, impermeable layer of protection for personnel against gross liquid contamination and is worn over the warfighter's protective ensemble. SCALP is commonly applied to protect armor and explosive ordinance disposal (EOD) personnel who may be required to leave sheltering to perform duties and functions. SCALP is also applied by units performing decontamination operations where personnel may become soaked by decontaminants and Medical Services personnel with potential for prolonged contact with body fluids. Standard wet-weather gear (e.g., poncho, rain parka, rain suit, etc.) is also applied as a barrier against saturation of the warfighter's protective ensemble by contact with liquids such as rain, sea spray, etc. The M-2 apron is applied by personnel performing decontamination aprons and is worn over the ensemble. The apron is full length and sleeve to maximize coverage, although the back is open. COTS assets meeting OSHA requirements (and NFPA for firefighters) are applied by selected civilian personnel performing specific functions such as firefighting, EMS, hazardous materials, etc. Medical barrier impermeable barrier protective assets may also be applied by Medical Services practitioners potentially at risk for contact with fluids.

<sup>14</sup> Military CBRND percutaneous protective equipment provides protection to the wearer from all known chemical warfare agents, radioactive particulates, and biological agents. The equipment also affords protection against selected TIM agents. However, the equipment does not protect against all high-threat TIM agents. Further, certain agents cause rapid saturation rapidly decreasing the time period of protection. High winds, such as rotor wind or propeller/jet wash, may cause penetration of the protective equipment by agent. The protective garments are vulnerable to saturation by rain, sea spray, and high humidity. The CBRND protective capabilities of COTS equipment will vary. COTS equipment manufactured within the United States or to U.S. specifications for toxic environments must comply with OSHA standards. However, COTS equipment must be compared against the threat, if applied, and for the level of required protection identified in OSHA standards. COTS equipment not manufactured within the United States and not for U.S. sale may or may not meet equivalent standards, if mandatory standards exist. OSHA-standard equipment may not be applicable for non-U.S. personnel at locations outside the United States. Existing national standards for the host or originating country may be applicable and may not provide equivalent protection to OSHA.

<sup>15</sup> Approved percutaneous protection for MWAs does not exist.

<sup>16</sup> Doctrine, policy, procedures, training, exercises, and evaluations serve to build the capability of individuals to perform tasks while wearing percutaneous protection. However, the encumbrances associated with percutaneous protection do degrade performance and limit the conduct of certain tasks (especially those associated with the repair and maintenance of delicate and intricate assets). Prolonged wear places stress upon the individual and will impact performance. Doctrine, policy, and procedures are inadequate for sustained operations within a CBRN/TIM environment, especially forces conducting expeditionary operations in austere environments and possessing reduced logistical footprints.

<sup>17</sup> Operations with threat apply MOPP levels detailing the ready availability of percutaneous protection. Depending upon the MOPP level, the individual will wear portions or all components of percutaneous protection including gloves, jacket, pants, and boot covers. Respiratory/ocular protection is donned first to protect the individual followed by the remaining components of percutaneous protection upon warning or alerting of a CBRN/TIM agent. Selected systems require the fitting and preparation within COLPRO, such as the high-performance aircrew ensembles and similar systems. Personnel outside COLPRO are required to maintain ready availability of percutaneous protection capable of rapid attainment of protection.

<sup>18</sup> Plans incorporate MOPP levels and methodologies are adjustable to meet local operations and threat needs. MOPP levels and methodologies apply to military personnel and are generally considered to apply to equipped nonmilitary personnel (although doctrine, policy, procedures, and TTPs do not address application to these personnel). The MOPP methodologies in planning and operations include CBRND COLPRO to mitigate or prevent the effects of CBRN/TIM agents upon critical functions, activities, and operations.

<sup>19</sup> Current mobile COLPRO systems are predominantly integrated into selected combat vehicles/vessels and do not support the protection of MWDs. The only currently fielded land-based mobile group COLPRO is CBPS. The CBPS system is available on a mobile platform and can provide a limited number of people protection. The CBPS consists of a dedicated M1113 HMMWV with an LMS mounted on the back and provides a highly mobile, contamination-free, environmentally controlled work area for forward deployed medical units. The CBPS has been fielded to treatment squads, forward surgical teams, and medical companies. Four personnel are required to operate the CBPS. However, these systems are limited in supply and are generally dedicated to medical and C4ISR operations. None are allocated for the protection of MWDs or MWD teams.

<sup>20</sup> Limited COLPRO is available in type and quantity to support operations, particularly multiple operations with threat. Limitations are considered during planning and alternatives are developed by the staff. The combination of IPE and available COLPRO provides flexibility to meet and maintain operational capability.

<sup>21</sup> The USMC MGPTS with CB Protective Liner System provides a positive-pressure, filtered-air, toxic-free shelter for protection against CBRN agents. However, there are insufficient quantities. The USAF CP-SSS is a small-scale CPS applied for the conduct of C2 operations, maintenance of critical equipment, force beddown, and the provision of R2 for sortie generators and key leadership. This shelter is in limited supply and unlikely sufficient quantities would be available to support MWDs, especially during operations against an adversary. The M20/M20A1 SCPE is a lightweight, modular system involving a liner designed for inflation within a room or building. The M20A1 serves to bridge the gap between the M20 SCPE and CBPS. Quantities are limited and are not likely to be available during operations against an adversary. Current plans generally do not address the application of COLPRO to MWDs and do not allocate the limited COLPRO resources to this resource. Fixed-site COLPRO within the United States and its territories is predominantly designed for nuclear fallout and does not address other CBRN/TIM hazards and threats arising after September 11, 2001. Selected critical key facilities are equipped with CBRN COLPRO, but are not available to other than designated personnel. Fixed-site CBRN COLPRO is installed in facilities housing selected activities and functions within HTAs. However, these facilities are dedicated to critical operational requirements and restricted to assigned and designated personnel. MWD handlers may possess access to COLPRO, depending upon performed activity and location, against the effects of CBRN/TIM agents. However, MWDs are not permitted into COLPRO unless specified by the commander and/or senior ranking person within the shelter.

<sup>22</sup> Plans incorporate MOPP levels and methodologies are adjustable to meet local operations and threat needs. MOPP levels and methodologies apply to military personnel and are generally considered to apply to equipped nonmilitary personnel (although doctrine, policy, procedures, and TTPs do not address application to these personnel). The MOPP methodologies in planning and operations include CBRND actions, activities, and requirements to mitigate or prevent the effects of CBRN/TIM agents.

<sup>23</sup> Plans incorporate MOPP levels and methodologies are adjustable to meet local operations and threat needs. MOPP levels and methodologies apply to military personnel and are generally considered to apply to equipped nonmilitary personnel (although doctrine, policy, procedures, and TTPs do not address application to these personnel). The MOPP methodologies in planning and operations include CBRND IPE to mitigate or prevent the effects of CBRN/TIM agents.

<sup>24</sup> Plan-identified forces are trained on MOPP level requirements and associated actions. Each level identifies the protective equipment forces are to don and maintain. However, although MOPP levels are generally considered to apply to equipped nonmilitary personnel, DOTLPF does not adequately address MOPP application to these personnel.

<sup>25</sup> MWDs are not CBRND trained, equipped, and fully integrated into CBRND exercises and evaluations requiring the use of IPE at the appropriate MOPP levels. MOPP does not address MWDs. MWD handlers are trained and equipped with IPE to achieve required MOPP levels upon notification or warning and to evacuate MWDs as best possible.

<sup>26</sup> MOPP levels and methodologies provide flexibility for the adjustment of IPE to meet local operational and threat requirements. The intent is to achieve and maintain the lowest level necessary for survival of the force and operational accomplishment. Adjustments are made as dictated by local circumstances. However, prolonged wear of IPE will degrade performance.

<sup>27</sup> Personnel are instructed and trained to adopt full MOPP protection upon alerting or warning of a CBRN/TIM agent attack or presence. Reduction in MOPP level is performed upon receipt of guidance and as outlined.

<sup>28</sup> Unit staff conducts planning and coordination activities for operations with threat to mitigate or preclude operational and survival impacts upon operations and personnel by CBRN/TIM agents. These plans include the integration and dissemination of MOPP levels and methodologies. The MOPP levels are adjustable to meet local operations and threat needs. MOPP levels and methodologies apply to military personnel and are generally considered to apply to equipped nonmilitary personnel (although doctrine, policy, procedures, and TTPs do not address application to these personnel).

<sup>29</sup> Unit staff planning and operational activities address the identification, allocation, and application of IPE by the force for operations with threat. Detailed guidance and instructions are provided to participating units for effective preparation and post-event activities and actions for CBRN/TIM agents. Unit staff personnel planning is guided by current doctrine, policy, procedures, and TTPs. Select HTA doctrine does provide limited guidance on the provisioning of protection to in-place, known, eligible civilians not supporting the mission (e.g., military dependents, etc.). However, the emphasis within HTAs is upon short-term protection until evacuation. Planning for the provision of CBRND to nonmilitary personnel is a combination of known available assets not otherwise committed to operations, threat, number of persons involved, ability to protect the target population, available relocation resources, expected time to move the population, and expected operational demands. DOTLPP providing guidance for CBRND of detainees does not exist. The protection of non-force members within the United States and its territories is constrained by available protective resources and impacted by OSHA requirements for nonuniformed personnel. Staff training, processes, and planning/operating guidance do not adequately consider civilians supporting the mission and remaining within the AO, particularly non-U.S. personnel. The provisioning and standards for civilians performing mission support tasks, activities, and functions are not adequately addressed for the provision of military force equivalent CBRND IPE where and when appropriate. Civilians supporting the mission within the United States and its governed territories are governed by OSHA requirements. Staff personnel representing selected activities such as fire department, EMS, and other similar standard response functions are aware and knowledgeable of OSHA requirements and are involved in staff planning and operational processes. However, equipage of these personnel is currently restricted to selected activities and functions. Further, host-nation standards and requirements similar to OSHA may exist and apply to non-U.S. personnel, activities, and functions supporting the mission and are not generally known to the staff. Most civilian personnel, both those performing mission support and not, are not addressed in planning for survival and operations within a CBRN/TIM environment.

<sup>30</sup> Equipping the force is an integral part of staff planning and preparation for operations with threat. Allocation and issuance of individual protective assets are detailed in plans and tracked for accomplishment and operational readiness. However, the provisioning of individual protective equipment and measures to nonmilitary members of the force is not adequately addressed in DOTLPP.

<sup>31</sup> DOTLPP does not address and require the allocation of CBRND resources for the protection of MWDs. Plans call for the evacuation of MWAs upon notification of an impending CBRN/TIM release.

<sup>32</sup> Unit staff planning and preparations include preparing the force for operations within a CBRN/TIM environment. Degradation is considered in the development of taskings, R2 requirements, and force application. MOPP levels are developed, implemented, and adjusted to meet local operational needs and threat. Constant evaluation of force activities is performed for necessary changes and modifications to maintain force operational capabilities.

<sup>33</sup> Currently, the transmission and reception of CBRN/TIM hazard alarm, warning, and report information is performed manually predominantly using ATP-45 formats and processes. Each unit is responsible for ensuring potentially or indirectly affected subordinate units are notified of the hazard. This is generally performed using nondedicated existing and available communication systems. All personnel are trained during military basic training and periodic CBRND training on alerting nearby personnel, warning those in their area, and reporting the event as outlined in their unit procedures. This training is reinforced during deployment preparation for operations with a threat. CBRND specialists are fully trained and receive recurring training on the conduct of performing CBRN warning and reporting. Units not possessing primary duty CBRND specialist do assign selected staff personnel with CBRN responsibilities and provide access to the necessary training. CBRN warning and reporting competencies of these later personnel will vary, but sufficient capability exists. Selected staff personnel are also trained using these warnings and reports to assess and recommend courses of action (COAs) to the commander for maintenance of operations tempo (OPTEMPO) while providing for the safety and well-being of the force. Exercises and evaluations do not generally challenge all areas of unit capabilities for alerting, warning, and reporting. Adjacent units, particularly non-U.S. and often other U.S. Services, may not receive alerts, warnings, and reports until after these have been processed up through channels and then disseminated back down channels, creating unnecessary delays with potential ramifications for OPTEMPO and unit survivability.

<sup>34</sup> Equipping and supply the force is an integral part of planning and preparation. The combination of established force organic assets, material acquisitions, prepositioned material, and movement of identified CBRND resources from stockpiles and reallocation activities are pursued by units staff with the Joint Task Force (JTF) staff to prepare and support forces as outlined by the appropriate plan and adjusted to meet local operational requirements.

<sup>35</sup> Unit staff provides for R2 of personnel operating outside COLPRO at least once every 24 hours within COLPRO. Staff also manages COLPRO allocation and operations for support of operational requirements and critical activities/functions.

<sup>36</sup> Legacy systems will remain in the inventory throughout the mid term. These systems will be gradually replaced by new joint systems of respiratory/ocular protection as they are fielded. The JSAM replaces the Service-specific systems. When incorporated with anti-G protection of high-performance aircraft aviators, the JSAM will provide simultaneous CBRN and anti-G protection. The JSAM is compatible with existing and programmed CBRN IPE, provides flame and thermal protection, and reduces the heat stress associated with existing systems of ocular/respiratory protection. Further, the JSAM may be donned and doffed during flight. The JSGPM also replaces current Service-specific ocular/respiratory protection. The system provides respiratory and ocular protection from CBRN agents and selected TIMs. Reduces wear encumbrances associated with existing systems. The JSGPM will be OSHA-approved for use by DoD civilians and military personnel in nonmilitary unique operations. The JSGPM is designed to interface with current and co-developmental chemical protective garments and to be compatible with mission-essential equipment. The JCESM is a COTS one-time use, one-size-fits-all, respiratory/ocular protective system affording 2 hours of protection and is lightweight and disposable. The system is designed to provide low-level CBRN vapor, aerosol, and particulate protection to the wearer for egressing the contaminated environment. The JCESM is projected for use when standard respiratory/ocular protection is not practical. The JCESM is not programmed for general dissemination. The Guardian Program is projected to review, assess, and implement protection for critical members of the installation/facility populace during the mid term. This will predominantly be COTS-based assets for respiratory/ocular protection. However, the Guardian Program is not expected to address the provision of CBRND protective assets for general base populace, as well as eligible civilian protection within the AO for other than existing U.S. military installations and facilities. MWA respiratory/ocular protection is not programmed or forecasted.

<sup>37</sup> Legacy systems will remain in the inventory throughout the mid term. These systems will be gradually replaced by new joint systems of percutaneous protection as they are fielded. The JSLIST NBC Protective Garment is a two-piece, risk-taking, overgarment with integrated hood affording protection against CBRN agents and selected TIMs. The garment reduces the physiological and psychological encumbrances associated with legacy systems. The JSLIST is under evaluation by NIOSH for application to OSHA protection requirements. The JPACE replaces the Service-specific systems. The JPACE provides aircrew members with equivalent protection to the JSLIST ensemble. The JPACE is designed to not interfere with emergency ejection from a combat aircraft and continues to provide CBRN percutaneous protection following ejection and during escape and evasion operations. The ensemble is both flame-retardant and self-extinguishing to permit emergency egress from a burning aircraft. Further, the ensemble provides CBRN protection when subject to rotor, propeller, and jet wash. Joint Service glove upgrades are provided under the Joint Block 1 and 2 Glove Upgrade Program (JB1/2GU) in the near and mid term. The JB1GU responds to an urgent need by designated elements of the force for increased tactility/durability supporting mission requirements. The JB1GU is expected to meet most of the requirements within the JSLIST Operational Requirements Document (ORD) and is viewed as an evolutionary approach in the development of the JB2GU. Versions under consideration include a protective inner glove worn under existing warfighter gloves, a replacement glove for existing hand wear, or a combination of glove shell and liner affording CBRN protection of the legacy gloves they are projected to replace. The JFIRE addresses protection of military firefighters within a CBRN/TIM environment conducting firefighting operations involving structural and crash/firefighting/rescue. The JFIRE incorporates the JSLIST into firefighter bunker gear. The MULO is projected to replace legacy footwear covers. The ability of the MULO to provide adequate antislip protection for USN personnel asea is under review. The Guardian Program is projected to review, assess, and implement protection for critical members of the installation/facility populace during the mid term. This will predominantly be COTS-based assets for percutaneous protection. However, the Guardian Program is not expected to address the provision of CBRND protective assets for general base populace, as well as eligible civilian protection within the AO for other than existing U.S. military installations and facilities. MWA percutaneous protection is not programmed or forecasted.

<sup>38</sup> Fielding of the P3I upgraded CBPS for heavy/airborne use is projected for the mid term, as are two variants of the JSLNBCRS, the M93A1 Fox NBCRS Block II, and backfit of LHA/LHDs to include CITADEL.

<sup>39</sup> The projected initial fielding of JECP within the mid term provides additional capabilities for the COLPRO protection of the force and critical activities/functions. JECP includes COLPRO adaptive inserts for building/rooms and legacy tentage and stand-alone COLPRO sheltering for small units. The projected mid-term fielding of JECP may alleviate COLPRO shortages but will likely be insufficient to satisfy all COLPRO requirements. Quantities to be fielded of these systems have not been determined. JTCOPS Block I is also projected for initial fielding during the mid term. Prior planning and prioritization of COLPRO allocation is critical.

<sup>40</sup> The projected fielding of JWARN will decrease the time taken to disseminate alerting and warning information to the force. Additionally, JWARN will enable the notification of adjacent units connected to the network. Manual notification methods and means will remain foundational for many units during the transition period and for elements of units.

<sup>41</sup> The next-generation series of aviator and nonaviator masks is in R&D. The capabilities and fielding of these masks are not as yet determined.

<sup>42</sup> The next-generation series of aviator and nonaviator percutaneous protective assets are in R&D. The capabilities and fielding of these assets are not as yet determined.

<sup>43</sup> The projected Future Tactical Lift Option is under evaluation for the potential addition of COLPRO in the design and production specifications. A decision on the inclusion of COLPRO in the LHA(R) is expected in the mid term.

<sup>44</sup> JTCOPS Block II is projected for the far term. Continued fielding of JECF.

### 13.1.3 Functional Solution Analysis

#### 13.1.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** Not all CBRND protective equipment and measures protect against all CBRN/TIM agents.

**Partial Non-Materiel Solutions:** *Doctrine:* Ensure doctrine effectively describes the limitations of CBRND protective equipment to enable users to choose appropriate equipment for the threat encountered.
- 2. Deficiency:** Encumbrances associated with ocular/respiratory and percutaneous protection degrade performance and limit the conduct of certain tasks.

**Partial Non-Materiel Solutions:** *Doctrine:* Enforce existing doctrine addressing prolonged wear of IPE and MOPP gear exchange. *Organization:* Develop organizational structures, resources, staffing, and capabilities to support personnel exchange and R2 to preclude degradation of tasks and to promote the well-being of the force. *Training:* Ensure training, exercises, and evaluations effectively promote acclimation and endurance of wear of IPE. *Leadership:* Ensure awareness of degradation effects.
- 3. Deficiency:** Expeditionary operations are a particular concern as most CBRND systems and associated logistics are not designed for a highly mobile force, with a reduced logistical footprint, and for the initial period of operations until the theater matures (usually the first 30–90 days).

**Partial Non-Materiel Solutions:** *Doctrine:* Complete the JCIDS process and central correlation/comparison of national and strategic plans to identify CBRND resources necessary and available to support expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct expeditionary operations while possessing reduced logistical footprint and during the first 30–90 days of operations following commencement of hostilities. *Training:* Train, exercise, and evaluate expeditionary capabilities of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operations using CBRND resources supporting expeditionary operations. *Leadership:* Recognize differences and challenges associated with expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint, training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.

- 4. Deficiency:** DOTLPP for Protective Posture Protocols is inadequate or nonexistent addressing CBRND of eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing eligible civilian personnel for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of eligible civilian personnel within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians; and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilian personnel.
- 5. Deficiency:** DOTLPP for Protective Posture Protocols is inadequate or nonexistent addressing CBRND of MWAs.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing MWAs, particularly MWDs, for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of MWAs within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWAs.
- 6. Deficiency:** Deploying eligible civilians are not equipped and trained to survive a CBRN/TIM environment.

**Partial Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures for CBRND protection of eligible civilians and training for CBRN/TIM environment survival. *Organization:* Ensure organizational consideration for maintenance and support of eligible civilians CBRND protective equipment, measures, and activities. *Training:* Establish institutional and unit training of eligible civilians for CBRND measures and activities. Integrate into CBRND exercises and evaluations. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for eligible civilian survivability. *Facilities:* Develop supporting infrastructure for eligible civilians CBRND (e.g., logistics, medical, communications, training, etc.).
- 7. Deficiency:** Deploying MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment.

**Partial Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of MWAs, particularly MWDs, and training for CBRN/TIM environment survival. *Organization:* Ensure organizational consideration for maintenance and support of MWA CBRND protective equipment, measures, and activities. *Training:* Establish institutional and unit training of MWD handlers and MWDs for CBRND measures and activities. Integrate into CBRND exercises and evaluations. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for MWA survivability.
- 8. Deficiency:** The command staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing civilian personnel and operations for CBRND. *Organization:* Identify organizational services

and activities supporting the mission performed by civilian personnel and operations.

*Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians. Conduct CBRND training, exercises, and evaluations. *Leadership:*

Implement and manage CBRND training, equipping, and protection of eligible civilians.

*Personnel:* Ensure that eligible civilians supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities:* Develop supporting infrastructure for eligible civilian CBRND (e.g.,

logistics, medical, veterinary surveillance, training, communications, etc.).

9. **Deficiency:** The command staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying MWAs.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing MWA, particularly MWD, operations for CBRND. *Organization:* Identify organizational services and activities supporting the mission performed by MWA CBRN/TIM survivability and mission operations. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWAs. Conduct CBRND training, exercises, and evaluations.

*Leadership:* Implement and manage CBRND training, equipping, and protection of MWAs.

*Facilities:* Develop supporting infrastructure for MWA CBRND (e.g., logistics, medical, veterinary surveillance, training, communications, etc.).

10. **Deficiency:** Current doctrine, the *Universal Joint Task List (UJTL)*, and operational planning do not adequately address sustained operations within a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, procedures, and *UJTL* sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.

11. **Deficiency:** Exercises and training do not emphasize task performance and operations in a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, and procedures sustained operations within a CBRN/TIM environment. *Organization:* Ensure resources, taskings, and staff are in place or available to plan and perform sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.

12. **Deficiency:** COTS equipment not manufactured within the United States and not for U.S. sale may or may not meet equivalent OSHA standards.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, and TTPs guidance for the application of non-OSHA approved material for protection of eligible civilians.

*Organization:* Ensure resources, taskings, and staff are in place or available to plan, acquire,

disseminate, and manage the provision of non-OSHA/standard force IPE assets and measures to eligible civilians. *Leadership*: Ensure awareness of potential variances in requirements for protection of eligible civilians. Ensure planning and preparation activities adequately address this area. *Facilities*: Develop supporting infrastructure to support the provisioning of non-OSHA-standard force IPE assets and measures to eligible civilians.

**13. Deficiency:** Inadequate COLPRO to support expeditionary and highly mobile forces

**Partial Non-Materiel Solutions:** *Doctrine*: Develop and disseminate appropriate doctrine, policy, and procedures for the application of common materials for COLPRO and for COLPRO kits and components. *Organization*: Develop organizational structures, resources, staffing, and capabilities to enable effective application of available COLPRO and implementation of expedient COLPRO capabilities. *Training*: Establish initial and recurring training of all members of the force on the conduct of expedient COLPRO. Exercises and evaluations incorporate criteria challenging this capability. *Leadership*: Recognize potential for expedient COLPRO to improve force capabilities and survivability. *Facilities*: Develop supporting infrastructure enabling expedient COLPRO and the effective application of available COLPRO.

**14. Deficiency:** MWDs are not permitted into COLPRO unless specified by the command and/or senior ranking person within the shelter.

**Partial Non-Materiel Solutions:** *Doctrine*: Establish in doctrine requirement for the provision of COLPRO for MWDs in kenneling and field circumstances, as well as mandate provisioning of COLPRO space in circumstances when MWD COLPRO is unavailable. *Leadership*: Ensure awareness of value of force multiplying asset and criticality for operations. Enforce compliance with doctrine.

**15. Deficiency:** CBRND of detainees is inadequate.

**Partial Non-Materiel Solutions:** *Doctrine*: Include in doctrine, policies, and TTPs requirements and guidance for the provision of CBRND to detainees. *Organization*: Ensure resources, taskings, and staff are in place or available to plan and conduct CBRND of detainees. *Training*: Train, exercise, and evaluate the force for effective CBRND of detainees. *Leadership*: Recognize criticality of protection of detainees within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force. *Facilities*: Develop infrastructure to support CBRND of detainees.

**16. Deficiency:** Standard force individual protection does not meet OSHA standards.

**Non-Materiel Solutions:** *Doctrine*: Include requirement for standard force individual protection to meet the appropriate OSHA protection standard, if applicable.

**17. Deficiency:** National standards and requirements similar to OSHA may exist and apply to non-U.S. personnel, activities, and functions supporting the mission and are not generally known to the staff.

**Non-Materiel Solutions:** *Doctrine*: Include in doctrine, policy, and TTPs guidance for the application of non-OSHA approved material for protection of eligible civilians.

*Organization:* Ensure resources, taskings, and staff are in place or available to plan, acquire, disseminate, and manage the provision of non-OSHA-standard force IPE assets and measures to eligible civilians. *Leadership:* Ensure awareness of potential variances in requirements for protection of eligible civilians. Ensure planning and preparation activities adequately address this area. *Facilities:* Develop supporting infrastructure to support the provisioning of non-OSHA-standard force IPE assets and measures to eligible civilians.

**18. Deficiency:** Manual nature of current alerting and warning processes impact dissemination to subordinate and neighboring units and implementation of MOPP requirements for CBRND.

**Non-Materiel Solutions:** *Doctrine:* Include requirement for cross-Service notification of adjacent force elements. *Training:* Include cross-Service notification of adjacent force elements in training criteria. Incorporate criteria into exercises and evaluations to challenge alerting and notification of adjacent force elements. *Leadership:* Ensure awareness of adjacent elements and criticality of time to protect the force. *Facilities:* Develop supporting infrastructure for cross-Service communications.

### 13.1.3.2 IMA Assessment Summary

Table 13.1-3 is a list of ideas for material approaches and a corresponding description of each idea. Approaches vary from modification of current IPE to developing new systems and conducting early technology assessments. Significant issues remain concerning MWAs, primarily establishing priorities concerning the need to develop IPE. Table 13.1-4 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 13.1-3. TASHLD 1: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Assess CBRND material	Test and assess all CBRND material for protective abilities against future threat agents, including TIM.
Broad-application above-the-neck respiratory protection	Develop above-the-neck respiratory protection with broad application for the general population, including MWAs.
Chemical air generation	Integrated compounds within warfighter's IPE applying chemical reaction to generate oxygen without reliance upon external sources.
Chemical treatment	Develop solution for treatment of existing MOPP suit and other warfighter clothing fabric that neutralizes or block the effect of CBRN/TIM agents, including future agents.
COTS CBRND IPE materiel for MWD protection	Adapt COTS protective equipment, where necessary and desirable, for CBRND of MWDs.
Develop COLPRO kits	Develop COLPRO kits containing all necessary supplies to construct field-expedient COLPRO that is easily stored and maintained in ready condition, easily and safely erected, operated, maintained, and struck within a CBRN/TIM environment by IPE-encumbered personnel using minimal resources and supports COLPRO requirements.
Develop and establish generic unit CBRND kits	Develop, preposition, and maintain reserve stocks of generic CBRND kits for a standard unit. Components are adjusted as necessary for specific operations involving threat.
Develop MWD COLPRO	Develop or adapt joint level MWD transport and field kenneling systems for COLPRO function as transporter, field shelter, and COLPRO.
Develop/adapt MWA transport system with pressure/filtration	Develop or adapt MWA transport systems to provide COLPRO protection from CBRN/TIM agents.
Disposable COLPRO	Develop one-time-use COLPRO that is rapidly erected with little instruction, training, and effort and affords term protection for critical activities and functions, maintenance and repair activities, prelocated consumables, as well as personnel associated with this task.
Disposable IPE	Develop low-cost disposable IPE providing protection for transport aircrew members and/or determine available COTS protection to support air operations in a contaminated environment or while carrying contaminated cargo.

Field-expedient COLPRO kits	Develop field-expedient COLPRO kits designed to adapt existing structures, tentage, etc., for the expansion of COLPRO field capabilities and mission support and the provision of collective protection to the force, critical functions and activities, maintenance and repair activities and functions, resources, etc.
Field-expedient COLPRO materials	Identify commonly available materials (duct tape, plastic sheeting, wooden crate, plywood, tarps, coverings, wraps, caulk, sealant gels/sprays, etc.) for application in the construction of expedient COLPRO needed to construct field-expedient COLPRO when COLPRO availability is limited or not advantageous.
Filtration system lowering inhalation pressure requirement	Improve current mask systems by reducing the inhalation effort required. Options may include air streaming into the mask from a contained system that either has a stored supply or generates air flow.
Improved IPE garments and accessories	Develop new generation of IPE garments and accessories (e.g., boots/boot covers, gloves, hoods, etc.) using modern materials permitting greater range of motion, longer wear without performance degradation, increased durability, integrated into warfighter personal equipment, and protects against all threat CBRN and high-risk TIM agents.
Integrate CBRN/TIM protective features into functional garments	Develop materials integrating CBRN/TIM protective capabilities and design standard functional garments using these materials for protection of the force.
Integrated mobile COLPRO	Develop warfighting platforms (air, land, and sea) with COLPRO that is an integral part of the operational system and protects against current and future/advanced agents.
Rebreathing	Closed circuit mechanism to permit an individual's exhaled air to be filtered, CO <sub>2</sub> removed and recirculated for breathing, allowing user to make use of all available oxygen in a closed environment.
Regenerative filtration	CBRN regenerative filters able to flush retained agent, neutralize agent, or by other inherent means affords extended period of protection.
Respiratory protection for MWAs	Modify existing technology for application by MWAs to provide some protection from CBRN/TIM. Specific masks would be desirable that are comparable to the human form factor.
Topical	Develop topical barrier that is easily applied (i.e., spray), acts as a contact hazard barrier, and affords protection from CBRN/TIM.

## 13.2 Task TASHLD 2: Initiate medical prophylactic measures to counter CBRN/TIM effects

### 13.2.1 Functional Area Analysis

#### 13.2.1.1 Definition

Prophylaxis may be administered prior to actual exposure or following exposure but prior to presentation of signs and symptoms. Prophylaxis may be administered prior to, during, or post deployment. Prophylaxes exist for a number of chemical, biological, and radiological agents. Medical prophylaxes prevent or reduce the agent effects from exposures and/or increase the effectiveness of post exposure treatments. These preventive measures will reduce the number of casualties requiring medical services, as well as decrease the impact upon operations resulting from exposure to CBRN/TIM agents.

#### 13.2.1.2 Derivation

*Joint Enabling Concept for CBRN Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (TA 7, TA 7.1).*

#### 13.2.1.2.1 Supported Task: N/A

#### 13.2.1.2.2 Lateral Task: TASHA 24

#### 13.2.1.2.3 Supporting Task: N/A

#### 13.2.1.3 Condition

Perform this task under conditions of:

##### Physical

1. Undeveloped to highly developed land. (C1.1.1)
2. Riverine to open sea. (C1.2)
3. Natural and induced air. (C1.3)
4. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

##### Military

1. Severe health status. (NEW<sup>1</sup>)
2. Partially completed mission preparation. (C2.1.3)

---

<sup>1</sup> Proposed New Condition—Personnel Health Status (applicable Section C2.2): *Degree to which personnel, due to contraindications or preexisting conditions/illness, can be effectively diagnosed or receive medical prophylaxis or treatment.* Descriptors: Normal—Contraindications or conditions/illness do not exist. Limited—Conditions/illness exist complicating diagnosis. Contraindication or condition/illness exists but alternate prophylaxis or treatment is available. Severe—Contraindication or condition/illness exists and alternate prophylaxis or treatment is not available.

3. Marginal to strong forces. (C2.2)
4. Good personnel physical conditioning. (C2.2.4.3)
5. Poor mission-essential government-service civilian physical conditioning. (C2.2.4.3 – NEW)
6. Poor mission-essential contract-service civilian physical conditioning. (C2.2.4.3 – NEW)
7. Negligible personnel experience. (C2.2.4.5)
8. Limited staff expertise. (C2.3.1.3)
9. Limited deployed supplies. (C2.8.2)
10. Limited prepositioned materiel. (C2.8.4)

### Civil

1. Poor civil health. (C3.3.1.4)
2. High health risk. (C3.3.1.5)
3. TIMs present in the civilian sector. (C3.3.7.5)

## 13.2.2 Functional Needs Analysis

### 13.2.2.1 Capability and Deficiency Assessment Summary

Tables 13.2-1 through 13.2-2 discuss medical prophylactic measures to provide protection of warfighters against the effects of CBR agents. These prophylactic measures include preexposure, post-exposure, and presymptomatic measures. The overall capabilities for current, near/mid, and far term are rated “yellow.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

### Current Capability and Deficiency

Medical prophylaxes do exist for the protection of the warfighter against specific biological and chemical agents. However, few are FDA approved. A number possess investigational new drug (IND) authorization for application. Medications are considered for their potential prophylactic value, but are not always FDA approved for this purpose. Not all threat CBRN agents and high-threat/high-risk TIMs (particularly toxic industrial chemical [TICs]) are addressed by CBRND medical countermeasures. Efficacy, time to achieve a level of protection, and the number of administrations vary between prophylaxes. Eligible civilians and MWAs are not adequately addressed by DOTLPF for CBRND medical countermeasures. Clear DOTLPF addressing the CBRND provisioning and training of eligible civilians is inadequate. MWAs are not afforded prophylaxis against the effects of CBRN/TIM agents. MOPP DOTLPF is adequate for military personnel and operations. The establishment of adjustable MOPP levels, reflective of local operations and threat, are well defined, as are continuing evaluation for change/adjustments. However, operations increasingly involve U.S. and non-U.S. civilians. MOPP DOTLPF does not adequately address their presence and inclusion into MOPP methodologies and levels, particularly when these personnel may (or may not) be prepared for CBRND operations.

**Projected Near/Mid-Term Capability and Deficiency**

Ongoing R&D into medical prophylaxes will provide additional prophylactic measures but still fail to address all threat CBRN agents and high-threat/high-risk TIM agents.

**Projected Far-Term Capability and Deficiency**

Continued R&D into potential medical prophylaxes may result in additional protective measures for the force. However, specifics are unknown at this time.

**13.2.2.2 Resource Systems****Individual Protection Medical Protection:**

***Vaccines:*** Immunizations providing a level of acquired immunity against the effects of CBRN agents.

***Topicals:*** Protective barrier products applied to the skin to enhance protection of wear against contact with CBRN/TIM agents. Includes both inert and reactive materials.

***Medications:*** Medical materials taken to mitigate or prevent the effects of exposure to CBRN/TIM agents. Includes medications taken routinely or upon exposure (but prior to symptom display) to build resistance/immunity or to mitigate/resolve medical impacts of CBRN/TIM agent exposure/contamination.

**MOPP Methodology:** Stepped level of CBRND protective measures. Standardized levels permit the rapid increase or decrease of unit MOPP level.

**Unit Staff:** The application of DOTLPF for all phases of operations with threat from preplanning to post-force return to home stations. Includes all aspects of C2 and supporting staff activities/functions (e.g., logistics, intelligence, etc.) enabling mission and task accomplishment.

Table 13.2-1. TASHLD-2: Capability and Deficiency Assessment

System/Measure	M1	M2	M3	M4	M5	M6
<b>Current</b>

<b>Overall</b>						
<b>Current Overall Capability</b>	4	8	6	4	5	6
<b>Near/Mid-Term Overall Capability</b>	4	8	6	4	5	6
<b>Far-Term Overall Capability</b>	4	8	6	4	5	6

	FAA Measure	Scale
M1	Forces can be protected by medical prophylaxis for all threat agents of concern in the Joint Operations Area (JOA).	<p><b>8–10:</b> Medical CBRND countermeasures exist and are available for all threat CBRN and high-risk TIM agents and encompass all eligible at-risk populations.</p> <p><b>4–7:</b> Medical CBRND countermeasures exist and are available for high-threat CBRN and selected high-risk TIM agents for U.S. military and eligible civilian members supporting the mission/operations.</p> <p><b>1–3:</b> Medical CBRND countermeasures do not adequately address high-threat CBRN agents.</p> <p><b>0:</b> Medical CBRND countermeasures do not exist for CBRN agents.</p>
M2	Capability exists to rapidly and accurately initiate medical response and perform necessary medical measures upon identification of CBRN/TIM threat or hazard.	<p><b>8–10:</b> Plans and tasked resources exist and are in place to rapidly and accurately implement and conduct effective medical response and focused medical measures upon notification of a CBRN/TIM threat or hazard within the AO.</p> <p><b>4–7:</b> Plans exist and identify taskings and resources for the implementation and conduct of medical response and medical measures upon notification of a CBRN/TIM threat or hazard within the AO.</p> <p><b>1–3:</b> Plans exist and generally identify taskings and resources for the implementation and conduct of medical response and medical measures upon notification of a CBRN/TIM threat or hazard within the AO.</p> <p><b>0:</b> Plans for the implementation and conduct of medical response and medical measures upon notification of a CBRN/TIM threat or hazard within the AO are nonexistent.</p>

M3	Force are trained to appropriately apply medical prophylaxis.	<p><b>8–10:</b> All force members (military, eligible civilians, and MWA) are trained on the appropriate application and use of medical prophylaxis against threat CBRN/TIM agents.</p> <p><b>4–7:</b> Force members (military and eligible civilians support the mission) are trained on the appropriate application and use of medical prophylaxis against threat CBRN/TIM agents.</p> <p><b>1–3:</b> Military force members are trained on the appropriate application and use of medical prophylaxis against threat CBRN/TIM agents.</p> <p><b>0:</b> Training on the appropriate application and use of medical prophylaxis against threat CBRN/TIM agents is nonexistent.</p>
M4	Medical personnel are trained to appropriately administer prophylaxis.	<p><b>8–10:</b> Medical personnel receive recurring training on the procedures, dosing, siting, application, identification and mitigation of potential adverse reactions, and documentation associated with administration of each medical prophylaxis.</p> <p><b>4–7:</b> Medical personnel are trained on the procedures, dosing, siting, application, identification and mitigation of potential adverse reactions, and documentation associated with the administration of medical prophylaxis.</p> <p><b>1–3:</b> Selected medical personnel are trained on the procedures, dosing, siting, application, identification and mitigation of potential adverse reactions, and documentation associated with the administration of specific medical prophylaxis associated with identified operational threat.</p> <p><b>0:</b> Medical personnel are not trained on the procedures, dosing, siting, application, identification, and mitigation of potential adverse reactions, and documentation associated with the administration of medical prophylaxis.</p>
M5	Prophylaxes are FDA approved	<p><b>8–10:</b> Available medical CBRND countermeasures are FDA approved.</p> <p><b>4–7:</b> Available medical CBRND countermeasures are FDA approved or possess IND status.</p> <p><b>1–3:</b> Available medical CBRND countermeasures include non-FDA approved/IND status CBRND medical countermeasures.</p> <p><b>0:</b> Medical CBRND countermeasures are not FDA approved or possess IND status.</p>
M6	There is effective DOTMLPF in place to conduct task.	<p><b>8–10:</b> DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations</p> <p><b>4–7:</b> Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds.</p> <p><b>1–3:</b> DOTLPF is inadequate for accomplishment of this task.</p> <p><b>0:</b> DOTLPF does not exist for this task.</p>

<sup>1</sup> Forces are not protected against all identified threat CBRN/TIM capabilities. Medical prophylaxis does not exist for all threat CBRN/TIM agents. Current prophylaxis and supporting doctrine, policy, and procedures do not address presymptomatic medical CBRND protective countermeasures by other than U.S. forces, excluding MWAs and eligible civilians. Prophylaxis against most high-threat TIMs are not currently available due to the relatively recent consideration of these agents as a potential threat. Additionally, the efficacy of existing prophylaxis, particularly vaccines, widely varies. Military personnel are administered and/or issued CBRND medical countermeasures for operations with threat. Vaccines for selected biological agents, topicals, and preexposure and/or post-exposure/presymptomatic medications are applied to mitigate or preclude the effects of specific CBRN/TIM agents. Currently, preexposure prophylaxis is available for nerve agents (G and V series), and vesicants (H, HD, HN, L, CX), topical only. SERPACWA is the preexposure countermeasure for vesicants and one nerve agent. TSP is approved by the FDA as a supplement for SERPACWA. Post-exposure prophylaxis is available for pulmonary (CG) agent, but is not FDA approved. Radioprotective steroids and neutraceuticals may be effective as pre- and post-exposure prophylactics. 5-androstenediol is an IND preexposure treatment for radiological exposure. Iodide/potassium iodide is FDA

approved for application against Iodine 131, 132, 134, and 135. Post-exposure radiological exposure prophylaxis consists of neutraceuticals, plant isoflavone genistein, and alpha tocopherol (Vitamin E) but are not approved by the FDA for prophylaxis against radiation. FDA-approved preexposure medical countermeasures are available for anthrax, cholera, HFRS (Haantan), Rift Valley fever, yellow fever, HFRS (Haantan), and smallpox. IND status vaccines are currently available for Q-fever, tularemia (although use has been placed on hold by the FDA), Botulinum, Junin hemorrhagic fever, and VEE/WEE/EEE. Antiviral/bacterial medications may be administered and/or issued to provide a level of protection against biological agents. Medical prophylaxes are developed for the military force. Prophylaxis for MWAs is virtually nonexistent. Prophylaxis for eligible civilians is not addressed. Availability of prophylaxis is questionable for issue and administration to eligible civilians. The issue and administration of prophylaxis to eligible civilians requires review due to questions regarding applicability to the range of body types, ages, and physical/medical factors inherent within a potential population, as well as long-term health issues and legal implications.

<sup>2</sup> The force is equipped with prophylaxes for selected threat agents, trained in their application and identification of symptoms, and are instructed on the proper use of the material, whether preexposure or post-exposure/presymptomatic. The conduct of an accurate threat analysis drawing upon multiple correlated sources is critical to the identification of threats to the force and the appropriate prophylactic treatment. Rapid detection and characterization of the agent with dissemination of the information throughout the force is important to the accurate application of prophylaxes used for post-exposure/presymptomatic treatment.

<sup>3</sup> Military members tasked to participate in operations with threat are briefed on the threat agents and associated CBRND measures, including medical prophylaxes. If preexposure and/or post-exposure/presymptomatic prophylaxes are issued, the force is trained on the use of the medication. However, CBRND prophylaxes for MWAs do not exist, and DOTLPF is inadequate for the training of non-U.S. military personnel for prophylactic treatment of CBRN/TIM agent exposure.

<sup>4</sup> Medical practitioners and Medical Corps support personnel are formally trained on the administration of medications for standard medical treatment. The application of this training to prophylaxes is generally transparent. However, IND prophylaxes place increased requirements upon medical personnel to ensure the protocols for the particular prophylaxis are stringently followed and the recipients are fully briefed. DOTLPF requires documentation of the prophylaxis be placed within the recipient's medical records. Additional reporting and documentation requirements may be applied to a specific IND prophylaxis treatment. However, medical personnel are not generally trained on IND requirements and specifics for particular IND prophylaxis treatments. Generally, personnel tasked to perform the administration and documentation of the treatments are provided a short briefing with reading material to prepare to conduct the activity. The depth of the briefing varies between units.

<sup>5</sup> Not all prophylaxes are FDA approved. Several are categorized and applied as IND medical measures. Although FDA approval is a criteria for medical material applied as prophylaxes, the limited quantities required by DoD and the lack of a commercial demand may dictate many prophylactic measures do not achieve full FDA approval. Further, selected medications may be applied prophylactically. While a number may possess FDA approval, they may not be approved for prophylactic use by the FDA and therefore may not be considered FDA approved.

<sup>6</sup> DOTLPF exists for the conduct of this task for military personnel. However, DOTLPF for this task as applies to non-U.S. military personnel and MWAs is inadequate for the protection and survival of these personnel in a CBRN/TIM environment.

<sup>7</sup> Plans incorporate MOPP levels and methodologies and are adjustable to meet local operations and threat needs. MOPP levels and methodologies apply to military personnel and are generally considered to apply to equipped nonmilitary personnel (although doctrine, policy, procedures, and TTPs do not address application to these personnel). The MOPP methodologies in planning and operations include CBRND medical countermeasures and IPE to mitigate or prevent the effects of CBRN/TIM agents.

<sup>8</sup> Unit MOPP level guidance and planning includes prophylaxes. Materials are administered/issued according to the developed plans and guidance.

<sup>9</sup> Forces are trained to perform the actions associated with the appropriate MOPP level, including the administration of prophylactic materials, as outlined in Unit plans and guidance.

<sup>10</sup> Unit staff planning and operational activities address the identification, allocation, and application of CBRND medical countermeasures by the force for operations with threat. Detailed guidance and instructions are provided to participating units for effective preparation and post-event activities and actions for CBRN/TIM agents. Unit staff personnel planning is guided by current doctrine, policy, procedures, and TTPs. DOTLPF does not adequately address the administration and issue of prophylaxis to eligible civilians and other non-U.S. military personnel. Staff training, processes, and planning/operating guidance do not adequately consider civilians supporting the mission and remaining within the AO, particularly non-U.S. personnel. The provisioning and standards for civilians performing mission support tasks, activities, and functions are not adequately addressed for the provision of military force equivalent CBRND where and when appropriate. The administration and issuance of prophylaxis is addressed by the staff during the planning and support for operations. Prophylaxis for MWAs is virtually nonexistent. Prophylaxis for eligible civilians is not adequately addressed in current doctrine, policy, and procedures. National policies of the coalition/non-U.S. forces regarding medical prophylaxis is a factor the commander and supporting staff must consider during planning and operations. Religious considerations may also impact the use of medical prophylaxis.

<sup>11</sup> Medical and operational unit plans identify taskings and resources for the preparation of the force for operations with threat, and support of the force throughout operations, including CBRND operations. Specific implementation measures for the application of prophylactic immunizations and treatments (not issued to the individual) are addressed in the medical unit plans. The combination of established element organic assets, prepositioned material, and movement of identified CBRND resources from stockpiles and reallocation activities pursued by the medical and operational unit staffs, in collaboration and coordination with each other and higher authorities, to prepare and support forces as outlined in plans and adjusted to the circumstances. Medical resources and systems are reallocated, when necessary and in coordination with higher authorities, by medical authorities from prepositioned and dispersed stocks of Medical Services elements deploying or operating within an OA to rapidly and accurately address CBRN/TIM hazard exposure of the force.

<sup>12</sup> Unit staff planning for operations with threat includes the preparation and equipping of the tasked forces for CBRN/TIM operations. Medical prophylactic protection is one component of CBRND. The threat is compared to available prophylactic treatments in coordination with Medical Services to identify and obtain the appropriate material. Prophylactic material self-administered periodically or applied upon exposure, but prior to symptomatic display, are issued and personnel are trained on the specific prophylaxes. The training is documented and incorporated into the unit's readiness determinations. Prophylactic material applied upon exposure, but prior to symptomatic display, are issued and personnel are trained on the specific prophylaxes.

<sup>13</sup> Medical staff ensure medical practitioners and Medical Corps support personnel are trained and ready to brief, administer, and document administration of prophylaxes appropriately.

<sup>14</sup> Unit and associated medical staff ensure personnel administered or issued IND medications and other non-FDA approved medical materials are fully informed and are briefed as outlined in doctrine, policies, and procedures related to this task and non-FDA-approved materials.

<sup>15</sup> Cell Culture Derived Vaccinia is projected for production during the near-term. Clostridium Botulinum Toxin Medical Defense System is projected for availability during the mid term for Serotypes A, B, C, E, and F. The SERPACWA Active TSP is also projected for production during the late mid term.

<sup>16</sup> Active TSPs are projected for replacement of SERPACWA TSP and SERPACWA Active TSP in the far term. The Chemical Agent Prophylaxis and Cyanide Pretreatment are also projected for the far term. The Multivalent VEE Vaccine is projected to begin production in FY2013. The Next-Generation Anthrax Vaccine, Tularemia Vaccine, and Plague Vaccine are projected for production beginning in FY2010. Serotypes A and B are addressed in the Recombinant Bivalent Botulinum Vaccine projected for production in FY2012. A number of R&D efforts are under way for the development of preexposure and post-exposure prophylaxes. Potentially, these efforts may produce viable prophylaxes within the mid and far term resulting in fielded material. However, possible resulting prophylaxes cannot be predicted at this time.

### 13.2.3 Functional Solution Analysis

#### 13.2.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** Forces are not protected against all identified threat CBRN/TIM capabilities.  
**Partial Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards for prophylactic CBRND protection against all threat agents.  
*Leadership:* Enforce compliance with established standards (see Doctrine) for prophylactic CBRND protection.
- 2. Deficiency:** Medical prophylaxis does not exist for all threat CBRN/TIM and TIM agents.  
**Partial Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards for prophylactic CBRND protection against all threat agents.  
*Leadership:* Enforce compliance with established standards (see Doctrine) for prophylactic CBRND protection. Implement and ensure training is adequate and conduct exercises and evaluations to ensure readiness.
- 3. Deficiency:** Current prophylaxis and supporting doctrine, policy, and procedures to not address presymptomatic medical CBRND protective countermeasures by other than U.S. forces, excluding eligible civilians.  
**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing eligible civilians during CBRND operations and the provision of CBRND protection, including prophylaxis. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians.
- 4. Deficiency:** Current prophylaxis and supporting doctrine, policy, and procedures to not address presymptomatic medical CBRND protective countermeasures by other than U.S. forces, excluding MWAs.  
**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing MWAs, particularly MWDs, during CBRND operations and the provision of CBRND protection, including prophylaxis. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWAs.
- 5. Deficiency:** Prophylaxis against most high-threat TIMs are not currently available due to the relatively recent consideration of these agents as a potential threat.  
**Partial Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of metrics for standards and criteria for protection against all high-threat TIM agents. *Training:* Train, exercise, and evaluate personnel (military and eligible civilians) on

the use of prophylactic CBRND protection against threat agents. *Leadership*: Enforce compliance with established metrics for standards and criteria. Implement and ensure training is adequate and conduct exercises and evaluations to ensure readiness.

6. **Deficiency**: The efficacy of existing prophylaxis, particularly vaccines, widely varies.  
**Partial Non-Materiel Solutions**: *Doctrine*: Establish in doctrine, policy, and procedures the application of baseline standards for prophylactic CBRND protection against all threat agents. *Leadership*: Enforce compliance with established standards (see Doctrine) for prophylactic CBRND protection.
7. **Deficiency**: Short-notice operations and reallocated taskings impact the administration and issue of prophylaxis for the threat.  
**Non-Materiel Solutions**: *Doctrine*: Establish in doctrine, policy, and procedures the application of baseline standards for prophylactic CBRND protection against all threat agents. *Leadership*: Enforce compliance with established standards (see Doctrine) for prophylactic CBRND protection.
8. **Deficiency**: Forces have, and may in the future, require medical prophylaxis administration/issue upon arrival in the area of responsibility (AOR).  
**Non-Materiel Solutions**: *Doctrine*: Emphasize in doctrine, policies, and procedures for preparation of the force for CBRND protection during and throughout deployment, redeployment, relocation, and en route phases of movement. *Organization*: Ensure resources, taskings, and staff are in place or available to perform CBRND operations within a CBRN/TIM environment by deploying, redeploying, relocating, and en route forces. *Training*: Train, exercise, and evaluate the force for CBRND operations within a CBRN/TIM environment while deploying, redeploying, relocating, and en route. *Leadership*: Recognize criticality of readiness of the force for potential CBRND operations within a CBRN/TIM environment while deploying, redeploying, relocation, and en route; training providing the skills to manage the force in these circumstances; and willingness and ability to implement necessary changes and activities to prepare and appropriately protect the force. *Facilities*: Develop supporting infrastructure for CBRND operations of the force while preparing, deploying, redeploying, relocating, and en route.
9. **Deficiency**: The administration of many vaccines requires multiple administrations over a period of time for acquired immunity.  
**Partial Non-Materiel Solutions**: *Doctrine*: Include in doctrine, policy, and procedures requirement for CBRN/TIM protective prophylaxis protecting the force through the deployment cycle. *Organization*: Establish organizational incentives to address CBRN/TIM protective prophylaxis providing protection of the force throughout the deployment cycle. *Leadership*: Ensure standards, criteria, and metrics for CBRN/TIM medical prophylaxis R&D are concise and adequately protect the force throughout the deployment cycle with a minimum of administrations, preferably one.
10. **Deficiency**: Prophylaxis for MWA is virtually nonexistent.  
**Partial Non-Materiel Solutions**: *Doctrine*: Establish doctrine, policy, and procedures CBRND protection of MWAs, particularly MWDs, and training for CBRN/TIM environment

survival. *Organization*: Ensure organizational consideration for maintenance and support of MWA CBRND protective equipment, measures, and activities. *Training*: Establish institutional and unit training of handlers and MWAs for CBRND measures and activities. *Leadership*: Ensure awareness and planning for CBRND measures and requirements for MWA survivability. *Facilities*: Develop supporting infrastructure for MWA CBRND (e.g., logistics, veterinary surveillance, etc.).

**11. Deficiency:** Prophylaxis for eligible civilians is not addressed.

**Non-Materiel Solutions:** *Doctrine*: Establish in doctrine, policy, and procedures requirement to address the administration, provision, and application of medical CBRND protective countermeasures by other than U.S. forces (e.g., civilians, non-U.S. forces, etc.). *Organization*: Address organizational issues (e.g., who provides the equipment, support forces to train and equip, etc.) related to the provision of CBRN/TIM protection to eligible civilians and non-U.S. forces. *Training*: Include eligible civilians in CBRND training, exercises, and evaluations. Identify training requirements and responsibilities for non-U.S. forces. *Leadership*: Ensure leadership awareness of criticality of increased dependence of military operations upon civilians. *Personnel*: Require eligible civilians supporting the mission to meet minimum standards for safe use of CBRND resources.

**12. Deficiency:** Availability of prophylaxis is questionable for issue and administration to eligible civilians.

**Non-Materiel Solutions:** *Doctrine*: Establish in doctrine, policy, and procedures the application of CBRND standards and prophylaxis for protection of eligible civilians addressing the variation within a potential protected population. *Training*: Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRN/TIM training, exercises, and evaluations, where appropriate. *Leadership*: Implement and manage CBRND training, equipping, and protection of eligible civilians.

**13. Deficiency:** The issue and administration of prophylaxis to eligible civilians requires review due to questions regarding applicability to the range of body types, ages, and physical/medical factors inherent within a potential population, as well as possible long-term health issues and legal implications.

**Partial Non-Materiel Solutions:** *Doctrine*: Establish in doctrine, policy, and procedures the application of standards and measures for protection of eligible civilians addressing the variation within the potential protected population. *Leadership*: Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRN/TIM training, exercises, and evaluations.

**14. Deficiency:** Prophylaxis for eligible civilians is not adequately addressed in current doctrine, policy, and procedures.

**Non-Materiel Solutions:** *Doctrine*: Establish in doctrine, policy, and procedures requirement to address the administration, provision, and application of medical CBRND protective countermeasures by other than U.S. forces (e.g., civilians, non-U.S. forces, etc.). *Organization*: Address organizational issues (e.g., who provides the equipment, support forces to train and equip, etc.) related to the provision of CBRN/TIM protection to eligible civilians and non-U.S. forces. *Training*: Include eligible civilians in CBRND training,

exercises, and evaluations. Identify training requirements and responsibilities for non-U.S. forces. *Leadership*: Ensure leadership awareness of criticality of increased dependence of military operations upon civilians. *Personnel*: Require eligible civilians supporting the mission to meet minimum standards for safe use of CBRND resources.

- 15. Deficiency:** MWAs are not equipped, trained, and prepared for survival in a CBRN/TIM environment.

**Partial Non-Materiel Solutions:** *Doctrine*: Establish doctrine, policy, and procedures CBRND protection of MWAs, particularly MWDs, and training for CBRN/TIM environment survival. *Organization*: Ensure organizational consideration for maintenance and support of MWA CBRND protective equipment, measures, and activities. *Training*: Establish institutional and unit training of handlers and MWAs for CBRND measures and activities. *Leadership*: Ensure awareness and planning for CBRND measures and requirements for MWA survivability. *Facilities*: Develop supporting infrastructure for MWA CBRND (e.g., logistics, veterinary surveillance, etc.).

- 16. Deficiency:** Existing DOTLPF is inadequate, or nonexistent, for eligible civilians.

**Non-Materiel Solutions:** *Doctrine*: Promulgate doctrine, policy, and procedures addressing eligible civilian personnel for CBRND. *Organization*: Identify organization services and activities necessary to support survivability of eligible civilian personnel within a CBRN/TIM environment. *Training*: Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians; and conduct CBRND training, exercises, and evaluations. *Leadership*: Implement and manage CBRND training, equipping, and protection of eligible civilian personnel.

- 17. Deficiency:** Existing DOTLPF is inadequate, or nonexistent, for MWAs.

**Non-Materiel Solutions:** *Doctrine*: Promulgate doctrine, policy, and procedures addressing eligible civilian personnel and MWAs, particularly MWDs, for CBRND. *Organization*: Identify organization services and activities necessary to support survivability of MWAs within a CBRN/TIM environment. *Training*: Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations. *Leadership*: Implement and manage CBRND training, equipping, and protection of MWAs.

- 18. Deficiency:** The command staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians.

**Non-Materiel Solutions:** *Doctrine*: Promulgate doctrine, policy, and procedures addressing civilian personnel and operations for CBRND. *Organization*: Identify organizational services and activities supporting the mission performed by civilian personnel and operations. *Training*: Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians; and conduct CBRND training, exercises, and evaluations. *Leadership*: Implement and manage CBRND training, equipping, and protection of eligible civilians. *Personnel*: Ensure that eligible civilians supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM

environment. *Facilities*: Develop supporting infrastructure for eligible civilian CBRND (e.g., logistics, medical, veterinary surveillance, training, communications, etc.).

- 19. Deficiency:** The command staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying MWAs.

**Non-Materiel Solutions:** *Doctrine*: Promulgate doctrine, policy, and procedures addressing MWAs, particularly MWDs, and operations for CBRND. *Organization*: Identify organizational services and activities supporting the mission performed by MWA CBRN/TIM survivability and mission operations. *Training*: Establish CBRND training, exercise, and evaluation criteria and programs for MWDs and conduct CBRND training, exercises, and evaluations. *Leadership*: Implement and manage CBRND training, equipping, and protection of MWAs. *Personnel*: Ensure that eligible civilians supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities*: Develop supporting infrastructure for MWD and eligible civilian CBRND (e.g., logistics, medical, veterinary surveillance, training, communications, etc.).

- 20. Deficiency:** Medical personnel are not generally trained on IND requirements and specifics for particular IND prophylaxis treatments.

**Non-Materiel Solutions:** *Doctrine*: Enforce existing doctrine.

- 21. Deficiency:** Not all prophylaxes are FDA approved.

**Non-Materiel Solutions:** *Doctrine*: Require FDA approval of all prophylaxes, including medications potentially applied as prophylaxes. The latter requires specific approval as prophylactic treatment. Develop DoD policies to provide required R&D to gain FDA approval of medical prophylaxis.

- 22. Deficiency:** Current prophylaxes and supporting DOTLPF do not address presymptomatic medical CBRND protective countermeasures for eligible civilians and non-U.S. forces.

**Partial Non-Materiel Solutions:** *Doctrine*: Establish in doctrine, policy, and TTPs guidance and instructions for the application of presymptomatic medical CBRND protective countermeasures for eligible civilians and non-U.S. forces. *Organization*: Ensure resources, taskings, and staff are in place or available to plan, disseminate/administer, and monitor presymptomatic medical CBRND protective countermeasures for eligible civilians and non-U.S. forces. *Training*: Train, potential eligible civilians on presymptomatic medical CBRND protective countermeasures. *Leadership*: Recognize criticality of protection of eligible civilians within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply force resources. *Facilities*: Develop supporting infrastructure to support presymptomatic medical CBRND protective countermeasures of eligible civilians.

- 23. Deficiency:** Current prophylaxes and supporting DOTLPF do not address presymptomatic medical CBRND protective countermeasures for MWAs.

**Partial Non-Materiel Solutions:** *Doctrine*: Establish in doctrine, policy, and TTPs guidance and instructions for the application of presymptomatic medical CBRND protective

countermeasures for MWAs. *Organization*: Ensure resources, taskings, and staff are in place or available to plan, disseminate/administer, and monitor presymptomatic medical CBRND protective countermeasures for MWAs. *Training*: Train, non-U.S. forces on presymptomatic MWA medical CBRND protective countermeasures. *Leadership*: Recognize criticality of protection of MWAs within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply force resources. *Facilities*: Develop supporting infrastructure to support presymptomatic medical CBRND protective countermeasures of MWAs.

- 24. Deficiency:** DOTLPP for Protective Posture Protocols is inadequate or nonexistent addressing CBRND of eligible civilians.

**Non-Materiel Solutions:** *Doctrine*: Promulgate doctrine, policy, and procedures addressing eligible civilian personnel for CBRND. *Organization*: Identify organization services and activities necessary to support survivability eligible civilian personnel within a CBRN/TIM environment. *Training*: Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians; and conduct CBRND training, exercises, and evaluations. *Leadership*: Implement and manage CBRND training, equipping, and protection of eligible civilian personnel.

- 25. Deficiency:** DOTLPP for Protective Posture Protocols is inadequate or nonexistent addressing CBRND of MWAs.

**Non-Materiel Solutions:** *Doctrine*: Promulgate doctrine, policy, and procedures addressing MWAs, particularly MWDs, for CBRND. *Organization*: Identify organization services and activities necessary to support survivability of MWAs within a CBRN/TIM environment. *Training*: Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations. *Leadership*: Implement and manage CBRND training, equipping, and protection for MWAs.

### 13.2.3.2 IMA Assessment Summary

Table 13.2-2 is a list of ideas for material approaches and a corresponding description of each idea. Approaches focus on development of new / improved vaccines and antidotes that are: more affective; more efficiently introduced into the body; and address a broader range of threat agents (combination of agents). Table 13.2-3 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPP assessment.

**Table 13.2-2. TASHLD 2: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Combinatorial prophylaxes	Develop prophylaxes affording protection or minimizing the impact from a broad range of CBRN/TIM agents.
Current prophylaxes	There currently exists a variety of prophylaxes used for protection against CBRN. FDA testing and necessary modifications of prophylactics must be made to obtain FDA approval. Review available medical material and prophylaxes for application to high-risk TIMs.
Future prophylaxes	Some preexposure prophylaxes for biological agents require several administrations, immunity attainment is time-consuming, or the period of coverage does not address the full operational period. Future prophylaxes should provide immunity against all known threat CBRN and high-risk TIM agents, as well as potential future threat agents, and be FDA approved. CBRND medical countermeasures are needed providing a sustained level of protection over an extended period of time (minimally the operational period), do not require multiple administrations, are easily disseminated and administered, support a minimum level of protection, protect against a broad range of agents, cover the range of preexposure to post-exposure/presymptomatic application needs, and are applicable to the protected population (including eligible civilians).
MWA prophylaxes	Develop or adapt CBRND medical countermeasures and Veterinary Medicine for preexposure and post-exposure/presymptomatic protection of MWD from CBRN/TIM. Develop topical that is easy to apply and provides shielding from CBRN/TIM, preventing agent absorption through hair or skin.
Prepositioned/reserve CBRN medical resources	Establish and maintain sufficient stocks of prepositioned and reserve CBRND medical resources identified in plans and required to support multiple operations with threat and ensure availability for expeditious movement to the and within the AO in the event of a CBRN event.
Prophylactic administration to diverse groups	Prophylaxes address dosage range for eligible civilians (e.g., children, elderly, overweight, underweight subjects, etc.). Stabilize prophylactic effects over a wide range of dosages to address diverse applications of targeted populations.
Topical	Develop topical barrier that is easily applied (i.e., spray), acts as a contact hazard barrier, and affords protection from CBRN/TIM.

### 13.3 Task TASHLD 3: Protect casualties unable to wear standard individual protection equipment

#### 13.3.1 Functional Area Analysis

##### 13.3.1.1 Definition

Casualties may include existing patients of a medical facility and the wounded and injured resulting from accidents or adversary attack. Treatment may require transport of exposed personnel for medical evaluation, continued care, or theater evacuation. CBRN protection must be available at all times for casualties and for personnel (medical and unit) charged with treatment and transport. Casualties may be medically unable to wear standard IPE. These casualties must be protected from contamination, if uncontaminated. Contaminated infectious casualties may require application of casualty IPE to prevent secondary contamination/exposure of personnel and equipment. Medical personnel must be able to render aid to the casualty inside the IPE without the risk of infiltration/exfiltration of contaminants. This task may include medical evaluation, treatment, and oversight. Removing contaminated casualties from the front reduces the amount of protection required by forces staying behind. Early reduction of MOPP will decrease mission degradation and increase mission performance.

##### 13.3.1.2 Derivation

*Joint Enabling Concept for CBRN Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (TA 7, TA 7.1).*

##### 13.3.1.2.1 Supported Task: N/A

##### 13.3.1.2.2 Lateral Task: TASHA 24

##### 13.3.1.2.3 Supporting Task: N/A

##### 13.3.1.3 Condition

Perform this task under conditions of:

###### Physical

1. Undeveloped to highly developed land. (C1.1.1)
2. Riverine to open sea. (C1.2)
3. Natural and induced air. (C1.3)
4. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

###### Military

1. Partially completed mission preparation. (C2.1.3)
2. Marginal forces. (C2.2)

3. Marginal to adequate forces allocated. (C2.2.3)
4. Negligible personnel experience. (C2.2.4.5)
5. Limited staff expertise. (C2.3.1.3)
6. Limited deployed supplies. (C2.8.2)
7. Limited CONUS resupply. (C2.8.3)
8. No prepositioned materiel. (C2.8.4)
9. No host-nation support. (C2.8.5)
10. Negligible to limited commercial procurement. (C2.8.6)

**Civil.** N/A

### **13.3.2 Functional Needs Analysis**

#### **13.3.2.1 Capability and Deficiency Assessment Summary**

Tables 13.3-1 discuss current capabilities used and future capabilities projected to accomplish this task. The overall capabilities for current, near/mid, and far term are rated “yellow.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

#### **Current Capability and Deficiency**

Standard transport methods and means continue to be critical both in transporting contaminated casualties, as well as transporting uncontaminated casualties through contaminated areas. Two categories of casualty movement are considered: first, the movement of uncontaminated casualties through areas of contamination (e.g., movement of patients from COLPRO within a contaminated area, etc.) and second, the movement of contaminated casualties through clean areas or using clean transport (e.g., contaminated casualties evacuated from a contamination zone to a treatment facility within a clean area, contaminated casualties carried by uncontaminated transport, etc.). The wearing of standard IPE is still the preferred current solution that affords the patient maximum possible protection. However, training is required to protect the medical personnel from secondary contamination. Additionally, medical units are not equipped with CBRND respiratory/ocular and percutaneous protection in sufficient quantities to replace contaminated patient IPE. The PPW offers protection to transporters and medical care providers but prevents full access to the patient for treatment, limits the application of medical systems, and requires the use of respiratory/ocular protection in proximity to the patient. DOTLPF does not adequately address protection of casualties unable to wear ocular/respiratory protection during periods outside of COLPRO. The protection of the casualty, handlers, medical personnel and associated assets is critical and foundational to this task. Replacement IPE for patients and casualties is not adequately addressed in DOTLPF. Current DOTLPF requires the patient/casualty assigned unit provide the individual’s IPE to Medical Services. However, this procedure is not operationally feasible, and joint doctrine needs to address resupply of patient/casualty IPE. The movement of contaminated/exposed/infectious casualties is an issue involving potential survivability of the casualty and in the absence of negative pressure isolation systems. Standard land transport is the preferred method with strong reluctance to apply rotary-

wing craft for battlefield evacuation of these types of casualties. Tactical and strategic fixed-wing airlift of contaminated casualties is not considered feasible. In both cases, the concern is the potential loss of the airframe due to concerns about contamination. In short, rapid movement of contaminated casualties from the battlefield to medical attention is a continuing concern. Further, medical practitioners do not provide medical assistance until the casualty completes decontamination. Medical support staff and corpsmen perform triage, lifesaving, and decontamination activities on received casualties and pass the casualties through the contamination control area (CCA) to medical practitioners for attention. This procedure delays the provision of medical attention. The Services currently field a variety of CBRND assets providing respiratory/ocular, percutaneous, and COLPRO protection. This diversity of assets complicates the logistical support of operations with threat for joint operations. Existing Service-specific IPE is limited in the period and scope of protection afforded the warfighter. Respiratory/ocular and percutaneous CBRND assets protect against known chemical and biological warfare agents and particulate radiologicals. Protection is afforded to a select number of TIMs. Physiological and psychological encumbrances increase with prolonged wear. Regular exercising and wear to acclimate and adjust the wearer to enable performance of assigned functions and activities is necessary and performed to reduce the impact of encumbrances and subsequent degradation of performance. Current site COLPRO generally requires extensive site preparation and resources to erect, operate, and strike but cannot be erected/striking in a CBRN/TIM environment. Mobile COLPRO is a diversity of systems ranging from forced clean air systems to full COLPRO. However, their application is limited. In general, current COLPRO is limited in quantity and does not adequately support expeditionary and highly mobile maneuver operations, particularly those in an austere environment with reduced logistical footprints. Most mobile platforms (including land, sea, and air) are not equipped with COLPRO. This circumstance requires prioritization of available assets and the application of IPE for CBRND. COTS protective assets are applied for selected eligible civilians such as hazardous materials, firefighters, EMS, etc. However, eligible civilians (in general) and MWAs are not adequately addressed by DOTLPF for CBRND. Clear DOTLPF addressing the CBRND provisioning and training of eligible civilians is inadequate. MWAs are not afforded protection against the effects of CBRN/TIM agents, including COLPRO. MOPP DOTLPF is adequate for military personnel and operations. The establishment of adjustable MOPP levels, reflective of local operations and threat, are well defined, as are continuing evaluation for change/adjustments. However, operations increasingly involve U.S. and non-U.S. civilians. MOPP DOTLPF does not adequately address their presence and inclusion into MOPP methodologies and levels, particularly when these personnel may (or may not) be equipped with nonstandard IPE. Further, the largely manual current nature of command operations inherently delays protective actions versus automation, further complicated by the current stovepipe reporting and information flow as information flows vertically without a corresponding horizontal flow for alerting/warning of CBRN/TIM agents.

### **Projected Near/Mid-Term Capability and Deficiency**

Future configurations focus on reducing psychological and physiological stresses associated with the wearing of IPE, as well as striving for commonality of form factor among all services to reducing the logistics burden, development cost, and improved availability. The JPACE, JSAM, and JSGPM are projected to be initially fielded during the mid term. The JSLIST continues

fielding until full operational capable is complete. The JSLIST is under review for NIOSH certification for compliance with OSHA protective standards. The certification will permit application of the garment for AT/FP installation activities within CONUS and selected OCONUS. The possibility exists for potential application by requiring eligible civilians. Legacy Service-specific IPE will remain in the inventory throughout the mid term and into the far term during the transition to the joint IPE systems. R&D by USAF for a Patient Isolation Unit is expected to provide a capability in the mid term to transport casualties unable to wear IPE. JECF is projected to initially field during the mid term with three COLPRO systems primarily addressing expeditionary operations. The P3I upgraded CBPS, JTCOPS, CP-DEPMEDS, and backfit of LHA/LHD vessels are projected for initial fielding or action in the mid term. These systems, depending upon the quantity fielded, may provide additional COLPRO to address critical needs. Otherwise, changes from current capabilities and deficiencies are not projected.

### Projected Far-Term Capability and Deficiency

Future configurations focus upon reducing psychological and physiological stresses associated with the wearing of IPE, as well as striving for commonality of form factor among all Services. The standardization of CBRND respiratory/ocular and percutaneous protection will reduce the logistics burden and development cost and subsequently improve availability. Legacy Service-specific IPE will continue to be replaced by the joint systems of CBRND protective equipment until fielding is complete to all Service units, including Guard and Reserve, early in the far term. Next-generation IPE assets are in R&D and are expected to be fielded sometime in the far term. However, specifics of design, characteristics, and protective capabilities are not as yet determined for these systems. The potential for COLPRO in the Future Tactical Lift Option builds upon the mid-term COLPRO capabilities. Additional changes in capabilities from the mid term are not projected.

#### 13.3.2.2 Resource Systems

### Individual Protection

#### 1. Respiratory/Ocular Protection:

**COTS:** Commercially available systems of protection, manufactured and tested meeting OSHA standards for the United States or equivalent organization in other nations.

**M17 Series Masks w/M13 Series Filters:** Obsolescent warfighter system of protection. Retained in selected HTAs for NEO application. Designed for adults.

**MBU-19/P Chemical-Biological Aircrew Eye/Respiratory Protection (AERP):** USAF combat aircrew protection. Includes protective hood, MBU-12/P mask, C-2 canister, intercom for ground communications, and blower assembly.

**A/P22P-14(V) Respirator Assembly:** USN/USMC system for rotary-wing (Version 1 for USN) and fixed-wing (Versions 2–4 for USN/USMC) aircrews. Includes CB filter, dual air/oxygen supply, and crossover manifold for dual protective capabilities in air or on ground. Version 1 is not compatible with aircraft oxygen supply systems; Version 2 applied to EA-6B and F18A airframes; Version 3 to AV-8B and F-18C/D aircraft; and Version 4 is used for C-130 airframes.

**M40/M42 CB Protective Mask:** U.S. Army mask system designed for military standard profile and uses standard C-2 canister. M42 integrates with combat vehicle clean air supply system and has a connectable dynamic microphone for combat vehicle intercom system.

**M45 Aircrew Aviator Mask:** Replaces M42 and M49 systems for U.S. Army. Available with a canister-compatible hose assembly and a valve cassette that enables use of supplied air (from aircraft, SCBA or PAPR). The M45 is used by military personnel who cannot fit the M40A1, M42A2, or MCU-2/P masks.

**M48 CB Apache Aviator Mask:** Used by Apache aviator and flight support personnel. Replaced M43 Type 1 mask system and uses blower assembly with C-2 filter canister.

**MCU-2A/P:** Mainstay USAF and USN system for nonaviator personnel and aircrew personnel not performing flight operations, except for aircrew personnel not issued aviator systems and noncombat platforms/airframes without clean air supply systems. Applies C-2 filter for filter air.

**Joint Service Aviator Mask (JSAM):** Initial fielding projected in the mid term replacing Service-specific aviator respiratory/ocular protective systems. Provides CBRN protection under high-G conditions, compatible with existing and projected aviator CBRN IPE, flame and thermal protective, reduces stress associated with existing aviator IPE, and may be donned/doffed during flight.

**Joint Service General Purpose Mask (JSGPM):** Initial fielding projected in the mid term replacing Service-specific standard respiratory/ocular protective systems. Provides respiratory/ocular protection from CBRN agents and selected TIMs. Improves field-of-vision and encumbrances associated with existing Service systems.

**Joint Service Chemical Environment Survival Mask (JCESM):** COTS one-time use, one-size-fits-all, respiratory/ocular protective system affording two hours of protection in low-level CBRN vapor, aerosol, and particulate environments. Selected force element application only.

## 2. Percutaneous Protection:

**COTS:** Commercially available systems of protection, manufactured and tested meeting OSHA standards for the United States or equivalent organization in other nations.

**Battle Dress Overgarment (BDO):** U.S. Army/USAF two-piece camouflage-patterned garment (top and trousers) providing 24-hour protection against CBRN agents in vapor, liquid, droplet, and particulate forms.

**Saratoga:** USMC two-piece camouflage-patterned garment (top and trousers) providing 24-hour protection against CBRN agents in vapor, liquid, droplet, and particulate forms. Launderable for hygiene.

**CPOG:** Legacy two-piece green garment currently in use with USN providing limited-term protection against CBRN agents in vapor, liquid, droplet, and particulate forms.

**Chemical Protective Undergarment (CPU):** Worn under standard IPE as additional layer of protection against contact with CBRN agents.

**CWU-66/P:** One-piece USAF green flightsuit providing 24-hour protection against CBRN agents in vapor, liquid, droplet, and particulate forms. Available in tan as CWU-77/P flightsuit.

**Disposal Aircrew Protective Cape:** Transparent disposable cape covering head and shoulders of aviator during periods between aircraft mounting/dismounting and shelter.

**BVO/GVO:** Vinyl overboots (VO) worn over wearer's standard footwear and protects against contact with CBRN agents. Available in black (BVO) and green (GVO).

**Chemical Protective Footwear Cover (CPFC):** Legacy system of CBRN protective footwear cover in use by USN. Requires wearer to pull protective sole tabs up and wrap/tie laces around cover to secure over footwear.

**Disposable Aircrew Footwear Cover:** Transparent disposable footwear covers worn over aviator footwear to protect aviator during periods between aircraft mounting/dismounting and shelter.

**Chemical Protective Glove (CPG):** Standard CBRN protective glove. Available in 7-, 14-, and 25-mil thicknesses addressing functional requirements for durability, dexterity, and tactile sensitivity.

**Disposable Aircrew Hand Protection:** Transparent disposable hand coverings applied by USAF, USN, and USMC over aviator gloves during periods between aircraft mounting/dismounting and shelter. Also applied as between aviator inner and outer gloves enabling essential functional requirements for dexterity and tactile sensitivity.

**Chemical Protective Helmet System (CPHS):** CBRN protective camouflage-patterned helmet cover to protect helmet from contact with CBRN contaminants.

**SCALP:** Disposable, lightweight, impermeable overgarment designed for wear over IPE for additional protection in grossly contaminated environments. Applied by personnel required to leave protective sheltering in these environments to perform mission-critical tasks. Also applied by decontamination units/teams and medical personnel performing decontamination or potentially at risk for prolonged contact with liquids.

**Wet-Weather Gear: Includes Severe-Weather Gear (USN).** Provides barrier against contact with liquids potentially damaging to protective abilities of IPE.

**M-2 Apron:** Butyl rubber-coated sleeved apron worn over IPE and applied by decontamination units/teams and other designated personnel performing decontamination or potentially at risk for contact with liquids. Provides barrier against contact with liquids potentially damaging to protective abilities of IPE. Decontaminable.

**Medical Barrier Assets:** Standard barrier assets applied by Medical Services personnel against contact with biohazards. May provide a degree of additional barrier protection against CBRN hazards when applied with IPE.

**Patient Protective Wrap (PPW):** Enclosed casualty bag made of CBRN protective materials. Incorporates small flexible transparent window positioned over casualties face for viewing by medical practitioners. Uses cardboard stays to maintain separation of bag from casualty's face. Does not permit head-to-toe viewing of casualty. Supports limited medical assistance. Requires the wear of standard warfighter respiratory/ocular protection. Two wraps currently in stock. Legacy system provides protection up to 3 hours and newer system up to 6 hours.

**Joint Service Lightweight Integrated Suit Technology (JSLIST):** Two-piece (jacket and trousers) CBRN risk-taking protective garment with integrated hood. Affords protection against selected TIM agents. Reduces physiological and psychological encumbrances associated with existing Service-specific systems it replaces with initial fielding in the mid term. Under review for NIOSH certification for OSHA protection standards.

**Joint Protective Aircrew Ensemble (JPACE):** CBRN protective aviator flightsuit projected for initial fielding in the mid term and replacing Service-specific CBRN protective flightsuits. Provides JSLIST equivalent protection and provides protection when subject to rotor, propeller, and jetwash. Flame-retardant and self-extinguishing properties. Supports escape and evasion requirements.

**Joint Block I/II Glove Upgrade (JB1/2GU):** Projected fielding in near mid term replacing CPG for designated force elements requiring increased tactility/durability for mission performance. Various configurations under consideration.

**Joint Firefighter Integrated Response Ensemble (JFIRE):** Incorporates JSLIST into firefighter bunker gear, permitting firefighters to conduct firefighting operations within a CBRN/TIM environment.

**Multi-purpose Overboot (MULO):** Projected initial fielding in mid term and replacing legacy CBRN footwear covers.

## COLPRO

### 1. Mobile COLPRO

**CBPS:** M1113 HMMWV-mounted COLPRO system consisting of a hardshell filtration, power, and transport and expandable softshell tentage with contamination control area/entry. The COLPRO unit is designated the Lightweight Multipurpose shelter (LMS).

**Crewed Combat Vehicles (Ground):** Two types of COLPRO. First supplies filter air using forced clean air supply system. Requires wear of IPE and connection to crew mask. This is the type of system in the M1A1 Abrams MBT. Second system is incorporates full COLPRO and permits reduction of IPE during operation. JSLNBCLR is an example of the second type of system.

**Airframe Air Supply System:** Provides clean air from compressed air storage system either until aircraft is outside of contamination and airframe interior is flushed of vapor contaminants or throughout flight operations.

**CITADEL:** System of protection installed with USN vessels to afford protection to selected connected spaces including C4ISR, medical, and R2.

### 2. Fixed-Site COLPRO

**MGPTS:** USMC Medium General Purpose Tent System (MGPTS) with CB Protective Liner System designed for support of USMC operational C4ISR and R2.

**CP-DEPMEDS:** Component-based system of tentage, connective corridors, ISO containers, etc., with COLPRO liners for configuration into field hospitals and includes supporting power and utility systems, lighting, engine control units, and filtration systems. Large system requiring extensive use of resources to prepare location, erect/strike, operate, and maintain.

**JTCOPS:** Similar to CP-DEPMEDS, but for critical functions and activities of the force (e.g., staff operations, aircrew housing and briefing, etc.).

**CP-EMEDS:** USAF air-transportable system similar to CP-DEPMEDS on a smaller scale and configurable from one medical shelter to a 25-bed field hospital.

**CP-SSS:** USAF small-scale COLPRO transportable system designed to support C2 functions.

**JECP:** Projected program of COLPRO designed for application in highly mobile operations, expeditionary operations, forced-entry operations, and/or to supplement larger-scale COLPRO systems in support of operations. Consists of building/room and tentage insert kits and small-unit stand-alone COLPRO kits.

**M20/M20A1 SCPE:** Lightweight and modular COLPRO system consisting of an inflatable liner for insert into rooms or buildings.

**Building integrated COLPRO systems:** COLPRO systems designed and installed into buildings as integral systems, usually facility construction. Post-construction installation is based upon building design and COLPRO requirements. Varies between buildings based upon applied technology, date of construction/installation, system engineering, facility function, etc. Most existing facility COLPRO was established during Cold War period.

**MOPP Methodology:** Stepped level of CBRND protective measures. Standardized levels permit the rapid increase or decrease of unit MOPP level.

**Unit Staff:** The application of DOTLPF for all phases of operations with threat from preplanning to post-force return to home stations. Includes all aspects of C2 and supporting staff activities/functions (e.g., logistics, intelligence, etc.) enabling mission and task accomplishment.

	FAA Measure	Scale
M1	Casualties are safely transported.	<p><b>8–10:</b> In-place doctrine, protective assets, and training provide for the safe handling and transport of exposed or contaminated casualties without potential for secondary exposure or contamination of personnel, activities, transport assets, and resources performing the handling and transport.</p> <p><b>4–7:</b> Doctrine and training address the safe handling and transport of exposed or contaminated casualties and protective assets are applied to prevent secondary exposure or contamination of personnel and transport assets performing the handling and transport.</p> <p><b>1–3:</b> Doctrine generally addresses the safe handling and transport of exposed or contaminated casualties and protective assets are applied to prevent secondary exposure or contamination of personnel performing the handling and transport.</p> <p><b>0:</b> Doctrine and assets do not exist to safely transport casualties.</p>
M2	Potential for secondary contamination is prevented.	<p><b>8–10:</b> Medical and transport operations, procedures, processes and the application of COLPRO, decontamination, and casualty and staff IPE preclude potential for secondary contamination of personnel and resources.</p> <p><b>4–7:</b> Medical and transport operations, procedures, processes, and the application of COLPRO, decontamination, and casualty and staff IPE effectively mitigate potential for secondary contamination of personnel and resources.</p> <p><b>1–3:</b> Medical and transport operations, procedures, processes, and the application of COLPRO, decontamination, casualty IPE, and/or staff IPE reduce potential for secondary contamination of personnel and/or resources.</p> <p><b>0:</b> Medical and transport processes and material do not exist for the reduction of the potential for secondary contamination of personnel and/or resources.</p>
M3	Protective IPE for casualties is available.	<p><b>8–10:</b> CBRN protective equipment for exposed and contaminated casualties, to include those medically unable to wear IPE, are readily available and provide protection for an extended period (8+ hours).</p> <p><b>4–7:</b> CBRN protective equipment for exposed and contaminated casualties, to include those medically unable to wear IPE, is available.</p> <p><b>1–3:</b> CBRN protective equipment for exposed and contaminated casualties is available.</p> <p><b>0:</b> CBRN protective equipment for exposed and contaminated casualties is nonexistent.</p>
M4	Medical personnel are trained and equipped to handle contaminated casualties.	<p><b>8–10:</b> All medical personnel are formally trained and receive recurring training on the handling of contaminated casualties and are appropriately equipped.</p> <p><b>4–7:</b> Support medical personnel and designated medical providers are trained on the handling of contaminated casualties and are appropriately equipped.</p> <p><b>1–3:</b> Designated support medical personnel are trained on the handling of contaminated casualties and are appropriately equipped.</p> <p><b>0:</b> Training and equipping for the handling of contaminated casualties is nonexistent.</p>
M5	Casualties are protected by medical casualty IPE.	<p><b>8–10:</b> Medical casualty IPE is readily available for the extended period (8+ hours) protection of casualties and medical/transport personnel. The IPE supports medical evaluation, treatment, and oversight without risk of infiltration/exfiltration of contaminants.</p> <p><b>4–7:</b> Medical casualty IPE is available for the limited period (4–8 hours) protection of casualties and medical/transport personnel. The IPE provides limited support of medical evaluation, treatment, and oversight.</p> <p><b>1–3:</b> Medical casualty IPE is available for short period (1–3 hours) protection of casualties and medical/transport personnel. The IPE provides limited support of medical evaluation, treatment, and oversight.</p> <p><b>0:</b> Medical casualty IPE is nonexistent.</p>

M6	Contaminated casualties are removed safely and quickly from main battle area.	<p><b>8–10:</b> In-place doctrine, protective assets, transport assets, and training provide for the safe handling and rapid transport of exposed or contaminated casualties from the main battle area to medical aid without potential for secondary exposure or contamination of personnel, activities, transport assets, and resources performing the handling and transport.</p> <p><b>4–7:</b> Doctrine and training address the safe handling and transport of exposed or contaminated casualties from the main battle area to medical aid and the application of protective assets to prevent secondary exposure or contamination of personnel and transport assets performing the handling and transport.</p> <p><b>1–3:</b> Doctrine generally addresses the safe handling and transport of exposed or contaminated casualties from the main battle area to medical aid and the application of protective assets to prevent secondary exposure or contamination of personnel performing the handling and transport.</p> <p><b>0:</b> Doctrine and assets do not exist to safely transport casualties from the main battle area to medical aid.</p>
M7	There is effective DOTMLPF in place to conduct task.	<p><b>8–10:</b> DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations.</p> <p><b>4–7:</b> Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds.</p> <p><b>1–3:</b> DOTLPF is inadequate for accomplishment of this task.</p> <p><b>0:</b> DOTLPF does not exist for this task.</p>

<sup>1</sup> Doctrine, policy, procedures, and TTPs exist for the movement of contaminated casualties to medical treatment. Military personnel performing handling and transport are required to wear CBRND ocular/respiratory protection against the potential for secondary exposure/contamination. Casualties able to wear standard IPE are not placed into PPWs. Doctrine requires the individual's unit of assignment provide individual protective assets when the individual is received. However, the ability of any unit to pull and transfer equipment with each casualty, especially during operations, is generally not considered. Medical units, however, are not equipped with additional protective material for existing patients and replacement assets for casualties. Uncontaminated casualties unable to wear standard IPE are placed into PPWs to protect against contamination when moving through a contaminated area. Contaminated casualties must be able to wear standard IPE to protect against secondary contamination by transporting and handling personnel, a requirement that may not be achievable for certain types of casualties. Standard warfighter respiratory/ocular protection is worn by the casualty and requires the ability to provide a seal and obtain a draw against filter resistance. Improved PPWs and PIUs are expected in the mid term. Further, military personnel handling and transporting casualties in PPWs, whether contaminated or not, are required to wear CBRND IPE. Doctrine, policy, procedures, and TTPs do not adequately address the protection of nonmilitary personnel performing handling and transport activities potentially involving exposed/contaminated personnel. However, OSHA and CDC requirements may apply and should be addressed as applicable. Non-U.S. personnel subject to these functions are not addressed.

<sup>2</sup> Expelled air from an exposed/contaminated casualty equipped with standard ocular/respiratory protection is not filtered and may present a potential secondary hazard or contamination source for handling and transporting personnel and resources. The application of standard warfighter IPE to exposed/contaminated casualties provides containment of the potential contamination within the IPE, a requirement that may not be achievable for certain types of casualties. Improved PPWs and PIUs are expected in the mid term. Respiratory/ocular protection is diverse across the Services and performed functions. USAF combat aircrews conduction operations within a CBRN environment are equipped with the MBU-19/P Chemical-Biological AERP that includes protective hood, MBU-12/P mask, C-2 filter canister, an intercom for ground communications, and a blower assembly. The AERP provides protection whether or not supplemental oxygen is present. USN and USMC aviators use the A/P22P-14(V) Respirator Assembly that is a self-contained protective system deployed for rotary-wing (Version 1 for USN) and fixed-wing (Versions 2–4 for USN and USMC) aircrews. The system incorporates a CB filter, dual air/oxygen supply, and a crossover manifold with dual protective capabilities for flight and ground protection. The A/P 22P-14(V) 1 is not compatible with aircraft with oxygen delivery systems and supports helicopter crew use. Version 2 is used for the EA-6B and F-18A, Version 3 for AV-8B and F-18C/D, and Version 4 is applied for C-130 aircrews. The M17 series mask is obsolescent and is relegated to NEO support in selected HTAs. The mask is designed for the military standard profile (ground) and does not adequately protect all potential nonmilitary populace members, for which is retained. The M40/M42 CB Protective Mask is in service with the U.S. Army. The mask uses the C-2 canister for filtration of CBRN contaminants. The M42 integrates with combat vehicle filtration protection system and has a dynamic microphone with cable for connection to vehicle communications systems. The M45 Aircrew Aviator

Mask replaced the U.S. Army M43 Type II and M49 Mask Systems. The system uses a low-profile canister compatible hose assembly for both hose and face-mounted configurations. The mask system incorporates selectable filtration for support both during aircraft systems activation and using the connectable filter pack. The mask also is applied to personnel who cannot be fitted with the standard M40A1, M42A2, or MCU-2A/P masks. The M48 CB Apache Aviator Mask protects AH-64 Apache helicopter aviators and flight support personnel. The blower assembly uses the C-2 filter canister to provide filtered, breathable air. The M-48 replaced the M43 Type I mask. The MCU-2A/P is the mainstay USAF and USN mask employed by personnel not equipped with aircrew masks and by aircrew when not performing flight operations. The MCU-2A/P is also used by aircrew during flight operations who are not equipped with aircrew masks. COTS equipment meeting OSHA requirements (and NFPA for firefighters) is applied by selected civilian personnel performing specific functions such as firefighting, EMS, hazardous materials, etc. Limited quantities of COTS may be available within HTAs for known NEO requirements for the protection of populace members unable to wear the M17 series or standard warfighter respiratory/ocular protective devices. MWAs are not afforded respiratory/ocular protection. Eligible civilians are inadequately addressed in DOTLPF.

<sup>3</sup> Doctrine, policies, procedures, TTPs, and plans require casualties able to wear standard respiratory/ocular protection be equipped and wear the protection when outside of COLPRO. Casualties unable to wear standard respiratory/ocular protection must remain within COLPRO until the hazard is no longer present or the casualty progresses sufficiently to wear respiratory/ocular protection. No provision is made for casualties requiring movement and unable to wear respiratory/ocular protection. Medical units are not provided stocks of protective respiratory/ocular equipment for use by patients. Medical policy in the patient's unit is responsible for providing the material to the medical unit for use by the patient. Operationally involved units may be delayed, at best, in providing the assets. The movement of large numbers of infectious, exposed, and/or contaminated casualties is not adequately addressed by existing doctrine, policy, procedures, and TTPs. However, improved PPWs and PIUs are expected in the mid term.

<sup>4</sup> Medical personnel are trained on the proper wear of protective respiratory/ocular protection as outlined in doctrine, policy, procedures, and TTPs. Expelled air from an exposed/contaminated casualty equipped with standard ocular/respiratory protection is not filtered and may present a potential secondary hazard or contamination source for handling and transporting personnel and resources. The application of standard warfighter IPE to exposed/contaminated casualties provides containment of the potential contamination within the IPE, a requirement that may not be achievable for certain types of casualties. Improved PPWs and PIUs are expected in the mid term. Respiratory/ocular protection is diverse across the Services and performed functions. The M40/M42 CB Protective Mask is in service with the U.S. Army. The mask uses the C-2 canister for filtration of CBRN contaminants. The M45 Aircrew Aviator Mask replaced the U.S. Army M43 Type II and M49 Mask Systems. The system uses a low-profile canister compatible hose assembly for both hose and face-mounted configurations. The mask system incorporates selectable filtration for support both during aircraft systems activation and using the connectable filter pack. The mask also is applied to personnel who cannot be fitted with the standard M40A1, M42A2, or MCU-2A/P masks. The MCU-2A/P is the mainstay USAF and USN mask employed by personnel not equipped with aircrew masks and by aircrew when not performing flight operations. The MCU-2A/P is also used by aircrew during flight operations who are not equipped with aircrew masks. COTS equipment meeting OSHA requirements (and NFPA for firefighters) is applied by selected civilian personnel performing specific functions such as firefighting, EMS, hazardous materials, etc. Limited quantities of COTS may be available within HTAs for known NEO requirements for the protection of populace members unable to wear the M17 series or standard warfighter respiratory/ocular protective devices. MWAs are not afforded respiratory/ocular protection. Eligible civilians are inadequately addressed in DOTLPF.

<sup>5</sup> Within the AO, existing doctrine/policy/procedure/TTPs encompass most critical aspects of this task. The task can be performed as the majority of movement is conducted using tactical land transport means to fixed locations within the AO. COLPRO sheltering of uncontaminated casualties is provided by CBPS and transportable shelters allocated to medical unit operations. Rotary-wing transport, although a last resort, can be applied for movement within the AO by air. Movement from land to at-sea ship is also performed if required and decontamination cannot be performed on land. However, extended movement is not supportable. Assets do not exist enabling this activity. Further, COLPRO of contaminated casualties to preclude secondary contamination during transport of multiple casualties does not exist. Additionally, DOTLPF does not adequately address casualties unable to wear protective equipment. However, improved PPWs and PIUs are expected in the mid term.

<sup>6</sup> Doctrine, policy, procedures, and TTPs require the application of percutaneous protection by handling and transporting personnel against the potential for secondary exposure/contamination. Standard warfighter percutaneous protection is worn by military personnel performing these functions. Doctrine, policy, procedures, and TTPs do not adequately address the protection of nonmilitary personnel performing handling and transport activities potentially involving exposed/contaminated personnel. However, OSHA and CDC requirements may apply and should be addressed as applicable. Non-U.S. personnel subject to these functions are not addressed. Exposed and contaminated c unable to wear percutaneous protection are not adequately addressed in doctrine, policy and standards. Protective equipment is not available for these casualties. Standard warfighter respiratory/ocular protection is worn by the casualty and requires the ability to provide a seal and obtain a draw against filter resistance. The PPW is limited in the number of hours of afforded protection to uncontaminated casualties, depending upon date of manufacture. PPWs in stock prior to 2004 have a maximum protection time period of 3 hours. PPWs obtained for stockage in 2004 and subsequently provide protection up to 6 hours. This is considered adequate for

most initial casualty movements within the AO. Casualties able to wear standard percutaneous protection assets are required to apply the equipment outside of CPSs. However, improved PPWs and PIUs are expected in the mid term. Medical units, meanwhile, are not provided stocks of this equipment for use by patients. Medical policy is the patient's unit is responsible for providing the material to the medical unit for use by the patient. Operationally involved units may be delayed, at best, in providing the assets.

<sup>7</sup> Doctrine, policy, procedures, and TTPs exist for the movement of contaminated casualties to medical treatment. Military personnel performing handling and transport are required to wear CBRND percutaneous protection against the potential for secondary exposure/contamination. Casualties able to wear standard IPE are not placed into PPWs. Doctrine requires the individual's unit of assignment provide individual protective assets when the individual is received. However, the ability of any unit to pull and transfer equipment with each casualty, especially during operations, is generally not considered. Medical units, however, are not equipped with additional protective material for existing patients and replacement assets for casualties. Uncontaminated casualties unable to wear standard IPE are placed into PPWs to protect against contamination when moving through a contaminated area. Contaminated casualties must be able to wear standard IPE to protect against secondary contamination by transporting and handling personnel, a requirement that may not be achievable for certain types of casualties. Improved PPWs and PIUs are expected in the mid term. Further, military personnel handling and transporting casualties in PPWs, whether contaminated or not, are required to wear CBRND IPE. Doctrine, policy, procedures, and TTPs do not adequately address the protection of nonmilitary personnel performing handling and transport activities potentially involving exposed/contaminated personnel. However, OSHA and CDC requirements may apply and should be addressed as applicable. Non-U.S. personnel subject to these functions are not addressed. Service-specific CBRND percutaneous protection is currently applied for the protection of the force. The BDO, used by the USAF and U.S. Army, is a two-piece garment providing protection for a 24-hour period against chemical agent vapors, liquids, and droplets; biological agents and toxins and contact with radioactive particles. The BDO's protective abilities are lost if the suit is torn, ripped, splashed with POL, or is saturated with water and is designed for a one-time use and is worn by ground and most flight personnel (non-high-performance aircraft). The USMC uses the Saratoga COLPRO suit similar in design to the BDO, but launderable for personnel hygiene. The CPOG is a legacy two-piece garment for protection against CBRN agents. The CPOG is in use with the USN. The CPU is designed to provide an additional layer of protection for the warfighter and is worn under standard IPE. The USAF CWU-66/P (and 77/P) is a one-piece flightsuit providing protection for a 24-hour period against standard CBRN agents and is designed for compatibility with aircrew lift support equipment. The USN, USAF, and USMC use the disposable aircrew protective cape to protect aircrew between sheltering and the combat aircraft. The cape drapes over the wearer and is removed during entry into the aircraft to prevent transfer of contamination into the aircraft interior. The BVO/GVO overboots are applied over the wearer's standard footwear to protect against contact with CBRND. The USN uses the CPFC, commonly called the "fishtail" for its design, to protect the wearer's footwear. The CPFC, considered obsolete, does provide a measure of antislip protection shipboard. The disposable aircrew boot cover is worn by USAF, USN, and USMC aviators over aircrew footwear while en route and mounting combat aircraft. The covers are removed during aircraft entry and are designed to prevent contamination transfer into the aircraft. Hand protection is provided by the CPG in 7-, 14-, and 25-mil thicknesses to meet warfighter hand protection and dexterity needs. Disposable aircrew hand protection is applied by the USAF, USMC, and USN for aviators over their gloves (and may be worn between glove layers for additional protection) during movement between shelter and aircraft. When used as an overglove, the gloves are removed during aircraft mounting during aircraft entry to preclude the potential for transfer of contamination into the aircraft interior. Medical Services practitioners performing treatment The CPHS is designed to prevent contact of the warfighter's helmet with liquid contamination which may be absorbed, impact helmet integrity, and/or constitute a potential secondary hazard to the wearer. SCALP provides a disposable, lightweight, impermeable layer of protection for personnel against gross liquid contamination and is worn over the warfighter's protective ensemble. SCALP is commonly applied to protect armor and EOD personnel who may be required to leave sheltering to perform duties and functions. SCALP is also applied by units performing decontamination operations where personnel may become soaked by decontaminants and Medical Services personnel with potential for prolonged contact with body fluids. Standard wet-weather gear (e.g., poncho, rain parka, rain suit, etc.) is also applied as a barrier against saturation of the warfighter's protective ensemble by contact with liquids such as rain, sea spray, etc. The M-2 apron is applied by personnel performing decontamination aprons and is worn over the ensemble. The apron is full length and sleeve to maximize coverage, although the back is open. COTS assets meeting OSHA requirements (and NFPA for firefighters) is applied by selected civilian personnel performing specific functions such as firefighting, EMS, hazardous materials, etc. Medical impermeable barrier protective assets (e.g. splash shields, medical aprons, etc.) may also be applied by Medical Services practitioners potentially at risk for contact with fluids.

<sup>8</sup> Doctrine, policies, procedures, TTPs, and plans require casualties able to wear standard percutaneous protection be equipped and wear the protection when outside of COLPRO. Casualties unable to wear standard percutaneous protection, but able to wear respiratory/ocular protection, are placed into PPWs. No provision is made for casualties requiring movement and unable to wear respiratory/ocular protection. However, improved PPWs and PIUs are expected in the mid term. Medical units, meanwhile, are not provided stocks of protective percutaneous equipment for use by patients. Medical policy is the patient's unit is responsible for providing the material

to the medical unit for use by the patient. Operationally involved units may be delayed, at best, in providing the assets. The movement of large numbers of infectious, exposed, and/or contaminated casualties is not adequately addressed by existing doctrine, policy, procedures, and TTPs.

<sup>9</sup> Medical personnel are trained on the proper wear of percutaneous protective protection as outlined in doctrine, policy, procedures, and TTPs. Doctrine, policy, procedures, and TTPs exist for the handling of contaminated casualties for medical treatment. Military personnel performing handling and transport are required to wear CBRND percutaneous protection against the potential for secondary exposure/contamination. Casualties able to wear standard IPE are not placed into PPWs. Uncontaminated casualties unable to wear standard IPE are placed into PPWs to protect against contamination when moving through a contaminated area. Contaminated casualties must be able to wear standard IPE to protect against secondary contamination by transporting and handling personnel, a requirement that may not be achievable for certain types of casualties. Improved PPWs and PIUs are expected in the mid term. Further, military personnel handling and transporting casualties in PPWs, whether contaminated or not, are required to wear CBRND IPE. Doctrine, policy, procedures, and TTPs do not adequately address the protection of nonmilitary personnel performing handling and transport activities potentially involving exposed/contaminated personnel. However, OSHA and CDC requirements may apply and should be addressed as applicable. Non-U.S. personnel subject to these functions are not addressed. Service-specific CBRND percutaneous protection is currently applied for the protection of the force. The BDO, used by the USAF and U.S. Army, is a two-piece garment providing protection for a 24-hour period against chemical agent vapors, liquids, and droplets; biological agents and toxins and contact with radioactive particles. The BDO's protective abilities are lost if the suit is torn, ripped, splashed with POL, or is saturated with water and is designed for a one-time use and is worn by ground and most flight personnel (non-high-performance aircraft). The USMC uses the Saratoga COLPRO suit similar in design to the BDO, but launderable for personnel hygiene. The CPOG is a legacy two-piece garment for protection against CBRN agents. The CPOG is in use with the USN. The USAF CWU-66/P (and 77/P) is a one-piece flightsuit providing protection for a 24-hour period against standard CBRN agents and is designed for compatibility with aircrew lift support equipment. The BVO/GVO overboots are applied over the wearer's standard footwear to protect against contact with CBRND. The USN uses the CPFC, commonly called the "fishtail" for its design, to protect the wearer's footwear. The CPFC, considered obsolete, does provide a measure of antislip protection shipboard. Hand protection is provided by the CPG in 7-, 14-, and 25-mil thicknesses to meet warfighter hand protection and dexterity needs. SCALP provides a disposable, lightweight, impermeable layer of protection for personnel against gross liquid contamination and is worn over the warfighter's protective ensemble. SCALP is commonly applied to protect armor and EOD personnel who may be required to leave sheltering to perform duties and functions. SCALP is also applied by units performing decontamination operations where personnel may become soaked by decontaminants and Medical Services personnel with potential for prolonged contact with body fluids. Standard wet-weather gear (e.g., poncho, rain parka, rain suit, etc.) is also applied as a barrier against saturation of the warfighter's protective ensemble by contact with liquids such as rain, sea spray, etc. The M-2 apron is applied by personnel performing decontamination aprons and is worn over the ensemble. The apron is full length and sleeve to maximize coverage, although the back is open. COTS assets meeting OSHA requirements (and NFPA for firefighters) is applied by selected civilian personnel performing specific functions such as firefighting, EMS, hazardous materials, etc. Medical barrier impermeable barrier protective assets may also be applied by Medical Services practitioners potentially at risk for contact with fluids.

<sup>10</sup> Mobile casualty COLPRO does not exist for the transport of exposed/contaminated casualties precluding or mitigating the potential for secondary exposure/contamination of handling and transport personnel and resources. Handling and transport personnel must wear IPE and the transporting resource is considered contaminated until decontaminated and verified.

<sup>11</sup> Negative-pressure COLPRO with filtered expelled air does not exist within the inventory for the transport of numbers of exposed/contaminated casualties. Hospital ships are not equipped with COLPRO. All current COLPRO systems in land, air, and sea assets are not designed for the containment and transport of exposed/contaminated casualties. Casualties must be decontaminated before entry into COLPRO. COLPRO, however, may be applied for the protection of uncontaminated casualties against exposure/contamination to CBRN/TIM agents. Current mobile COLPRO systems are predominantly integrated into selected combat vehicles/vessels and do not support transport of exposed/contaminated casualties. The only currently fielded land-based mobile COLPRO is CBPS. The CBPS system is available on a mobile platform and can provide a limited number of people protection. The CBPS consists of a dedicated M1113 HMMWV with an LMS mounted on the back and provides a highly mobile, contamination-free, environmentally controlled work area for forward deployed medical units. The CBPS has been fielded to treatment squads, forward surgical teams, and medical companies. Four personnel are required to operate the CBPS. However, these systems are limited in supply and cannot provide COLPRO during movement.

<sup>12</sup> Mobile COLPRO does not exist to protect uncontaminated casualties and transporting personnel/resources during movement within the AO.

<sup>13</sup> The USMC MGPTS with CB Protective Liner System provides a positive-pressure, filtered-air, toxic-free shelter for protection against CBRN agents. However, there are insufficient quantities to meet all operational requirements for protection from CBRN/TIM effects. The CP-DEPMEDS provides a clean, toxic-free, environmentally controlled, patient treatment area and the components are designed to integrate as field hospitals. They are packaged as a set for deployment to threat areas for hospital

operations. The entire composite hospital consists of expandable tentage, passageways, environmental control units, and ISO shelters. The CP-DEPMEDS exist in very limited quantities. Although it could be applied to provide COLPRO to the task identified groups, its designed and primary function is that of medical care. A similar COLPRO is the USAF's CP-EMEDS, which is an air-transportable medical facility deployable in various configurations from a single shelter to a 25-bed patient hospital. The CP-EMEDS is in a very limited number and, like the CP-DEPMEDS, is designed for its primary function of the provision of medical care. The USAF CP-SSS is a small-scale CPS applied for the conduct of C2 operations, maintenance of critical equipment, force beddown, and the provision of R2 for sortie generators and key leadership. This shelter is in limited supply and unlikely sufficient quantities would be available to support a group of any size, especially during operations against an adversary. The M20/M20A1 SCPE is a lightweight, modular system involving a liner designed for inflation within a room or building. The M20A1 serves to bridge the gap between the M20 SCPE and CBPS. These systems are designed for standard room configurations and, like other COLPRO systems, are in limited number. Fixed-site COLPRO within the United States and its territories is predominantly designed for nuclear fallout and does not address other CBRN/TIM hazards and threats arising after September 11, 2001. Selected critical key facilities are equipped with CBRN COLPRO, but are not available to other than designated personnel and are not installed in medical treatment facilities. Fixed-site CBRN COLPRO is installed in facilities housing selected activities and functions within HTAs. However, these facilities are dedicated to critical operational requirements and restricted to assigned and designated personnel and do not generally include medical treatment facilities. However, the Guardian Program is reviewing FP protective measures at U.S. installations and facilities will be addressing these issues for critical members of the installation/facility populace. The projected mid-term fielding of JECF may alleviate COLPRO shortages but will likely be insufficient to satisfy all COLPRO requirements. Prior planning and prioritization of COLPRO allocation is critical.

<sup>14</sup> Plans incorporate MOPP levels and methodologies are adjustable to meet local operations and threat needs. MOPP levels and methodologies outlined in doctrine, policy, procedures, and TTPs require levels of protection readiness based upon the threat and/or presence of contaminants. Full protection is required in the presence of contamination. This includes protective measures and the wear of protective equipment when the possibility exists for secondary exposure/contamination to personnel and equipment, such as the movement of exposed/contaminated casualties. MOPP levels and methodologies are generally considered to apply to equipped nonmilitary personnel. Plans within HTAs may incorporate this perception. However, doctrine, policy, procedures, and TTPs do not address their application to nonmilitary personnel.

<sup>15</sup> Existing standards and procedures provide adequate protection of handling and transporting personnel against secondary exposure/contamination and require the application of protective equipment and measures if the potential exists for contamination/exposure. Transport assets are considered contaminated until decontaminated and verified. Unit-level training is limited to the movement of casualties to the medical facility and is predominantly reliant upon tactical ground transport. Standard transport is used to perform movement of uncontaminated casualties. Air transport (tactical rotary-wing) is a last resort due to concerns about asset contamination. Tactical and strategic fixed-wing air transport is considered an acceptable means of transport. Air and sea transport resources are inadequately equipped and prepared to transport exposed and contaminated human and MWA casualties. Exposed and contaminated casualties (human and MWA) unable to wear IPE and mask are not adequately addressed in doctrine, policy and standards. Protective equipment is not available for these casualties. The PPW may not be medically advisable for all casualties. Casualties able to wear standard IPE are required to apply the equipment outside of CPSs. However, improved PPWs and PIUs are expected in the mid term. Medical units, meanwhile, are not provided stocks of standard IPE for use by patients. Medical policy is the patient's unit is responsible for providing the equipment to the medical unit for use by the patient. Operationally involved units may be delayed, at best, in providing the equipment.

<sup>16</sup> Doctrine, policies, procedures, and processes applied by medical and transport operations are designed to preclude or reduce the potential of secondary contamination of personnel and resources. The planned and adjusted tasking, allocation, and use of COLPRO, decontamination, and casualty and staff IPE are applied to protect casualties, personnel, and resources. Unit staff monitors, tracks, and directs the employment of resources to safely perform the handling and transport of casualties. The staff also manages the decontamination of employed resources for continued availability and support of operations.

<sup>17</sup> No provision is made for casualties requiring movement and unable to wear respiratory/ocular protection. Medical units are not provided stocks of protective equipment for use by patients. Medical policy is the patient's unit is responsible for providing the material to the medical unit for use by the patient. Operationally involved units may be delayed, at best, in providing the assets. The movement of large numbers of infectious, exposed, and/or contaminated casualties is not adequately addressed by existing doctrine, policy, procedures, and TTPs. However, improved PPWs and PIUs are expected in the mid term.

<sup>18</sup> Training for the treatment of contaminated/exposed casualties is available through the Army Medical Department (AMEDD), but is not mandatory for medical practitioners identified for deployment or assignment where there exists a CBRN/TIM threat. The ability to ensure medical capabilities for CBRND is limited by routine medical operations and requirements. Periodic exercises are performed with medical activities, but on a limited basis, to provide training opportunities and to assess

capabilities. Casualty care, until completion of decontamination, is performed by Medical Corpsmen, not medical practitioners. Unit training is provided to selected personnel to conduct medical operations, including decontamination and triage, within a CBRN/TIM hazard.

<sup>19</sup> The staffs of medical and transporting units maintain close coordination with operational units and higher headquarters to identify and move casualties rapidly from the battlefield to medical treatment centers. Front aid stations also coordinate movements from their locations to medical treatment centers with supporting units and medical unit staffs.

<sup>20</sup> Legacy systems will remain in the inventory throughout the mid term. These systems will be gradually replaced by new joint systems of respiratory/ocular protection as they are fielded. The JSAM replaces the Service-specific systems. When incorporated with anti-G protection of high-performance aircraft aviators, the JSAM will provide simultaneous CBRN and anti-G protection. The JSAM is compatible with existing and programmed CBRN IPE, provides flame and thermal protection, and reduces the heat stress associated with existing systems of ocular/respiratory protection. Further, the JSAM may be donned and doffed during flight. The JSGPM also replaces current Service-specific ocular/respiratory protection. The system provides respiratory and ocular protection from CBRN agents and selected TIMs. The field-of-vision is improved and encumbrances associated with legacy systems are reduced. The JSGPM incorporates state of the art technology and is designed to integrate with future warfighter CBRND IPE and function equipment/assets. The JCESM is a COTS one-time use, one-size-fits-all, respiratory/ocular protective system affording 2 hours of protection and is lightweight and disposable. The system is designed to provide low-level CBRN vapor, aerosol, and particulate protection to the wearer for egressing the contaminated environment. The JCESM is projected for use when standard respiratory/ocular protection is not practical. The JCESM is not programmed for general dissemination. The Guardian Program is projected to review, assess, and implement protection for critical members of the installation/facility populace during the mid term. This will predominantly be COTS-based assets for respiratory/ocular protection. However, the Guardian Program is not expected to address the provision of CBRND protective assets for general base populace, as well as eligible civilian protection within the AO for other than existing U.S. military installations and facilities. MWA respiratory/ocular protection is not programmed or forecasted.

<sup>21</sup> Legacy systems will remain in the inventory throughout the mid term. These systems will be gradually replaced by new joint systems of percutaneous protection as they are fielded. The JSLIST NBC Protective Garment is a two-piece, risk-taking, overgarment with integrated hood affording protection against CBRN agents and selected TIMs. The garment reduces the physiological and psychological encumbrances associated with legacy systems. The JSLIST is under evaluation by NIOSH for application to OSHA protection requirements. The JPACE replaces the Service-specific systems. The JPACE provides aircrew members with equivalent protection to the JSLIST ensemble. The JPACE is designed to not interfere with emergency ejection from a combat aircraft and continues to provide CBRN percutaneous protection following ejection and during escape and evasion operations. The ensemble is both flame-retardant and self-extinguishing to permit emergency egress from a burning aircraft. Further, the ensemble provides CBRN protection when subject to rotor, propeller, and jet wash. Joint Service glove upgrades are provided under the Joint Block 1 and 2 Glove Upgrade Program (JB1/2GU) in the near and mid term. The JB1GU responds to an urgent need by designated elements of the force for increased tactility/durability supporting mission requirements. The JB1GU is expected to meet most of the requirements within the JSLIST ORD and is viewed as an evolutionary approach in the development of the JB2GU. Versions under consideration include a protective inner glove worn under existing warfighter gloves, a replacement glove for existing hand wear, or a combination of glove shell and liner affording CBRN protection of the legacy gloves they are projected to replace. The JFIRE addresses protection of military firefighters within a CBRN/TIM environment conducting firefighting operations involving structural and crash/firefighting/rescue. The JFIRE incorporates the JSLIST into firefighter bunker gear. The MULO is projected to replace legacy footwear covers. The ability of the MULO to provide adequate antislip protection for USN personnel asea is under review. The Guardian Program is projected to review, assess, and implement protection for critical members of the installation/facility populace during the mid term. This will predominantly be COTS-based assets for percutaneous protection. However, the Guardian Program is not expected to address the provision of CBRND protective assets for general base populace, as well as eligible civilian protection within the AO for other than existing U.S. military installations and facilities. MWA percutaneous protection is not programmed or forecasted.

<sup>22</sup> Fielding of the P3I upgraded CBPS for heavy/airborne use is projected for the mid term, as is CITADEL backfit of LHA/LHDs.

<sup>23</sup> The projected initial fielding of JECP within the mid term provides additional capabilities for the COLPRO protection of casualties within CBRN/TIM contaminated areas. JECP includes COLPRO adaptive inserts for buildings/rooms and legacy tentage and stand-alone COLPRO sheltering for small units. The projected mid-term fielding of JECP may alleviate COLPRO shortages but will likely be insufficient to satisfy all COLPRO requirements. Quantities to be fielded of these systems have not been determined. JTCOPS Block I is projected for initial fielding during the mid term. Prior planning and prioritization of COLPRO allocation is critical.

<sup>24</sup> Within the AO, existing doctrine/policy/procedure/TTPs encompass most critical aspects of this task. The task can be performed as the majority of movement is conducted using tactical land transport means to fixed locations within the AO. COLPRO sheltering of uncontaminated casualties is provided by CBPS and transportable shelters allocated to medical unit operations. Rotary-wing transport, although a last resort, can be applied for movement within the AO by air. Movement from land to at-

sea ship is also performed if required and decontamination cannot be performed on land. However, extended movement is not supportable. Assets do not exist enabling this activity. Further, COLPRO of contaminated casualties to preclude secondary contamination during transport of multiple casualties does not exist. Additionally, DOTLPF does not adequately address casualties unable to wear protective equipment.

<sup>25</sup> The projected Future Tactical Lift Option is under evaluation for the potential addition of COLPRO in the design and production specifications. A decision on the inclusion of COLPRO in the LHA(R) is expected in the mid term.

<sup>26</sup> JTCOPS Block II is projected for the far term. Continued fielding of JECF.

### 13.3.3 Functional Solution Analysis

#### 13.3.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** Medical units are not equipped with additional protective material for existing patients and replacement assets for casualties.  
**Non-Materiel Solutions:** *Doctrine:* Adjust joint doctrine to require force planning of IPE support of Medical Services for patients and casualties. Disconnect requirement with operational unit. *Organization:* Develop organizational structures, resources, staffing, and stock management capabilities to support IPE requirements for patients and casualties.
- 2. Deficiency:** Casualties unable to wear PPWs or respiratory/ocular protection are not addressed.  
**Partial Non-Materiel Solutions:** *Doctrine:* Establish alternative procedures and processes within doctrine, policy, and procedures for casualties unable to wear PPWs or respiratory/ocular protection and who must be moved within or through a CBRN/TIM contaminated zone. *Organization:* Develop organizational structures, resources, staffing, and stock management capabilities to support casualties unable to wear PPWs or respiratory/ocular protection. *Training:* Implement institutional, recurring, and unit training on established procedures and processes (see Doctrine) for the protection of casualties unable to wear PPWs or respiratory/ocular protection.
- 3. Deficiency:** CBRND protective equipment and measures do not protect against all CBRN/TIM agents.  
**Partial Non-Materiel Solutions:** *Doctrine:* Requirement for measures to protect against all CBRN/TIM agents, particularly high-risk/high-threat agents.
- 4. Deficiency:** Medical Services doctrine, policy, and procedures are inadequate for the provision of medical care by medical providers in a CBRN/TIM environment.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine methods, policy, procedures and technology enabling medical care by medical providers within a CBRN/TIM environment. *Organization:* Identify organization services and activities necessary to support the provision of medical care by medical providers within a CBRN/TIM environment (both with and without CPSs). *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for medical care by medical providers within a CBRN/TIM environment (both with and without CPSs); and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of medical providers and supporting medical staff. *Personnel:* Require eligible civilians supporting the mission to meet minimum standards for safe use of CBRND resources.
- 5. Deficiency:** DOTLPF is inadequate or nonexistent addressing CBRND of eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing eligible civilian personnel for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of eligible civilian personnel within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians; and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilian personnel.

6. **Deficiency:** DOTLPF is inadequate or nonexistent addressing CBRND of MWDs.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing MWDs for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of MWDs within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWDs and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWDs.

7. **Deficiency:** The movement of large numbers of infectious, exposed, and/or contaminated casualties is not adequately addressed in DOTLPF.

**Non-Materiel Solutions:** *Doctrine:* Expand doctrine, policy, and procedures to address the movement of large numbers of infectious, exposed, and/or contaminated casualties. *Organization:* Identify organization services and activities necessary to support the movement of large numbers of infectious, exposed, and/or contaminated casualties. *Training:* Establish training criteria and standards for the movement of large numbers of infectious, exposed, and/or contaminated casualties. Develop and implement criteria for exercises and evaluations challenging the ability to perform the movement of large numbers of infectious, exposed, and/or contaminated casualties. *Facilities:* Identify and establish necessary infrastructure to support the movement of large numbers of infectious, exposed, and/or contaminated casualties.

8. **Deficiency:** Existing DOTLPF is inadequate, or nonexistent, for eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing eligible civilian personnel for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of eligible civilian personnel within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians; and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilian personnel.

9. **Deficiency:** Existing DOTLPF is inadequate, or nonexistent, for MWDs.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing MWDs for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of MWDs within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWDs and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWDs.

- 10. Deficiency:** The command staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians.
- Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing civilian personnel and operations for CBRND. *Organization:* Identify organizational services and activities supporting the mission performed by civilian personnel and operations. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians; and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians. *Personnel:* Ensure that eligible civilians supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities:* Develop supporting infrastructure for eligible civilian CBRND (e.g., logistics, medical, training, communications, etc.).
- 11. Deficiency:** The command staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying MWAs.
- Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing civilian personnel and operations for CBRND. *Organization:* Identify organizational services and activities supporting the mission performed by MWA, particularly MWD, operations. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWAs. *Facilities:* Develop supporting infrastructure for MWD CBRND (e.g., logistics, medical, veterinary surveillance, training, communications, etc.).
- 12. Deficiency:** Mobile assets enabling extended period transport of infectious, exposed, and/or contaminated casualties.
- Partial Non-Materiel Solutions:** *Doctrine:* Establish in doctrine methods and processes enabling the extended transport of infectious, exposed, and/or contaminated casualties safely and without risk of secondary exposure/contamination by transporting personnel and resources. *Training:* Implement institutional, recurring, and unit training on the safe extended transport of infectious, exposed, and/or contaminated casualties.
- 13. Deficiency:** COLPRO of contaminated casualties to preclude secondary contamination during transport of multiple casualties does not exist.
- Partial Non-Materiel Solutions:** *Doctrine:* Establish in doctrine methods and processes enabling the transport of multiple casualties safely and without risk of secondary exposure/contamination by transporting personnel and resources. *Training:* Implement institutional, recurring, and unit training of the safe transport (see Doctrine) of multiple contaminated casualties.
- 14. Deficiency:** Non-U.S. personnel performing the handling and movement of contaminated casualties are not addressed in DOTLPP.
- Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing CBRND of non-U.S. personnel performing the handling and movement of contaminated casualties. *Organization:* Identify organization services and activities necessary to support

CBRND of non-U.S. personnel performing the handling and movement of contaminated casualties. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for non-U.S. personnel, and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of non-U.S. personnel performing the handling and movement of contaminated casualties.

- 15. Deficiency:** Expelled air from an exposed/contaminated casualty equipped with standard ocular/respiratory protection is not filtered and may present a potential secondary hazard or contamination source or handling and transporting personnel and resources.

**Partial Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing the safe management of potentially hazardous expelled air by exposed/contaminated casualties wearing standard ocular/respiratory protection to preclude the potential for secondary exposure/contamination of handling/transporting personnel and resources. *Training:* Establish institutional, recurring, and unit training, exercise, and evaluation criteria and programs addressing potentially hazardous expelled air by exposed/contaminated casualties wearing standard ocular/respiratory protection.

- 16. Deficiency:** Mobile COLPRO that operates and provides protection while moving is not available for the protection of casualties.

**Partial Non-Materiel Solutions:** *Doctrine:* Establish in doctrine methods and processes enabling the transport of multiple casualties safely and without risk of secondary exposure/contamination by transporting personnel and resources (if casualties are contaminated) or exposure/contamination of casualties (if casualties are uncontaminated). *Training:* Implement institutional, recurring, and unit training of the safe transport (see Doctrine) of multiple casualties.

- 17. Deficiency:** Negative-pressure COLPRO with filtered expelled air does not exit within the inventory for the transport and sheltering of numbers of exposed, infectious, and/or contaminated casualties.

**Partial Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing negative-pressure COLPRO and the safe management of potentially hazardous exhausted air to preclude the potential for secondary exposure/contamination of uncontaminated/unexposed personnel and resources. *Training:* Establish institutional, recurring, and unit training, exercise, and evaluation criteria and programs addressing the operation and application of negative-pressure COLPRO and management of potentially hazardous exhaust air.

- 18. Deficiency:** DOTLPF for Protective Posture Protocols is inadequate or nonexistent addressing CBRND of eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing eligible civilian personnel for CBRND. *Organization:* Identify organization services and activities necessary to support survivability eligible civilian personnel within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs eligible civilians; and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilian personnel.

**19. Deficiency:** DOTLPF for Protective Posture Protocols is inadequate or nonexistent addressing CBRND of MWAs.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing MWAs, particularly MWDs, for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of MWAs within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWAs.

**20. Deficiency:** Air and sea transport resources are inadequately equipped and prepared to transport exposed, infectious, and contaminated casualties.

**Partial Non-Materiel Solutions:** *Doctrine:* Establish in doctrine methods and processes enabling the transport of multiple casualties safely and without risk of secondary exposure/contamination by transporting personnel and resources. *Training:* Implement institutional, recurring, and unit training of the safe transport (see Doctrine) of multiple contaminated casualties.

**21. Deficiency:** Air and sea transport resources are inadequately equipped and prepared to transport exposed, infectious, and contaminated MWA casualties.

**Partial Non-Materiel Solutions:** *Doctrine:* Establish in doctrine methods and processes enabling the transport of multiple MWA, particularly MWD casualties safely and without risk of secondary exposure/contamination by transporting personnel and resources. *Training:* Implement institutional, recurring, and unit training of the safe transport (see Doctrine) of multiple contaminated MWA casualties.

**22. Deficiency:** The ability of the command and Medical Services staff to ensure medical capabilities for CBRND is limited by routine medical operations and requirements.

**Non-Materiel Solutions:** *Doctrine:* Incorporate the safe handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties into doctrine, policy and procedures and requires specific exercising and evaluation for these operations and activities that includes all activities and functions conducting these functions including nonmedical activities and functions. *Organization:* Ensure resources, taskings, and trained personnel are in place or available to support the handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties by all activities and functions conducting these functions including nonmedical activities and functions. *Training:* Train, exercise, and evaluate the handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties by all activities and functions conducting these functions including nonmedical activities and functions, including the prevention of secondary exposure/contamination. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe handling, transport, medical reception and triage, and treatment of contaminated casualties by all activities and functions conducting these functions including nonmedical activities and functions.

**23. Deficiency:** Generally, casualty care, until completion of decontamination, is performed by medical corpsmen, not medical practitioners.

**Non-Materiel Solutions:** *Doctrine:* Incorporate the safe handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties into doctrine, policy and procedures and requires specific exercising and evaluation for these operations and activities that includes all activities and functions conducting these functions including nonmedical activities and functions. *Organization:* Ensure resources, taskings, and trained personnel are in place or available to support the handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties by all activities and functions conducting these functions including nonmedical activities and functions. *Training:* Train, exercise, and evaluate the handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties by all activities and functions conducting these functions including nonmedical activities and functions, including the prevention of secondary exposure/contamination. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe handling, transport, medical reception and triage, and treatment of contaminated casualties by all activities and functions conducting these functions including nonmedical activities and functions.

**24. Deficiency:** Generally, MWA casualty care, until completion of decontamination, is performed by medical corpsmen, not medical/veterinary practitioners.

**Non-Materiel Solutions:** *Doctrine:* Incorporate the safe handling, transport, protective measures, medical reception and triage, and treatment of contaminated MWA casualties into doctrine, policy and procedures and requires specific exercising and evaluation for these operations and activities that includes all activities and functions conducting these functions including nonmedical activities and functions. *Organization:* Ensure resources, taskings, and trained personnel are in place or available to support the handling, transport, protective measures, medical reception and triage, and treatment of contaminated MWA casualties by all activities and functions conducting these functions including nonmedical activities and functions. *Training:* Train, exercise, and evaluate the handling, transport, protective measures, medical reception and triage, and treatment of contaminated MWA casualties by all activities and functions conducting these functions including nonmedical activities and functions, including the prevention of secondary exposure/contamination. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe handling, transport, medical reception and triage, and treatment of contaminated MWA casualties by all activities and functions conducting these functions including nonmedical activities and functions.

### 13.3.3.2 IMA Assessment Summary

Table 13.3-2 is a list of ideas for material approaches and a corresponding description of each idea. Approaches vary from modification of current IPE developing new systems and conducting early technology assessments. Table 13.3-3 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 13.3-2. TASHLD 3: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Assess CBRND material	Test and assess all CBRND material for protective abilities against future threat agents, including TIM.
Broad-application above-the-neck respiratory protection	Develop above-the-neck respiratory protection with broad application for the general population, including MWAs.
Casualty protective system with integrated pseudomask	Develop a new-generation PPW with an integrated mask area that is contact-free of the face area and applies positive air flow.
Chemical air generation	Integrated compounds within warfighter's IPE applying chemical reaction to generate oxygen without reliance upon external sources.
Chemical treatment	Develop solution for treatment of existing MOPP suit and other warfighter clothing fabric that neutralizes or block the effect of CBRN/TIM agents, including future agents.
Contaminated casualty transport system	Develop/adapt clear, head-to-toe view of casualty, medical systems supporting, airtight and self-flushing system with positive/negative pressure capabilities and access ports for medical treatment.
Develop COLPRO kits	Develop COLPRO kits containing all necessary supplies to construct field-expedient COLPRO that is easily stored and maintained in ready condition, easily and safely erected, operated, maintained, and struck within a CBRN/TIM environment by IPE-encumbered personnel using minimal resources and supports COLPRO requirements.
Develop and establish generic unit CBRND kits	Develop, preposition, and maintain reserve stocks of generic CBRND kits for a standard unit. Components are adjusted as necessary for specific operations involving threat.
Disposable COLPRO	Develop one-time-use COLPRO that is rapidly erected with little instruction, training, and effort and affords term protection for critical activities and functions, maintenance and repair activities, prelocated consumables, as well as personnel associated with this task.
Disposable IPE	Develop low-cost disposable IPE providing protection for transport aircrew members and/or determine available COTS protection to support air operations in a contaminated environment or while carrying contaminated cargo.
Filtration system lowering inhalation pressure requirement	Improve current mask systems by reducing the inhalation effort required. Options may include air streaming into the mask from a contained system that either has a stored supply or generates air flow.

Idea for Materiel Approach	Description
Improved IPE garments and accessories	Develop new generation of IPE garments and accessories (e.g., boots/boot covers, gloves, hoods, etc.) with modern materials permitting greater range of motion, longer wear without performance degradation, increased durability, integrated into warfighter personal equipment, and protection against all threat CBRN and high-risk TIM agents.
Integrate CBRN/TIM protective features into functional garments	Develop materials integrating CBRN/TIM protective capabilities and design standard functional garments using these materials for protection of the force.
Integrated mobile COLPRO	Develop warfighting platforms (air, land, and sea) with COLPRO that is an integral part of the operational system and protects against current and future/advanced agents.
Prepositioned/reserve CBRN medical resources	Establish and maintain sufficient stocks of prepositioned and reserve CBRND medical resources identified in plans and required to support multiple operations with threat and ensure availability for expeditious movement to the and within the AO in the event of a CBRN event.
Field-expedient COLPRO kits	Develop field-expedient COLPRO kits designed to adapt existing structures, tentage, etc., for the expansion of COLPRO field capabilities and mission support and the provision of COLPRO to the force, critical functions and activities, maintenance and repair activities and functions, resources, etc.
Regenerative filtration	CBRN regenerative filters able to flush retained agent, neutralize agent, or by other inherent means affords extended period of protection
Topical	Develop topical barrier that is easily applied (i.e., spray), acts as a contact hazard barrier, and affords protection from CBRN/TIM.

**13.4 Task TASHLD 4: Protect MWDs against CBRN/TIM contamination/exposure****13.4.1 Functional Area Analysis****13.4.1.1 Definition**

This task encompasses the survivability of an MWD subjected to a CBRN/TIM attack. MWD require both individual and COLPRO. MWD also require preventive veterinary/medical CBRN countermeasures to increase survivability from exposure to a toxic/infectious environment.

**13.4.1.2 Derivation**

*Joint Enabling Concept for CBRN Operations, Protection Joint Functional Concept, UJTL (TA 7, TA 7.1).*

**13.4.1.2.1 Supported Task:** N/A

**13.4.1.2.2 Lateral Task:** TASHA 24

**13.4.1.2.3 Supporting Task:** N/A

**13.4.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Undeveloped to highly developed land. (C1.1.1)
2. Riverine to open sea. (C1.2)
3. Natural and induced air. (C1.3)
4. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Partially completed mission preparation. (C2.1.3)
2. Marginal forces. (C2.2)
3. Marginal to adequate forces allocated. (C 2.2.3)
4. Good personnel physical conditioning. (C2.2.4.3)
5. Negligible personnel experience. (C2.2.4.5)
6. Limited staff expertise. (C2.3.1.3)
7. Limited deployed supplies. (C2.8.2)
8. Limited prepositioned materiel. (C2.8.4)

**Civil**

1. High health risk. (C3.3.1.5)

2. TIMs present in the civilian sector. (C3.3.7.5)

### 13.4.2 Functional needs Analysis

#### 13.4.2.1 Capability and Deficiency Assessment

This task deals with the survivability of MWDs exposed to CBRN/TIM agents. MWDs require IPE and COLPRO. There is also a need to have preventive veterinary/medical CBRN countermeasures for MWDs to increase the chances of their surviving exposure to a toxic/infectious environment. The overall capabilities for current, near/mid, and far term are rated “red.” Programs and materiel to perform CBRND of MWDs are inadequate or nonexistent, nor are any projected into the far term.

#### Current Capability and Deficiency

No current identified capability. There is a need to identify and develop CBRN/TIM collective and individual protective equipment and to conduct research on medical countermeasures to increase survivability from exposure to chemical or biological agents. DOTLPF is inadequate to promote the survival of these assets in a CBRN/TIM environment. For example, current DOTLPF does not mandate COLPRO allocation/space, although no other protective measure currently exists, for the protection of these assets.

#### Projected Near/Mid-Term Capability and Deficiency

No change projected for this task.

#### Projected Far-Term Capability and Deficiency

No change projected for this task.

#### 13.4.2.2 Resource Systems

##### Individual Protection

##### 1. Respiratory/Ocular Protection:

**COTS:** Commercially available systems affording equivalent level of protection for the handler, manufactured and tested meeting OSHA standards for the United States or equivalent organization in other nations.

##### 2. Percutaneous Protection:

**COTS:** Commercially available systems affording equivalent level of protection for the handler, manufactured and tested meeting OSHA standards for the United States or equivalent organization in other nations.

3. **Medical Protection:** Human and veterinary medications and vaccines, applicable to MWAs, applied as preventative measures. May include CBRND medical countermeasures such as SERPACWA upon investigation and determination of applicability for use.

## COLPRO

### 1. Mobile COLPRO:

**CBPS:** M1113 HMMWV-mounted COLPRO system consisting of a hardshell filtration, power, and transport and expandable softshell tentage with contamination control area/entry. The COLPRO unit is designated the Lightweight Multipurpose shelter (LMS).

**CITADEL:** System of protection installed with USN vessels to afford protection to selected connected spaces including C4ISR, medical, and R2.

### 2. Fixed-Site COLPRO:

**MGPTS:** USMC Medium General Purpose Tent System (MGPTS) with CB Protective Liner System designed for support of USMC operational C4ISR and R2.

**JTCOPS:** Component-based system of tentage, connective corridors, ISO containers, etc., with COLPRO liners for critical functions and activities of the force (e.g., staff operations, aircrew housing and briefing, etc.). Large system requiring extensive use of resources to prepare location, erect/strike, operate, and maintain.

**CP-SSS:** USAF small-scale COLPRO transportable system designed to support C2 functions.

**JECP:** Projected program of COLPRO designed for application in highly mobile operations, expeditionary operations, forced-entry operations, and/or to supplement larger-scale COLPRO systems in support of operations. Consists of building/room and tentage insert kits and small-unit stand-alone COLPRO kits.

**M20/M20A1 SCPE:** Lightweight and modular COLPRO system consisting of an inflatable liner for insert into rooms or buildings.

**Building integrated COLPRO systems:** COLPRO systems designed and installed into buildings as integral systems, usually facility construction. Post-construction installation is based upon building design and COLPRO requirements. Varies between buildings based upon applied technology, date of construction/installation, system engineering, facility function, etc. Most existing facility COLPRO was established during Cold War period.

**MOPP Methodology:** Stepped level of CBRND protective measures. Standardized levels permit the rapid increase or decrease of unit MOPP level.

**Unit Staff:** Application of DOTLPF, knowledge, experience, and acquired skills for the conduct of CBRND by command staff (as individual entities and a single body) and appropriate supporting activities.

	FAA Measure	Scale
M1	MWD sheltering (includes COLPRO against CBRN/TIM agents) is on hand.	<p><b>8–10:</b> MWD CBRND COLPRO is available, allocated, in place, and provides protection from all CBRN agents and high-risk TIMs in field, R&amp;R, and kenneling circumstances facilitating MWD survival, health and well-being, and support activities.</p> <p><b>4–7:</b> CBRND COLPRO is available, allocated, in place, and provides protection from all CBRN warfare agents and selected high-risk TIMs in field, R&amp;R, and kenneling circumstances and facilitating MWD survival, health and well-being, and support activities.</p> <p><b>1–3:</b> CBRND COLPRO is available, allocated, in place, and provides protection against all CBRN warfare agents in field, R&amp;R, and kenneling circumstances and facilitating MWD survival, health and well-being, and support activities.</p> <p><b>0:</b> CBRND COLPRO is not specifically allocated for protection of MWD against CBRN/TIM agents in field, R&amp;R, and kenneling circumstances facilitating MWD support activities.</p>
M2	MWDs are equipped with IPE.	<p><b>8–10:</b> MWDs are equipped with effective IPE against all CBRN agents and high-risk TIMs.</p> <p><b>4–7:</b> MWDs are equipped with effective IPE against all CBRN warfare agents and selected high-risk TIMs.</p> <p><b>1–3:</b> MWDs are equipped with effective IPE against all CBRN warfare agents.</p> <p><b>0:</b> MWD IPE is nonexistent.</p>
M3	MWD and handlers possess access to COLPRO away from kennels.	<p><b>8–10:</b> MWD CBRND COLPRO is available, allocated, in place, and provides protection from all CBRN agents and high-risk TIMs in field and R&amp;R circumstances facilitating MWD survival and health and well-being.</p> <p><b>4–7:</b> CBRND COLPRO is available, allocated, in place, and provides protection from all CBRN warfare agents and selected high-risk TIMs in field and R&amp;R circumstances and facilitating MWD survival and health and well-being.</p> <p><b>1–3:</b> CBRND COLPRO is available, allocated, in place, and provides protection against all CBRN warfare agents in field and R&amp;R circumstances and facilitating MWD survival and health and well-being.</p> <p><b>0:</b> CBRND COLPRO is not specifically allocated for protection of MWD against CBRN/TIM agents in field and kenneling circumstances facilitating MWD support activities.</p>
M4	MWDs are protected by medical prophylaxis.	<p><b>8–10:</b> MWD medical CBRND countermeasures exist and are available for all threat CBRN and high-risk TIM agents.</p> <p><b>4–7:</b> MWD medical CBRND countermeasures exist and are available for high-threat CBRN and selected high-risk TIM agents.</p> <p><b>1–3:</b> MWD medical CBRND countermeasures do not adequately address high-threat CBRN agents.</p> <p><b>0:</b> MWD medical CBRND countermeasures do not exist for CBRN agents.</p>

M5	MWDs and handlers are trained in operations within CBRN/TIM environment.	<b>8-10</b> MWD teams are trained and equipped to maintain operations within a CBRN/TIM environment. <b>4-7:</b> MWD teams are trained and equipped to perform limited activities within a CBRN/TIM environment. <b>1-3:</b> MWD handlers are trained to conduct survival activities within a CBRN/TIM environment. <b>0:</b> MWD teams are not equipped and trained to survive a CBRN/TIM environment.
M6	There is effective DOTLPP in place to conduct task	<b>8-10:</b> DOTLPP exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations. <b>4-7:</b> Most critical aspects of DOTLPP for this task are addressed. Task can be performed with limitations requiring work-arounds. <b>1-3:</b> DOTLPP is inadequate for accomplishment of this task. <b>0:</b> DOTLPP does not exist for this task.

<sup>1</sup> MWD respiratory/ocular protection from CBRND does not exist within the DoD inventory, and applicable and tested COTS assets supporting mission requirements are not known.

<sup>2</sup> MWD handlers are trained and equipped to perform CBRND for themselves. MWD protective measures are restricted to available COLPRO (provided the commander permits the MWD within the shelter), or performing a barrier activity (e.g., wrapping in poncho, placing within a vehicle, etc.), performing limited decontamination using standard personnel decontamination kit, and immediately transporting to veterinary activities for evaluation and treatment.

<sup>3</sup> DOTLPP does not currently exist for this task. Current draft U.S. Army Veterinary Corps doctrine provides limited task support such as information on decontamination, COLPRO, and possible handler actions to reduce exposure/contamination but is inadequate as it does not establish and require COLPRO allocation and provide for the protection of MWD to preclude necessity for treatment, operational impacts, and/or asset loss.

<sup>4</sup> MWD percutaneous protection from CBRND does not exist within the DoD inventory and applicable, and tested COTS assets supporting mission requirements are not known.

<sup>5</sup> Standard prophylaxes do not exist for MWDs. Veterinarians do administer medications and vaccines routinely which may provide some prophylactic value, but are not designed and applied as CBRND measures.

<sup>6</sup> MWD handlers are equipped and trained for survival within a CBRND environment. However, MWDs are not.

<sup>7</sup> Current mobile COLPRO systems are predominantly integrated into selected combat vehicles/vessels and do not support the protection of MWDs. The only currently fielded land-based mobile group COLPRO is CBPS. The CBPS system is available on a mobile platform and can provide a limited number of people protection. The CBPS consists of a dedicated M1113 HMMWV with an LMS mounted on the back and provides a highly mobile, contamination-free, environmentally controlled work area for forward deployed medical units. The CBPS has been fielded to treatment squads, forward surgical teams, and medical companies. Four personnel are required to operate the CBPS. However, these systems are limited in supply and are generally dedicated to medical and C4ISR operations. None are allocated for the protection of MWD or MWD teams.

<sup>8</sup> MWD handlers are trained in personal survival activities, including mobile COLPRO, against the effects of CBRN/TIM agents. However, MWDs are not and are only permitted into mobile COLPRO when specified by the commander and/or senior ranking person within the shelter.

<sup>9</sup> The USMC MGPTS with CB Protective Liner System provides a positive-pressure, filtered-air, toxic-free shelter for protection against CBRN agents. However, there are insufficient quantities. The USAF CP-SSS is a small-scale CPS applied for the conduct of C2 operations, maintenance of critical equipment, force beddown, and the provision of R2 for sortie generators and key leadership. This shelter is in limited supply and unlikely sufficient quantities would be available to support MWDs, especially during operations against an adversary. The M20/M20A1 SCPE is a lightweight, modular system involving a liner designed for inflation within a room or building. The M20A1 serves to bridge the gap between the M20 SCPE and CBPS. Quantities are limited and are not likely to be available during operations against an adversary. Current plans generally do not address the application of COLPRO to MWDs and do not allocate the limited COLPRO resources to this resource. Fixed-site COLPRO within the United States and its territories is predominantly designed for nuclear fallout and does not address other CBRN/TIM hazards and threats arising after September 11, 2001. Selected critical key facilities are equipped with CBRN COLPRO, but are not available to other than designated personnel. Fixed-site CBRN COLPRO is installed in facilities housing selected activities and functions within HTAs. However, these facilities are dedicated to critical operational requirements and restricted to assigned and designated personnel. The projected mid-term fielding of JECF may alleviate COLPRO shortages but will likely be insufficient to satisfy personnel, operations, and MWD sheltering needs.

<sup>10</sup> MWD handlers may possess access to COLPRO, depending upon performed activity and location, against the effects of CBRN/TIM agents. However, MWDs are not permitted into COLPRO unless specified by the commander and/or senior ranking person within the shelter.

<sup>11</sup> MWD handlers are trained in personal survival activities, including fixed site COLPRO, against the effects of CBRN/TIM agents. However, MWDs are not permitted into COLPRO unless specified by the commander and/or senior ranking person within the shelter.

<sup>12</sup> CBRND COLPRO is not specifically allocated or designed for the protection of MWDs against CBRN/TIM agents during operations for R2, kenneling, and enabling the care and maintenance of MWDs. MOPP does not address MWDs.

<sup>13</sup> MWDs are not CBRND trained, equipped, and fully integrated into CBRND exercises and evaluations requiring the use of IPE at the appropriate MOPP levels. MOPP does not address MWDs. MWD handlers are trained and equipped with IPE to achieve required MOPP levels upon notification or warning.

<sup>14</sup> MWD teams away from kenneling are not equipped with and are not allocated COLPRO accommodating MWDs. MOPP does not address MWDs. Handlers may possess access to COLPRO, but the inclusion of the MWD is dependent upon the decision of the commander and/or senior ranking person within the shelter.

<sup>15</sup> Prophylaxes for select CBRN agents are available for the personal use of the MWD handler. MOPP does not address MWDs.

<sup>16</sup> Doctrine, policy, procedures, and TTPs do not address the application of MOPP levels and associated CBRND training and equipping of MWDs. DOTLPP addresses the CBRND training and equipping of MWD handlers and MOPP levels apply to these personnel.

<sup>17</sup> Plans incorporate MOPP levels and methodologies are adjustable to meet local operations and threat needs. MOPP levels and methodologies apply to military personnel, including MWD handlers. However, doctrine, policy, procedures, and TTPs do not address the application of MOPP levels to MWDs.

<sup>18</sup> DOTLPP does not address and require the allocation of CBRND resources for the protection of MWDs.

### 13.4.3 Functional Solution Analysis

#### 13.4.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Include in doctrine requirement for allocation of COLPRO for MWDs.  
**Partial Non-Materiel Solution:** *Doctrine:* Incorporate into doctrine, policy, procedures, and TTPs the provision of COLPRO for MWD activities and functions supporting operations with threat. *Organization:* Organizational supporting structures, manning, and resources to support MWD COLPRO operations. *Training:* Formal and recurring training of MWD units and personnel on COLPRO operations for MWDs. *Leadership:* Ensure recognition of MWDs as a limited valuable resource requiring protection. *Facilities:* Develop supporting infrastructure (e.g., logistics, veterinary services, communications, etc.) to support MWD COLPRO.
2. **Deficiency:** Include in doctrine requirement for COLPRO access for MWDs accompanied by handlers away from primary MWD COLPRO.  
**Partial Non-Materiel Solution:** *Doctrine:* Incorporate into doctrine, policy, procedures, and TTPs the requirement to permit accompanied MWD access to COLPRO when away from MWD COLPRO operations. *Leadership:* Ensure recognition of MWDs as a limited valuable resource requiring protection and enforcement of doctrine.
3. **Deficiency:** MWDs are not equipped, trained, and prepared to survive a CBRN/TIM environment.  
**Partial Non-Materiel Solution:** *Doctrine:* Establish doctrine, policy, and procedures for CBRND protection of MWDs and training enabling CBRN/TIM environment survival. *Organization:* Ensure organizational consideration for maintenance and support of MWD CBRND protective equipment, measures, and activities. *Training:* Establish institutional and unit training of MWD handlers and MWDs for CBRND measures and activities. Integrate into CBRND exercises and evaluations. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for MWD survivability. *Facilities:* Develop supporting infrastructure for MWD CBRND (e.g., logistics, veterinary surveillance, communications, training, etc.).
4. **Deficiency:** Command staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to MWD.  
**Non-Materiel Solution:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing MWD and operations for CBRND. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWDs and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWDs.
5. **Deficiency:** Adjust MOPP protocols to address MWDs.

**Non-Materiel Solution:** *Doctrine:* Adjust doctrine, policy, procedures, and TTPs to address actions for the protection of MWDs at each MOPP level. *Training:* Establish institutional and unit training for the conduct of MWD-related MOPP level actions. *Leadership:* Incorporate MWD-related activities for each MOPP level into planning and disseminated instructions.

6. **Deficiency:** Prophylaxis for MWAs is virtually nonexistent.

**Partial Non-Materiel Solution:** *Doctrine:* Establish doctrine, policy, and procedures for CBRND protection of MWDs and survival within a CBRN/TIM environment. *Organization:* Ensure organizational consideration for maintenance and support of MWD CBRND protective equipment, measures, and activities. *Training:* Establish institutional and unit training of handlers and MWDs on CBRND measures and activities. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for MWD survivability. *Facilities:* Develop supporting infrastructure for MWD CBRND (e.g., logistics, veterinary surveillance, etc.).

7. **Deficiency:** Existing CBRND DOTLPF is inadequate, or nonexistent, for MWDs.

**Non-Materiel Solution:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing MWDs for CBRND. *Organization:* Identify organizational services and activities necessary to support survivability of MWDs within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWD handlers and MWDs and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND DOTLPF for MWDs.

#### 13.4.3.2 IMA Assessment Summary

Table 13.4-2 is a list of ideas for material approaches and a corresponding description of each idea. Approaches vary from modifying current COLPRO systems to the development of new antibodies and vaccines. Table 13.4-3 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 13.4-2. TASHLD 4: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Broad-application above-the-neck respiratory protection	Develop above-the-neck respiratory protection with broad application for the general population, including MWAs.
Chemical air generation	Integrated compounds within warfighter's IPE applying chemical reaction to generate oxygen without reliance upon external sources.
Combinatorial prophylaxes	Develop prophylaxes affording protection or minimizing the impact from a broad range of CBRN/TIM agents.
COTS CBRND IPE materiel for MWD protection	Adapt COTS protective equipment, where necessary and desirable, for CBRND of MWDs.
Current prophylaxes	There currently exists a variety of prophylaxes used for protection against CBRN. FDA testing and necessary modifications of prophylactics must be made to obtain FDA approval. Review available medical material and prophylaxes for application to high-risk TIMs.
Develop COLPRO kits	Develop COLPRO kits containing all necessary supplies to construct field-expedient COLPRO that is easily stored and maintained in ready condition, easily and safely erected, operated, maintained, and struck within a CBRN/TIM environment by IPE-encumbered personnel using minimal resources and supports COLPRO requirements.
Develop MWD COLPRO	Develop or adapt joint-level MWD transport and field kenneling systems for COLPRO function as transporter, field shelter, and COLPRO.
Develop/adapt MWA transport system with pressure/filtration	Develop or adapt MWA transport systems to provide COLPRO protection from CBRN/TIM agents.
Disposable COLPRO	Develop one-time-use COLPRO that is rapidly erected with little instruction, training, and effort and affords term protection for critical activities and functions, maintenance and repair activities, prelocated consumables, as well as personnel associated with this task.
Field-expedient COLPRO kits	Develop field-expedient COLPRO kits designed to adapt existing structures, tentage, etc., for the expansion of COLPRO field capabilities and mission support and the provision of collective protection to the force, critical functions and activities, maintenance and repair activities and functions, resources, etc.
Field-expedient COLPRO materials	Identify commonly available materials (duct tape, plastic sheeting, wooden crate, plywood, tarps, coverings, wraps, caulk, sealant gels/sprays, etc.) for application in the construction of expedient COLPRO needed to construct field-expedient COLPRO when COLPRO availability is limited or not advantageous.

Idea for Materiel Approach	Description
Future prophylaxes	Some preexposure prophylaxes for biological agents require several administrations, immunity attainment is time-consuming, or the period of coverage does not address the full operational period. Future prophylaxes should provide immunity against all known threat CBRN and high-risk TIM agents, as well as potential future threat agents, and be FDA approved. CBRND medical countermeasures are needed providing a sustained level of protection over an extended period of time (minimally the operational period), do not require multiple administrations, are easily disseminated and administered, support a minimum level of protection, protect against a broad range of agents, cover the range of preexposure to post-exposure/presymptomatic application needs, and are applicable to the protected population (including eligible civilians).
GOTS CBRND IPE materiel for MWD protection	Adapt existing GOTS CBRND materiel (e.g., PPW, etc.) for application to CBRND of MWDs.
Improved IPE garments and accessories	Develop new generation of IPE garments and accessories (e.g., boots/boot covers, gloves, hoods, etc.) using modern materials permitting greater range of motion, longer wear without performance degradation, increased durability, integrated into warfighter personal equipment, and protects against all threat CBRN and high-risk TIM agents.
Integrated mobile COLPRO	Develop warfighting platforms (air, land, and sea) with COLPRO that is an integral part of the operational system and protects against current and future/advanced agents.
Modular COLPRO	Develop modular COLPRO that can be erected in various configurations to protect various groups of people separately by their designation (EPWs, civilian, etc.); accommodates small to large numbers of people; protects all critical activities and functions, MWAs, prelocated consumables, and maintenance/repair activities; and addresses the commander's intent.
MWA prophylaxes	Develop or adapt CBRND medical countermeasures and veterinary medicine for preexposure and post-exposure/presymptomatic protection of MWDs from CBRN/TIM. Develop topical that is easy to apply and provides shielding from CBRN/TIM, preventing agent absorption through hair or skin.
Rebreathing	Closed circuit mechanism to permit an individual's exhaled air to be filtered, CO <sub>2</sub> removed and recirculated for breathing, allowing user to make use of all available oxygen in a closed environment.
Regenerative filtration	CBRN regenerative filters able to flush retained agent, neutralize agent, or by other inherent means affords extended period of protection.
Respiratory protection for MWAs	Modify existing technology for application by MWAs to provide some protection from CBRN/TIM. Specific masks would be desirable that are comparable to the human form factor.
Topical	Develop topical barrier that is easily applied (i.e., spray), acts as a contact hazard barrier, and affords protection from CBRN/TIM.

### **13.5 Task TASHLD 5: Protect evacuees, detainees, civilians, and other identified groups from CBRN/TIM effects**

#### **13.5.1 Functional Area Analysis**

##### **13.5.1.1 Definition**

Establish and provide COLPRO and/or individual protection to eligible civilians and detainees. The afforded protection is dependent upon the function and activities performed by the individual. NOTE: Civilians will encompass the full range of body types, ages, disabilities, and may include both genders.

##### **13.5.1.2 Derivation**

*Joint Enabling Concept for CBRN Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (TA 7, TA 7.1).*

##### **13.5.1.2.1 Supported Task: OPSHLD 6**

##### **13.5.1.2.2 Lateral Task: TASHA 24**

##### **13.5.1.2.3 Supporting Task: N/A**

##### **13.5.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Undeveloped to highly developed land. (C1.1.1)
2. Riverine to open sea. (C1.2)
3. Natural and induced air. (C1.3)
4. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

##### **Military**

1. Partially completed mission preparation. (C2.1.3)
2. Marginal forces. (C2.2)
3. Marginal to adequate forces allocated. (C2.2.3)
4. Poor personnel (evacuees, detainees, civilians, and other identified group) nutrition and health. (C2.2.4.1)
5. Poor personnel physical conditioning. (C2.2.4.3)
6. Poor mission-essential government-service civilian physical conditioning. (C2.2.4.3 – NEW)
7. Poor mission-essential contract-service civilian physical conditioning. (C2.2.4.3 – NEW)

8. Poor evacuee, detainee, and other civilian physical conditioning. (C2.2.4.3 – NEW<sup>2</sup>)
9. Negligible personnel experience. (C2.2.4.5)
10. Limited staff expertise. (C2.3.1.3)
11. Limited deployed supplies. (C2.8.2)
12. No prepositioned materiel. (C2.8.4)
13. No host-nation support. (C2.8.5)
14. Negligible to limited commercial procurement. (C2.8.6)

### Civil

1. Negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)
3. Uncertain international organization support. (C3.1.2.5)
4. Poor civil health. (C3.3.1.4)

## 13.5.2 Functional Needs Analysis

### 13.5.2.1 Capability and Deficiency Assessment Summary

Table 13.5-1 discusses various capabilities to perform the task to the designated standards. The overall capabilities for current, near/mid, and far term are rated “red.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

### Current Capability and Deficiency

Collective protection would afford the most widespread protection to the affected groups, but these assets are limited in quantity and are intended for warfighter protection as a primary role. CBRND respiratory/ocular and percutaneous protection are available in certain situations, either possessed by detainees or provided in theater for dependents and contractors. But widespread use in all cases are limited based on the physical variety of individuals that would need to be considered, i.e., children of various ages. The Guardian Program is attempting to address the protection of critical personnel within the civilian populace on an established military installation but is currently focused upon installation response and mitigation capabilities primarily addressing first responders and follow-on incident management. Planning, respiratory/ocular protection, percutaneous protection, COLPRO, and training are included in this program. However, the provision of IPE and COLPRO for application of CBRND for detainees, civilians, and other identified groups is not adequately addressed in current DOTLMPF and stocks are inadequate, if they exist at all.

---

<sup>2</sup> The current *UJTL* condition description applies to only military personnel. The description should be expanded to include evacuees, detainees, and other civilians.

## Projected Near/Mid-Term Capability and Deficiency

The projected mid-term fielding of JECF will expand capabilities to provide COLPRO for support of operations. However, the quantities remain in question and timing may shift to late mid term. The Guardian Program is expected to address critical civilian personnel within the general installation/facility population during the near to early mid-term. However, the Guardian Program is not expected to address general population, detainees, and non-U.S. personnel, nor operations involving locations other than established U.S. installations and facilities. Although additional assets are projected for the warfighter, no change is projected to DOTLPF.

## Projected Far-Term Capability and Deficiency

Continued fielding of JECF is expected during the far term with possible expansion of the program to address other identified and applicable COLPRO issues. The Guardian Program is expected to continue to address and resolve or mitigate CBRND issues on a limited basis for U.S. installations and facilities. Although additional assets are projected for the warfighter, no change is projected to DOTLPF.

### 13.5.2.2 Resource Systems

#### Individual Protection

##### 1. Respiratory/Ocular Protection:

**COTS:** Commercially available systems of protection, manufactured and tested meeting OSHA standards for the United States or equivalent organization in other nations.

**M17 Series Masks w/M13 Series Filters:** Obsolescent warfighter system of protection. Retained in selected HTAs for NEO application. Designed for adults.

**Other warfighter respiratory/ocular protection as available:** Includes all standard warfighter respiratory/ocular systems of protection (e.g., M40, MCU-2A/P, etc.) that may be available and applied at the direction of the commander.

##### 2. Percutaneous Protection:

**COTS:** Commercially available systems of protection, manufactured and tested meeting OSHA standards for the United States or equivalent organization in other nations.

**Obsolescing warfighter percutaneous protection:** Obsolete or obsolescing warfighter CBRN ensembles, usually first- or second-generation protection, retained in selected HTAs for NEO application, when applied. Designed for adults.

**Other warfighter percutaneous protection as available:** Includes all standard Service-specific warfighter percutaneous protective assets (e.g., BDO, Saratoga, etc.) that may be available and applied at the direction of the commander.

##### 3. Medical Protection: Standard warfighter CBRND prophylaxes. Designed for military population profile.

## COLPRO

### 1. Mobile COLPRO:

**CBPS:** M1113 HMMWV-mounted COLPRO system consisting of a hardshell filtration, power, and transport and expandable softshell tentage with contamination control area/entry. The COLPRO unit is designated the Lightweight Multipurpose shelter (LMS).

**CITADEL:** System of protection installed with USN vessels to afford protection to selected connected spaces including C4ISR, medical, and R2.

### 2. Fixed-Site COLPRO:

**MGPTS:** USMC Medium General Purpose Tent System (MGPTS) with CB Protective Liner System designed for support of USMC operational C4ISR and R2.

**CP-DEPMEDS:** Component-based system of tentage, connective corridors, ISO containers, etc., with COLPRO liners for configuration into field hospitals and includes supporting power and utility systems, lighting, engine control units, and filtration systems. Large system requiring extensive use of resources to prepare location, erect/strike, operate, and maintain.

**JTCOPS:** Similar to CP-DEPMEDS, but for critical functions and activities of the force (e.g., staff operations, aircrew housing and briefing, etc.).

**CP-EMEDS:** USAF air-transportable system similar to CP-DEPMEDS on a smaller scale and configurable from one medical shelter to a 25-bed field hospital.

**CP-SSS:** USAF small-scale COLPRO transportable system designed to support C2 functions.

**JECP:** Projected program of COLPRO designed for application in highly mobile operations, expeditionary operations, forced-entry operations, and/or to supplement larger-scale COLPRO systems in support of operations. Consists of building/room and tentage insert kits and small-unit stand-alone COLPRO kits.

**M20/M20A1 SCPE:** Lightweight and modular COLPRO system consisting of an inflatable liner for insert into rooms or buildings.

**Building integrated COLPRO systems:** COLPRO systems designed and installed into buildings as integral systems, usually facility construction. Post-construction installation is based upon building design and COLPRO requirements. Varies between buildings based upon applied technology, date of construction/installation, system engineering, facility function, etc. Most existing facility COLPRO was established during Cold War period.

**MOPP Methodology:** Stepped level of CBRND protective measures. Standardized levels permit the rapid increase or decrease of unit MOPP level.

**Unit Staff:** Application of DOTLPF, knowledge, experience, and acquired skills for the conduct of CBRND by command staff (as individual entities and a single body) and appropriate supporting activities.

	FAA Measure	Scale
M1	Plans established for protecting detainees, civilians, and other identified groups from CBRN/TIM effects.	<p><b>8–10:</b> Plans, policies, and procedures provide clear and specific guidance for the provision of CBRND protective measures, equipment, and training to detainees (with and without CBRND articles and personal effects authorized under the appropriate Geneva Convention), eligible civilians, and other plan identified and similar groups. Resources are allocated and in place for the effective accomplishment of this task. Forces are trained and equipped to provide CBRND protection as outlined in the appropriate plans, policies, and procedures.</p> <p><b>4–7:</b> Plans provide general guidance and information for the provision of CBRND protective equipment and training to detainees (with and without CBRND articles and personal effects authorized under the appropriate Geneva Convention), eligible civilians, and other plan identified and similar groups. Resources are allocated and available for the accomplishment of this task. Forces are trained and equipped to support CBRND protection of these groups.</p> <p><b>1–3:</b> Plans reference doctrine and policy on the provision of CBRND protective equipment to detainees (with and without CBRND articles and personal effects authorized under the appropriate Geneva Convention), eligible civilians, and other similar groups. Forces are trained on doctrine and policy regarding CBRND protection of these groups.</p> <p><b>0:</b> Plans do not address the provision of CBRND protection for detainees, eligible civilians, and similar groups.</p>
M2	Eligible non–force members are protected using COLPRO.	<p><b>8–10:</b> CBRND COLPRO is available, allocated, in place, and provides protection from all CBRN agents and high-risk TIMs for all sheltering eligible non–force members.</p> <p><b>4–7:</b> CBRND COLPRO is available, allocated, in place, and provides protection from all CBRN warfare agents and selected high-risk TIMs for sheltering eligible non–force members.</p> <p><b>1–3:</b> CBRND COLPRO is available, allocated, in place, and provides protection against all CBRN warfare agents for sheltering eligible non–force members.</p> <p><b>0:</b> CBRND COLPRO is not allocated and in place for sheltering eligible non–force members.</p>
M3	Eligible non–force members are protected using IPE.	<p><b>8–10:</b> Eligible non–force members are trained, equipped, and possess ready access to CBRND protective measures and equipment.</p> <p><b>4–7:</b> Mission support eligible civilians and at-risk eligible civilians are trained, equipped, and possess ready access to CBRND protective measures and equipment.</p> <p><b>1–3:</b> Training, equipping, and ready access to CBRND protective measures and equipment is limited to select groups.</p> <p><b>0:</b> Training, equipping, and ready access to CBRND protective measures and equipment is nonexistent.</p>

M4	Detained personnel possess or are provided individual protection and/or collective protection against exposure to CBRN/TIM agents.	<p><b>8–10:</b> Detained personnel are trained, equipped, and possess ready access to COLPRO and immediate identifiable IPE for protection against CBRN/TIM agent exposure.</p> <p><b>4–7:</b> Detained personnel are equipped and possess access to COLPRO and/or identifiable IPE for protection against CBRN/TIM agent exposure.</p> <p><b>1–3:</b> Detained personnel are equipped and possess access to IPE for protection against CBRN/TIM agent exposure.</p> <p><b>0:</b> Detained personnel are not equipped or possess access to IPE.</p>
M5	There is effective DOTMLPF in place to conduct task.	<p><b>8–10:</b> DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations.</p> <p><b>4–7:</b> Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds.</p> <p><b>1–3:</b> DOTLPF is inadequate for accomplishment of this task.</p> <p><b>0:</b> DOTLPF does not exist for this task.</p>

<sup>1</sup> Plans exist in selected HTAs for the protection of eligible civilians, primarily civilians not supporting operations, using existing and obsolescing force standard and limited acquired COTS respiratory/ocular protective assets. At the direction of the commander, stocks of force equipment and consumables may be applied to offset shortages in equipment for the short term. Current plans for operations outside the United States call for the evacuation of eligible civilians to safe areas outside the AO. Civilians supporting the mission and remaining within the AO, particularly non-U.S. personnel, however, are not adequately addressed for the provision of military force–equivalent CBRND IPE. Civilians supporting the mission within the United States and its governed territories are governed by OSHA requirements. However, equipage of these personnel is currently restricted to selected activities and functions. Most civilian personnel, both those performing mission support and not, are not equipped and trained for survival in a CBRN/TIM environment. Plans for the collection and housing of EPWs and detained civilians envision locations far to the rear or outside the AO. However, these personnel are required to be furnished and afforded protection throughout their custody, not just the period of long-term containment. EPWs governed by the Geneva Convention for the Treatment of Prisoners of War, are permitted to retain personal effects and protective equipment such as CBRN protective masks and clothing. However, both governing Geneva Conventions for prisoners of war (POWs) and civilians require the detaining force protect the detainees. The U.S., as a signatory of the Conventions, is obligated to provide protective assets to these personnel if they do not possess protective respiratory/ocular devices and working stocks were not captured from the adversary. Consequently, the U.S. must provide protection from the point of capture until release. Stocks designed to support force operational needs would be subject to issue if a threat exists. EPW-designated IPE, including respiratory/ocular protection, which is clearly identifiable, does not exist and the potential is present for confusion in identification between EPW and force members. Current planning does not consider this potential force impacting issue.

<sup>2</sup> Civilians supporting the mission within the United States and its governed territories are governed by OSHA requirements. However, equipage of these personnel is currently restricted to selected activities and functions such as hazardous materials response teams, EMS, fire department, etc. Most civilian personnel, both those performing mission support and not, are not equipped and trained for survival in a CBRN/TIM environment. Force stocks are also applied during operations directed by national authorities requiring rapid response for the evacuation and/or protection of designated personnel or groups. Civilians not supporting the mission in selected HTAs are provided CBRND respiratory/ocular protection using obsolescing force standard (M17 series masks with M13 series filters) and limited acquired COTS respiratory/ocular protection. Additional assets must be pulled from force stocks should the available designated assets be depleted. At the direction of the commander, stocks of force equipment and consumables may be applied to offset shortages in equipment for the short term. Civilians on U.S. installations and facilities within the United States and its territories are generally not equipped with CBRND respiratory/ocular protection. However, the Guardian Program is reviewing FP protective measures at U.S. installations and facilities for civilian personnel and will be addressing these issues for critical members of the installation/facility populace. The Guardian Program, however, is not likely to address non-U.S. personnel supporting operations and civilians protected under a national authority–directed evacuation/protection rapid response operation.

<sup>3</sup> EPWs governed by the Geneva Convention for the Treatment of Prisoners of War, are permitted to retain personal effects and protective equipment such as CBRN protective masks and clothing. However, both governing Geneva Conventions for POWs and civilians require the detaining force protect the detainees. The U.S., as a signatory of the Conventions, is obligated to provide protective assets to these personnel if they do not possess protective IPE and working stocks were not captured from the adversary. Consequently, the U.S. must provide protection from the point of capture until release. Stocks designed to support force operational needs would be subject to issue if a threat exists. EPW-designated IPE that is clearly identifiable does not exist and the potential is present for confusion in identification between EPW and force members. Current planning does not consider this potential force impacting issue. Plans for the collection and housing of EPWs and detained civilians envision locations far to the rear or outside the AO. However, these personnel are required to be furnished and afforded protection throughout their custody, not just the period of long-term containment.

<sup>4</sup> Doctrine, policy, procedures, TTPs, and planning are inadequate to afford effective CBRND respiratory/ocular protection to detainees, civilians, and other identified groups. Eligible civilians are not defined, the provision of CBRND measures and material to other than U.S. military members is not sufficiently addressed, and current DOTLPF does not reflect and support the changing nature of the force. DOTLPF providing guidance for CBRND of detainees does not exist.

<sup>5</sup> Plans exist in selected HTAs for the protection of eligible civilians, primarily civilians not supporting operations, using existing and obsolescing force standard and limited acquired COTS percutaneous protective assets. At the direction of the commander, stocks of force equipment and consumables may be applied to offset shortages in equipment for the short term. Current plans for operations outside the United States call for the evacuation of eligible civilians to safe areas outside the AO. Civilians supporting the mission and remaining within the AO, particularly non-U.S. personnel, however, are not adequately addressed for the provision of military force equivalent CBRND IPE. Civilians supporting the mission within the United States and its governed territories are governed by OSHA requirements. However, equipment of these personnel is currently restricted to selected activities and functions. Most civilian personnel, both those performing mission support and not, are not equipped and trained for survival in a CBRN/TIM environment. Plans for the collection and housing of EPWs and detained civilians envision locations far to the rear or outside the AO. However, these personnel are required to be furnished and afforded protection throughout their custody, not just the period of long-term containment. EPWs governed by the Geneva Convention for the Treatment of Prisoners of War, are permitted to retain personal effects and protective equipment such as CBRN protective masks and clothing. However, both governing Geneva Conventions for POWs and civilians require the detaining force protect the detainees. The U.S., as a signatory of the Conventions, is obligated to provide protective assets to these personnel if they do not possess protective respiratory/ocular devices and working stocks were not captured from the adversary. Consequently, the U.S. must provide protection from the point of capture until release. Stocks designed to support force operational needs would be subject to issue if a threat exists. EPW-designated IPE, including percutaneous protection, which is clearly identifiable, does not exist and the potential is present for confusion in identification between EPW and force members. Current planning does not consider this potential force impacting issue.

<sup>6</sup> Civilians supporting the mission within the United States and its governed territories are governed by OSHA requirements. However, equipment of these personnel is currently restricted to selected activities and functions such as hazardous materials response teams, EMS, fire department, etc. Most civilian personnel, both those performing mission support and not, are not equipped and trained for survival in a CBRN/TIM environment. Force stocks are also applied during operations directed by national authorities requiring rapid response for the evacuation and/or protection of designated personnel or groups. Civilians not supporting the mission in selected HTAs are provided CBRND percutaneous protection using obsolescing force standard and limited acquired COTS respiratory/ocular protection. Additional assets must be pulled from force stocks should the designated assets be depleted. At the direction of the commander, stocks of force equipment and consumables may be applied to offset shortages in equipment for the short term. Civilians on U.S. installations and facilities within the United States and its territories are generally not equipped with CBRND respiratory/ocular protection. However, the Guardian Program is reviewing FP protective measures at U.S. installations and facilities for critical civilian personnel and will be addressing these issues. The Guardian Program, however, is not likely to address non-U.S. personnel supporting operations and civilians protected under a National authority-directed evacuation/protection rapid response operation.

<sup>7</sup> EPWs governed by the Geneva Convention for the Treatment of Prisoners of War, are permitted to retain personal effects and protective equipment such as CBRN protective masks and clothing. However, both governing Geneva Conventions for POWs and civilians require the detaining force protect the detainees. The U.S., as a signatory of the Conventions, is obligated to provide protective assets to these personnel if they do not possess protective IPE and working stocks were not captured from the adversary. Consequently, the U.S. must provide protection from the point of capture until release. Stocks designed to support force operational needs would be subject to issue if a threat exists. EPW-designated IPE that is clearly identifiable does not exist and the potential is present for confusion in identification between EPW and force members. Current planning does not consider this potential force impacting issue. Plans for the collection and housing of EPWs and detained civilians envision locations far to the rear or outside the AO. However, these personnel are required to be furnished and afforded protection throughout their custody, not just the period of long-term containment.

<sup>8</sup> Doctrine, policy, procedures, TTPs, and planning are inadequate to afford effective CBRND percutaneous protection to detainees, civilians, and other identified groups. Eligible civilians are not defined, the provision of CBRND measures and material to other than U.S. military members is not sufficiently addressed, and current DOTLPF does not reflect and support the changing nature of the force. DOTLPF providing guidance for CBRND of detainees does not exist.

<sup>9</sup> Doctrine, policy, procedures, TTPs, and planning do not address the provisioning of CBRND medical countermeasures to nonmilitary members.

<sup>10</sup> Plans do not adequately address the provisioning of mobile COLPRO systems for the protection of nonoperational personnel and predominantly rely upon IPE and evacuation for these personnel in HTAs and the AO. Civilians supporting the mission are not considered separately, but are included in unit mobile sheltering requirements if integrated into a force unit. COLPRO for other civilians supporting the mission (e.g., Host-nation personnel, contractor employees, third-party nationals, etc.) is generally not planned or provided. Mobile COLPRO within the United States and its territories is predominantly confined to deployable unit warfighting resources and selected Homeland Defense response activities. LHA/LHDs and selected grey-water combatant vessels are outfitted with CITADEL COLPRO. These systems are dedicated to vessel crew and operations, but may be applied to protect otherwise unprotected personnel.

<sup>11</sup> Current mobile COLPRO systems are predominantly integrated into selected combat vehicles/vessels and do not support the protection of detainees, civilians, and other eligible or identified groups. The only currently fielded land-based mobile COLPRO is CBPS. The CBPS system is available on a mobile platform and can provide a limited number of people protection. The CBPS consists of a dedicated M1113 HMMWV with an LMS mounted on the back and provides a highly mobile, contamination-free, environmentally controlled work area for forward deployed medical units. The CBPS has been fielded to treatment squads, forward surgical teams, and medical companies. Four personnel are required to operate the CBPS. However, these systems are limited in supply and are generally dedicated to medical and C4ISR operations.

<sup>12</sup> Doctrine, policy, procedures, TTPs, and planning are inadequate to afford effective CBRND COLPRO protection to detainees, civilians, and other identified groups. Eligible civilians are not defined, the provision of CBRND measures and material to other than U.S. military members is not sufficiently addressed, and current DOTLPF does not reflect and support the changing nature of the force. DOTLPF providing guidance for CBRND of detainees does not exist.

<sup>13</sup> Plans do not adequately address the provisioning of mobile COLPRO systems for the protection of nonoperational personnel and predominantly rely upon IPE and evacuation for these personnel in HTAs and the AO. Civilians supporting the mission are not considered separately, but are included in unit sheltering requirements if integrated into a force unit. COLPRO for other civilians supporting the mission (e.g., host-nation personnel, contractor employees, third-party nationals, etc.) is generally not planned or provided.

<sup>14</sup> The USMC MGPTS with CB Protective Liner System provides a positive-pressure, filtered-air, toxic-free shelter for protection against CBRN agents. However, there are insufficient quantities to protect detainees, civilians, and other identified groups from CBRN/TIM effects. The CP-DEPMEDS provides a clean, toxic-free, environmentally controlled, patient treatment area and the components are designed to integrate as field hospitals. They are packaged as a set for deployment to threat areas for hospital operations. The entire composite hospital consists of expandable tentage, passageways, environmental control units, and ISO shelters. The CP-DEPMEDS exist in very limited quantities. Although it could be applied to provide COLPRO to the task identified groups, its designed and primary function is that of medical care. A similar COLPRO is the USAF's CP-EMEDS, which is an air-transportable medical facility deployable in various configurations from a single shelter to a 25-bed patient hospital. The CP-EMEDS is in a very limited number and, like the CP-DEPMEDS, is designed for its primary function of the provision of medical care. The USAF CP-SSS is a small-scale CPS applied for the conduct of C2 operations, maintenance of critical equipment, force beddown, and the provision of R2 for sortie generators and key leadership. This shelter is in limited supply and unlikely sufficient quantities would be available to support a group of any size, especially during operations against an adversary. The M20/M20A1 SCPE is a lightweight, modular system involving a liner designed for inflation within a room or building. The M20A1 serves to bridge the gap between the M20 SCPE and CBPS. Quantities are limited and are not likely to be available during operations against an adversary. Current COLPRO systems are not available in the quantities and types necessary to support the protection of eligible civilians and detainees. Current plans generally do not address the application of COLPRO to non-force personnel and do not allocate the limited COLPRO resources to this activity. Fixed-site COLPRO within the United States and its territories is predominantly designed for nuclear fallout and does not address other CBRN/TIM hazards and threats arising after September 11, 2001. Selected critical key facilities are equipped with CBRN COLPRO, but are not available to other than designated personnel. Fixed-site CBRN COLPRO is installed in facilities housing selected activities and functions within HTAs. However, these facilities are dedicated to critical operational requirements and restricted to assigned and designated personnel. However, the Guardian Program is reviewing FP protective measures at U.S. installations and facilities for critical civilian personnel and will be addressing these issues. The Guardian Program, however, is not likely to address non-U.S. personnel supporting operations and civilians protected under a national authority-directed evacuation/protection rapid response operation. The projected mid-term fielding of JECF may alleviate COLPRO shortages but will likely be insufficient to satisfy both operational and eligible civilian sheltering needs.

<sup>15</sup> Plans incorporate MOPP levels and methodologies are adjustable to meet local operations and threat needs. MOPP levels and methodologies are generally considered to apply to equipped nonmilitary personnel. Plans within HTAs may incorporate this perception. However, doctrine, policy, procedures, and TTPs do not address their application to these personnel.

<sup>16</sup> Nonmilitary personnel are generally not trained and fully integrated into exercises and evaluations requiring the use of COLPRO as relates to the appropriate MOPP levels.

<sup>17</sup> Nonmilitary personnel are generally not trained, equipped, and fully integrated into exercises and evaluations requiring the use of IPE at the appropriate MOPP levels.

Designated nonmilitary personnel performing selected functions and activities (e.g., EMS, fire department, etc.) are trained, equipped, and exercised/evaluated.

<sup>18</sup> Detained personnel may not be cognizant of U.S. MOPP levels and their associated actions. Alternative designations and training may be required to enhance detainee survival.

<sup>19</sup> Doctrine, policy, procedures, and TTPs do not address the application of MOPP levels and associated training and equipping of non-U.S. military personnel. DOTLPF providing guidance for CBRND of detainees does not exist.

<sup>20</sup> Unit staff personnel planning is guided by current doctrine, policy, procedures, and TTPs. Select HTA doctrine does provide limited guidance on the provisioning of protection to in-place, known, eligible civilians not supporting the mission (e.g., military dependents, etc.). However, the emphasis within HTAs is upon short-term protection until evacuation. Planning for the provision of CBRND to nonmilitary personnel is a combination of known available assets not otherwise committed to operations, threat, number of persons involved, ability to protect the target population, available relocation resources, expected time to move the population, and expected operational demands. DOTLPF providing guidance for CBRND of detainees does not exist. The protection of non-force members within the United States and its territories is constrained by available protective resources and impacted by OSHA requirements for nonuniformed personnel. Staff training, processes, and planning/operating guidance do not adequately consider civilians supporting the mission and remaining within the AO, particularly non-U.S. personnel. The provisioning and standards for civilians performing mission support tasks, activities, and functions are not adequately addressed for the provision of military force equivalent CBRND IPE where and when appropriate. Civilians supporting the mission within the United States and its governed territories are governed by OSHA requirements. Staff personnel representing selected activities such as fire department, EMS, and other similar standard response functions are aware and knowledgeable of OSHA requirements and are involved in staff planning and operational processes. However, equipment of these personnel is currently restricted to selected activities and functions. Further, host-nation standards and requirements similar to OSHA may exist and apply to non-U.S. personnel, activities, and functions supporting the mission and are not generally known to the staff. Most civilian personnel, both those performing mission support and not, are not addressed in planning for survival and operations within a CBRN/TIM environment.

<sup>21</sup> Availability of COLPRO for other than operational needs is not a consideration the unit staff can reasonably expect or build into plans. However, the Guardian Program is reviewing FP protective measures at U.S. installations and facilities for critical civilian personnel and will be addressing these issues. The Guardian Program, however, is not likely to address non-U.S. personnel supporting operations and civilians protected under a National authority-directed evacuation/protection rapid response operation. The projected mid-term fielding of JECF may alleviate COLPRO shortages but will likely be insufficient to satisfy both operational and eligible civilian sheltering needs.

<sup>22</sup> Unit staff planners in selected HTAs do address the short-term protection of nonmilitary personnel not supporting the mission. However, the equipping and training of civilians supporting the mission is not adequately defined and addressed for planning action by unit staff planners and supporting functions. However, the Guardian Program is reviewing FP protective measures at U.S. installations and facilities for critical civilian personnel and will be addressing these issues. The Guardian Program, however, is not likely to address non-U.S. personnel supporting operations and civilians protected under a National authority-directed evacuation/protection rapid response operation. The projected mid-term fielding of JECF may alleviate COLPRO shortages but will likely be insufficient to satisfy both operational and eligible civilian sheltering needs.

<sup>23</sup> DOTLPF providing guidance for CBRND of detainees does not exist.

<sup>24</sup> Doctrine, policy, procedures, and TTPs do not address the application of MOPP levels and associated training and equipping of non-U.S. military personnel other than for selected personnel, functions, and activities such as fire department, EMS, and similar entities. DOTLPF providing guidance for CBRND of detainees does not exist.

<sup>25</sup> Improvements are expected as a result of the Guardian Program as assets are identified and fielded for critical civilian personnel. However, protection of the general population is not likely to be addressed.

<sup>26</sup> The projected fielding of JECF in the mid term includes adaptive/insertive COLPRO for existing tentage and facilities. Quantities to be fielded of these systems has not been determined.

<sup>27</sup> Continued Guardian Program progress and corresponding development of associated detailed DOTLPF is expected to address the protection of the critical nonmilitary populace at U.S. facilities and installations. The Guardian Program, however, is not likely to address non-U.S. personnel supporting operations and civilians protected under a National authority-directed evacuation/protection rapid response operation. Further, the Guardian Program is not expected to address detainees.

### 13.5.3 Functional Solutions Analysis

#### 13.5.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** The definition of “eligible civilians” is not clear.

**Non-Materiel Solutions:** *Doctrine:* Define “eligible civilians” supporting the mission/military operations for CBRND and establish their inclusion in the force within doctrine, policy, procedures, and TTPs. Define other eligible civilians and their relationship to the force, protection afforded by the force, and obligations of the force and the target population. *Organization:* Identify organizational services dependent upon civilians for mission/military operations success. Identify organization services and activities necessary to support survivability of eligible civilians, detainees, evacuees, and other designated/identified groups. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians, detainees, evacuees, and other designated/identified groups; and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians, detainees, evacuees, and other designated/identified groups. *Personnel:* Ensure that eligible civilians supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities:* Develop supporting infrastructure for eligible civilian, detainees, and other designated group CBRND (e.g., logistics, medical, training, communications, security, etc.).

2. **Deficiency:** The command staffs do not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to eligible civilians, detainees, evacuees, and other non-U.S. military identified groups.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing civilian personnel, detainees, non-U.S. personnel, and other groups and operations for CBRND. *Organization:* Identify organizational services and activities supporting the mission performed by civilian personnel and operations. Address organizational issues (e.g., who provides the equipment, support forces to train and equip, etc.) related to the provision of CBRN/TIM protection to eligible civilians, detainees, evacuees, and other identified groups. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians, detainees, and other designated personnel. Conduct CBRN/TIM training, exercises, and evaluations including these groups, where appropriate. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians, detainees, and other designated personnel. *Personnel:* Ensure that eligible civilians supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities:* Develop supporting infrastructure for eligible civilian, detainees, and other designated group CBRND (e.g., logistics, medical, training, communications, security, etc.).

- 3. Deficiency:** DOTLPPF is inadequate or nonexistent addressing CBRND of eligible civilians, detainees, evacuees, and other designated/identified groups.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, procedures, and TTPs addressing CBRND of eligible civilians, detainees, evacuees, and other designated/identified groups. *Organization:* Identify organization services and activities necessary to support survivability of eligible civilians, detainees, evacuees, and other designated/identified groups. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians, detainees, evacuees, and other designated/identified groups; and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians, detainees, evacuees, and other designated/identified groups. *Personnel:* Establish criteria and requirements that eligible civilians supporting the mission/military operations are medically qualified to perform their tasks in a CBRN/TIM environment using CBRND resources and are adequately trained in CBRND and operations within a CBRN/TIM environment. *Facilities:* Develop supporting infrastructure for eligible civilian, detainees, and other designated group CBRND (e.g., logistics, medical, training, communications, security, etc.).
- 4. Deficiency:** Policies and plans do not adequately address the protection of eligible civilians, detainees, evacuees, and other designated groups from CBRN/TIM.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing eligible civilians, detainees, evacuees, and other designated groups for CBRND. Includes specific guidance for planning and operations involving these groups. *Leadership:* Ensure awareness of need for planning and resource allocation for the protection of eligible civilians, detainees, evacuees, and other designated groups from the effects of CBRN/TIM.
- 5. Deficiency:** Eligible civilians, detainees, evacuees, and other identified groups are not equipped and trained to survive a CBRN/TIM environment.

**Partial Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, procedures, and TTPs for the identification, equipping, preparing, training, and protection of eligible civilians, detainees, evacuees, and other identified groups for survival and operations within a CBRN/TIM environment. *Organization:* Ensure organizational consideration for maintenance and support of eligible civilian, detainee, evacuee, and other identified group CBRND protective equipment, measures, and activities. *Training:* Establish institutional and unit training of eligible civilians supporting the mission for CBRND measures and activities. Includes training of other civilians, detainees, evacuees, and other identified groups for survival in a CBRN/TIM environment. Also includes integration into CBRND exercises and evaluations. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for eligible civilian, detainee, evacuee, and other identified group survival. *Personnel:* Ensure that eligible civilians supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities:* Develop supporting infrastructure for eligible civilian, detainees, and other designated group CBRND (e.g., logistics, medical, training, communications, security, etc.).
- 6. Deficiency:** Most civilians are not equipped or have access to IPE for survival within a CBRN/TIM environment. Detainees are likely not to possess IPE.

**Partial Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the provisioning of civilians, evacuees, detainees, and other designated groups with CBRND that addresses the variation within a potential population. Institute in doctrine, policy, and procedures the central correlation of plans and taskings to identify eligible civilian, detainee, evacuee, and other designated group CBRND support requirements for two or more concurrent operations with threat with comparison to existing and programmed quantities and types of CBRND systems and resources, to include replenishment and preposition of CBRND assets for these groups. *Organization:* Ensure organizational consideration for maintenance and support of eligible civilian, detainee, evacuee, and other identified group CBRND protective equipment, measures, and activities. *Training:* Establish institutional and unit training of eligible civilians supporting the mission for CBRND measures and activities. Training of other civilians, detainees, evacuees, and other identified groups for survival in a CBRN/TIM environment. Integrate into CBRND exercises and evaluations. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for eligible civilian, detainee, evacuee, and other identified group survival. *Personnel:* Ensure that eligible civilians supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities:* Develop supporting infrastructure for eligible civilian, detainees, and other designated group CBRND (e.g., logistics, medical, training, communications, security, etc.).

7. **Deficiency:** Most civilians performing essential activities supporting operations are not equivalently equipped to their military counterparts. This statement is particularly true of contractors.

**Partial Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards for protection of eligible civilians supporting the mission/military operations addressing the variation within the potential protected working populations. *Organization:* Identify organizational services dependent upon civilians for mission/military operations success. *Training:* Establish institutional and unit training of eligible civilians supporting the mission for CBRND measures and activities. Integrate into CBRND exercises and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians. *Personnel:* Ensure that eligible civilians supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities:* Develop supporting infrastructure for eligible civilians supporting the mission/operations CBRND (e.g., logistics, medical, training, communications, security, etc.).

8. **Deficiency:** Short-notice NEO evacuation operations for other than existing areas prepared in advance for NEO activities, are likely to necessitate the use of military force assets which may provide inadequate protection for segments of the potential population (e.g., babies, young children, disabled, etc.).

**Partial Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards for protection of evacuees during NEO operations with threat and addressing the variation within the potential protected working populations. *Leadership:* Awareness and ensure plans adequately address CBRND protection of evacuees during NEO operations with threat. *Facilities:* Infrastructure supports the acquisition and provisioning of COTS/GOTS material for the protection of evacuees.

**9. Deficiency:** Prophylaxis for eligible civilians is not addressed.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures requirement to address the administration, provision, and application of medical CBRN/TIM protective countermeasures by other than U.S. forces (e.g., civilians, non-U.S. forces, detainees, etc.). *Organization:* Address organizational issues (e.g., who provides the equipment, support forces to train and equip, etc.) related to the provision of CBRN/TIM protection to eligible civilians, detainees, evacuees, and other identified groups. *Training:* Include eligible civilians, detainees, and other identified groups in CBRND training, exercises, and evaluations. Identify training requirements and responsibilities for non-U.S. personnel. *Leadership:* Ensure leadership awareness of criticality and increased dependence of military operations, requirements to protect detainees, and need to protect other eligible/designated groups. *Personnel:* Require eligible civilians supporting the mission to meet minimum standards for safe use of CBRND resources.

**10. Deficiency:** Availability of prophylaxis is questionable for issue and administration to eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of CBRND standards and prophylaxis for protection of eligible civilians addressing the variation within a potential protected population. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRN/TIM training, exercises, and evaluations, where appropriate. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians.

**11. Deficiency:** The issue and administration of prophylaxis to eligible civilians requires review due to questions regarding applicability to the range of body types, ages, and physical/medical factors inherent within a potential population, as well as possible long-term health issues and legal ramifications.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of CBRND standards and prophylaxis for protection of eligible civilians addressing the variation within a potential protected population. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRN/TIM training, exercises, and evaluations, where appropriate. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians.

### 13.5.3.2 IMA Assessment Summary

Table 13.5-2 is a list of ideas for material approaches and a corresponding description of each idea. While current IPE could be used for mission essential civilians; the larger quantities required meeting this task and the difficulties/hazards associated with it make IPE unrealistic. Approaches need to focus on use of current COLPRO systems and developing field-expedient and rapidly deployable systems. Table 13.5-3 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 13.5-2. TASHLD 5: Materiel Approaches**

Idea for Materiel Approach	Description
Procure/develop field-expedient COLPRO kits	Procure COLPRO kits similar to those used for the Chemical Stockpile Emergency Preparedness Program for appropriate activities and requirements. This protective measure is currently provided to populations located in the vicinity of chemical demilitarization sites. Other materials may be adaptable and procured to establish COLPRO in existing structures. Develop field-expedient COLPRO kits designed to adapt existing structures, tentage, etc., for the expansion of COLPRO field capabilities and mission support and the provision of collective protection to the force, critical functions and activities, maintenance and repair activities and functions, resources, etc.
Disposable COLPRO	Develop one-time-use COLPRO that is rapidly erected with little instruction, training, and effort and affords term protection for critical activities and functions, maintenance and repair activities, prelocated consumables, as well as personnel associated with this task.
Modular COLPRO	Develop modular COLPRO that can be erected in various configurations to protect various groups of people separately by their designation (EPW, civilian, etc.); accommodates small to large numbers of people; protects all critical activities and functions, MWAs, prelocated consumables, and maintenance/repair activities; and addresses the commander's intent.

Table 13.5-3. TASHLD 5: IMA Assessment

Identified Gaps	Ideas for Material Approaches (IMA)		
	Develop/Procure Field-Expedient COLPRO Kits	Disposable COLPRO	Modular COLPRO
Eligible civilians, detainees, evacuees, and other identified groups are not equipped and trained to survive a CBRN/TIM environment	X	X	X
Most civilians are not equipped or have access to IPE for survival within a CBRN/TIM environment. Detainees are likely not to possess IPE.	X	X	X
Most civilians performing essential activities supporting operations are not equivalently equipped to their military counterparts. This statement is particularly true of contractors.	X	X	X
Short-notice NEO evacuation operations for other than existing areas prepared in advance for NEO activities, are likely to necessitate the use of military force assets which may provide inadequate protection for segments of the potential population (e.g., babies, young children, disabled, etc.).	X	X	X

### **13.6 Task TASHLD 6: Provide safe, collectively protected environment for critical and essential mission tasks and activities and for rest and relief**

#### **13.6.1 Functional Area Analysis**

##### **13.6.1.1 Definition**

COLPRO provides a contamination-free (MOPP-free) environment where critical activities (e.g., command and control, communication, and maintenance of low-density assets) can be performed, and provides MOPP relief for individuals and units. COLPRO may be included in a fixed facility, transportable shelter, mobile-mounted shelter, vehicle, aircraft, ship, or an expedient shelter. Entry/exit procedures must be strictly followed to prevent introducing contamination into a CPS. A CPS is brought to fully operational condition if not done so prior to an attack.

Because COLPRO assets are limited (if available at all), commanders must prioritize those activities that are critical to battlefield success to be performed in CPS. Forces are rotated, when and where possible, for rest and relief within CPS facilities or outside the hazard area. The facility, vessel, or vehicular (air or ground) CPS clean air supply system is activated if COLPRO filtration systems were not placed into operation prior to the event. Unoccupied vehicles (air and surface) remain sealed to prevent the infiltration of contamination. Environmental Sheltering with Reduced CB Hazard CPS is placed into operation. Prior to an actual attack, CPS may be activated and the following tasks performed:

- CPSs are assessed and prepared for use. The commander may place a CPS into operation or on standby for an anticipated attack.
- Facilities, vehicles, vessels, and aircraft are prepared wherever possible against infiltration of a CBRN/TIM agent.
- Expedient shelters are established in facilities, vehicles, vessels, aircraft, etc., for protection of resources. Expedient shelters may also be constructed using available materials.

##### **13.6.1.2 Derivation**

*Joint Enabling Concept for CBRN Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (TA 5, TA 7, TA 7.1).*

##### **13.6.1.2.1 Supported Task: OPSHLD 7**

##### **13.6.1.2.2 Lateral Task: TASHA 24**

##### **13.6.1.2.3 Supporting Task: N/A**

### 13.6.1.3 Condition

Perform this task under conditions of:

#### Physical

1. Undeveloped to highly developed land. (C1.1.1)
2. Riverine to open sea. (C1.2)
3. Natural and induced air. (C1.3)
4. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

#### Military

1. Partially completed mission preparation. (C2.1.3)
2. Marginal forces. (C2.2)
3. Marginal to adequate forces allocated. (C2.2.3)
4. Negligible personnel experience. (C2.2.4.5)
5. Limited staff expertise. (C2.3.1.3)
6. Limited deployed supplies. (C2.8.2)
7. Limited CONUS resupply. (C2.8.3)
8. No prepositioned materiel. (2.8.4)
9. No host-nation support. (C2.8.5)
10. Negligible to limited commercial procurement. (C2.8.6)

Civil. N/A

### 13.6.2 Functional Needs Analysis

#### 13.6.2.1 Capability and Deficiency Assessment Summary

Table 13.6-1 discusses current capabilities to perform the task to the designated standards. The overall capabilities for current, near/mid, and far term are rated “yellow.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

#### Current Capability and Deficiency

Current site COLPRO generally requires extensive site preparation and resources to erect, operate, and strike but cannot be erected/striking in a CBRN/TIM environment. Mobile COLPRO is a diversity of systems ranging from forced clean air systems to full COLPRO. However, their application is limited. In general, current COLPRO is limited in quantity and does not adequately support expeditionary and highly mobile maneuver operations, particularly those in an austere environment with reduced logistical footprints. Most mobile platforms (including land, sea, and air) are not equipped with COLPRO. This circumstance requires prioritization of available assets

to address critical activities/functions and the application of IPE for CBRND. However, although prioritization is applied for critical activities and functions, not all such requirements can be satisfied with current COLPRO. Individual protection, therefore, remains the mainstay for protection against CBRN/TIM agents. The Services currently field a variety of CBRND assets providing respiratory/ocular, percutaneous, and COLPRO protection. This diversity of assets complicates the logistical support of operations with threat for joint operations. Existing Service-specific IPE is limited in the period and scope of protection afforded the warfighter.

Respiratory/ocular and percutaneous CBRND assets protect against known chemical and biological warfare agents and particulate radiologicals. Protection is afforded to a select number of TIMs. Physiological and psychological encumbrances increase with prolonged wear. Regular exercising and wear to acclimate and adjust the wearer to enable performance of assigned functions and activities are necessary and performed to reduce the impact of encumbrances and subsequent degradation of performance.

Medical prophylaxes do exist for the protection of the warfighter against a limited number of biological and chemical agents. However, few are FDA approved. A number possess IND authorization for application. Medications are considered for their potential prophylactic value, but are not always FDA approved for this purpose. Not all threat CBRN agents are addressed by CBRND medical countermeasures. Efficacy, time to achieve a level of protection, and the number of administrations vary between prophylaxes.

COTS protective assets are applied for selected eligible civilians such as hazardous materials, firefighters, EMS, etc. However, eligible civilians (in general) and MWAs are not adequately addressed by DOTLPF for CBRND. Clear DOTLPF addressing the CBRND provisioning and training of eligible civilians is inadequate. MWAs are not afforded protection against the effects of CBRN/TIM agents, including COLPRO. MOPP DOTLPF is adequate for military personnel and operations. The establishment of adjustable MOPP levels, reflective of local operations and threat, are well defined, as are continuing evaluation for change/adjustments. However, operations increasingly involve U.S. and non-U.S. civilians. MOPP DOTLPF does not adequately address their presence and inclusion into MOPP methodologies and levels, particularly when these personnel may (or may not) be equipped with nonstandard IPE. DOTLPF does address the need for R2 of non-COLPRO-protected personnel in a contamination/hazard-free environment at least once every 24 hours. The methodology includes COLPRO, rotation to a clean area, and other planned considerations. However, operational requirements may not support this activity, particularly by engaged elements. Further, the largely manual current nature of command operations inherently delays protective actions versus automation, further complicated by the current stovepipe reporting and information flow as information flows vertically without a corresponding horizontal flow for alerting/warning of CBRN/TIM agents.

### **Projected Near/Mid-Term Capability and Deficiency**

JECP is projected to initially field during the mid term with three COLPRO systems primarily addressing expeditionary operations. The P3I upgraded CBPS, JTCOPS, CP-DEPMEDS, fielding of the JSLNBCRS variants, and backfit of LHA/LHD vessels are projected to include COLPRO in the mid term. These systems, depending upon the quantity fielded, may provide additional COLPRO to address critical needs. However, individual protection is projected to

remain the principal method of CBRND. Future configurations focus on reducing psychological and physiological stresses associated with the wearing of IPE, as well as striving for commonality of form factor among all services to reducing the logistics burden, development cost, and improved availability. The JPACE, JSLIST, JSAM, and JSGPM are projected to be initially fielded during the mid term. The JSLIST is under review for NIOSH certification for compliance with OSHA protective standards. The certification will permit application of the garment for AT/FP installation activities within CONUS and selected OCONUS. The possibility exists for potential application by requiring eligible civilians. Legacy Service-specific IPE will remain in the inventory throughout the mid term and into the far term during the transition to the joint IPE systems. Ongoing R&D into medical prophylaxes will provide additional prophylactic measures but still fail to address all threat CBRN agents and high-threat/high risk TIMs (particularly TICs). Otherwise, changes from current capabilities and deficiencies are not projected.

### Projected Far-Term Capability and Deficiency

The potential for COLPRO in the Future Tactical Lift Option builds upon the mid-term COLPRO capabilities. As with the mid term, CBRND will continue to rely upon individual CBRND protection against CBRN/TIM agents. Future configurations focus upon reducing psychological and physiological stresses associated with the wearing of IPE, as well as striving for commonality of form factor among all Services. The standardization of CBRND respiratory/ocular and percutaneous protection which will reduce the logistics burden and development cost and subsequently improve availability. Legacy Service-specific IPE will continue to be replaced by the joint systems of CBRND protective equipment until fielding is complete to all Service units, including Guard and Reserve, early in the far term. Next-generation IPE assets are in R&D and are expected to be fielded sometime in the far term. However, specifics of design, characteristics, and protective capabilities are not as yet determined for these systems. Continued R&D into potential medical prophylaxes may result in additional protective measures for the force. However, specifics are unknown at this time. Additional changes in capabilities from the mid term are not projected.

#### 13.6.2.2 Resource Systems

### Individual Protection

#### 1. Respiratory/Ocular Protection:

**COTS:** Commercially available systems of protection, manufactured and tested meeting OSHA standards for the United States or equivalent organization in other nations.

**M42 CB Protective Mask:** U.S. Army mask system designed for military standard profile and uses standard C-2 canister. M42 integrates with combat vehicle clean air supply system and has a connectable dynamic microphone for combat vehicle intercom system.

**M45 Aircrew Aviator Mask:** Replaces M42 and M49 systems for U.S. Army. Available with a canister-compatible hose assembly and a valve cassette that enables use of supplied air (from aircraft, SCBA or PAPR). The M45 is used by military personnel who cannot fit the M40A1, M42A2, or MCU-2/P masks.

**MCU-2A/P:** Mainstay USAF and USN system for nonaviator personnel and aircrew personnel not performing flight operations, except for aircrew personnel not issued aviator systems and noncombat platforms/airframes without clean air supply systems. Applies C-2 filter for filter air.

**Joint Service General Purpose Mask (JSGPM):** Initial fielding projected in the mid term replacing Service-specific standard respiratory/ocular protective systems. Provides respiratory/ocular protection from CBRN agents and selected TIMs. Improves field-of-vision and encumbrances associated with existing Service systems.

**Joint Service Chemical Environment Survival Mask (JCESM):** COTS one-time use, one-size-fits-all, respiratory/ocular protective system affording two hours of protection in low-level CBRN vapor, aerosol, and particulate environments. Selected force element application only.

## 2. Percutaneous Protection:

**COTS:** Commercially available systems of protection, manufactured and tested meeting OSHA standards for the United States or equivalent organization in other nations.

**Battle Dress Overgarment (BDO):** U.S. Army/USAF two-piece camouflage-patterned garment (top and trousers) providing 24-hour protection against CBRN agents in vapor, liquid, droplet, and particulate forms.

**Saratoga:** USMC two-piece camouflage-patterned garment (top and trousers) providing 24-hour protection against CBRN agents in vapor, liquid, droplet, and particulate forms. Launderable for hygiene.

**CPOG:** Legacy two-piece green garment currently in use with USN providing limited-term protection against CBRN agents in vapor, liquid, droplet, and particulate forms.

**Chemical Protective Undergarment (CPU):** Worn under standard IPE as additional layer of protection against contact with CBRN agents.

**BVO/GVO:** Vinyl overboots (VO) worn over wearer's standard footwear and protects against contact with CBRN agents. Available in black (BVO) and green (GVO).

**Chemical Protective Footwear Cover (CPFC):** Legacy system of CBRN protective footwear cover in use by USN. Requires wearer to pull protective sole tabs up and wrap/tie laces around cover to secure over footwear.

**Chemical Protective Glove (CPG):** Standard CBRN protective glove. Available in 7-, 14-, and 25-mil thicknesses addressing functional requirements for durability, dexterity, and tactile sensitivity.

**Chemical Protective Helmet System (CPHS):** CBRN protective camouflage-patterned helmet cover to protect helmet from contact with CBRN contaminants.

**SCALP:** Disposable, lightweight, impermeable overgarment designed for wear over IPE for additional protection in grossly contaminated environments. Applied by personnel required to leave protective sheltering in these environments to perform mission-critical tasks. Also applied by decontamination units/teams and medical personnel performing decontamination or potentially at risk for prolonged contact with liquids.

**Wet-Weather Gear: Includes Severe-Weather Gear (USN).** Provides barrier against contact with liquids potentially damaging to protective abilities of IPE.

**M-2 Apron:** Butyl rubber-coated sleeved apron worn over IPE and applied by decontamination units/teams and other designated personnel performing decontamination

or potentially at risk for contact with liquids. Provides barrier against contact with liquids potentially damaging to protective abilities of IPE. Decontaminable.

**Joint Service Lightweight Integrated Suit Technology (JSLIST):** Two-piece (jacket and trousers) CBRN risk-taking protective garment with integrated hood. Affords protection against selected TIM agents. Reduces physiological and psychological encumbrances associated with existing Service-specific systems it replaces with initial fielding in the mid term. Under review for NIOSH certification for OSHA protection standards.

**Joint Block I/II Glove Upgrade (JB1/2GU):** Projected fielding in near mid term replacing CPG for designated force elements requiring increased tactility/durability for mission performance. Various configurations under consideration.

**Joint Firefighter Integrated Response Ensemble (JFIRE):** Incorporates JSLIST into firefighter bunker gear, permitting firefighters to conduct firefighting operations within a CBRN/TIM environment.

**Multi-purpose Overboot (MULO):** Projected initial fielding in mid term and replacing legacy CBRN footwear covers.

### 3. Medical Protection:

**Vaccines:** Immunizations providing a level of acquired immunity against the effects of CBRN agents.

**Topicals:** Protective barrier products applied to the skin to enhance protection of wear against contact with CBRN/TIM agents. Includes both inert and reactive materials.

**Medications:** Medical materials taken to mitigate or prevent the effects of exposure to CBRN/TIM agents. Includes medications taken routinely or upon exposure (but prior to symptom display) to build resistance/immunity or to mitigate/resolve medical impacts of CBRN/TIM agent exposure/contamination.

## COLPRO

### 1. Mobile COLPRO

**CBPS:** M1113 HMMWV-mounted COLPRO system consisting of a hardshell filtration, power, and transport and expandable softshell tentage with contamination control area/entry. The COLPRO unit is designated the Lightweight Multipurpose shelter (LMS).

**Crewed Combat Vehicles (Ground):** Two types of COLPRO. First supplies filter air using forced clean air supply system. Requires wear of IPE and connection to crew mask. This is the type of system in the M1A1 Abrams MBT. Second system is incorporates full COLPRO and permits reduction of IPE during operation. JSLNBCRS is an example of the second type of system.

**Airframe Air Supply System:** Provides clean air from compressed air storage system either until aircraft is outside of contamination and airframe interior is flushed of vapor contaminants or throughout flight operations.

**CITADEL:** System of protection installed with USN vessels to afford protection to selected connected spaces including C4ISR, medical, and R2.

## 2. Fixed-Site COLPRO

**MGPTS:** USMC Medium General Purpose Tent System (MGPTS) with CB Protective Liner System designed for support of USMC operational C4ISR and R2.

**CP-DEPMEDS:** Component-based system of tentage, connective corridors, ISO containers, etc., with COLPRO liners for configuration into field hospitals and includes supporting power and utility systems, lighting, engine control units, and filtration systems. Large system requiring extensive use of resources to prepare location, erect/strike, operate, and maintain.

**JTCOPS:** Similar to CP-DEPMEDS, but for critical functions and activities of the force (e.g., staff operations, aircrew housing and briefing, etc.).

**CP-EMEDS:** USAF air-transportable system similar to CP-DEPMEDS on a smaller scale and configurable from one medical shelter to a 25-bed field hospital.

**CP-SSS:** USAF small-scale COLPRO transportable system designed to support C2 functions.

**JECP:** Projected program of COLPRO designed for application in highly mobile operations, expeditionary operations, forced-entry operations, and/or to supplement larger-scale COLPRO systems in support of operations. Consists of building/room and tentage insert kits and small-unit stand-alone COLPRO kits.

**M20/M20A1 SCPE:** Lightweight and modular COLPRO system consisting of an inflatable liner for insert into rooms or buildings.

**Building integrated COLPRO systems:** COLPRO systems designed and installed into buildings as integral systems, usually facility construction. Post-construction installation is based upon building design and COLPRO requirements. Varies between buildings based upon applied technology, date of construction/installation, system engineering, facility function, etc. Most existing facility COLPRO was established during Cold War period.

**MOPP Methodology:** Stepped level of CBRND protective measures. Standardized levels permit the rapid increase or decrease of unit MOPP level.

**Unit Staff:** The application of DOTLPF for all phases of operations with threat from preplanning to post-force return to home stations. Includes all aspects of C2 and supporting staff activities/functions (e.g., logistics, intelligence, etc.) enabling mission and task accomplishment.

<b>Far-Term Overall Capability</b>	7	7	9	0	0	1	6	0	7	6	7	5

	FAA Measure	Scale
M1	Critical activities and functions are afforded COLPRO.	<b>8–10:</b> All critical facilities and activities are equipped with operational COLPRO. <b>4–7:</b> Selected critical facilities and activities possess are equipped or possess access to operational COLPRO. <b>1–3:</b> Selected key critical facilities and activities are equipped or possess access to COLPRO. <b>0:</b> Critical facilities and activities are not equipped or possess access to COLPRO.
M2	Unit COLPRO systems are established/ operational rapidly within receipt of commander's orders.	<b>8–10:</b> COLPRO requires minimal unit resources to rapidly and safely erect, place into operation, and maintain upon implementation instructions. <b>4–7:</b> COLPRO requires the application of considerable unit resources to rapidly and safely erect, place into operation, and maintain upon implementation instructions. <b>1–3:</b> COLPRO requires significant unit and assistive resources to rapidly and safely erect, place into operation, and maintain upon implementation instructions. <b>0:</b> COLPRO cannot be rapidly and safely erected, placed into operation, and maintained upon implementation instructions.
M3	Priorities are established for use of COLPRO assets.	<b>8–10:</b> Detailed prioritization of available and appropriate COLPRO is established, implemented, and adjusted when necessary to support critical activities and functions, and the rotation of forces for rest and relief based upon mission, criticality, threat, assessments, and resources. <b>4–7:</b> General prioritization of COLPRO exists and is applied to the allocation of available COLPRO to critical activities, functions, and force rest and relief. <b>1–3:</b> Prioritization of available COLPRO is inadequate to address the allocation of available COLPRO to critical activities, functions, and force rest and relief. <b>0:</b> COLPRO prioritization is nonexistent.
M4	Sustained operational capability is achieved with COLPRO.	<b>8–10:</b> Sufficient and adequate COLPRO is available and operational to sustain operational capabilities within a CBRN/TIM environment. <b>4–7:</b> Adequate operational capabilities are sustained for selected functions and activities with available and operational COLPRO. <b>1–3:</b> Sustained operational capabilities are seriously degraded and limited within a CBRN/TIM environment and are not mitigated by the application of COLPRO. <b>0:</b> Sustained operational capability is not supported by COLPRO and individual protection.
M5	Unit COLPRO systems are erectable within a contaminated environment while encumbered by MOPP.	<b>8–10:</b> COLPRO is rapidly and safely erected/struck, placed in operation, and maintained within a CBRN/TIM environment by personnel encumbered by IPE and with minimal resources. <b>4–7:</b> COLPRO is safely erected/struck, placed in operation, and maintained within a CBRN/TIM environment by IPE-encumbered personnel. <b>1–3:</b> Selected COLPRO is safely erected/struck, placed in operation, and maintained within a CBRN/TIM environment by IPE-encumbered personnel. <b>0:</b> COLPRO cannot be rapidly and safely erected, placed into operation, and maintained by IPE-encumbered personnel.

M6	Unit and personnel are trained and capable of fabricating expedient sheltering using available material and/or kits.	<p><b>8–10:</b> Units and personnel are fully trained and routinely exercised and evaluated on the effective application of expedient COLPRO measures and equipment.</p> <p><b>4–7:</b> Units and personnel are fully trained and evaluated on the application of expedient COLPRO measures and equipment upon predeployment notification for operations with threat.</p> <p><b>1–3:</b> Units and personnel are provided limited training on the application of expedient COLPRO measures and equipment.</p> <p><b>0:</b> Training, exercising, and evaluation of forces on the application of expedient COLPRO measures and equipment is inadequate or nonexistent.</p>
M7	All personnel possess access to collective protection for rest and relief in a 24-hour period.	<p><b>8–10:</b> Units are adequately equipped with or have sufficient access to COLPRO to provide all personnel with R&amp;R access more than once every 24 hours.</p> <p><b>4–7:</b> Units are adequately equipped with or have sufficient access to COLPRO to provide all personnel with R&amp;R access at least once every 24 hours.</p> <p><b>1–3:</b> Units are equipped with or have access to COLPRO to provide personnel with R&amp;R access once every 24 hours.</p> <p><b>0:</b> Units are inadequately equipment and possess insufficient access to COLPRO to provide all personnel with R&amp;R access at least once every 24 hours.</p>
M8	Appropriate collective protection for maintenance precludes maintenance backlog resulting from contaminated critical items not repairable due to lack of collectively protected maintenance facilities.	<p><b>8–10:</b> COLPRO affording a minimum necessary and safe level of protection for maintenance of contaminated critical items is available and in place and maintains support of OPTEMPO and operations.</p> <p><b>4–7:</b> COLPRO is available and in place affording reduced protection requirements for maintenance of contaminated critical items essential to OPTEMPO and operations.</p> <p><b>1–3:</b> Limited COLPRO is available and in place supporting the maintenance of selected contaminated critical assets essential to OPTEMPO and operations.</p> <p><b>0:</b> COLPRO does not exist to perform maintenance of contaminated critical assets.</p>
M9	Operational activities and functions are not degraded/unavailable due to CBRN/TIM release.	<p><b>8–10:</b> Operational capabilities are maintained within a CBRN/TIM environment through the application of COLPRO and individual protection.</p> <p><b>4–7:</b> Operational capabilities are degraded or limited within a CBRN/TIM environment but are supported by the application of COLPRO and individual protection.</p> <p><b>1–3:</b> IPE encumbrances and COLPRO availability impose serious impacts and limitations upon operational capabilities and performance of functions and activities within a CBRN/TIM environment.</p> <p><b>0:</b> IPE encumbrances and COLPRO availability preclude operational capability and performance within a CBRN/TIM environment.</p>
M10	Forces are collectively protected against CBRN/TIM environment.	<p><b>8–10:</b> Forces are allocated and have in place CBRND COLPRO in required quantities and types and are afforded protection from all CBRN agents and high-risk TIMs.</p> <p><b>4–7:</b> Forces are allocated and have in place CBRND COLPRO in sufficient quantities and types to afford protection from all CBRN agents and selected high-risk TIMs.</p> <p><b>1–3:</b> Forces are allocated and have in place CBRND COLPRO in quantities and types to afford protection from all CBRN warfare agents.</p> <p><b>0:</b> Forces are not allocated and have in place sufficient CBRND COLPRO quantities and types to afford protection from CBRN agents.</p>

M11	Procedures prepared to prevent spread of contamination into collective protection interior.	<p><b>8–10:</b> Detailed procedures and measures are in place for the decontamination and removal of contaminated resources during entry processing, and are checked by shelter personnel for compliance and presence of contamination, prior to accessing the contamination-free interior of the shelter and all force personnel are trained to perform the procedures and measures. The procedures and measures are posted, in brief, within the CCA as guidance and reference.</p> <p><b>4–7:</b> Designated shelter personnel receive detailed training on procedures and measures for the decontamination/removal of entering contaminated resources and the conduct of checking for contamination presence, prior to release and access to the contamination-free interior of the shelter and force personnel are provided limited training to perform the procedures and measures under the direction of the overseeing shelter personnel. General procedures and measures are posted, in brief, within the contamination control.</p> <p><b>1–3:</b> Shelter and force personnel are provided general guidelines and procedures and limited training for decontamination and removal of contaminated resources during entry processing prior to accessing the contamination-free interior of the shelter.</p> <p><b>0:</b> Procedures are not provided and personnel trained to preclude the introduction and spread of contamination within the COLPRO contamination-free area.</p>
M12	There is effective DOTLPPF in place to conduct task.	<p><b>8–10:</b> DOTLPPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations.</p> <p><b>4–7:</b> Most critical aspects of DOTLPPF for this task are addressed. Task can be performed with limitations requiring work-arounds.</p> <p><b>1–3:</b> DOTLPPF is inadequate for accomplishment of this task.</p> <p><b>0:</b> DOTLPPF does not exist for this task.</p>

<sup>1</sup> Doctrine, policy, procedures, training, exercises, and evaluations serve to build the capability of individuals to perform tasks while wearing respiratory/ocular protection. However, the encumbrances associated with percutaneous protection do degrade performance and limit the conduct of certain tasks. Prolonged wear places stress upon the individual and will impact performance. Doctrine, policies, procedures, TTPs, and training do not address the erection of COLPRO within a contaminated environment but do address the operation and maintenance of COLPRO in a toxic environment. CBRND IPE is currently Service-specific and protects against all known CBRN warfare agents and selected TIMs. Respiratory/ocular protection is diverse across the Services and performed functions. The M40/M42 CB Protective Mask is in service with the U.S. Army. The mask uses the C-2 canister for filtration of CBRN contaminants. The M42 integrates with combat vehicle filtration protection system and has a dynamic microphone with cable for connection to vehicle communications systems. The M45 Aircrew Aviator Mask replaced the U.S. Army M43 Type II and M49 Mask Systems. The system uses a low-profile canister compatible hose assembly for both hose and face-mounted configurations. The mask system incorporates selectable filtration for support both during aircraft systems activation and using the connectable filter pack. The mask also is applied to personnel who cannot be fitted with the standard M40A1, M42A2, or MCU-2A/P masks. The MCU-2A/P is the mainstay USAF and USN mask employed by personnel not equipped with aircrew masks and by aircrew when not performing flight operations. The MCU-2A/P is also used by aircrew during flight operations who are not equipped with aircrew masks. COTS equipment meeting OSHA requirements (and NFPA for firefighters) is applied by selected civilian personnel performing specific functions such as firefighting, EMS, hazardous materials, etc.

<sup>2</sup> Doctrine, policy, procedures, training, exercises, and evaluations serve to build the capability of individuals to perform tasks while wearing respiratory/ocular protection. However, the encumbrances associated with ocular/respiratory protection do degrade performance and limit the conduct of certain tasks. Prolonged wear places stress upon the individual and will impact performance. Doctrine, policy, and procedures are inadequate for sustained operations within a CBRN/TIM environment, especially forces conducting expeditionary operations in austere environments and possessing reduced logistical footprints.

<sup>3</sup> Doctrine, policies, procedures, TTPs, and training do not address the erection of COLPRO within a contaminated environment but do address the operation and maintenance of COLPRO in a toxic environment.

<sup>4</sup> Doctrine, policy, procedures, training, exercises, and evaluations serve to build the capability of individuals to perform tasks while wearing percutaneous protection. However, the encumbrances associated with percutaneous protection do degrade performance and limit the conduct of certain tasks. Prolonged wear places stress upon the individual and will impact performance. Doctrine, policies, procedures, TTPs, and training do not address the erection of COLPRO within a contaminated environment but do address the operation and maintenance of COLPRO in a toxic environment. Service-specific CBRND percutaneous protection is currently applied for the protection of the force against known CBRN warfare agents and selected TIMs. The BDO, used by the USAF and U.S. Army, is a two-piece garment providing protection for a 24-hour period against chemical agent vapors, liquids, and droplets; biological agents and toxins and contact with radioactive particles. The BDO's protective abilities are lost if the suit is torn, ripped, splashed with POL, or is saturated with water and is designed for a one-time use and is worn by ground and most flight personnel (non-high-performance aircraft). The USMC uses the Saratoga COLPRO suit similar in design to the BDO, but launderable for personnel hygiene. The CPOG is a legacy two-piece garment for protection against CBRN agents. The CPOG is in use with the USN. The CPU is designed to provide an additional layer of protection for the warfighter and is worn under standard IPE. The BVO/GVO overboots are applied over the wearer's standard footwear to protect against contact with CBRND. The USN uses the CPFC, commonly called the "fishtail" for its design, to protect the wearer's footwear. The CPFC, considered obsolete, does provide a measure of antislip protection shipboard. Hand protection is provided by the CPG in 7-, 14-, and 25-mil thicknesses to meet warfighter hand protection and dexterity needs. The CPHS is designed to prevent contact of the warfighter's helmet with liquid contamination which may be absorbed, impact helmet integrity, and/or constitute a potential secondary hazard to the wearer. Standard wet-weather gear (e.g., poncho, rain parka, rain suit, etc.) is also applied as a barrier against saturation of the warfighter's protective ensemble by contact with liquids such as rain, sea spray, etc. COTS assets meeting OSHA requirements (and NFPA for firefighters) are applied by selected civilian personnel performing specific functions such as firefighting, EMS, hazardous materials, etc.

<sup>5</sup> Doctrine, policy, procedures, training, exercises, and evaluations serve to build the capability of individuals to perform tasks while wearing percutaneous protection. However, the encumbrances associated with percutaneous protection do degrade performance and limit the conduct of certain tasks (especially those associated with the repair and maintenance of delicate and intricate assets). Prolonged wear places stress upon the individual and will impact performance. Doctrine, policy, and procedures are inadequate for sustained operations within a CBRN/TIM environment, especially forces conducting expeditionary operations in austere environments and possessing reduced logistical footprints.

<sup>6</sup> Inadequate quantities of mobile COLPRO systems exist to support highly mobile and expeditionary operations with reduced footprint. Further, there is insufficient quantities of COLPRO to protect all critical activities and functions within the force. Prioritization is required of the available resources. Current mobile COLPRO systems are predominantly integrated into selected combat vehicles/vessels. Selected U.S. Naval combat vessels may be equipped with full COLPRO (CITADEL). However, these systems are generally restricted to critical operations areas of the ships. The critical areas are contiguous in that they share common bulkheads and movement between areas is not prevented. CCAs are operated in areas located between the covered areas and the remainder of the ship. These areas are designated. The remainder of the interior of the vessel uses the Circle William concept. Circle William requires prior warning of the presence of a CBRN/TIM in the path of the ship or knowledge of an impending attack to be fully effective. This concept requires the shutdown of the ventilation system and sealing of hatches, bulkheads, and other such openings to seal the interior of the vessel from intrusion by a CBRN/TIM. However, the majority of these actions are performed manually and are initiated upon detection of the potential CBRN/TIM agent. There are concerns about the potential for large amounts of a CBRN/TIM agent to be drawn in by the high-velocity ventilation systems and dispersed throughout the interior of the ship during the period between agent encounter and completion of Circle William. There are concerns about the ability of the vessel to remain in Circle William until it is determined the vessel is no longer exposed to a CBRN/TIM. U.S. Naval combat vessels with full COLPRO of their critical functions currently include the DDG-51 class of destroyers, selected LSDs (vessel hulls 44 through 52), LHDs (vessel hulls 1 through 6), LHAs (vessel hulls 1 through 5), and four of the AOE-6 (vessel hulls 6 through 8 and 10) class ships. Submarines are considered fully protected so long as they remain sealed and do not take in air. The LHD and LHA Amphibious Assault Ships are undergoing a COLPRO backfit of SCPE for their critical functions. Other areas of these ships will use the Circle William Concept. Carriers, frigates, cruisers, DD-963 class destroyers, and other vessels not discussed earlier in note, do not currently afford their critical functions full COLPRO. Naval hospital ships, U.S. Naval auxiliaries, and USCG vessels are not equipped with COLPRO. Areas critical to the safe operation of the ship may not be protected against CBRN/TIMs. Ability of these vessels to successfully incorporate a concept similar to Circle William is a concern. There are also concerns about the ability of these vessels to prevent infiltration of CBRN/TIM into their interior. Infiltration of vapors can cause a build up of concentrations within the vessel that could exceed the levels surrounding the ship. U.S. Coast Guard (USCG) vessels are under the control and direction of DoD during a declared war. During peacetime, however, USCG is under the auspices of the Department of Homeland Security. USCG vessels are often attached to U.S. operations overseas for port security, coastal patrol, and similar functions. USCG personnel are also dispatched with military forces deploying overseas for peacekeeping and other operations. USCG vessels and personnel served in Vietnam, Haiti, Granada, and other force deployments. The ability of USCG resources to effectively integrate into DoD operations involving potential CBRN/TIM events is a concern. Mobile COLPRO are armored or soft-skinned vehicle-supported and -based systems. They include both ground and air platforms. The operation of the COLPRO may not be supported while the vehicle is in motion. They may or may not include CBRN/TIM filtration systems. Mobile COLPRO run the full range of protective capabilities from passive to fully protective COLPRO. The majority of vehicles qualify as passive COLPRO, provided the exchange of air between the interior and the exterior is limited. Mobile COLPRO systems generally do not

provide protection for large numbers of personnel. Currently, the M1A1 Abrams MBT and the M93A1 FOX NBC Reconnaissance System Block I provide full COLPRO for their crews. The CBPS is a general use fully protective COLPRO system mounted on an ECV HMMWV. The CBPS may be used for C4 operations, as aid stations, or for other needs. A variety of Environmental Sheltering with Reduced CB Hazard (ESRCBH) CPS exists in a small percentage aircraft and other vehicles. The majority of these provide clean filtered air through piping or hose systems. In both the ESRCBH CPS and passively protective COLPRO systems, the occupants must wear a minimum of respiratory/ocular protection. Combat crewed vehicles are not generally equipped with CBRN/TIM filtration systems. These vehicles are not able to provide clean filtered air to crew and passengers and thereby extend the operational capabilities of the force. Support vehicles are similar to combat vehicles in that they do not routinely have CBRN/TIM filtration systems. Operators and passengers must, as with the combat vehicles, depend upon their IPE for clean air and protection. Unlike the combat-crewed vehicles, support vehicles generally are more open for infiltration by CBRN/TIM agents. Most airframes are also not equipped with CBRN/TIM filtration systems. They are either open exchange (normally lower altitude airframes) or provide the ability to switch to bottled air (usually jet aircraft). The concern is the aircrews are dependent upon the filtration systems of their IPE to provide clean filtered air. This reduces the extended operational time of the aircrew to that of their IPE. A concern is the inability to conduct mobile combat operations and to move large numbers of troops throughout a CBRN/TIM hazard area without the need to maintain them in IPE. Degradation of performance is a factor after a period of time wearing IPE.

<sup>7</sup> Existing mobile COLPRO varies on the time period required to setup and establish operations. This may range from a few seconds (to activate system and manipulate switch to transfer from open air to filtered) or to several hours for ground preparation and system setup. If the COLPRO systems are set up and in readiness for placement into operation, this task can usually be accomplished quickly.

<sup>8</sup> Doctrine, policies, procedures, TTPs, and existing COLPRO systems do not address and support sustained operations within a CBRN/TIM environment.

<sup>9</sup> Mobile COLPRO systems installed as integral systems of combat systems can generally be placed into operation within a contaminated environment. However, selected systems must be erected and/or require extensive preparation that must be performed within a clean environment. Doctrine, policies, procedures, and TTPs do not address the erection and establishment of COLPRO within a contaminated environment. They are predicated upon these systems being prepared and in place prior to the presence of contaminants.

<sup>10</sup> Expedient COLPRO (ECP) kits, procedures, and training do not currently exist.

<sup>11</sup> Mobile COLPRO for the maintenance of critical material does not exist.

<sup>12</sup> Limited COLPRO is available in type and quantity to support operations, particularly multiple operations with threat. Limitations are considered during planning and alternatives are developed by the staff. The combination of IPE and available COLPRO provides flexibility to meet and maintain operational capability.

<sup>13</sup> Doctrine, policy, procedures, and TTPs outline the steps and requirements for removal of exposed/contaminated articles and decontamination of entering personnel prior to accessing the shelter interior. The CCA is located between the contaminated area and the shelter interior. All actions are taken in this area under the oversight of the designated and trained shelter management personnel. The force is provided varying levels of training for processing through the CCA. This ranges from predeployment training, exercises, and evaluations to briefings by the CCA personnel prior to entry. Procedures may be posted within the CCA for each processing station. Radiological monitoring is feasible for checking for contamination on personnel completing the processing. However, chemical and biological detection and monitoring capabilities are limited for verification of decontamination.

<sup>14</sup> Inadequate quantities of mobile COLPRO systems exist to support highly mobile and expeditionary operations with reduced footprint. Further, there is insufficient quantities of COLPRO to protect all critical activities and functions within the force. Prioritization is required of the available resources.

<sup>15</sup> There is insufficient quantities of COLPRO to protect all critical activities and functions within the force. Prioritization is required of the available resources. The USMC MGPTS with CB Protective Liner System provides a positive-pressure, filtered-air, toxic-free shelter for protection against CBRN agents. However, there are insufficient quantities to protect all critical activities and functions from CBRN/TIM effects. The CP-DEPMEDS provides a clean, toxic-free, environmentally controlled, patient treatment area and the components are designed to integrate as field hospitals. They are packaged as a set for deployment to threat areas for hospital operations. The entire composite hospital consists of expandable tentage, passageways, environmental control units, and ISO shelters. The CP-DEPMEDS exist in very limited quantities. Although it could be applied to provide COLPRO to the task identified groups, its designed and primary function is that of medical care. A similar COLPRO is the USAF's CP-EMEDS, which is an air-transportable medical facility deployable in various configurations from a single shelter to a 25-bed patient hospital. The CP-EMEDS is in a very limited number and, like the CP-DEPMEDS, is designed for its primary function of the provision of medical care. The USAF CP-SSS is a small-scale CPS applied for the conduct of C2 operations, maintenance of critical equipment, force beddown, and the provision of R2 for sortie generators and key leadership. This shelter is in limited supply and unlikely sufficient quantities would be available to support a group of any size, especially during operations against an adversary. The M20/M20A1 SCPE is a lightweight, modular system involving a liner designed for inflation within a room or building. The M20A1 serves to bridge the gap between the M20 SCPE and CBPS. Quantities are limited and are not likely to be available in any large quantity during operations against an adversary. Current COLPRO systems are not available in the quantities and types necessary to support the protection of eligible civilians and detainees. Current plans generally do not address the application of COLPRO to non-force personnel and do not allocate the limited COLPRO resources to this activity. Fixed-site

COLPRO within the United States and its territories is predominantly designed for nuclear fallout and does not address other CBRN/TIM hazards and threats arising after September 11, 2001. Selected critical key facilities are equipped with CBRN COLPRO, but are not available to other than designated personnel and specific functions and activities. Fixed-site CBRN COLPRO is installed in facilities housing selected activities and functions within HTAs. However, these are not present for all critical activities and functions. However, the Guardian Program is reviewing FP protective measures at U.S. installations and facilities and will address COLPRO for critical activities/functions. The Guardian Program, however, is not likely to address field COLPRO operations.

<sup>16</sup> Current site COLPRO requires significant resources, often involving assistive resources such as heavy construction equipment, to prepare the site and setup the system. Support services such as utilities are often required. These operations are often large and complex involving more than the COLPRO structure itself. Existing site COLPRO systems cannot be rapidly setup and placed into operation. However, if the COLPRO systems are setup and in readiness for placement into operation, this can usually be accomplished quickly.

<sup>17</sup> Current site COLPRO systems are not designed or enabled for erection and/or striking within a CBRN/TIM environment. Doctrine, policies, procedures, and TTPs do not support the erection and striking of COLPRO within a toxic environment. They predicate COLPRO establishment prior to the presence of contamination and striking after decontamination within an otherwise clean environment.

<sup>18</sup> Doctrine, policies, procedures, and TTPs do not address the application of COLPRO for maintenance of contaminated critical material with reduced IPE. Material must currently be contaminated prior to entry into COLPRO.

<sup>19</sup> There are insufficient quantities of COLPRO to protect all critical activities and functions within the force. Prioritization is required of the available resources.

<sup>20</sup> Plans incorporate MOPP levels and methodologies are adjustable to meet local operations and threat needs as determined by the commander. MOPP levels and methodologies define protective requirements and readiness for various level of threat and include the activation and operation of COLPRO as well as the ear and readiness of IPE by the force. MOPP levels and methodologies seek to protect the force through an integrated DOTLPF, COLPRO, and IPE scaled approach.

<sup>21</sup> Doctrine, policies, procedures, and TTPs do not support the erection and striking of COLPRO within a toxic environment. They predicate COLPRO establishment prior to the presence of contamination and striking after decontamination within an otherwise clean environment.

<sup>22</sup> MOPP levels and methodologies provide flexibility for the adjustment of IPE to meet local operational and threat requirements. The intent is to achieve and maintain the lowest level necessary for survival of the force and operational accomplishment. Adjustments are made as dictated by local circumstances. However, prolonged wear of IPE will degrade performance.

<sup>23</sup> Doctrine, policy, procedures, and TTPs combined with staff experience, training, and knowledge provide the basis for prioritization of allocation of limited COLPRO resources. Not all critical activities and functions can currently be allocated COLPRO. Requirements must be balanced with operational needs, available resources, and alternative protective capabilities. The staff functions formulate the allocation collaboratively and make recommendations to the commander for decisioning. The determinations are identified in plans and disseminated to the force. Adjustments are made when necessary during operations or upon changes in available resources.

<sup>24</sup> Staff plans are initiated within the AO to support operations and are adjusted as necessary to address changes in resources, threat, and circumstances. COLPRO are sited, prepared, and placed in readiness for operations to protect personnel, activities, and functions against the CBRN/TIM threat. The staff disseminates the alerting and warning to subordinate elements to commence CBRND operations. Currently, the transmission and reception of CBRN/TIM hazard alarm, warning, and report information is performed manually predominantly using ATP-45 formats and processes. Each unit is responsible for ensuring potentially or indirectly affected subordinate units are notified of the hazard. This task is generally performed using nondedicated existing and available communications systems. Personnel are trained to react to these messages and to perform the appropriate actions. The training is reinforced during deployment preparation for operations with a threat. However, adjacent units, particularly non-U.S. and often other U.S. Services, may not receive alerts, warnings, and reports until these have been processed up through channels and then disseminated back down channels, creating unnecessary delays with potential ramifications for OPTEMPO and unit survivability.

<sup>25</sup> Doctrine, policy, procedures, and TTPs require operational planning staffs consider and plan for the provision of at least one R2 within every 24-hour period for all force members. This requirement addresses the protective life of current IPE and provides for IPE exchange, feeding, and other needs of the force which cannot be performed within a CBRN/TIM environment. Staffs monitor and ensure resources are in place and available for support of the force commensurate with operational requirements and OPTEMPO. Alternatives identified in existing literature include rotation of units on the line, partial rotation of personnel within a unit, and a dedicated COLPRO-equipped support unit which travels the line.

<sup>26</sup> Unit staff planning and preparations include preparing the force for operations within a CBRN/TIM environment. Degradation is considered in the development of taskings, R2 requirements, and force application. MOPP levels are developed, implemented, and adjusted to meet local operational needs and threat. Constant evaluation of force activities is performed for necessary changes and modifications to maintain force operational capabilities. Unit staff provides for R2 of personnel operating outside COLPRO at least once every 24 hours within COLPRO. Staff also manages COLPRO allocation and operations for support of operational requirements and critical activities/functions.

<sup>27</sup> Commander and staff planning and predeployment preparation include ensuring shelter personnel are designated and trained to perform their tasks in a CBRN/TIM environment. Shelter operations are monitored and issues are addressed by the staff as necessary to ensure the safety and well-being of the force.

<sup>28</sup> Legacy systems will remain in the inventory throughout the mid term. These systems will be gradually replaced by new joint systems of respiratory/ocular protection as they are fielded. The JSGPM also replaces current Service-specific ocular/respiratory protection. The system provides respiratory and ocular protection from CBRN agents and selected TIMs. The field-of-vision is improved and encumbrances associated with legacy systems are reduced. The JSGPM incorporates state of the art technology and is designed to integrate with future warfighter CBRND IPE and function equipment/assets. The Guardian Program is projected to review, assess, and implement protection for critical members of the installation/facility populace during the mid term. This will predominantly be COTS-based assets for respiratory/ocular protection. However, the Guardian Program is not expected to address eligible civilian protection within the AO for other than existing U.S. military installations and facilities.

<sup>29</sup> Doctrine, policy, procedures, training, exercises, and evaluations serve to build the capability of individuals to perform tasks while wearing respiratory/ocular protection. However, the encumbrances associated with ocular/respiratory protection do degrade performance and limit the conduct of certain tasks. Prolonged wear places stress upon the individual and will impact performance. Doctrine, policy, and procedures are inadequate for sustained operations within a CBRN/TIM environment, especially forces conducting expeditionary operations in austere environments and possessing reduced logistical footprints.

<sup>30</sup> Legacy systems will remain in the inventory throughout the mid term. These systems will be gradually replaced by new joint systems of percutaneous protection as they are fielded. The JSLIST NBC Protective Garment is a two-piece, risk-taking, overgarment with integrated hood affording protection against CBRN agents and selected TIMs. The garment reduces the physiological and psychological encumbrances associated with legacy systems. The JSLIST is under evaluation by NIOSH for application to OSHA protection requirements. The JPACE replaces the Service-specific systems. The JPACE provides aircrew members with equivalent protection to the JSLIST ensemble. The JPACE is designed to not interfere with emergency ejection from a combat aircraft and continues to provide CBRN percutaneous protection following ejection and during escape and evasion operations. The ensemble is both flame-retardant and self-extinguishing to permit emergency egress from a burning aircraft. Further, the ensemble provides CBRN protection when subject to rotor, propeller, and jet wash. Joint Service glove upgrades are provided under the Joint Block 1 and 2 Glove Upgrade Program (JB1/2GU) in the near and mid term. The JB1GU responds to an urgent need by designated elements of the force for increased tactility/durability supporting mission requirements. The JB1GU is expected to meet most of the requirements within the JSLIST ORD and is viewed as an evolutionary approach in the development of the JB2GU. Versions under consideration include a protective inner glove worn under existing warfighter gloves, a replacement glove for existing hand wear, or a combination of glove shell and liner affording CBRN protection of the legacy gloves they are projected to replace. The JFIRE addresses protection of military firefighters within a CBRN/TIM environment conducting firefighting operations involving structural and crash/firefighting/rescue. The JFIRE incorporates the JSLIST into firefighter bunker gear. The MULO is projected to replace legacy footwear covers. The ability of the MULO to provide adequate antislip protection for USN personnel asea is under review. The Guardian Program is projected to review, assess, and implement protection for critical members of the installation/facility populace during the mid term. This will predominantly be COTS-based assets for percutaneous protection. However, the Guardian Program is not expected to address eligible civilian protection within the AO for other than existing U.S. military installations and facilities. MWA percutaneous protection is not programmed or forecasted.

<sup>31</sup> Doctrine, policy, procedures, training, exercises, and evaluations serve to build the capability of individuals to perform tasks while wearing percutaneous protection. However, the encumbrances associated with percutaneous protection do degrade performance and limit the conduct of certain tasks (especially those associated with the repair and maintenance of delicate and intricate assets). Prolonged wear places stress upon the individual and will impact performance. Doctrine, policy, and procedures are inadequate for sustained operations within a CBRN/TIM environment, especially forces conducting expeditionary operations in austere environments and possessing reduced logistical footprints.

<sup>32</sup> Fielding of the P3I upgraded CBPS for heavy/airborne use is projected for the mid term, as are two variants of the JSLNBCRS, the M93A1 Fox NBCRS Block II, and backfit of LHA/LHDs to include CITADEL.

<sup>33</sup> Doctrine, policies, procedures, TTPs, and existing COLPRO systems do not address and support sustained operations within a CBRN/TIM environment.

<sup>34</sup> JTCOPS Block I is projected for initial fielding during the mid term. The projected initial capabilities fielding of JECP is within the mid term and will include adaptive insertable COLPRO systems (including liner) for existing buildings/rooms and stand-alone COLPRO for small groups of personnel. JECP may provide the capability to provide COLPRO for critical activities and functions; however, JECP acquisition quantities have not as yet been determined.

<sup>35</sup> JECP requirements include rapid setup and initiation of operation.

<sup>36</sup> Identification, development and/or acquisition of assets for JECP include ECP assets for adaptation of tentage and structures to support expeditionary operations. The JECP program is currently proceeding through the JCIDS process.

<sup>37</sup> The projected fielding of JWARN will decrease the time taken to disseminate alerting and warning information to the force. Additionally, JWARN will enable the notification of adjacent units connected to the network. Manual notification methods and means will remain foundational for many units during the transition period and for elements of units.

---

<sup>38</sup> Commander and staff planning and predeployment preparation include ensuring shelter personnel are designated and trained to perform their tasks in a CBRN/TIM environment. Shelter operations are monitored and issues are addressed by the staff as necessary to ensure the safety and well-being of the force.

<sup>39</sup> The next-generation series of nonaviator respiratory/ocular protective assets is in R&D. The capabilities and fielding of these assets are not as yet determined.

<sup>40</sup> Doctrine, policy, procedures, training, exercises, and evaluations serve to build the capability of individuals to perform tasks while wearing respiratory/ocular protection. However, the encumbrances associated with ocular/respiratory protection do degrade performance and limit the conduct of certain tasks. Prolonged wear places stress upon the individual and will impact performance. Doctrine, policy, and procedures are inadequate for sustained operations within a CBRN/TIM environment, especially forces conducting expeditionary operations in austere environments and possessing reduced logistical footprints.

<sup>41</sup> The next-generation series of nonaviator percutaneous protective assets is in R&D. The capabilities and fielding of these assets are not as yet determined.

<sup>42</sup> Doctrine, policy, procedures, training, exercises, and evaluations serve to build the capability of individuals to perform tasks while wearing percutaneous protection. However, the encumbrances associated with percutaneous protection do degrade performance and limit the conduct of certain tasks (especially those associated with the repair and maintenance of delicate and intricate assets). Prolonged wear places stress upon the individual and will impact performance. Doctrine, policy, and procedures are inadequate for sustained operations within a CBRN/TIM environment, especially forces conducting expeditionary operations in austere environments and possessing reduced logistical footprints.

<sup>43</sup> The projected Future Tactical Lift Option is under evaluation for the potential addition of COLPRO in the design and production specifications. A decision on the inclusion of COLPRO in the LHA(R) is expected in the mid term.

<sup>44</sup> Doctrine, policies, procedures, TTPs, and existing COLPRO systems do not address and support sustained operations within a CBRN/TIM environment.

<sup>45</sup> JTCOPS Block II is projected for the far term. Continued fielding of JECF.

<sup>46</sup> Commander and staff planning and predeployment preparation include ensuring shelter personnel are designated and trained to perform their tasks in a CBRN/TIM environment. Shelter operations are monitored and issues are addressed by the staff as necessary to ensure the safety and well-being of the force.

### 13.6.3 Functional Solutions Analysis

#### 13.6.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** CBRND protective equipment and measures do not protect against all CBRN/TIM agents.

**Partial Non-Materiel Solutions:** *Doctrine:* Strengthen doctrine and require the joint development of CBRND protective assets/measures to protect forces against all CBRN agents and high-threat/high-risk TIMs. *Leadership:* Enforce compliance with established standards (see Doctrine) for prophylactic CBRND protection.
- 2. Deficiency:** Encumbrances associated with ocular/respiratory and percutaneous protection degrade performance and limit the conduct of certain tasks.

**Partial Non-Materiel Solutions:** *Organization:* Develop organizational structures, resources, staffing, and capabilities to support personnel exchange and R2 to preclude degradation of tasks and to promote the well-being of the force. *Training:* Ensure training, exercises, and evaluations effectively promote acclimation and endurance of wear of IPE. *Leadership:* Ensure awareness of degradation effects.
- 3. Deficiency:** Current doctrine, the *UJTL*, and operational planning do not adequately address sustained operations within a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, procedures, and *UJTL* sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.
- 4. Deficiency:** Current DOTLPF does not adequately address the erection, maintenance, operations, and striking of CPSs within a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, procedures, and TTPs the erection, maintenance, operation, and striking of CPS within a CBRN/TIM environment for CBRND. *Organization:* Organizational structures supporting the erection, maintenance, operation, and striking of CPSs within a CBRN/TIM environment for CBRND. *Training:* Develop institutional and unit-level training on the erection, maintenance, operation, and striking of CPSs within a CBRN/TIM environment to support operations and provide for CBRND of the force. *Leadership:* Ensure awareness and knowledge of establishing CPSs within a CBRN/TIM environment for operations within a CBRN/TIM environment. *Facilities:* Develop infrastructure to support erection, maintenance, operation, and striking of CPSs within a CBRN/TIM environment (e.g., logistics, training, etc.).

- 5. Deficiency:** Not all critical facilities and activities are equipped with COLPRO.  
**Non-Materiel Solutions:** *Doctrine:* Enforce existing doctrine and policy.
- 6. Deficiency:** Most naval vessels (including supply and transport vessels, carriers, and others) do not possess COLPRO.  
**Partial Non-Materiel Solutions:** *Doctrine:* Incorporate into doctrine, policy, and procedures the provision of COLPRO for at-risk vessels (civilian contract and military). *Organization:* Develop organizational structures, resources, staffing, and capabilities to support COLPRO operations on vessels supporting operations and at-risk. *Training:* Train, exercise, and evaluate crews for vessel COLPRO operations for CBRND. *Leadership:* Recognize differences and challenges associated with CBRND operations by at-risk vessels (both military and contract civilian) supporting operations. *Facilities:* Develop supporting infrastructure (e.g., logistics, maintenance, power systems, etc.) for vessel COLPRO.
- 8. Deficiency:** USCG assets supporting operations are not adequately equipped with CBRND assets and resources.  
**Partial Non-Materiel Solutions:** *Doctrine:* Establish with doctrine, policy, and procedures responsibilities for equipping, training, and supporting USCG assets supporting force operations during periods of other than declared war. *Organization:* Develop organizational structures, agreements, resources, and staffing to support and ensure survivability of supporting USCG resources. *Training:* Train, exercise, and evaluate USCG CBRND capabilities as integral component of force. *Leadership:* Recognize differences and challenges associated with CBRND operations by USCG assets and personnel, training providing skills and knowledge to managed operations involving these assets, and the ability and willingness to implement necessary changes and activities to prepare for and conduct operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for CBRND of the force, including allocated USCG assets and personnel.
- 9. Deficiency:** Current mobile COLPRO is inadequate to support operations by highly mobile forces.  
**Non-Materiel Solutions:** *Doctrine:* Complete analysis and central correlation/ comparison of national and strategic plans to identify quantities and types of mobile COLPRO (and supporting consumables) necessary and available to support highly mobile forces for envisioned plans and taskings. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct CBRND, including mobile COLPRO, of highly mobile forces. *Training:* Train, exercise, and evaluate CBRND, including mobile COLPRO, capabilities of the force in a CBRN/TIM threat during highly mobile force operations. *Leadership:* Recognize differences and challenges associated with CBRND operations by highly mobile forces, training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for CBRND of highly mobile forces.
- 10. Deficiency:** Maneuvering forces are inadequately equipped with COLPRO capabilities.  
**Non-Materiel Solutions:** *Doctrine:* Complete the JCIDS process and central correlation/ comparison of national and strategic plans to identify CBRND resources necessary and

available to support maneuver operations, particularly expeditionary operations during the first 30–90 days following commencement of hostilities, with a reduced logistical footprint. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct maneuver operations, particularly expeditionary operations during the first 30–90 days of operations following commencement of hostilities, while possessing reduced logistical footprint. *Training:* Train, exercise, and evaluate maneuver capabilities (particularly expeditionary capabilities) of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operations using organic, prepositioned, and planned CBRND resources supporting operations. *Leadership:* Recognize differences and challenges associated with maneuver operations, particularly expeditionary operations during the first 30–90 days following commencement of hostilities, with a reduced logistical footprint; training providing skills and knowledge to manage operations in these circumstances; and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.

- 11. Deficiency:** Existing COLPRO requires extensive services, logistics, and resources to establish.

**Partial Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, procedures, and TTPS guidelines and requirements for COLPRO by type of operation and involved forces. *Organization:* Develop minimal organizational structures, resources, and assets essential to the erection and establishment of COLPRO by system type. *Training:* Develop institutional and unit-level training on the erection and establishment of COLPRO with emphasis upon minimalization of committed resources. *Leadership:* Ensure awareness and knowledge of extent of committed resources to establish various types of COLPRO. *Facilities:* Review infrastructure with view towards minimalization of required services, logistics, and resources to erect and establish COLPRO.

- 12. Deficiency:** ECP kits, procedures, and training do not currently exist.

**Partial Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, procedures, and TTPs the use and application of ECP for CBRND. *Organization:* Organizational structures supporting the application of ECP for CBRND. *Training:* Develop institutional and unit-level training on the application of ECP to support operations and provide for CBRND of the force. *Leadership:* Ensure awareness and knowledge of versatility and application of ECP for operations within a CBRN/TIM environment. *Facilities:* Develop infrastructure to support ECP (e.g., logistics, training, etc.).

- 13. Deficiency:** COLPRO for maintenance of critical contaminated material permitting reduced IPE is nonexistent.

**Partial Non-Materiel Solutions:** *Doctrine:* Develop and establish in doctrine, policies, procedures, and TTPs requirements, standards, and guidelines for the application of COLPRO to maintenance activities on critical material that is contaminated and required for maintenance of OPTEMPO and mission success. *Organization:* Develop organizational structures, resources, staffing, and capabilities to enable effective application of COLPRO for maintenance of critical assets. *Training:* Implement institutional, recurring, and unit training

for all personnel tasked with performance of critical asset maintenance in the conduct of maintenance and repair activities in a CBRN/TIM environment upon contaminated assets. Exercises and evaluations incorporate criteria challenging this capability. *Leadership*: Recognize ability to sustain OPTEMPO and for mission success with the capability to perform sensitive repairs on critical assets. *Facilities*: Develop supporting infrastructure enabling and supporting maintenance and repair activities on contaminated assets.

**14. Deficiency:** Inadequate COLPRO to support expeditionary and highly mobile forces.

**Partial Non-Materiel Solutions:** *Doctrine*: Develop and disseminate appropriate doctrine, policy, and procedures for the application of common materials for COLPRO and for COLPRO kits and components. *Organization*: Develop organizational structures, resources, staffing, and capabilities to enable effective application of available COLPRO and implementation of expedient COLPRO capabilities. *Training*: Establish initial and recurring training of all members of the force on the conduct of expedient COLPRO. Exercises and evaluations incorporate criteria challenging this capability. *Leadership*: Recognize potential for expedient COLPRO to improve force capabilities and survivability. *Facilities*: Develop supporting infrastructure enabling expedient COLPRO and the effective application of available COLPRO.

**15. Deficiency:** Expeditionary operations are a particular concern as most CBRND systems and associated logistics are not designed for a highly mobile force, with a reduced logistical footprint, and for the initial period of operations until the theater matures (usually the first 30–90 days).

**Non-Materiel Solutions:** *Doctrine*: Complete the JCIDS process and central correlation/comparison of national and strategic plans to identify CBRND resources necessary and available to support expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint. *Organization*: Develop organizational structures, resources, staffing, and capabilities to conduct expeditionary operations while possessing reduced logistical footprint and during the first 30–90 days of operations following commencement of hostilities. *Training*: Train, exercise, and evaluate expeditionary capabilities of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operations using CBRND resources supporting expeditionary operations. *Leadership*: Recognize differences and challenges associated with expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint, training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities*: Develop supporting infrastructure for expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.

**16. Deficiency:** COLPRO for other than radiological is almost nonexistent, including critical facilities, outside HTA OCONUS.

**Non-Materiel Solutions:** *Doctrine*: Enforce existing doctrine and policy.

- 17. Deficiency:** Manual nature of current alerting and warning processes impact dissemination to subordinate and neighboring units and implementation of MOPP requirements for CBRND. **Non-Materiel Solutions:** *Doctrine:* Include requirement for cross-Service notification of adjacent force elements. *Training:* Include cross-Service notification of adjacent force elements in training criteria. Incorporate criteria into exercises and evaluations to challenge alerting and notification of adjacent force elements. *Leadership:* Ensure awareness of adjacent elements and criticality of time to protect the force. *Facilities:* Develop supporting infrastructure for cross-Service communications.
- 18. Deficiency:** Insufficient COLPRO is available to support rest and resupply activities for all personnel within a 24-hour period necessary to support sustained operations within a contaminated environment. This is particularly true of forward operating light forces. **Non-Materiel Solutions:** *Doctrine:* Enforce existing doctrine and policies.
- 19. Deficiency:** Quantities and availability of mobile COLPRO is inadequate. **Non-Materiel Solutions:** *Doctrine:* Complete analysis and central correlation/comparison of national and strategic plans to identify quantities and types of mobile COLPRO (and supporting consumables) necessary and available to support highly mobile forces for envisioned plans and taskings. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct CBRND, including mobile COLPRO, of highly mobile forces. *Training:* Train, exercise, and evaluate CBRND, including mobile COLPRO, capabilities of the force in a CBRN/TIM threat during highly mobile force operations. *Leadership:* Recognize differences and challenges associated with CBRND operations by highly mobile forces, training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for CBRND of highly mobile forces.
- 20. Deficiency:** Airlift assets (both tactical and strategic) are not equipped with COLPRO. **Partial Non-Materiel Solutions:** *Doctrine:* Incorporate into doctrine, policy, and procedures the provision of COLPRO to aircrew and passengers in appropriate airframes (military and civilian). *Training:* Train, exercise, and evaluate aircrews and supporting entities for airframe COLPRO operations for CBRND. *Leadership:* Recognize criticality of protecting aircrew and passengers of appropriate tactical and strategic airframes from the effects of CBRN/TIM agents. *Facilities:* Develop supporting infrastructure (e.g., logistics, aircraft maintenance, etc.) for airframe COLPRO.

### 13.6.3.2 IMA Assessment Summary

Table 13.6-2 is a list of ideas for material approaches and a corresponding description of each idea. Approaches focus on procurement of existing systems and development of field-expedient and modular systems. Table 13.6-3 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 13.6-11. TASHLD 6: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Assess CBRND material	Test and assess all CBRND material for protective abilities against future threat agents, including TIM.
Develop COLPRO kits	Develop COLPRO kits containing all necessary supplies to construct field-expedient COLPRO that is easily stored and maintained in ready condition, easily and safely erected, operated, maintained, and struck within a CBRN/TIM environment by IPE-encumbered personnel using minimal resources and supports COLPRO requirements.
Develop and establish generic unit CBRND kits	Develop, preposition, and maintain reserve stocks of generic CBRND kits for a standard unit. Components are adjusted as necessary for specific operations involving threat.
Disposable COLPRO	Develop one-time-use COLPRO that is rapidly erected with little instruction, training, and effort and affords term protection for critical activities and functions, maintenance and repair activities, prelocated consumables, as well as personnel associated with this task.
Field-expedient COLPRO kits	Develop field-expedient COLPRO kits designed to adapt existing structures, tentage, etc., for the expansion of COLPRO field capabilities and mission support and the provision of collective protection to the force, critical functions and activities, maintenance and repair activities and functions, resources, etc.
Field-expedient COLPRO materials	Identify commonly available materials (duct tape, plastic sheeting, wooden crate, plywood, tarps, coverings, wraps, caulk, sealant gels/sprays, etc.) for application in the construction of expedient COLPRO needed to construct field-expedient COLPRO when COLPRO availability is limited or not advantageous.
Integrated mobile COLPRO	Develop warfighting platforms (air, land, and sea) with COLPRO that is an integral part of the operational system and protects against current and future/advanced agents.
Modular COLPRO	Develop modular COLPRO that can be erected in various configurations to protect various groups of people separately by their designation (EPW, civilian, etc.); accommodates small to large numbers of people; protects all critical activities and functions, MWAs, prelocated consumables, and maintenance/repair activities; and addresses the commander's intent.
Regenerative filtration	CBRN regenerative filters able to flush retained agent, neutralize agent, or by other inherent means affords extended period of protection.

Table 13.6-12. TASHLD 6: IMA Assessment

Identified Gaps	Ideas for Material Approaches (IMA)								
	Assess CBRND Material	Develop COLPRO Kits	Develop and Establish Generic Unit CBRND Kits	Disposable COLPRO	Field-Expedient COLPRO Kits	Field-Expedient COLPRO Materials	Integrated Mobile COLPRO	Modular COLPRO	Regenerative Filtration
CBRND protective equipment and measures do not protect against all CBRN/TIM agents.	X	X	X						
Encumbrances associated with ocular/respiratory and percutaneous protection degrade performance and limit the conduct of certain tasks.	X	X	X	X	X	X		X

**13.7 Task TASHLD 7: Provide COLPRO for repairing critical assets****13.7.1 Functional Area Analysis****13.7.1.1 Definition**

Repairing critical components (e.g., avionics, electronics, etc) is especially difficult while wearing full MOPP gear. Decontamination of contaminated critical assets may not be possible or achievable. However, the nature of these assets may be such they are essential to military operations and replacements may not be readily available. The repair of these assets and their return to service and supports the force and mission. COLPRO is used to permit MOPP-reduced repair operations to continue in contaminated environments. Because COLPRO assets are limited, commanders must prioritize items to be repaired.

**13.7.1.2 Derivation**

*Joint Enabling Concept for CBRN Operations, Protection Joint Functional Concept, UJTL (TA 5, TA 7, TA 7.1).*

**13.7.1.2.1 Supported Task: OPSHLD 7****13.7.1.2.2 Lateral Task: TASHA 24****13.7.1.2.3 Supporting Task: N/A****13.7.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Undeveloped to highly developed land. (C1.1.1)
2. Riverine to open sea. (C1.2)
3. Natural and induced air. (C1.3)
4. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Partially completed mission preparation. (C2.1.3)
2. Marginal forces. (C2.2)
3. Marginal to adequate forces allocated. (C2.2.3)
4. Normal personnel experience. (C2.2.4.5)
5. Limited staff expertise. (C2.3.1.3)
6. Limited deployed supplies. (C2.8.2)
7. No prepositioned materiel. (C2.8.4)

Civil. N/A

## 13.7.2 Functional needs Analysis

### 13.7.2.1 Capability and Deficiency Assessment Summary

Table 13.7-1 discusses the performance of the task to the designated standards. The overall capabilities for current, near/mid, and far term are rated “yellow.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

#### Current Capability and Deficiency

Decontamination of contaminated complex, sensitive, and/or electronic assets may not possible due to component materials. Servicing of these assets often requires the application of instrumentation for assessment and subsequent repairs/maintenance involving high levels of dexterity, visual acuity, tactility, and finite movements within very confined, restricted, and potentially hazardous spaces. Often, these assets perform critical functions in operations and are high-value/low-density assets. The loss of these assets to await replacements may affect the success of the force. For example, a critical piece of electronics in a targeting pod attached to a ground combat support airframe may require repair to enable the airframe to successfully perform its task. Aggressive adversary activities and/or attrition of resources may necessitate maximum sustained application of remaining resources. Repair capabilities upon contaminated assets of this nature supports OPTEMPO sustainment and sortie generation. Current capabilities are inadequate to support this need. These assets must be repaired outside COLPRO (adversely impacting the ability to perform high-fidelity-type repairs), replaced (potentially removing the end asset out of operations until a replacement component/asset is received), or decontaminated (not always possible due to constructed materials or design). Services currently field a variety of CBRND assets providing respiratory/ocular, percutaneous, and COLPRO protection. This diversity of assets complicates the logistical support of operations with threat for joint operations. The assets protect against known chemical and biological warfare agents and particulate radiologicals. Protection is afforded to a select number of TIMs. Existing Service-specific IPE is limited on the period and scope of protection afforded the warfighter. Physiological and psychological encumbrances increase with prolonged wear. This tendency requires regular exercising and wear to acclimate and adjust the wearer to enable performance of assigned functions and activities. Current site COLPRO generally requires extensive site preparation and resources to erect, operate, and strike but cannot be erected/striking in a CBRN/TIM environment. Mobile COLPRO is a diversity of systems ranging from forced clean air systems to full COLPRO. However, their application is limited and does not include maintenance activities of critical contaminated assets. In general, current COLPRO is limited in quantity and does not adequately support expeditionary and highly mobile maneuver operations, particularly those in an austere environment with reduced logistical footprints. Most mobile platforms (including land, sea, and air) are not equipped with COLPRO. This circumstance requires prioritization of available assets to address critical activities/functions and the application of IPE for CBRND. However, although prioritization is applied for critical activities

and functions, not all such requirements can be satisfied with current COLPRO. Individual protection, therefore, remains the mainstay for protection against CBRN/TIM agents. The Services currently field a variety of CBRND assets providing respiratory/ocular, percutaneous, and COLPRO protection. This diversity of assets complicates the logistical support of operations with threat for joint operations. Existing Service-specific IPE is limited in the period and scope of protection afforded the warfighter. Respiratory/ocular and percutaneous CBRND assets protect against known chemical and biological warfare agents and particulate radiologicals. Protection is afforded to a select number of TIMs. Physiological and psychological encumbrances increase with prolonged wear. Regular exercising and wear to acclimate and adjust the wearer to enable performance of assigned functions and activities is necessary and performed to reduce the impact of encumbrances and subsequent degradation of performance. COTS protective assets are applied for selected eligible civilians such as hazardous materials, firefighters, EMS, etc. However, eligible civilians and MWAs are not adequately addressed by DOTLPF for CBRND. Clear DOTLPF addressing the provisioning and training of eligible civilians with CBRND is inadequate. MWAs are not afforded protection against the effects of CBRN/TIM agents, including COLPRO. MOPP DOTLPF is adequate for military personnel and operations. The establishment of adjustable MOPP levels, reflective of local operations and threat, are well defined, as are continuing evaluation for change/adjustments. However, operations increasingly involve U.S. and non-U.S. civilians. MOPP DOTLPF does not adequately address their presence and inclusion into MOPP methodologies and levels, particularly when these personnel may (or may not) be equipped with nonstandard IPE.

### **Projected Near/Mid-Term Capability and Deficiency**

JECP is projected to initially field during the mid term with three COLPRO systems primarily addressing expeditionary operations. JTCOPS, CP-DEPMEDS, and the P3I upgraded CBPS are projected to include COLPRO in the mid term. These systems, depending upon the quantity fielded, may provide additional COLPRO to address critical needs. However, these systems, as with current systems, are not projected to support this task. Individual protection is projected to remain the principal method of CBRND. Future configurations focus on reducing psychological and physiological stresses associated with the wearing of IPE, as well as striving for commonality of form factor among all services to reducing the logistics burden, development cost, and improved availability. The JPACE, JSLIST, JSAM, and JSGPM are projected to be initially fielded during the mid term. The JSLIST is under review for NIOSH certification for compliance with OSHA protective standards. The certification will permit application of the garment for AT/FP installation activities within CONUS and selected OCONUS. The possibility exists for potential application by requiring eligible civilians. Legacy Service-specific IPE will remain in the inventory throughout the mid term and into the far term during the transition to the joint IPE systems.

### **Projected Far-Term Capability and Deficiency**

As with the mid term, CBRND will continue to rely upon individual CBRND protection against CBRN/TIM agents. Future configurations focus upon reducing psychological and physiological stresses associated with the wearing of IPE, as well as striving for commonality of form factor among all Services. The standardization of CBRND respiratory/ocular and percutaneous

protection which will reduce the logistics burden and development cost and subsequently improve availability. Legacy Service-specific IPE will continue to be replaced by the joint systems of CBRND protective equipment until fielding is complete to all Service units, including Guard and Reserve, early in the far term. Next-generation IPE assets are in R&D and are expected to be fielded sometime in the far term. However, specifics of design, characteristics, and protective capabilities are not as yet determined for these systems.

### 13.7.2.2 Resource Systems

#### Individual Protection

##### 1. Respiratory/Ocular Protection:

**COTS:** Commercially available systems of protection, manufactured and tested meeting OSHA standards for the United States or equivalent organization in other nations.

**M40/M42 CB Protective Mask:** U.S. Army mask system designed for military standard profile and uses standard C-2 canister. M42 integrates with combat vehicle clean air supply system and has a connectable dynamic microphone for combat vehicle intercom system.

**M45 Aircrew Aviator Mask:** Replaces M42 and M49 systems for U.S. Army. Available with a canister-compatible hose assembly and a valve cassette that enables use of supplied air (from aircraft, SCBA or PAPR). The M45 is used by military personnel who cannot fit the M40A1, M42A2, or MCU-2/P masks.

**MCU-2A/P:** Mainstay USAF and USN system for nonaviator personnel and aircrew personnel not performing flight operations, except for aircrew personnel not issued aviator systems and noncombat platforms/airframes without clean air supply systems. Applies C-2 filter for filter air.

**Joint Service General Purpose Mask (JSGPM):** Initial fielding projected in the mid term replacing Service-specific standard respiratory/ocular protective systems. Provides respiratory/ocular protection from CBRN agents and selected TIMs. Improves field-of-vision and encumbrances associated with existing Service systems.

**Joint Service Chemical Environment Survival Mask (JCESM):** COTS one-time use, one-size-fits-all, respiratory/ocular protective system affording two hours of protection in low-level CBRN vapor, aerosol, and particulate environments. Selected force element application only.

##### 2. Percutaneous Protection:

**COTS:** Commercially available systems of protection, manufactured and tested meeting OSHA standards for the United States or equivalent organization in other nations.

**Battle Dress Overgarment (BDO):** U.S. Army/USAF two-piece camouflage-patterned garment (top and trousers) providing 24-hour protection against CBRN agents in vapor, liquid, droplet, and particulate forms.

**Saratoga:** USMC two-piece camouflage-patterned garment (top and trousers) providing 24-hour protection against CBRN agents in vapor, liquid, droplet, and particulate forms. Launderable for hygiene.

- CPOG:** Legacy two-piece green garment currently in use with USN providing limited-term protection against CBRN agents in vapor, liquid, droplet, and particulate forms.
- Chemical Protective Undergarment (CPU):** Worn under standard IPE as additional layer of protection against contact with CBRN agents.
- BVO/GVO:** Vinyl overboots (VO) worn over wearer's standard footwear and protects against contact with CBRN agents. Available in black (BVO) and green (GVO).
- Chemical Protective Footwear Cover (CPFC):** Legacy system of CBRN protective footwear cover in use by USN. Requires wearer to pull protective sole tabs up and wrap/tie laces around cover to secure over footwear.
- Chemical Protective Glove (CPG):** Standard CBRN protective glove. Available in 7-, 14-, and 25-mil thicknesses addressing functional requirements for durability, dexterity, and tactile sensitivity.
- Chemical Protective Helmet System (CPHS):** CBRN protective camouflage-patterned helmet cover to protect helmet from contact with CBRN contaminants.
- SCALP:** Disposable, lightweight, impermeable overgarment designed for wear over IPE for additional protection in grossly contaminated environments. Applied by personnel required to leave protective sheltering in these environments to perform mission-critical tasks. Also applied by decontamination units/teams and medical personnel performing decontamination or potentially at risk for prolonged contact with liquids.
- Wet-Weather Gear: Includes Severe-Weather Gear (USN).** Provides barrier against contact with liquids potentially damaging to protective abilities of IPE.
- M-2 Apron:** Butyl rubber-coated sleeved apron worn over IPE and applied by decontamination units/teams and other designated personnel performing decontamination or potentially at risk for contact with liquids. Provides barrier against contact with liquids potentially damaging to protective abilities of IPE. Decontaminable.
- Joint Service Lightweight Integrated Suit Technology (JSLIST):** Two-piece (jacket and trousers) CBRN risk-taking protective garment with integrated hood. Affords protection against selected TIM agents. Reduces physiological and psychological encumbrances associated with existing Service-specific systems it replaces with initial fielding in the mid term. Under review for NIOSH certification for OSHA protection standards.
- Joint Block I/II Glove Upgrade (JB1/2GU):** Projected fielding in near mid term replacing CPG for designated force elements requiring increased tactility/durability for mission performance. Various configurations under consideration.
- Joint Firefighter Integrated Response Ensemble (JFIRE):** Incorporates JSLIST into firefighter bunker gear, permitting firefighters to conduct firefighting operations within a CBRN/TIM environment.
- Multi-purpose Overboot (MULO):** Projected initial fielding in mid term and replacing legacy CBRN footwear covers.

## COLPRO

### 1. Mobile COLPRO

- CBPS:** M1113 HMMWV-mounted COLPRO system consisting of a hardshell filtration, power, and transport and expandable softshell tentage with contamination control area/entry. The COLPRO unit is designated the Lightweight Multipurpose shelter (LMS).

**Crewed Combat Vehicles (Ground):** Two types of COLPRO. First supplies filter air using forced clean air supply system. Requires wear of IPE and connection to crew mask. This is the type of system in the M1A1 Abrams MBT. Second system is incorporates full COLPRO and permits reduction of IPE during operation. JSLNBCLR is an example of the second type of system.

**CITADEL:** System of protection installed with USN vessels to afford protection to selected connected spaces including C4ISR, medical, and R2.

## 2. Fixed-Site COLPRO

**MGPTS:** USMC Medium General Purpose Tent System (MGPTS) with CB Protective Liner System designed for support of USMC operational C4ISR and R2.

**CP-DEPMEDS:** Component-based system of tentage, connective corridors, ISO containers, etc., with COLPRO liners for configuration into field hospitals and includes supporting power and utility systems, lighting, engine control units, and filtration systems. Large system requiring extensive use of resources to prepare location, erect/strike, operate, and maintain.

**JTCOPS:** Similar to CP-DEPMEDS, but for critical functions and activities of the force (e.g., staff operations, aircrew housing and briefing, etc.).

**CP-EMEDS:** USAF air-transportable system similar to CP-DEPMEDS on a smaller scale and configurable from one medical shelter to a 25-bed field hospital.

**CP-SSS:** USAF small-scale COLPRO transportable system designed to support C2 functions.

**JECP:** Projected program of COLPRO designed for application in highly mobile operations, expeditionary operations, forced-entry operations, and/or to supplement larger-scale COLPRO systems in support of operations. Consists of building/room and tentage insert kits and small-unit stand-alone COLPRO kits.

**M20/M20A1 SCPE:** Lightweight and modular COLPRO system consisting of an inflatable liner for insert into rooms or buildings.

**Building integrated COLPRO systems:** COLPRO systems designed and installed into buildings as integral systems, usually facility construction. Post-construction installation is based upon building design and COLPRO requirements. Varies between buildings based upon applied technology, date of construction/installation, system engineering, facility function, etc. Most existing facility COLPRO was established during Cold War period.

**MOPP Methodology:** Stepped level of CBRND protective measures. Standardized levels permit the rapid increase or decrease of unit MOPP level.

**Unit Staff:** The application of DOTLPF for all phases of operations with threat from preplanning to post-force return to home stations. Includes all aspects of C2 and supporting staff activities/functions (e.g., logistics, intelligence, etc.) enabling mission and task accomplishment.

<b>Far-Term Overall Capability</b>	6	7	1	5

	FAA Measure	Scale
M1	Repair activities are not degraded/unavailable due to CBRN/TIM attacks.	<p><b>8–10:</b> Maintenance and repair activities supporting operations are maintained within a CBRN/TIM environment through the application of COLPRO and individual protection.</p> <p><b>4–7:</b> Maintenance and repair activities supporting operations are degraded or limited within a CBRN/TIM environment but are supported by the application of COLPRO and individual equipment.</p> <p><b>1–3:</b> IPE encumbrances and COLPRO availability impose serious impacts and limitations upon maintenance and repair activities supporting operations within a CBRN/TIM environment.</p> <p><b>0:</b> IPE encumbrances and COLPRO availability preclude maintenance and repair activities and performance supporting operations within a CBRN/TIM environment.</p>
M2	Critical repair activities are accommodated by COLPRO.	<p><b>8–10:</b> Critical repair activities and functions are equipped with COLPRO affording the minimum necessary and safe level of protection for maintenance of contaminated critical items as well as full protection of maintenance personnel during periods not performing maintenance on contaminated assets.</p> <p><b>4–7:</b> Critical repair activities are equipped with COLPRO affording reduced protection requirements for maintenance of contaminated critical items.</p> <p><b>1–3:</b> Selected critical repair activities are equipped with COLPRO supporting the maintenance of contaminated critical assets.</p> <p><b>0:</b> Critical repair activities are not equipped with COLPRO to perform maintenance of contaminated critical assets.</p>
M3	COLPRO is rapidly erectable within contaminated environment by personnel wearing IPE.	<p><b>8–10:</b> COLPRO is rapidly and safely erectable/striking, placed in operation, and easily maintained within a CBRN/TIM environment by personnel encumbered by IPE and with minimal resources.</p> <p><b>4–7:</b> COLPRO is safely erectable/striking, placed in operation, and maintained within a CBRN/TIM environment by IPE-encumbered personnel.</p> <p><b>1–3:</b> COLPRO that is safely erectable/striking, placed in operation, and maintained within a CBRN/TIM environment by IPE-encumbered personnel is inadequate and/or does not exist in sufficient quantities to support operations.</p> <p><b>0:</b> COLPRO that is safely erectable/striking, placed in operation, and maintained within a CBRN/TIM environment by IPE-encumbered personnel is nonexistent.</p>
M4	There is effective DOTLPP in place to conduct task.	<p><b>8–10:</b> DOTLPP exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations.</p> <p><b>4–7:</b> Most critical aspects of DOTLPP for this task are addressed. Task can be performed with limitations requiring work-arounds.</p> <p><b>1–3:</b> DOTLPP is inadequate for accomplishment of this task.</p> <p><b>0:</b> DOTLPP does not exist for this task.</p>

<sup>1</sup> Doctrine, policy, procedures, training, exercises, and evaluations serve to build the capability of individuals to perform tasks while wearing respiratory/ocular protection. However, the encumbrances associated with percutaneous protection do degrade performance and limit the conduct of certain tasks. Prolonged wear places stress upon the individual and will impact performance. Doctrine, policies, procedures, TTPs, and training do not address the erection of COLPRO within a contaminated environment but do address the operation and maintenance of COLPRO in a toxic environment. CBRND IPE is currently Service-specific and protects against all known CBRN warfare agents and selected TIMs. Respiratory/ocular protection is diverse across the Services and performed functions. The M40/M42 CB Protective Mask is in service with the U.S. Army. The mask uses the C-2 canister for filtration of CBRN contaminants. The M42 integrates with combat vehicle filtration protection system and has a dynamic microphone with cable for connection to vehicle communications systems. The M45 Aircrew Aviator Mask replaced the U.S. Army M43 Type II and M49 Mask Systems. The system uses a low-profile

canister compatible hose assembly for both hose and face-mounted configurations. The mask system incorporates selectable filtration for support both during aircraft systems activation and using the connectable filter pack. The mask also is applied to personnel who cannot be fitted with the standard M40A1, M42A2, or MCU-2A/P masks. The MCU-2A/P is the mainstay USAF and USN mask employed by personnel not equipped with aircrew masks and by aircrew when not performing flight operations. The MCU-2A/P is also used by aircrew during flight operations who are not equipped with aircrew masks. COTS equipment meeting OSHA requirements (and NFPA for firefighters) is applied by selected civilian personnel performing specific functions such as firefighting, EMS, hazardous materials, etc.

<sup>2</sup> Doctrine, policies, procedures, TTPs, and training do not address the erection of COLPRO within a contaminated environment but do address the operation and maintenance of COLPRO in a toxic environment.

<sup>3</sup> Doctrine, policy, procedures, training, exercises, and evaluations serve to build the capability of individuals to perform tasks while wearing percutaneous protection. However, the encumbrances associated with percutaneous protection do degrade performance and limit the conduct of certain tasks. Prolonged wear places stress upon the individual and will impact performance. Doctrine, policies, procedures, TTPs, and training do not address the erection of COLPRO within a contaminated environment but do address the operation and maintenance of COLPRO in a toxic environment. Service-specific CBRND percutaneous protection is currently applied for the protection of the force against known CBRN warfare agents and selected TIMs. The BDO, used by the USAF and U.S. Army, is a two-piece garment providing protection for a 24-hour period against chemical agent vapors, liquids, and droplets; biological agents and toxins and contact with radioactive particles. The BDO's protective abilities are lost if the suit is torn, ripped, splashed with POL, or is saturated with water and is designed for a one-time use and is worn by ground and most flight personnel (non-high-performance aircraft). The USMC uses the Saratoga COLPRO suit similar in design to the BDO, but launderable for personnel hygiene. The CPOG is a legacy two-piece garment for protection against CBRN agents. The CPOG is in use with the USN. The CPU is designed to provide an additional layer of protection for the warfighter and is worn under standard IPE. The BVO/GVO overboots are applied over the wearer's standard footwear to protect against contact with CBRND. The USN uses the CPFC, commonly called the "fishtail" for its design, to protect the wearer's footwear. The CPFC, considered obsolete, does provide a measure of antislip protection shipboard. Hand protection is provided by the CPG in 7-, 14-, and 25-mil thicknesses to meet warfighter hand protection and dexterity needs. The CPHS is designed to prevent contact of the warfighter's helmet with liquid contamination which may be absorbed, impact helmet integrity, and/or constitute a potential secondary hazard to the wearer. Standard wet-weather gear (e.g., poncho, rain parka, rain suit, etc.) is also applied as a barrier against saturation of the warfighter's protective ensemble by contact with liquids such as rain, sea spray, etc. COTS assets meeting OSHA requirements (and NFPA for firefighters) is applied by selected civilian personnel performing specific functions such as firefighting, EMS, hazardous materials, etc.

<sup>4</sup> Limited COLPRO is available in type and quantity to support operations, particularly multiple operations with threat. Limitations are considered during planning and alternatives are developed by the staff. The combination of IPE and available COLPRO provides flexibility to meet and maintain operational capability. Prioritization is required of the available resources. Current mobile COLPRO systems are predominantly integrated into selected combat vehicles/vessels. Selected U.S. Naval combat vessels may be equipped with full COLPRO (CITADEL). However, these systems are generally restricted to critical operations areas of the ships. These areas are designated. The remainder of the interior of the vessel uses the Circle William concept. Circle William requires prior warning of the presence of a CBRN/TIM in the path of the ship or knowledge of an impending attack to be fully effective. This concept requires the shutdown of the ventilation system and sealing of hatches, bulkheads, and other such openings to seal the interior of the vessel from intrusion by a CBRN/TIM. However, the majority of these actions are performed manually and are initiated upon detection of the potential CBRN/TIM agent. There are concerns about the potential for large amounts of a CBRN/TIM agent to be drawn in by the high-velocity ventilation systems and dispersed throughout the interior of the ship during the period between agent encounter and completion of Circle William. There are concerns about the ability of the vessel to remain in Circle William until it is determined the vessel is no longer exposed to a CBRN/TIM. Mobile COLPRO are armored or soft-skinned vehicle-supported and -based systems. They include both ground and air platforms. They may or may not include CBRN/TIM filtration systems. Mobile COLPRO run the full range of protective capabilities from passive to fully protective COLPRO. The majority of vehicles qualify as passive COLPRO, provided the exchange of air between the interior and the exterior is limited. Mobile COLPRO systems generally do not provide protection for large numbers of personnel. The CBPS is a general use fully protective COLPRO system mounted on an ECV HMMWV. The CBPS may be used for C4 operations, as aid stations, or for other needs.

<sup>5</sup> Mobile COLPRO systems installed as integral systems of combat systems can generally be placed into operation within a contaminated environment. However, selected systems must be erected and/or require extensive preparation that must be performed within a clean environment. Doctrine, policies, procedures, and TTPs do not address the erection and establishment of COLPRO within a contaminated environment. They are predicated upon these systems being prepared and in place prior to the presence of contaminants.

<sup>6</sup> Doctrine, policies, procedures, TTPs, and existing COLPRO systems do not address and support sustained operations within a CBRN/TIM environment. Inadequate quantities of mobile COLPRO systems exist to support highly mobile and expeditionary operations with reduced footprint. Further, there is insufficient quantities of COLPRO to protect all critical activities and functions within the force. Prioritization is required of the available resources.

<sup>7</sup> Limited COLPRO is available in type and quantity to support operations, particularly multiple operations with threat. Limitations are considered during planning and alternatives are developed by the staff. The combination of IPE and available COLPRO provides flexibility to meet and maintain operational capability. There is insufficient quantities of COLPRO to protect all critical activities and functions within the force. Prioritization is required of the available resources. The USMC MGPTS with CB Protective Liner System provides a positive-pressure, filtered-air, toxic-free shelter for protection against CBRN agents. However, there are insufficient quantities to protect all activities and functions from CBRN/TIM effects. The CP-DEPMEDS provides a clean, toxic-free, environmentally controlled, patient treatment area and the components are designed to integrate as field hospitals. They are packaged as a set for deployment to threat areas for hospital operations. The entire composite hospital consists of expandable tentage, passageways, environmental control units, and ISO shelters. The CP-DEPMEDS exist in very limited quantities. Although it could be applied to provide COLPRO to the task identified groups, its designed and primary function is that of medical care. A similar COLPRO is the USAF's CP-EMEDS, which is an air-transportable medical facility deployable in various configurations from a single shelter to a 25-bed patient hospital. The CP-EMEDS is in a very limited number and, like the CP-DEPMEDS, is designed for its primary function of the provision of medical care. The USAF CP-SSS is a small-scale CPS applied for the conduct of C2 operations, maintenance of critical equipment, force beddown, and the provision of R2 for sortie generators and key leadership. This shelter is in limited supply and unlikely sufficient quantities would be available to support a repair operation of any size, especially during operations against an adversary. The M20/M20A1 SCPE is a lightweight, modular system involving a liner designed for inflation within a room or building. The M20A1 serves to bridge the gap between the M20 SCPE and CBPS. Quantities are limited and are not likely to be available in any large quantity during operations against an adversary. Fixed-site COLPRO within the United States and its territories is predominantly designed for nuclear fallout and does not address other CBRN/TIM hazards and threats arising after September 11, 2001. Selected critical key facilities are equipped with CBRN COLPRO, but are not available to other than designated personnel and specific functions and activities. Fixed-site CBRN COLPRO is installed in facilities housing selected activities and functions within HTAs. However, these are not present for all activities and functions. However, the Guardian Program is reviewing FP protective measures at U.S. installations and facilities and will address COLPRO for critical activities/functions. The Guardian Program, however, is not likely to address field COLPRO operations.

<sup>8</sup> Current site COLPRO systems are not designed or enabled for erection and/or striking within a CBRN/TIM environment. Doctrine, policies, procedures, and TTPs do not support the erection and striking of COLPRO within a toxic environment. They predicate COLPRO establishment prior to the presence of contamination and striking after decontamination within an otherwise clean environment.

<sup>9</sup> Doctrine, policies, procedures, and TTPs do not address the application of COLPRO for maintenance of contaminated critical material with reduced IPE. Material must currently be contaminated prior to entry into COLPRO. Doctrine, policies, procedures, TTPs, and existing COLPRO systems do not address and support sustained operations within a CBRN/TIM environment. Inadequate quantities of COLPRO systems exist to support all critical activities and functions within the force. Prioritization is required of the available resources.

<sup>10</sup> Plans incorporate MOPP levels and methodologies are adjustable to meet local operations and threat needs as determined by the commander. MOPP levels and methodologies define protective requirements and readiness for various level of threat and include the activation and operation of COLPRO as well as the ear and readiness of IPE by the force. MOPP levels and methodologies seek to protect the force through an integrated DOTLPF, COLPRO, and IPE scaled approach. MOPP levels and methodologies provide flexibility for the adjustment of IPE to meet local operational and threat requirements. The intent is to achieve and maintain the lowest level necessary for survival of the force and operational accomplishment. Adjustments are made as dictated by local circumstances. However, prolonged wear of IPE will degrade performance.

<sup>11</sup> Doctrine, policies, procedures, and TTPs do not support the erection and striking of COLPRO within a toxic environment. They predicate COLPRO establishment prior to the presence of contamination and striking after decontamination within an otherwise clean environment.

<sup>12</sup> Doctrine, policy, procedures, and TTPs combined with staff experience, training, and knowledge provide the basis for prioritization of allocation of limited COLPRO resources. Not all critical activities and functions can currently be allocated COLPRO. Requirements must be balanced with operational needs, available resources, and alternative protective capabilities. The staff functions formulate the allocation collaboratively and make recommendations to the commander for decisioning. The determinations are identified in plans and disseminated to the force. Adjustments are made when necessary during operations or upon changes in available resources. Unit staff planning and preparations include preparing the force for operations within a CBRN/TIM environment. Degradation is considered in the development of taskings, R2 requirements, and force application. MOPP levels are developed, implemented, and adjusted to meet local operational needs and threat. Constant evaluation of force activities is performed for necessary changes and modifications to maintain force operational capabilities. Unit staff provides for R2 of personnel operating outside COLPRO at least once every 24 hours within COLPRO. Staff also manages COLPRO allocation and operations for support of operational requirements and critical activities/functions.

<sup>13</sup> Legacy systems will remain in the inventory throughout the mid term. These systems will be gradually replaced by new joint systems of respiratory/ocular protection as they are fielded. The JSGPM also replaces current Service-specific ocular/respiratory protection. The system provides respiratory and ocular protection from CBRN agents and selected TIMs. The field-of-vision is improved and encumbrances associated with legacy systems are reduced. The JSGPM incorporates state of the art technology and is designed to

integrate with future warfighter CBRND IPE and function equipment/assets. The Guardian Program is projected to review, assess, and implement protection for critical members of the installation/facility populace during the mid term. This will predominantly be COTS-based assets for respiratory/ocular protection. However, the Guardian Program is not expected to address eligible civilian protection within the AO for other than existing U.S. military installations and facilities.

<sup>14</sup> Doctrine, policies, procedures, TTPs, and training do not address the erection of COLPRO within a contaminated environment but do address the operation and maintenance of COLPRO in a toxic environment.

<sup>15</sup> Legacy systems will remain in the inventory throughout the mid term. These systems will be gradually replaced by new joint systems of percutaneous protection as they are fielded. The JSLIST NBC Protective Garment is a two-piece, risk-taking, overgarment with integrated hood affording protection against CBRN agents and selected TIMs. The garment reduces the physiological and psychological encumbrances associated with legacy systems. The JSLIST is under evaluation by NIOSH for application to OSHA protection requirements. Joint Service glove upgrades are provided under the Joint Block 1 and 2 Glove Upgrade Program (JB1/2GU) in the near and mid term. The JB1GU responds to an urgent need by designated elements of the force for increased tactility/durability supporting mission requirements. The JFIRE addresses protection of military firefighters within a CBRN/TIM environment conducting firefighting operations involving structural and crash/firefighting/rescue. The JFIRE incorporates the JSLIST into firefighter bunker gear. The JB1GU is expected to meet most of the requirements within the JSLIST ORD and is viewed as an evolutionary approach in the development of the JB2GU. Versions under consideration include a protective inner glove worn under existing warfighter gloves, a replacement glove for existing hand wear, or a combination of glove shell and liner affording CBRN protection of the legacy gloves they are projected to replace. The MULO is projected to replace legacy footwear covers. The ability of the MULO to provide adequate antislip protection for USN personnel asea is under review. The Guardian Program is projected to review, assess, and implement protection for critical members of the installation/facility populace during the mid term. This will predominantly be COTS-based assets for percutaneous protection. However, the Guardian Program is not expected to address eligible civilian protection within the AO for other than existing U.S. military installations and facilities.

<sup>16</sup> Fielding of the P3I upgraded CBPS for heavy/airborne use is projected for the mid term, as are two variants of the JSLNBCRS, the M93A1 and Fox NBCRS Block II to include COLPRO.

<sup>17</sup> JTCOPS Block I is projected for initial fielding during the mid term. The projected initial capabilities fielding of JECF is within the mid term and will include adaptive insertable COLPRO systems (including liner) for existing buildings/rooms and stand-alone COLPRO for small groups of personnel. JECF may provide the capability to provide COLPRO for critical activities and functions; however, JECF acquisition quantities have not as yet been determined.

<sup>18</sup> The next-generation series of nonaviator respiratory/ocular protective assets is in R&D. The capabilities and fielding of these assets are not as yet determined.

<sup>19</sup> Doctrine, policies, procedures, TTPs, and training do not address the erection of COLPRO within a contaminated environment but do address the operation and maintenance of COLPRO in a toxic environment.

<sup>20</sup> The next-generation series of nonaviator percutaneous protective assets is in R&D. The capabilities and fielding of these assets are not as yet determined.

<sup>21</sup> A decision on the inclusion of COLPRO in the LHA(R) is expected in the mid term.

<sup>22</sup> JTCOPS Block II is projected for the far term. Continued fielding of JECF.

### 13.7.3 Functional Solution Analysis

#### 13.7.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** CBRND protective equipment and measures do not protect against all CBRN/TIM agents.

**Partial Non-Materiel Solutions:** *Doctrine:* Promulgate requirement for development of CBRND protective equipment and measures to protect against all CBRN/TIM agents, particularly high-risk/high-threat agents. *Leadership:* Enforce compliance with established standards (see Doctrine) for prophylactic CBRND protection.
- 2. Deficiency:** Encumbrances associated with ocular/respiratory and percutaneous protection degrade performance and limit the conduct of certain tasks.

**Partial Non-Materiel Solutions:** *Organization:* Develop organizational structures, resources, staffing, and capabilities to support personnel exchange and R2 to preclude degradation of tasks and to promote the well-being of the force. *Training:* Ensure training, exercises, and evaluations effectively promote acclimation and endurance of wear of IPE. *Leadership:* Ensure awareness of degradation effects.
- 3. Deficiency:** Current doctrine, the *UJTL*, and operational planning do not adequately address sustained operations within a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, procedures, and *UJTL* sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.
- 4. Deficiency:** Current DOTLPF does not adequately address the erection, maintenance, operations, and striking of CPSs within a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, procedures, and TTPs the erection, maintenance, operation, and striking of CPSs within a CBRN/TIM environment for CBRND. *Organization:* Organizational structures supporting the erection, maintenance, operation, and striking of CPSs within a CBRN/TIM environment for CBRND. *Training:* Develop institutional and unit-level training on the erection, maintenance, operation, and striking of CPS within a CBRN/TIM environment to support operations and provide for CBRND of the force. *Leadership:* Ensure awareness and knowledge of establishing CPSs within a CBRN/TIM environment for operations within a CBRN/TIM environment. *Facilities:* Develop infrastructure to support erection, maintenance, operation, and striking of CPSs within a CBRN/TIM environment (e.g., logistics, training, etc.).

5. **Deficiency:** Not all critical facilities and activities are equipped with COLPRO.  
**Non-Materiel Solutions:** *Doctrine:* Enforce existing doctrine and policy.
6. **Deficiency:** Most naval vessels (including supply and transport vessels, carriers, and others) do not possess COLPRO.  
**Partial Non-Materiel Solutions:** *Doctrine:* Incorporate into doctrine, policy, and procedures the provision of COLPRO for at-risk vessels (civilian contract and military). *Organization:* Develop organizational structures, resources, staffing, and capabilities to support COLPRO operations on vessels supporting operations and at-risk. *Training:* Train, exercise, and evaluate crews for vessel COLPRO operations for CBRND. *Leadership:* Recognize differences and challenges associated with CBRND operations by at-risk vessels (both military and contract civilian) supporting operations. *Facilities:* Develop supporting infrastructure (e.g., logistics, maintenance, power systems, etc.) for vessel COLPRO.
7. **Deficiency:** Current mobile COLPRO is inadequate to support operations by highly mobile forces.  
**Non-Materiel Solutions:** *Doctrine:* Complete analysis and central correlation/comparison of national and strategic plans to identify quantities and types of mobile COLPRO (and supporting consumables) necessary and available to support highly mobile forces for envisioned plans and taskings. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct CBRND, including mobile COLPRO, of highly mobile forces. *Training:* Train, exercise, and evaluate CBRND, including mobile COLPRO, capabilities of the force in a CBRN/TIM threat during highly mobile force operations. *Leadership:* Recognize differences and challenges associated with CBRND operations by highly mobile forces, training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for CBRND of highly mobile forces.
8. **Deficiency:** Maneuvering forces are inadequately equipped with COLPRO capabilities.  
**Non-Materiel Solutions:** *Doctrine:* Complete the JCIDS process and central correlation/comparison of national and strategic plans to identify CBRND resources necessary and available to support maneuver operations, particularly expeditionary operations during the first 30–90 days following commencement of hostilities, with a reduced logistical footprint. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct maneuver operations, particularly expeditionary operations during the first 30–90 days of operations following commencement of hostilities, while possessing reduced logistical footprint. *Training:* Train, exercise, and evaluate maneuver capabilities (particularly expeditionary capabilities) of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operations using organic, prepositioned, and planned CBRND resources supporting operations. *Leadership:* Recognize differences and challenges associated with maneuver operations, particularly expeditionary operations during the first 30–90 days following commencement of hostilities, with a reduced logistical footprint; training providing skills and knowledge to manage operations in these circumstances; and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities:*

Develop supporting infrastructure for expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.

9. **Deficiency:** Existing COLPRO requires extensive services, logistics, and resources to establish.

**Partial Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, procedures, and TTPS guidelines and requirements for COLPRO by type of operation and involved forces. *Organization:* Develop minimal organizational structures, resources, and assets essential to the erection and establishment of COLPRO by system type. *Training:* Develop institutional and unit-level training on the erection and establishment of COLPRO with emphasis upon minimalization of committed resources. *Leadership:* Ensure awareness and knowledge of extent of committed resources to establish various types of COLPRO. *Facilities:* Review infrastructure with view towards minimalization of required services, logistics, and resources to erect and establish COLPRO.

10. **Deficiency:** ECP kits, procedures, and training do not currently exist.

**Partial Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, procedures, and TTPs the use and application of ECP for CBRND. *Organization:* Organizational structures supporting the application of ECP for CBRND. *Training:* Develop institutional and unit-level training on the application of ECP to support operations and provide for CBRND of the force. *Leadership:* Ensure awareness and knowledge of versatility and application of ECP for operations within a CBRN/TIM environment. *Facilities:* Develop infrastructure to support ECP (e.g., logistics, training, etc.).

11. **Deficiency:** COLPRO for maintenance of critical contaminated material permitting reduced IPE is nonexistent.

**Partial Non-Materiel Solutions:** *Doctrine:* Develop and establish in doctrine, policies, procedures, and TTPs requirements, standards, and guidelines for the application of COLPRO to maintenance activities on critical material that is contaminated and required for maintenance of OPTEMPO and mission success. *Organization:* Develop organizational structures, resources, staffing, and capabilities to enable effective application of COLPRO for maintenance of critical assets. *Training:* Implement institutional, recurring, and unit training for all personnel tasked with performance of critical asset maintenance in the conduct of maintenance and repair activities in a CBRN/TIM environment upon contaminated assets. Exercises and evaluations incorporate criteria challenging this capability. *Leadership:* Recognize ability to sustain OPTEMPO and for mission success with the capability to perform sensitive repairs on critical assets. *Facilities:* Develop supporting infrastructure enabling and supporting maintenance and repair activities on contaminated assets.

12. **Deficiency:** Inadequate COLPRO to support expeditionary and highly mobile forces.

**Partial Non-Materiel Solutions:** *Doctrine:* Develop and disseminate appropriate doctrine, policy, and procedures for the application of common materials for COLPRO and for COLPRO kits and components. *Organization:* Develop organizational structures, resources, staffing, and capabilities to enable effective application of available COLPRO and implementation of expedient COLPRO capabilities. *Training:* Establish initial and recurring training of all members of the force on the conduct of expedient COLPRO. Exercises and

evaluations incorporate criteria challenging this capability. *Leadership*: Recognize potential for expedient COLPRO to improve force capabilities and survivability. *Facilities*: Develop supporting infrastructure enabling expedient COLPRO and the effective application of available COLPRO.

**13. Deficiency:** Quantities and availability of mobile COLPRO is inadequate.

**Non-Materiel Solutions:** *Doctrine*: Complete analysis and central correlation/comparison of national and strategic plans to identify quantities and types of mobile COLPRO (and supporting consumables) necessary and available to support highly mobile forces for envisioned plans and taskings. *Organization*: Develop organizational structures, resources, staffing, and capabilities to conduct CBRND, including mobile COLPRO, of highly mobile forces. *Training*: Train, exercise, and evaluate CBRND, including mobile COLPRO, capabilities of the force in a CBRN/TIM threat during highly mobile force operations. *Leadership*: Recognize differences and challenges associated with CBRND operations by highly mobile forces, training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities*: Develop supporting infrastructure for CBRND of highly mobile forces.

**14. Deficiency:** Airlift assets (both tactical and strategic) are not equipped with COLPRO.

**Partial Non-Materiel Solutions:** *Doctrine*: Incorporate into doctrine, policy, and procedures the provision of COLPRO to aircrew and passengers in appropriate airframes (military and civilian). *Training*: Train, exercise, and evaluate aircrews and supporting entities for airframe COLPRO operations for CBRND. *Leadership*: Recognize criticality of protecting aircrew and passengers of appropriate tactical and strategic airframes from the effects of CBRN/TIM agents. *Facilities*: Develop supporting infrastructure (e.g., logistics, aircraft maintenance, etc.) for airframe COLPRO.

### 13.7.3.2 IMA Assessment Summary

Table 13.7-2 is a list of ideas for material approaches and a corresponding description of each idea. Approaches focus on procurement of existing systems, and development of field-expedient and modular systems. Table 13.7-3 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 13.7-2. TASHLD 7: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Assess CBRND material	Test and assess all CBRND material for protective abilities against future threat agents, including TIM.
Develop COLPRO kits	Develop COLPRO kits containing all necessary supplies to construct field-expedient COLPRO that is easily stored and maintained in ready condition, easily and safely erected, operated, maintained, and struck within a CBRN/TIM environment by IPE-encumbered personnel using minimal resources and supports COLPRO requirements.
Develop and establish generic unit CBRND kits	Develop, preposition, and maintain reserve stocks of generic CBRND kits for a standard unit. Components are adjusted as necessary for specific operations involving threat.
Disposable COLPRO	Develop one-time-use COLPRO that is rapidly erected with little instruction, training, and effort and affords term protection for critical activities and functions, maintenance and repair activities, prelocated consumables, as well as personnel associated with this task.
Field-expedient COLPRO kits	Develop field-expedient COLPRO kits designed to adapt existing structures, tentage, etc., for the expansion of COLPRO field capabilities and mission support and the provision of collective protection to the force, critical functions and activities, maintenance and repair activities and functions, resources, etc.
Field-expedient COLPRO materials	Identify commonly available materials (duct tape, plastic sheeting, wooden crate, plywood, tarps, coverings, wraps, caulk, sealant gels/sprays, etc.) for application in the construction of expedient COLPRO needed to construct field-expedient COLPRO when COLPRO availability is limited or not advantageous.
Integrated mobile COLPRO	Develop warfighting platforms (air, land, and sea) with COLPRO that is an integral part of the operational system and protects against current and future/advanced agents.
Modular COLPRO	Develop modular COLPRO that can be erected in various configurations to protect various groups of people separately by their designation (EPW, civilian, etc.); accommodates small to large numbers of people; protects all critical activities and functions, MWAs, prelocated consumables, and maintenance/repair activities; and addresses the commander's intent.
Regenerative filtration	CBRN regenerative filters able to flush retained agent, neutralize agent, or by other inherent means affords extended period of protection.

Table 13.7-3. TASHLD 7: IMA Assessment

Identified Gaps	Ideas for Material Approaches (IMA)								
	Assess CBRND Material	Develop COLPRO Kits	Develop and Establish Generic Unit CBRND Kits	Disposable COLPRO	Field-Expedient COLPRO Kits	Field-Expedient COLPRO Materials	Integrated Mobile COLPRO	Modular COLPRO	Regenerative Filtration
CBRND protective equipment and measures do not protect against all CBRN/TIM agents.	X	X	X						
Encumbrances associated with ocular/respiratory and percutaneous protection degrade performance and limit the conduct of certain tasks.	X	X	X	X	X	X	X	X	X

**13.8 Task TASHLD 8: Prelocate consumables to COLPRO and units****13.8.1 Functional Area Analysis****13.8.1.1 Definition**

CBRND stocks fall in both medical and nonmedical categories. Items are transported and positioned in anticipation of need. Especially critical are consumables such as filters and extra sets of protective overgarments. NBC staff personnel work closely with logisticians and medical service personnel to ensure required stocks are on hand or readily available. Refer to individual Service documents for specifics.

**13.8.1.2 Derivation**

*Joint Enabling Concept for CBRN Operations, Protection Joint Functional Concept, UJTL (TA 7, TA 7.1).*

**13.8.1.2.1 Supported Task: OPSHLD 8****13.8.1.2.2 Lateral Task: TASHA 20****13.8.1.2.3 Supporting Task: N/A****13.8.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Undeveloped to highly developed land. (C1.1.1)
2. Riverine to open sea. (C1.2)
3. Natural and induced air. (C1.3)
4. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Partially completed mission preparation. (C2.1.3)
2. Marginal forces. (C2.2)
3. Marginal to adequate forces allocated. (C2.2.3)
4. Negligible personnel experience. (C2.2.4.5)
5. Limited staff expertise. (C2.3.1.3)
6. Limited deployed supplies. (C2.8.2)
7. No prepositioned materiel. (C2.8.4)
8. No host-nation support. (C2.8.5)
9. Negligible to limited commercial procurement. (C2.8.6)

Civil. N/A

## 13.8.2 Functional Needs Analysis

### 13.8.2.1 Capability and Deficiency Assessment Summary

Table 13.8-1 discusses various current and expected capabilities applied to accomplish this task. The overall capabilities for current, near/mid, and far term are rated “yellow.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

#### Current Capability and Deficiency

DOTLPF is central to ensuring the prepositioning of consumables for asset availability to the warfighter. General logistics DOTLPF exists addressing the planning, movement, management and positioning of material for support of operations. Reallocation and integration of resources are addressed in existing DOTLPF. Deficiencies include inadequate quantities and types of COLPRO, inadequate prophylaxes addressing all CBRN agents and high-threat/high-risk TIMs (particularly TICs), insufficient DOTLPF for sustained operations within a CBRN/TIM environment, individual combat loads restricting available weight and space for CBRND materiel, and the absence of CBRND for MWDs. Expeditionary and highly mobile force operations, both with reduced and limited logistical support, are not adequately addressed in DOTMLPF, and the design of most CBRND systems and associated logistics does not adequately support these type of operations. Deploying eligible civilians and MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment; nor does the command staff possess clear guidance for planning and providing CBRND of these personnel and elements. The Services currently field a variety of CBRND assets providing respiratory/ocular, percutaneous, and COLPRO protection. This diversity of assets complicates the logistical support of operations with threat for joint operations. Existing Service-specific IPE is limited in the period and scope of protection afforded the warfighter. Respiratory/ocular and percutaneous CBRND assets protect against known chemical and biological warfare agents and particulate radiologicals. Protection is afforded to a select number of TIMs. Physiological and psychological encumbrances increase with prolonged wear. Regular exercising and wear to acclimate and adjust the wearer to enable performance of assigned functions and activities are necessary and performed to reduce the impact of encumbrances and subsequent degradation of performance. Current site COLPRO generally requires extensive site preparation and resources to erect, operate, and strike but cannot be erected/striking in a CBRN/TIM environment. Mobile COLPRO is a diversity of systems ranging from forced clean air systems to full COLPRO. However, their application is limited. In general, current COLPRO is limited in quantity and does not adequately support expeditionary and highly mobile maneuver operations, particularly those in an austere environment with reduced logistical footprints. Most mobile platforms (including land, sea, and air) are not equipped with COLPRO. This circumstance requires prioritization of available assets and the application of IPE for CBRND. Medical prophylaxes do exist for the protection of the warfighter against a limited number of biological and chemical agents. However, few are FDA approved. A number possess IND authorization for application.

Medications are considered for their potential prophylactic value, but are not always FDA approved for this purpose. Not all threat CBRN agents are addressed by CBRND medical countermeasures. Efficacy, time to achieve a level of protection, and the number of administrations vary between prophylaxes. COTS protective assets are applied for selected eligible civilians such as hazardous materials, firefighters, EMS, etc. However, eligible civilians (in general) and MWAs are not adequately addressed by DOTLPF for CBRND. Clear DOTLPF addressing the CBRND provisioning and training of eligible civilians is inadequate. MWAs are not afforded protection against the effects of CBRN/TIM agents, including COLPRO. MOPP DOTLPF is adequate for military personnel and operations. The establishment of adjustable MOPP levels, reflective of local operations and threat, are well defined, as are continuing evaluation for change/adjustments. However, operations increasingly involve U.S. and non-U.S. civilians. MOPP DOTLPF does not adequately address their presence and inclusion into MOPP methodologies and levels, particularly when these personnel may (or may not) be equipped with nonstandard IPE.

### **Projected Near/Mid-Term Capability and Deficiency**

Future configurations focus on reducing psychological and physiological stresses associated with the wearing of IPE, as well as striving for commonality of form factor among all services to reducing the logistics burden, development cost, and improved availability. The JPACE, JSLIST, JSAM, and JSGPM are projected to be initially fielded during the mid term. The JSLIST is under review for NIOSH certification for compliance with OSHA protective standards. The certification will permit application of the garment for AT/FP installation activities within CONUS and selected OCONUS. The possibility exists for potential application by requiring eligible civilians. Legacy Service-specific IPE will remain in the inventory throughout the mid term and into the far term during the transition to the joint IPE systems. Ongoing R&D into medical prophylaxes will provide additional prophylactic measures but still fail to address all threat CBRN agents and high-threat/high risk TIMs (particularly TICs). JECP is projected to initially field during the mid term with three COLPRO systems primarily addressing expeditionary operations. The P3I upgraded CBPS, JTCOPS, CP-DEPMEDS, fielding of the JSLNBCRS variants, and backfit of LHA/LHD vessels are projected to include COLPRO in the mid term. These systems, depending upon the quantity fielded, may provide additional COLPRO to address critical needs. However, although the fielding of joint Service assets will gradually improve logistics, the force will continue to contend with the logistics support of existing Service-specific assets. Otherwise, changes from current capabilities and deficiencies are not projected.

### **Projected Far-Term Capability and Deficiency**

Future configurations focus upon reducing psychological and physiological stresses associated with the wearing of IPE, as well as striving for commonality of form factor among all Services. The standardization of CBRND respiratory/ocular and percutaneous protection which will continue to reduce the logistics burden and development cost and subsequently improve availability. Legacy Service-specific IPE will continue to be replaced by the joint systems of CBRND protective equipment until fielding is complete to all Service units, including Guard and Reserve, early in the far term. Next-generation IPE assets are in R&D and are expected to be

fielded sometime in the far term. However, specifics of design, characteristics, and protective capabilities are not as yet determined for these systems. Continued R&D into potential medical prophylaxes may result in additional protective measures for the force. However, specifics are unknown at this time. The potential for COLPRO in the Future Tactical Lift Option builds upon the mid-term COLPRO capabilities. Additional changes in capabilities from the mid term are not projected.

### 13.8.2.2 Resource Systems

#### Individual Protection

##### 1. Respiratory/Ocular Protection:

**COTS:** Commercially available systems of protection, manufactured and tested meeting OSHA standards for the United States or equivalent organization in other nations.

**M17 Series Masks w/M13 Series Filters:** Obsolescent warfighter system of protection. Retained in selected HTAs for NEO application. Designed for adults.

**MBU-19/P Chemical-Biological Aircrew Eye/Respiratory Protection (AERP):** USAF combat aircrew protection. Includes protective hood, MBU-12/P mask, C-2 canister, intercom for ground communications, and blower assembly.

**A/P22P-14(V) Respirator Assembly:** USN/USMC system for rotary-wing (Version 1 for USN) and fixed-wing (Versions 2–4 for USN/USMC) aircrews. Includes CB filter, dual air/oxygen supply, and crossover manifold for dual protective capabilities in air or on ground. Version 1 is not compatible with aircraft oxygen supply systems; Version 2 applied to EA-6B and F18A airframes; Version 3 to AV-8B and F-18C/D aircraft; and Version 4 is used for C-130 airframes.

**M40/M42 CB Protective Mask:** U.S. Army mask system designed for military standard profile and uses standard C-2 canister. M42 integrates with combat vehicle clean air supply system and has a connectable dynamic microphone for combat vehicle intercom system.

**M45 Aircrew Aviator Mask:** Replaces M42 and M49 systems for U.S. Army. Available with a canister-compatible hose assembly and a valve cassette that enables use of supplied air (from aircraft, SCBA or PAPR). The M45 is used by military personnel who cannot fit the M40A1, M42A2, or MCU-2/P masks.

**M48 CB Apache Aviator Mask:** Used by Apache aviator and flight support personnel. Replaced M43 Type 1 mask system and uses blower assembly with C-2 filter canister.

**MCU-2A/P:** Mainstay USAF and USN system for nonaviator personnel and aircrew personnel not performing flight operations, except for aircrew personnel not issued aviator systems and noncombat platforms/airframes without clean air supply systems. Applies C-2 filter for filter air.

**Joint Service Aviator Mask (JSAM):** Initial fielding projected in the mid term replacing Service-specific aviator respiratory/ocular protective systems. Provides CBRN protection under high-G conditions, compatible with existing and projected aviator CBRN IPE, flame and thermal protective, reduces stress associated with existing aviator IPE, and may be donned/doffed during flight.

**Joint Service General Purpose Mask (JSGPM):** Initial fielding projected in the mid term replacing Service-specific standard respiratory/ocular protective systems. Provides respiratory/ocular protection from CBRN agents and selected TIMs. Improves field-of-vision and encumbrances associated with existing Service systems.

**Joint Service Chemical Environment Survival Mask (JCESM):** COTS one-time use, one-size-fits-all, respiratory/ocular protective system affording two hours of protection in low-level CBRN vapor, aerosol, and particulate environments. Selected force element application only.

## 2. Percutaneous Protection:

**COTS:** Commercially available systems of protection, manufactured and tested meeting OSHA standards for the United States or equivalent organization in other nations.

**Battle Dress Overgarment (BDO):** U.S. Army/USAF two-piece camouflage-patterned garment (top and trousers) providing 24-hour protection against CBRN agents in vapor, liquid, droplet, and particulate forms.

**Saratoga:** USMC two-piece camouflage-patterned garment (top and trousers) providing 24-hour protection against CBRN agents in vapor, liquid, droplet, and particulate forms. Launderable for hygiene.

**CPOG:** Legacy two-piece green garment currently in use with USN providing limited-term protection against CBRN agents in vapor, liquid, droplet, and particulate forms.

**Chemical Protective Undergarment (CPU):** Worn under standard IPE as additional layer of protection against contact with CBRN agents.

**CWU-66/P:** One-piece USAF green flightsuit providing 24-hour protection against CBRN agents in vapor, liquid, droplet, and particulate forms. Available in tan as CWU-77/P flightsuit.

**Disposal Aircrew Protective Cape:** Transparent disposable cape covering head and shoulders of aviator during periods between aircraft mounting/dismounting and shelter.

**BVO/GVO:** Vinyl overboots (VO) worn over wearer's standard footwear and protects against contact with CBRN agents. Available in black (BVO) and green (GVO).

**Chemical Protective Footwear Cover (CPFC):** Legacy system of CBRN protective footwear cover in use by USN. Requires wearer to pull protective sole tabs up and wrap/tie laces around cover to secure over footwear.

**Disposable Aircrew Footwear Cover:** Transparent disposable footwear covers worn over aviator footwear to protect aviator during periods between aircraft mounting/dismounting and shelter.

**Chemical Protective Glove (CPG):** Standard CBRN protective glove. Available in 7-, 14-, and 25-mil thicknesses addressing functional requirements for durability, dexterity, and tactile sensitivity.

**Disposable Aircrew Hand Protection:** Transparent disposable hand coverings applied by USAF, USN, and USMC over aviator gloves during periods between aircraft mounting/dismounting and shelter. Also applied as between aviator inner and outer gloves enabling essential functional requirements for dexterity and tactile sensitivity.

**Chemical Protective Helmet System (CPHS):** CBRN protective camouflage-patterned helmet cover to protect helmet from contact with CBRN contaminants.

**SCALP:** Disposable, lightweight, impermeable overgarment designed for wear over IPE for additional protection in grossly contaminated environments. Applied by personnel required to leave protective sheltering in these environments to perform mission-critical tasks. Also applied by decontamination units/teams and medical personnel performing decontamination or potentially at risk for prolonged contact with liquids.

**Wet-Weather Gear: Includes Severe-Weather Gear (USN).** Provides barrier against contact with liquids potentially damaging to protective abilities of IPE.

**M-2 Apron:** Butyl rubber-coated sleeved apron worn over IPE and applied by decontamination units/teams and other designated personnel performing decontamination or potentially at risk for contact with liquids. Provides barrier against contact with liquids potentially damaging to protective abilities of IPE. Decontaminable.

**Medical Barrier Assets:** Standard barrier assets applied by Medical Services personnel against contact with biohazards. May provide a degree of additional barrier protection against CBRN hazards when applied with IPE.

**Patient Protective Wrap (PPW):** Enclosed casualty bag made of CBRN protective materials. Incorporates small flexible transparent window positioned over casualties face for viewing by medical practitioners. Uses cardboard stays to maintain separation of bag from casualty's face. Does not permit head-to-toe viewing of casualty. Supports limited medical assistance. Requires the wear of standard warfighter respiratory/ocular protection. Two wraps currently in stock. Legacy system provides protection up to 3 hours and newer system up to 6 hours.

**Joint Service Lightweight Integrated Suit Technology (JSLIST):** Two-piece (jacket and trousers) CBRN risk-taking protective garment with integrated hood. Affords protection against selected TIM agents. Reduces physiological and psychological encumbrances associated with existing Service-specific systems it replaces with initial fielding in the mid term. Under review for NIOSH certification for OSHA protection standards.

**Joint Protective Aircrew Ensemble (JPACE):** CBRN protective aviator flightsuit projected for initial fielding in the mid term and replacing Service-specific CBRN protective flightsuits. Provides JSLIST equivalent protection and provides protection when subject to rotor, propeller, and jetwash. Flame-retardant and self-extinguishing properties. Supports escape and evasion requirements.

**Joint Block I/II Glove Upgrade (JB1/2GU):** Projected fielding in near mid term replacing CPG for designated force elements requiring increased tactility/durability for mission performance. Various configurations under consideration.

**Joint Firefighter Integrated Response Ensemble (JFIRE):** Incorporates JSLIST into firefighter bunker gear, permitting firefighters to conduct firefighting operations within a CBRN/TIM environment.

**Multi-purpose Overboot (MULO):** Projected initial fielding in mid term and replacing legacy CBRN footwear covers.

### 3. Medical Protection:

**Vaccines:** Immunizations providing a level of acquired immunity against the effects of CBRN agents.

**Topicals:** Protective barrier products applied to the skin to enhance protection of wear against contact with CBRN/TIM agents. Includes both inert and reactive materials.

**Medications:** Medical materials taken to mitigate or prevent the effects of exposure to CBRN/TIM agents. Includes medications taken routinely or upon exposure (but prior to symptom display) to build resistance/immunity or to mitigate/resolve medical impacts of CBRN/TIM agent exposure/contamination.

## COLPRO

### 1. Mobile COLPRO

**CBPS:** M1113 HMMWV-mounted COLPRO system consisting of a hardshell filtration, power, and transport and expandable softshell tentage with contamination control area/entry. The COLPRO unit is designated the Lightweight Multipurpose shelter (LMS).

**Crewed Combat Vehicles (Ground):** Two types of COLPRO. First supplies filter air using forced clean air supply system. Requires wear of IPE and connection to crew mask. This is the type of system in the M1A1 Abrams MBT. Second system is incorporates full COLPRO and permits reduction of IPE during operation. JSLNBCLR is an example of the second type of system.

**Airframe Air Supply System:** Provides clean air from compressed air storage system either until aircraft is outside of contamination and airframe interior is flushed of vapor contaminants or throughout flight operations.

**CITADEL:** System of protection installed with USN vessels to afford protection to selected connected spaces including C4ISR, medical, and R2.

### 2. Fixed-Site COLPRO

**MGPTS:** USMC Medium General Purpose Tent System (MGPTS) with CB Protective Liner System designed for support of USMC operational C4ISR and R2.

**CP-DEPMEDS:** Component-based system of tentage, connective corridors, ISO containers, etc., with COLPRO liners for configuration into field hospitals and includes supporting power and utility systems, lighting, engine control units, and filtration systems. Large system requiring extensive use of resources to prepare location, erect/strike, operate, and maintain.

**JTCOPS:** Similar to CP-DEPMEDS, but for critical functions and activities of the force (e.g., staff operations, aircrew housing and briefing, etc.).

**CP-EMEDS:** USAF air-transportable system similar to CP-DEPMEDS on a smaller scale and configurable from one medical shelter to a 25-bed field hospital.

**CP-SSS:** USAF small-scale COLPRO transportable system designed to support C2 functions.

**JECP:** Projected program of COLPRO designed for application in highly mobile operations, expeditionary operations, forced-entry operations, and/or to supplement larger-scale COLPRO systems in support of operations. Consists of building/room and tentage insert kits and small-unit stand-alone COLPRO kits.

**M20/M20A1 SCPE:** Lightweight and modular COLPRO system consisting of an inflatable liner for insert into rooms or buildings.

**Building integrated COLPRO systems:** COLPRO systems designed and installed into buildings as integral systems, usually facility construction. Post-construction installation

is based upon building design and COLPRO requirements. Varies between buildings based upon applied technology, date of construction/installation, system engineering, facility function, etc. Most existing facility COLPRO was established during Cold War period.

**MOPP Methodology:** Stepped level of CBRND protective measures. Standardized levels permit the rapid increase or decrease of unit MOPP level.

**Unit Staff:** The application of DOTLPF for all phases of operations with threat from preplanning to post-force return to home stations. Includes all aspects of C2 and supporting staff activities/functions (e.g., logistics, intelligence, etc.) enabling mission and task accomplishment.

	FAA Measure	Scale
M1	Forces are equipped to operate in a CBRN/TIM environment.	<b>8–10:</b> Forces are adequately equipped and possess ready access to CBRND resources to conduct sustained operations in a CBRN/TIM environment. <b>4–7:</b> Forces are adequately equipped and possess ready access to CBRND resources to conduct operations in a CBRN/TIM environment. <b>1–3:</b> Uniformed forces are equipped and possess access to CBRND resources to conduct operations in a CBRN/TIM environment. <b>0:</b> Forces are not equipped and possess access to CBRND resources to conduct operations in a CBRN/TIM environment.
M2	Nonmedical CBRN/TIM consumables and expendables are on hand.	<b>8–10:</b> CBRND systems, components, and consumables are available and in place in plan identified quantities and types to support sustained operations within a CBRN/TIM environment. <b>4–7:</b> CBRND systems, components, and consumables are available and in place supporting operations but reflect adjusted plan quantities and types for limitations and constraints in availability. Adjustments to operations are made without serious impact. <b>1–3:</b> Limitations and constraints upon available CBRND system, component, and consumable quantities and types require changes to operations with potentially serious impact. <b>0:</b> CBRND systems, components, and consumables availability and allocation do not support operations.
M3	Medical CBRN/TIM consumables and expendables are on hand.	<b>8–10:</b> CBRND systems, components, and consumables are available and in place in plan identified quantities and types to support sustained operations within a CBRN/TIM environment. <b>4–7:</b> CBRND systems, components, and consumables are available and in place supporting operations but reflect adjusted plan quantities and types for limitations and constraints in availability. Adjustments to operations are made without serious impact. <b>1–3:</b> Limitations and constraints upon available CBRND system, component, and consumable quantities and types require changes to operations with potentially serious impact. <b>0:</b> CBRND systems, components, and consumables availability and allocation do not support operations.

M4	Operations are sustainable over multiple CBRN/TIM attacks based upon organic, on-hand, and issued CBRN/TIM protective assets, consumables, and expendables.	<p><b>8–10:</b> Forces (including military, eligible civilians, and MWAs) are adequately equipped and possess ready access to sufficient CBRND resources to support sustained operations through multiple CBRN/TIM attacks across the spectrum of operations and without unplanned and unforecasted resupply.</p> <p><b>4–7:</b> Forces (including military and eligible civilians) are equipped and possess ready access to sufficient CBRND to support sustained operations through multiple CBRN/TIM attacks involving major operations with planned and forecasted resupply.</p> <p><b>1–3:</b> Forces are inadequately equipped and/or possess limited access to CBRND resources to sustain operations through multiple CBRN/TIM attacks and/or are reliant upon resupply.</p> <p><b>0:</b> Forces are not equipped and resupplied with CBRND resources for operations with multiple CBRN/TIM attacks.</p>
M5	CBRND asset replenishment effectively maintains OPTEMPO and force survivability.	<p><b>8–10:</b> CBRND resources are stockpiled and prepositioned within or near the AO in plan identified quantities and types to support sustained operations against multiple CBRN/TIM attacks upon the force. Continuing replenishment of unit operating stocks, and AO stockpiles and prepositioned stocks maintains plan established and operations related adjusted stock levels.</p> <p><b>4–7:</b> CBRND resources are stockpiled and prepositioned within or near the AO in plan identified required quantities and types to support sustained operations in a CBRN/TIM environment. Periodic replenishment of unit operating stocks, and AO stockpiles and prepositioned stocks maintains plan established stock levels.</p> <p><b>1–3:</b> CBRND resources are stockpiled at depots outside the OA, prepositioned within or near the AO, and stocked within units in plan identified quantities and types to support sustained operations within a CBRN/TIM environment. Replenishment of operating unit and AO operating stocks from prepositioned and depot stocks are performed as outlined in the appropriate plan.</p> <p><b>0:</b> CBRND stockpiles and prepositioned stocks of CBRND resources and replenishment of operating stocks are inadequate to support sustained operations in a CBRN/TIM environment.</p>
M6	Positioning of consumables effectively supports forces.	<p><b>8–10:</b> Forces are issued identified CBRND assets and possess immediate access to replacement CBRND consumables. Replenishment is continuing and supports immediate availability.</p> <p><b>4–7:</b> Forces are issued identified CBRND assets and possess ready access to replacement CBRND consumables. Periodic replenishment maintains availability at a sufficient level to support operations</p> <p><b>1–3:</b> Forces are issued identified CBRND assets and possess reasonable access to replacement CBRND consumables. Programmed replenishment maintains minimal operational stocks.</p> <p><b>0:</b> Forces do not possess needed access to initial and replacement CBRND consumables. Programmed replenishment is inadequate to support operations in a CBRN/TIM environment.</p>
M7	Integrated staff effort (medical, logistics, NBC) to prepare plan.	<p><b>8–10:</b> Fully integrated staff functions collaboratively develop effective and detailed operational plans establishing integrated CBRND support requirements for CBRN/TIM defense operations.</p> <p><b>4–7:</b> Staff functions collaborate in the development of operational plans addressing CBRND support requirements for CBRN/TIM defense operations.</p> <p><b>1–3:</b> Force staff functions predominantly operate autonomously of each other and coordinate the development of operational plans involving CBRND support requirements and CBRN/TIM defense operations.</p> <p><b>0:</b> Force staff functions do not coordinate development of operational plans entailing inclusion of CBRND support requirements for CBRN/TIM defense operations.</p>

M8	There is effective DOTMLPF in place to conduct task.	<p><b>8–10:</b> DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations.</p> <p><b>4–7:</b> Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds.</p> <p><b>1–3:</b> DOTLPF is inadequate for accomplishment of this task.</p> <p><b>0:</b> DOTLPF does not exist for this task.</p>
----	--	---

<sup>1</sup> CBRND IPE is currently Service-specific. Respiratory/ocular protection is diverse across the Services and performed functions. USAF combat aircrews conduction operations within a CBRN environment are equipped with the MBU-19/P Chemical-Biological AERP that includes protective hood, MBU-12/P mask, C-2 filter canister, an intercom for ground communications, and a blower assembly. The AERP provides protection whether or not supplemental oxygen is present. USN and USMC aviators use the A/P22P-14(V) Respirator Assembly that is a self-contained protective system deployed for rotary-wing (Version 1 for USN) and fixed-wing (Versions 2–4 for USN and USMC) aircrews. The system incorporates a CB filter, dual air/oxygen supply, and a crossover manifold with dual protective capabilities for flight and ground protection. The A/P 22P-14(V) 1 is not compatible with aircraft with oxygen delivery systems and supports helicopter crew use. Version 2 is used for the EA-6B and F-18A, Version 3 for AV-8B and F-18C/D, and Version 4 is applied for C-130 aircrews. The M17 series mask is obsolescent and is relegated to NEO support in selected HTAs. The mask is designed for the military standard profile (ground) and does not adequately protect all potential nonmilitary populace members, for which is retained. The M40/M42 CB Protective Mask is in service with the U.S. Army. The mask uses the C-2 canister for filtration of CBRN contaminants. The M42 integrates with combat vehicle filtration protection system and has a dynamic microphone with cable for connection to vehicle communications systems. The system is a stand-alone system that accompanies the user. The M45 Aircrew Aviator Mask replaced the U.S. Army M43 Type II and M49 Mask Systems. The system uses a low-profile canister compatible hose assembly for both hose and face-mounted configurations. The mask system incorporates selectable filtration for support both during aircraft systems activation and using the connectable filter pack. The mask also is applied to personnel who cannot be fitted with the standard M40A1, M42A2, or MCU-2A/P masks. The M48 CB Aviator Mask protects AH-64 Apache helicopter aviators and flight support personnel. The blower assembly uses the C-2 filter canister to provide filtered, breathable air. The M-48 replaced the M43 Type 1 mask. The MCU-2A/P is the mainstay USAF and USN mask employed by personnel not equipped with aircrew masks and by aircrew when not performing flight operations. The MCU-2A/P is also used by aircrew during flight operations who are not equipped with aircrew masks. COTS equipment meeting OSHA requirements (and NFPA for firefighters) is applied by selected civilian personnel performing specific functions such as firefighting, EMS, hazardous materials, etc. Limited quantities of COTS may be available within HTAs for known NEO requirements for the protection of populace members unable to wear the M17 series or standard warfighter respiratory/ocular protective devices. MWAs are not afforded respiratory/ocular protection.

<sup>2</sup> Respiratory/ocular CBRND protection asset expendables and consumables include filters, batteries, exhaust and inlet valves, disposable aviator materials, and other assets designed for replacement or disposal. These are identified in the applicable technical manuals and directives and are a consideration in the planning, acquisition, positioning, and allocation of logistics resources supporting operations. The diversity of respiratory/ocular assets between the services does place an increased logistical burden upon planners and the logistics systems to accommodate unique requirements for specific systems. Limited standardization does exist, such as the C-2 filter canister, but not all expendable and consumable components are standard across the services. Doctrine, policy, procedures, and TTPs include the planning, identification, positioning, and allocation by the command staff of these assets to ensure their availability to the force.

<sup>3</sup> Doctrine, policy, and procedures do not adequately address sustained operations over multiple CBRN/TIM attacks. Current assets are limited in their ability to address these types of operations and will require increased quantities, service, replacement, and issue, placing serious demands upon logistics systems for support. Degradation to operational performance is a significant concern in these circumstances.

<sup>4</sup> Doctrine, policy, and procedures are adequate for planning, movement, management, and positioning of materiel (including CBRND materiel) in support of operations. CBRND materiel for an operation addresses the identified CBRN/TIM threat. The allocation and dissemination of CBRND materiel is managed by the staff based upon plans, operational requirements, anticipated or experienced threat, and available resources. Expeditionary operations are a particular concern. Availability of spares and resupply will be limited during the period until the theater matures (usually the first 30–90 days). Maneuvering highly mobile forces operating in austere environments, behind adversary lines, and possessing reduced logistical footprints are similarly constrained. The individual combat load also places limitations upon weight and type of equipment and consumables. Protective equipment may be reduced or eliminated despite threat level. Sustained operations within a CBRN/TIM environment are not adequately addressed in DOTLPF and, subsequently, in planning.

<sup>5</sup> DOTLPF is adequate for the planning, movement, management, positioning, and reallocation of CBRND materiel in support of operations. However, DOTLPF is inadequate for sustained operations within a CBRN/TIM environment and for expeditionary and highly mobile force operations with reduced logistical footprints. DOTLPF is also inadequate or nonexistent addressing CBRND of eligible civilians and MWAs.

<sup>6</sup> Service-specific CBRND percutaneous protection is currently applied for the protection of the force. The BDO, used by the USAF and U.S. Army, is a two-piece garment providing protection for a 24-hour period against chemical agent vapors, liquids, and droplets; biological agents and toxins and contact with radioactive particles. The BDO's protective abilities are lost if the suit is torn, ripped, splashed with POL, or is saturated with water and is designed for a one-time use and is worn by ground and most flight personnel (non-high-performance aircraft). The USMC uses the Saratoga COLPRO suit similar in design to the BDO, but launderable for personnel hygiene. The CPOG is a legacy two-piece garment for protection against CBRN agents. The CPOG is in use with the USN. The CPU is designed to provide an additional layer of protection for the warfighter and is worn under standard IPE. The USAF CWU-66/P (and 77/P) is a one-piece flightsuit providing protection for a 24-hour period against standard CBRN agents and is designed for compatibility with aircrew lift support equipment. The USN, USAF, and USMC use the disposable aircrew protective cape to protect aircrew between sheltering and the combat aircraft. The cape drapes over the wearer and is removed during entry into the aircraft to prevent transfer of contamination into the aircraft interior. The BVO/GVO overboots are applied over the wearer's standard footwear to protect against contact with CBRND. The USN uses the CPFC, commonly called the "fishtail" for its design, to protect the wearer's footwear. The CPFC, considered obsolete, does provide a measure of antislip protection shipboard. The disposable aircrew boot cover is worn by USAF, USN, and USMC aviators over aircrew footwear while en route and mounting combat aircraft. The covers are removed during aircraft entry and are designed to prevent contamination transfer into the aircraft. Hand protection is provided by the CPG in 7-, 14-, and 25-mil thicknesses to meet warfighter hand protection and dexterity needs. Disposable aircrew hand protection is applied by the USAF, USMC, and USN for aviators over their gloves (and may be worn between glove layers for additional protection) during movement between shelter and aircraft. When used as an overglove, the gloves are removed during aircraft mounting to preclude the potential for transfer of contamination into the aircraft interior. Medical Services practitioners performing treatment The CPHS is designed to prevent contact of the warfighter's helmet with liquid contamination which may be absorbed, impact helmet integrity, and/or constitute a potential secondary hazard to the wearer. SCALP provides a disposable, lightweight, impermeable layer of protection for personnel against gross liquid contamination and is worn over the warfighter's protective ensemble. SCALP is commonly applied to protect armor and EOD personnel who may be required to leave sheltering to perform duties and functions. SCALP is also applied by units performing decontamination operations where personnel may become soaked by decontaminants and Medical Services personnel with potential for prolonged contact with body fluids. Standard wet-weather gear (e.g., poncho, rain parka, rain suit, etc.) is also applied as a barrier against saturation of the warfighter's protective ensemble by contact with liquids such as rain, sea spray, etc. The M-2 apron is applied by personnel performing decontamination aprons and is worn over the ensemble. The apron is full length and sleeve to maximize coverage, although the back is open. COTS assets meeting OSHA requirements (and NFPA for firefighters) is applied by selected civilian personnel performing specific functions such as firefighting, EMS, hazardous materials, etc. Medical barrier impermeable barrier protective assets may also be applied by Medical Services practitioners potentially at risk for contact with fluids.

<sup>7</sup> The Service-specific ensembles, footwear, hand covers, and other percutaneous protective assets are designed for disposal following exposure to CBRN/TIM agents. However, selected assets are designed to be decontaminated and reused rather than disposal. These include the M-2 protective apron and BVO/GVO footwear covers. Expendable/consumable CBRND percutaneous protective assets are a consideration in the planning, acquisition, positioning, and allocation of logistics resources supporting operations. The diversity of percutaneous assets between the services places an increased logistical burden upon planners and the logistics systems to accommodate unique service requirements. Limited standardization does exist, such as footwear covers, aviator disposable coverings, ensembles (the BDO is used by the U.S. Army and USAF), but not all expendable and consumable assets are standard across the services. Doctrine, policy, procedures, and TTPs include the planning, identification, positioning, and allocation by the command staff of these assets to ensure their availability to the force.

<sup>8</sup> Forces are not protected against all identified threat CBRN/TIM capabilities. Medical prophylaxis does not exist for all threat CBRN/TIM agents. Current prophylaxis and supporting doctrine, policy, and procedures do not address presymptomatic medical CBRND protective countermeasures by other than U.S. forces, excluding MWAs and eligible civilians. Prophylaxis against most high-threat TIMs are not currently available due to the relatively recent consideration of these agents as a potential threat. Additionally, the efficacy of existing prophylaxis, particularly vaccines, widely varies. Military personnel are administered and/or issued CBRND medical countermeasures for operations with threat. Vaccines for selected biological agents, topicals, and preexposure and/or post-exposure/presymptomatic medications are applied to mitigate or preclude the effects of specific CBRN/TIM agents. Currently, preexposure prophylaxis is available for nerve agents (G and V series), and vesicants (H, HD, HN, L, CX), topical only. SERPACWA is the preexposure countermeasure for vesicants and one nerve agent. TSP is approved by the FDA as a supplement for SERPACWA. Post-exposure prophylaxis is available for pulmonary (CG) agent, but is not FDA approved. Radioprotective steroids and neutraceuticals may be effective as pre- and post-exposure prophylactics. 5-androstenediol is an IND preexposure treatment for radiological exposure. Iodide/potassium iodide is FDA approved for application against Iodine 131, 132, 134, and 135. Post-exposure radiological exposure prophylaxis consists of neutraceuticals, plant isoflavone genistein, and alpha tocopherol (Vitamin E) but are not approved by the FDA for prophylaxis against radiation. FDA-approved preexposure medical countermeasures are available for anthrax, cholera, HFRS (Haantan), Rift Valley fever, yellow fever, HFRS (Haantan), and smallpox. IND status vaccines are currently available for Q-fever, tularemia (although use has been placed on hold by the FDA), Botulinum, Junin hemorrhagic fever, and VEE/WEE/EEE. Antiviral/bacterial medications may be administered and/or issued to provide a level of protection against biological agents.

<sup>9</sup> Medical CBRND materiel, including consumables and expendables, are administered, issued, and prepositioned for identified CBRN/TIM threats. The types, quantities, movement, administration, issuance, and positioning of medical CBRND materiel is addressed by the command and support staffs during the planning and support for operations and is addressed in doctrine, policy, and procedures. Expeditionary and highly mobile force operations are particular concerns. Availability of spares and resupply will be limited for expeditionary forces during the period until the theater matures (usually the first 30–90 days). Highly mobile forces maneuvering and operating in austere environments, behind adversary lines, and possessing reduced logistical footprints are similarly constrained. The individual combat load also places limitations upon weight and type of equipment and consumables. Protective materiel may be reduced or eliminated despite threat level. Medical CBRND materiel for MWAs is virtually nonexistent. The application of presymptomatic medical CBRND materiel to eligible civilians is not addressed in current doctrine, policy, and procedures. Sustained operations within a CBRN/TIM environment are not adequately addressed in DOTLPF and, subsequently, in planning.

<sup>10</sup> Medical CBRND materiel, including consumables and expendables, are administered, issued, and prepositioned for identified CBRN/TIM threats. The types, quantities, movement, administration, issuance, and positioning of medical CBRND materiel is addressed by Medical Services, JTF, and unit staffs during the planning and support of operations and is addressed in doctrine, policy and procedures. Expeditionary and highly mobile force operations are particular concerns. Availability of spares and resupply will be limited for expeditionary forces during the period until the theater matures (usually the first 30–90 days). Highly mobile forces maneuvering and operating in austere environments, behind adversary lines, and possessing reduced logistical footprints are similarly constrained. The individual combat load also places limitations upon weight and type of equipment and consumables. Protective materiel may be reduced or eliminated despite threat level. Medical CBRND materiel for MWAs is virtually nonexistent. The application of presymptomatic medical CBRND materiel to eligible civilians is not addressed in current DOTLPF. Sustained operations within a CBRN/TIM environment are not adequately addressed in DOTLPF and, subsequently, in planning.

<sup>11</sup> Inadequate quantities of mobile COLPRO systems exist to support highly mobile and expeditionary operations with reduced footprint. Further, there is insufficient quantities of COLPRO to protect all critical activities and functions within the force. Prioritization is required of the available resources. Current mobile COLPRO systems are predominantly integrated into selected combat vehicles/vessels. Selected U.S. Naval combat vessels may be equipped with full COLPRO (CITADEL). However, these systems are generally restricted to critical operations areas of the ships. The critical areas are contiguous in that they share common bulkheads and movement between areas is not prevented. CCAs are operated in areas located between the covered areas and the remainder of the ship. These areas are designated. The remainder of the interior of the vessel uses the Circle William concept. Circle William requires prior warning of the presence of a CBRN/TIM in the path of the ship or knowledge of an impending attack to be fully effective. This concept requires the shutdown of the ventilation system and sealing of hatches, bulkheads, and other such openings to seal the interior of the vessel from intrusion by a CBRN/TIM. However, the majority of these actions are performed manually and are initiated upon detection of the potential CBRN/TIM agent. There are concerns about the potential for large amounts of a CBRN/TIM agent to be drawn in by the high-velocity ventilation systems and dispersed throughout the interior of the ship during the period between agent encounter and completion of Circle William. There are concerns about the ability of the vessel to remain in Circle William until it is determined the vessel is no longer exposed to a CBRN/TIM. U.S. Naval combat vessels with full COLPRO of their critical functions currently include the DDG-51 class of destroyers, selected LSDs (vessel hulls 44 through 52), LHDs (vessel hulls 1 through 6), LHAs (vessel hulls 1 through 5), and four of the AOE-6 (vessel hulls 6 through 8 and 10) class ships. Submarines are considered fully protected so long as they remain sealed and do not take in air. The LHD and LHA Amphibious Assault Ships are undergoing a COLPRO Backfit of SCPE for their critical functions. Other areas of these ships will use the Circle William Concept. Carriers, frigates, cruisers, DD-963 class destroyers, and other vessels not discussed earlier in note, do not currently afford their critical functions full COLPRO. Naval hospital ships, U.S. Naval auxiliaries, and USCG vessels are not equipped with COLPRO. Areas critical to the safe operation of the ship may not be protected against CBRN/TIMs. Ability of these vessels to successfully incorporate a concept similar to Circle William is a concern. There are also concerns about the ability of these vessels to prevent infiltration of CBRN/TIM into their interior. Infiltration of vapors can cause a build up of concentrations within the vessel that could exceed the levels surrounding the ship. USCG vessels are under the control and direction of DoD during a declared war. The USCG, however, is under the auspices of the Department of Homeland Security during peacetime. USCG vessels are often attached to U.S. operations overseas for port security, coastal patrol, and similar functions. USCG personnel are also dispatched with military forces deploying overseas for peacekeeping and other operations. USCG vessels and personnel served in Vietnam, Haiti, Granada, and other force deployments. The ability of USCG resources to effectively integrate into DoD operations involving potential CBRN/TIM events is a concern. Mobile COLPRO are armored or soft-skinned vehicle-supported and -based systems. They include both ground and air platforms. The operation of the COLPRO may not be supported while the vehicle is in motion. They may or may not include CBRN/TIM filtration systems. Mobile COLPRO run the full range of protective capabilities from passive to fully protective COLPRO. The majority of vehicles qualify as passive COLPRO, provided the exchange of air between the interior and the exterior is limited. Mobile COLPRO systems generally do not provide protection for large numbers of personnel. Currently, the M1A1 Abrams MBT and the M93A1 FOX NBC Reconnaissance System Block I provide full COLPRO for their crews. The CBPS is a general use fully protective COLPRO system mounted on an ECV HMMWV. The CBPS may be used for C4 operations, as aid stations, or for other needs. A variety of Environmental Sheltering with Reduced CB Hazard (ESRCBH) CPS exist in a small percentage aircraft and other vehicles. The majority of these provide clean filtered

air through piping or hose systems. In both the ESRCBH CPS and passively protective COLPRO systems, the occupants must wear a minimum of respiratory/ocular protection. Combat crewed vehicles are not generally equipped with CBRN/TIM filtration systems. These vehicles are not able to provide clean filtered air to crew and passengers and thereby extend the operational capabilities of the force. Support vehicles are similar to combat vehicles in that they do not routinely have CBRN/TIM filtration systems. Operators and passengers must, as with the combat vehicles, depend upon their IPE for clean air and protection. Unlike the combat-crewed vehicles, support vehicles generally are more open for infiltration by CBRN/TIM agents. Most airframes are also not equipped with CBRN/TIM filtration systems. They are either open exchange (normally lower altitude airframes) or provide the ability to switch to bottled air (usually jet aircraft). The concern is the aircrew are dependent upon the filtration systems of their IPE to provide clean filtered air. This reduces the extended operational time of the aircrew to that of their IPE. A concern is the inability to conduct mobile combat operations and to move large numbers of troops throughout a CBRN/TIM hazard area without the need to maintain them in IPE. Degradation of performance is a factor after a period of time wearing IPE.

<sup>12</sup> Mobile COLPRO expendables and consumables include filters, fuel, batteries, and other assets designed for replacement or disposal. These are identified in the applicable technical manuals and directives and are a consideration in the planning, acquisition, positioning, and allocation of logistics resources supporting operations. The diversity of COLPRO assets between the services does place an increased logistical burden upon planners and the logistics systems to accommodate unique requirements for specific systems. Limited standardization does exist, such as certain filters, but not all expendable and consumable components are standard across the services and systems. Doctrine, policy, procedures, and TTPs include the planning, identification, positioning, and allocation by the command staff of these assets to ensure their availability to the force.

<sup>13</sup> There are insufficient quantities of COLPRO to protect all critical activities and functions within the force. Prioritization is required of the available resources. The USMC MGPTS with CB Protective Liner System provides a positive-pressure, filtered-air, toxic-free shelter for protection against CBRN agents. However, there are insufficient quantities to protect all critical activities and functions from CBRN/TIM effects. The CP-DEPMEDS provides a clean, toxic-free, environmentally controlled, patient treatment area and the components are designed to integrate as field hospitals. They are packaged as a set for deployment to threat areas for hospital operations. The entire composite hospital consists of expandable tentage, passageways, environmental control units, and ISO shelters. The CP-DEPMEDS exist in very limited quantities. Although it could be applied to provide COLPRO to the task identified groups, its designed and primary function is that of medical care. A similar COLPRO is the USAF's CP-EMEDS, which is an air-transportable medical facility deployable in various configurations from a single shelter to a 25-bed patient hospital. The CP-EMEDS is in a very limited number and, like the CP-DEPMEDS, is designed for its primary function of the provision of medical care. The USAF CP-SSS is a small-scale CPS applied for the conduct of C2 operations, maintenance of critical equipment, force beddown, and the provision of R2 for sortie generators and key leadership. This shelter is in limited supply and unlikely sufficient quantities would be available to support a group of any size, especially during operations against an adversary. The M20/M20A1 SCPE is a lightweight, modular system involving a liner designed for inflation within a room or building. The M20A1 serves to bridge the gap between the M20 SCPE and CBPS. Quantities are limited and are not likely to be available in any large quantity during operations against an adversary. Current COLPRO systems are not available in the quantities and types necessary to support the protection of eligible civilians and detainees. Current plans generally do not address the application of COLPRO to non-force personnel and do not allocate the limited COLPRO resources to this activity. Fixed-site COLPRO within the United States and its territories is predominantly designed for nuclear fallout and does not address other CBRN/TIM hazards and threats arising after September 11, 2001. Selected critical key facilities are equipped with CBRN COLPRO, but are not available to other than designated personnel and specific functions and activities. Fixed-site CBRN COLPRO is installed in facilities housing selected activities and functions within HTAs. However, these are not present for all critical activities and functions. However, the Guardian Program is reviewing FP protective measures at U.S. installations and facilities and will address COLPRO for critical activities/functions. The Guardian Program, however, is not likely to address field COLPRO operations.

<sup>14</sup> Site COLPRO expendables and consumables include filters, fuel, batteries, and other assets designed for replacement or disposal. These are identified in the applicable technical manuals and directives and are a consideration in the planning, acquisition, positioning, and allocation of logistics resources supporting operations. The diversity of COLPRO assets between the services does place an increased logistical burden upon planners and the logistics systems to accommodate unique requirements for specific systems. Limited standardization does exist, such as certain filters, but not all expendable and consumable components are standard across the services and systems. Additionally complicating logistical support are legacy systems installed into MILCON facilities within HTAs and selected CONUS locations, as well as older vessels. These systems will vary based upon when the system was installed, facility/vessel design, and other factors largely associated with the age of the system. Doctrine, policy, procedures, and TTPs include the planning, identification, positioning, and allocation by the command staff of these supporting expendable and consumable assets to ensure their availability to the force for COLPRO operations.

<sup>15</sup> Plans incorporate MOPP levels and methodologies are adjustable to meet local operations and threat needs as determined by the commander. MOPP levels and methodologies define protective requirements and readiness for various level of threat and include the activation and operation of COLPRO as well as the wear and readiness of IPE by the force. MOPP levels and methodologies seek to protect the force through an integrated DOTLPF, COLPRO, and IPE scaled approach.

<sup>16</sup> The command staff reviews identified forces and the potential threat for planned operations. Specified forces, time permitting, train and prepare for operations involving the potential threat. Equipping the tasked force is an integral part of planning and preparation. The command staff tracks force readiness for planned operations. Readiness issues are addressed by the staff. The combination of established force organic assets, material acquisitions, prepositioned material, and movement of identified CBRND resources from assigned stockpiles and reallocation activities are pursued by the command staff to prepare and support deploying forces as outlined by the appropriate plan. Expeditionary operations are a particular concern as most CBRND systems and associated logistics are not designed for a highly mobile force, with a reduced logistical footprint, and for the initial period of operations until the theater matures (usually the first 30–90 days). Deploying units may not possess full CBRND resources and capabilities during the initial stages of deployment and until after arrival within the AO. The individual combat load places limitations upon weight and type of equipment and consumables. Protective equipment may be reduced or eliminated despite threat level. Additionally, deploying eligible civilians and MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment. The command staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians and MWAs. Sustained operations within a CBRN/TIM environment are not adequately addressed in DOTLPF and, subsequently, in planning.

<sup>17</sup> Doctrine, policy, and procedures are adequate for planning, movement, management, and positioning of materiel (including CBRND materiel) in support of operations. CBRND materiel for an operation addresses the identified CBRN/TIM threat. The allocation of CBRND materiel is managed by the command staff. Expeditionary operations are a particular concern. Availability of spares and resupply will be limited during the period until the theater matures (usually the first 30–90 days). Maneuvering highly mobile forces operating in austere environments, behind adversary lines, and possessing reduced logistical footprints are similarly constrained. The individual combat load also places limitations upon weight and type of equipment and consumables. Protective equipment may be reduced or eliminated despite threat level. Sustained operations within a CBRN/TIM environment are not adequately addressed in DOTLPF and, subsequently, in planning.

<sup>18</sup> Medical CBRND materiel, including consumables and expendables, are administered, issued, and prepositioned for identified CBRN/TIM threats. The types, quantities, movement, administration, issuance, and positioning of medical CBRND materiel is addressed by the JTF staff and supporting staffs during the planning and support for operations and is addressed in doctrine, policy, and procedures. Expeditionary and highly mobile forces are particular concerns. Availability of spares and resupply will be limited for expeditionary forces during the period until the theater matures (usually the first 30–90 days). Highly mobile forces maneuvering and operating in austere environments, behind adversary lines, and possessing reduced logistical footprints are similarly constrained. The individual combat load also places limitations upon weight and type of equipment and consumables. Protective materiel may be reduced or eliminated despite threat level. Medical CBRND materiel for MWAs is virtually nonexistent. The application of presymptomatic medical CBRND materiel to eligible civilians is not addressed in current doctrine, policy, and procedures. Sustained operations within a CBRN/TIM environment are not adequately addressed in DOTLPF and, subsequently, in planning.

<sup>19</sup> The command staff plans for operations using JTF plans for the potential threat. Equipping the force is an integral part of planning and preparation. The combination of established force organic assets, material acquisitions, prepositioned material, and movement of identified CBRND resources from unit designated stockpiles and reallocation activities are pursued by the command staff with the JTF staff to prepare and support the force as outlined by the appropriate plan. However, sustained operations within a CBRN/TIM environment are not adequately addressed in DOTLPF and, subsequently, in planning.

<sup>20</sup> Available CBRND systems are not prepositioned in sufficient quantities to support concurrent military operations. Timing for replenishment of systems is dependent upon operational consumption, available replenishment stocks within the AO and in the line of communications, manufacturing capabilities, system age, and funding availability. Production for replenishment by industry may require a period to expand or establish manufacturing capabilities which could exceed the necessary replenishment timeline. This concern is particularly applicable when components or systems are dependent upon non-U.S. manufacturing capabilities. Expeditionary operations are a particular concern. Availability of spares and resupply will be limited during the period until the theater matures (usually the first 30–90 days). Maneuvering highly mobile forces operating in austere environments, behind adversary lines, and possessing reduced logistical footprints are similarly constrained. The command staff coordinates operational replenishment requirements with the JTF staff and reallocates available resources to meet critical operational needs, as necessary. Sustained operations within a CBRN/TIM environment are not adequately addressed in DOTLPF and, subsequently, in planning.

<sup>21</sup> Plans, guidance, threats, taskings, and operational requirements are assessed by the command staff to determine operational requirements, including CBRND. However, dual taskings can occur on specific resources necessitating changes in resource taskings for operations. Unsatisfied requirements are reviewed for potential adjustments within available resources and/or identification and action for resolution. Limitations upon resource availability may necessitate adjustments to the planned mix and quantities. These adjustments may impact optimal CBRND protection with implications for operational planning and support. Identification of unsatisfied requirements are coordinated with the JTF staff for review and resolution assistance by the command staff.

<sup>22</sup> Doctrine, policy, and procedures for operational planning and operations management require the involvement and integration of all core and supporting functions and activities. Support requirements for CBRND are addressed in planning when there exists a CBRN/TIM threat. The command staff collects, processes, interprets, and acts upon information

obtained from all applicable resources. This requires a fully integrated staff effort for accurate and timely decision-making. However, sustained operations within a CBRN/TIM environment are not adequately addressed in DOTLPF and, subsequently, in planning.

<sup>23</sup> Legacy systems will remain in the inventory throughout the mid term. These systems will be gradually replaced by new joint systems of respiratory/ocular protection as they are fielded. The JSAM replaces the Service-specific systems. When incorporated with anti-G protection of high-performance aircraft aviators, the JSAM will provide simultaneous CBRN and anti-G protection. The JSAM is compatible with existing and programmed CBRN IPE, provides flame and thermal protection, and reduces the heat stress associated with existing systems of ocular/respiratory protection. Further, the JSAM may be donned and doffed during flight. The JSGPM also replaces current Service-specific ocular/respiratory protection. The system provides respiratory and ocular protection from CBRN agents and selected TIMs. The field-of-vision is improved and encumbrances associated with legacy systems are reduced. The JSGPM incorporates state of the art technology and is designed to integrate with future warfighter CBRND IPE and function equipment/assets. The JCESM is a COTS one-time use, one-size-fits-all, respiratory/ocular protective system affording 2 hours of protection and is lightweight and disposable. The system is designed to provide low-level CBRN vapor, aerosol, and particulate protection to the wearer for egressing the contaminated environment. The JCESM is projected for use when standard respiratory/ocular protection is not practical. The JCESM is not programmed for general dissemination. The Guardian Program is projected to review, assess, and implement protection for critical members of the installation/facility populace during the mid term. This will predominantly be COTS-based assets for respiratory/ocular protection. However, the Guardian Program is not expected to address eligible civilian protection within the AO for other than existing U.S. military installations and facilities. MWA respiratory/ocular protection is not programmed or forecasted.

<sup>24</sup> Fielding of standard joint Service CBRND respiratory/ocular protection will reduce logistical impacts and enable reallocation of related consumables/expendables between elements of the force within the AO. Standardization reduces the logistics impact and simplifies planning and support of operations. However, replacement of existing Service-specific systems will be performed over time and into the far term. Continued support of Service-specific systems will be required until removed from operational stocks.

<sup>25</sup> Legacy systems will remain in the inventory throughout the mid term. These systems will be gradually replaced by new joint systems of percutaneous protection as they are fielded. The JSLIST NBC Protective Garment is a two-piece, risk-taking, overgarment with integrated hood affording protection against CBRN agents and selected TIMs. The garment reduces the physiological and psychological encumbrances associated with legacy systems. The JSLIST is under evaluation by NIOSH for application to OSHA protection requirements. The JPACE replaces the Service-specific systems. The JPACE provides aircrew members with equivalent protection to the JSLIST ensemble. The JPACE is designed to not interfere with emergency ejection from a combat aircraft and continues to provide CBRN percutaneous protection following ejection and during escape and evasion operations. The ensemble is both flame-retardant and self-extinguishing to permit emergency egress from a burning aircraft. Further, the ensemble provides CBRN protection when subject to rotor, propeller, and jet wash. Joint Service glove upgrades are provided under the Joint Block 1 and 2 Glove Upgrade Program (JB1/2GU) in the near and mid term. The JB1GU responds to an urgent need by designated elements of the force for increased tactility/durability supporting mission requirements. The JB1GU is expected to meet most of the requirements within the JSLIST ORD and is viewed as an evolutionary approach in the development of the JB2GU. Versions under consideration include a protective inner glove worn under existing warfighter gloves, a replacement glove for existing hand wear, or a combination of glove shell and liner affording CBRN protection of the legacy gloves they are projected to replace. The JFIRE addresses protection of military firefighters within a CBRN/TIM environment conducting firefighting operations involving structural and crash/firefighting/rescue. The JFIRE incorporates the JSLIST into firefighter bunker gear. The MULO is projected to replace legacy footwear covers. The ability of the MULO to provide adequate antislip protection for USN personnel asea is under review. The Guardian Program is projected to review, assess, and implement protection for critical members of the installation/facility populace during the mid term. This will predominantly be COTS-based assets for percutaneous protection. However, the Guardian Program is not expected to address eligible civilian protection within the AO for other than existing U.S. military installations and facilities. MWA percutaneous protection is not programmed or forecasted.

<sup>26</sup> Fielding of standard joint Service CBRND percutaneous protection will reduce logistical impacts and enable reallocation of related consumables/expendables between elements of the force within the AO. Standardization reduces the logistics impact and simplifies planning and support of operations. However, replacement of existing Service-specific systems will be performed over time and into the far term. Continued support of Service-specific systems will be required until removed from operational stocks.

<sup>27</sup> Cell Culture Derived Vaccinia is projected for production during the near-term. Clostridium Botulinum Toxin Medical Defense System is projected for availability during the mid term for Serotypes A, B, C, E, and F. The SERPACWA Active TSP is also projected for production during the late mid term.

<sup>28</sup> Fielding of the P3I upgraded CBPS for heavy/airborne use is projected for the mid term, as are two variants of the JSLNBCRS, and the M93A1 Fox NBCRS Block II.

<sup>29</sup> Integration of standardized COLPRO systems into the design and backfit of mobile systems for CBRND operations will gradually replace legacy systems and their associated logistics support requirements. Further, the cross-service (primarily USAF, USMC, and U.S. Army) fielding of the CBPS provides a basis for further standardization of common mobile COLPRO system requirements between the services.

<sup>30</sup> JTCOPS Block I is projected for initial fielding during the mid term. The projected initial capabilities fielding of JECF is within the mid term and will include adaptive insertable COLPRO systems (including liner) for existing buildings/rooms and stand-alone COLPRO for small groups of personnel. JECF may provide the capability to provide COLPRO for critical activities and functions; however, JECF acquisition quantities have not as yet been determined.

<sup>31</sup> Integration of standardized COLPRO systems into the design and backfit of site systems for CBRND operations will gradually replace legacy systems and their associated logistics support requirements. Further, the cross-service fielding of JECF and JTCOPS provides a basis for further standardization of common site COLPRO system requirements between the services.

<sup>32</sup> The next-generation series of aviator and nonaviator masks is in R&D. The capabilities and fielding of these masks are not as yet determined.

<sup>33</sup> The next-generation series of aviator and nonaviator percutaneous protective assets are in R&D. The capabilities and fielding of these assets are not as yet determined.

<sup>34</sup> Active TSPs are projected for replacement of SERPACWA TSP and SERPACWA Active TSP in the far term. The Chemical Agent Prophylaxis and Cyanide Pretreatment are also projected for the far term. The Multivalent VEE Vaccine is projected to begin production in FY2013. The Next-Generation Anthrax Vaccine, Tularemia Vaccine, and Plague Vaccine are projected for production beginning in FY2010. Serotypes A and B are addressed in the Recombinant Bivalent Botulinum Vaccine projected for production in FY2012. A number of R&D efforts are under way for the development of preexposure and post-exposure prophylaxes. Potentially, these efforts may produce viable prophylaxes within the mid and far term resulting in fielded material. However, possible resulting prophylaxes cannot be predicted at this time.

<sup>35</sup> The projected Future Tactical Lift Option is under evaluation for the potential addition of COLPRO in the design and production specifications. A decision on the inclusion of COLPRO in the LHA(R) is expected in the mid term.

<sup>36</sup> JTCOPS Block II is projected for the far term. Continued fielding of JECF.

### 13.8.3 Functional Solutions Analysis

#### 13.8.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** CBRND protective equipment and measures do not protect against all CBRN/TIM agents.  
**Partial Non-Materiel Solutions:** *Doctrine:* Ensure doctrine effectively describes the limitations of CBRND protective equipment to enable users to choose appropriate equipment for the threat encountered. *Leadership:* Enforce compliance with established standards (see Doctrine) for prophylactic CBRND protection.
- 2. Deficiency:** Medical prophylaxis does not exist for all threat CBRN/TIM and TIM agents.  
**Partial Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards for prophylactic CBRND protection against all threat agents. *Training:* Train, exercise, and evaluate personnel (military and eligible civilians) on the use of prophylactic CBRND protection against threat agents. *Leadership:* Enforce compliance with established standards (see Doctrine) for prophylactic CBRND protection. Implement and ensure training is adequate and conduct exercises and evaluations to ensure readiness.
- 3. Deficiency:** Encumbrances associated with ocular/respiratory and percutaneous protection degrade performance and limit the conduct of certain tasks.  
**Partial Non-Materiel Solutions:** *Doctrine:* Enforce existing doctrine addressing prolonged wear of IPE. *Organization:* Develop organizational structures, resources, staffing, and capabilities to support personnel exchange and R2 to preclude degradation of tasks and to promote the well-being of the force. *Training:* Ensure training, exercises, and evaluations effectively promote acclimation and endurance of wear of IPE. *Leadership:* Ensure awareness of degradation effects.
- 4. Deficiency:** Current doctrine, the *UJTL*, and operational planning do not adequately address sustained operations within a CBRN/TIM environment.  
**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, procedures, and *UJTL* sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.
- 5. Deficiency:** Expeditionary operations are a particular concern as most CBRND systems and associated logistics are not designed for a highly mobile force, with a reduced logistical footprint, and for the initial period of operations until the theater matures (usually the first 30–90 days).

**Non-Materiel Solutions:** *Doctrine:* Complete the JCIDS process and central correlation/comparison of national and strategic plans to identify CBRND resources necessary and available to support expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct expeditionary operations while possessing reduced logistical footprint and during the first 30–90 days of operations following commencement of hostilities. *Training:* Train, exercise, and evaluate expeditionary capabilities of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operations using CBRND resources supporting expeditionary operations. *Leadership:* Recognize differences and challenges associated with expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint, training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.

6. **Deficiency:** Not all critical facilities and activities are equipped with COLPRO.

**Non-Materiel Solutions:** *Doctrine:* Enforce existing doctrine and policy.

7. **Deficiency:** Current mobile COLPRO is inadequate to support operations by highly mobile forces.

**Non-Materiel Solutions:** *Doctrine:* Complete analysis and central correlation/comparison of national and strategic plans to identify quantities and types of mobile COLPRO (and supporting consumables) necessary and available to support highly mobile forces for envisioned plans and taskings. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct CBRND, including mobile COLPRO, of highly mobile forces. *Training:* Train, exercise, and evaluate CBRND, including mobile COLPRO, capabilities of the force in a CBRN/TIM threat during highly mobile force operations. *Leadership:* Recognize differences and challenges associated with CBRND operations by highly mobile forces, training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for CBRND of highly mobile forces.

8. **Deficiency:** Maneuvering forces are inadequately equipped with COLPRO capabilities.

**Non-Materiel Solutions:** *Doctrine:* Complete the JCIDS process and central correlation/comparison of national and strategic plans to identify CBRND resources necessary and available to support maneuver operations, particularly expeditionary operations during the first 30–90 days following commencement of hostilities, with a reduced logistical footprint. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct maneuver operations, particularly expeditionary operations during the first 30–90 days of operations following commencement of hostilities, while possessing reduced logistical footprint. *Training:* Train, exercise, and evaluate maneuver capabilities (particularly expeditionary capabilities) of the force in a CBRN/TIM threat with reduced

logistical footprint during the initial 30–90 days of operations using organic, prepositioned, and planned CBRND resources supporting operations. *Leadership*: Recognize differences and challenges associated with maneuver operations, particularly expeditionary operations during the first 30–90 days following commencement of hostilities, with a reduced logistical footprint; training providing skills and knowledge to manage operations in these circumstances; and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities*: Develop supporting infrastructure for expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.

**9. Deficiency:** Inadequate COLPRO to support expeditionary and highly mobile forces.

**Partial Non-Materiel Solutions:** *Doctrine*: Develop and disseminate appropriate doctrine, policy, and procedures for the application of common materials for COLPRO and for COLPRO kits and components. *Organization*: Develop organizational structures, resources, staffing, and capabilities to enable effective application of available COLPRO and implementation of expedient COLPRO capabilities. *Training*: Establish initial and recurring training of all members of the force on the conduct of expedient COLPRO. Exercises and evaluations incorporate criteria challenging this capability. *Leadership*: Recognize potential for expedient COLPRO to improve force capabilities and survivability. *Facilities*: Develop supporting infrastructure enabling expedient COLPRO and the effective application of available COLPRO.

**10. Deficiency:** Quantities and availability of mobile COLPRO is inadequate.

**Non-Materiel Solutions:** *Doctrine*: Complete analysis and central correlation/comparison of national and strategic plans to identify quantities and types of mobile COLPRO (and supporting consumables) necessary and available to support highly mobile forces for envisioned plans and taskings. *Organization*: Develop organizational structures, resources, staffing, and capabilities to conduct CBRND, including mobile COLPRO, of highly mobile forces. *Training*: Train, exercise, and evaluate CBRND, including mobile COLPRO, capabilities of the force in a CBRN/TIM threat during highly mobile force operations. *Leadership*: Recognize differences and challenges associated with CBRND operations by highly mobile forces, training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities*: Develop supporting infrastructure for CBRND of highly mobile forces.

**11. Deficiency:** Most naval vessels (including supply and transport vessels, carriers, and others) do not possess COLPRO.

**Partial Non-Materiel Solutions:** *Doctrine*: Incorporate into doctrine, policy, and procedures the provision of COLPRO for at-risk vessels (civilian contract and military). *Organization*: Develop organizational structures, resources, staffing, and capabilities to support COLPRO operations on vessels supporting operations and at-risk. *Training*: Train, exercise, and evaluate crews for vessel COLPRO operations for CBRND. *Leadership*: Recognize differences and challenges associated with CBRND operations by at-risk vessels (both military and contract civilian) supporting operations. *Facilities*: Develop supporting infrastructure (e.g., logistics, maintenance, power systems, etc.) for vessel COLPRO.

**12. Deficiency:** USCG assets supporting operations are not adequately equipped with CBRND assets and resources.

**Partial Non-Materiel Solutions:** *Doctrine:* Establish with doctrine, policy, and procedures responsibilities for equipping, training, and supporting USCG assets supporting force operations during periods of other than declared war. *Organization:* Develop organizational structures, agreements, resources, and staffing to support and ensure survivability of supporting USCG resources. *Training:* Train, exercise, and evaluate USCG CBRND capabilities as integral component of force. *Leadership:* Recognize differences and challenges associated with CBRND operations by USCG assets and personnel, training providing skills and knowledge to managed operations involving these assets, and the ability and willingness to implement necessary changes and activities to prepare for and conduct operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for CBRND of the force, including allocated USCG assets and personnel.

**13. Deficiency:** Airlift assets (both tactical and strategic) are not equipped with COLPRO.

**Partial Non-Materiel Solutions:** *Doctrine:* Incorporate into doctrine, policy, and procedures the provision of COLPRO to aircrew and passengers in appropriate airframes (military and civilian). *Training:* Train, exercise, and evaluate aircrews and supporting entities for airframe COLPRO operations for CBRND. *Leadership:* Recognize criticality of protecting aircrew and passengers of appropriate tactical and strategic airframes from the effects of CBRN/TIM agents. *Facilities:* Develop supporting infrastructure (e.g., logistics, aircraft maintenance, etc.) for airframe COLPRO.

**14. Deficiency:** DOTLPF for Protective Posture Protocols is inadequate or nonexistent addressing CBRND of eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing eligible civilian personnel for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of eligible civilian personnel within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians; and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilian personnel.

**15. Deficiency:** DOTLPF for Protective Posture Protocols is inadequate or nonexistent addressing CBRND of MWAs.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing MWDs for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of MWDs within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWDs and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWDs.

**16. Deficiency:** Deploying eligible civilians are not equipped and trained to survive a CBRN/TIM environment.

**Partial Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of eligible civilians and training for CBRN/TIM environment survival. *Organization:* Ensure organizational consideration for maintenance and support of eligible civilians CBRND protective equipment, measures, and activities. *Training:* Establish institutional and unit training of eligible civilians for CBRND measures and activities. Integrate into CBRND exercises and evaluations. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for eligible civilians survivability. *Facilities:* Develop supporting infrastructure for eligible civilians CBRND (e.g., logistics, medical, communications, training, etc.).

- 17. Deficiency:** Deploying MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment.

**Partial Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of MWAs, particularly MWDs, and training for CBRN/TIM environment survival. *Organization:* Ensure organizational consideration for maintenance and support of MWA CBRND protective equipment, measures, and activities. *Training:* Establish institutional and unit training of MWA handlers, and MWA for CBRND measures and activities. Integrate into CBRND exercises and evaluations. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for MWA survivability. *Facilities:* Develop supporting infrastructure for MWA CBRND (e.g., logistics, medical, veterinary surveillance, communications, training, etc.).

- 18. Deficiency:** The command staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing civilian personnel and operations for CBRND. *Organization:* Identify organizational services and activities supporting the mission performed by civilian personnel and operations. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs eligible civilians; and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection eligible civilians. *Personnel:* Ensure that eligible civilians supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities:* Develop supporting infrastructure for eligible civilian CBRND (e.g., logistics, medical, training, communications, etc.).

- 19. Deficiency:** The command staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying MWAs.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing MWA, particularly MWD, survivability and mission and operations for CBRND. *Organization:* Identify organizational services and activities supporting MWA survivability and CBRN/TIM environment operations. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWDs and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWAs. *Facilities:* Develop supporting infrastructure for MWD CBRND (e.g., logistics, medical, veterinary surveillance, training, communications, etc.).

- 20. Deficiency:** Current prophylaxes and supporting DOTLPF do not address presymptomatic medical CBRND protective countermeasures for eligible civilians and non-U.S. forces.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and TTPs guidance and instructions for the application of presymptomatic medical CBRND protective countermeasures for eligible civilians and non-U.S. forces. *Organization:* Ensure resources, taskings, and staff are in place or available to plan, disseminate/administer, and monitor presymptomatic medical CBRND protective countermeasures for eligible civilians and non-U.S. forces. *Training:* Train, potential eligible civilians on presymptomatic medical CBRND protective countermeasures. *Leadership:* Recognize criticality of protection of eligible civilians within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply force resources. *Facilities:* Develop supporting infrastructure to support presymptomatic medical CBRND protective countermeasures of eligible civilians.
- 21. Deficiency:** Current prophylaxes and supporting DOTLPF do not address presymptomatic medical CBRND protective countermeasures for MWAs.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and TTPs guidance and instructions for the application of presymptomatic/veterinary medical CBRND protective countermeasures for eligible civilians, non-U.S. forces, and MWA. *Organization:* Ensure resources, taskings, and staff are in place or available to plan, disseminate/administer, and monitor presymptomatic medical CBRND protective countermeasures for eligible civilians, non-U.S. forces, and MWA. *Training:* Train, non-MWA handlers on presymptomatic medical CBRND protective countermeasures. *Leadership:* Recognize criticality of protection of MWAs within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply force resources. *Facilities:* Develop supporting infrastructure to support presymptomatic medical CBRND protective countermeasures of MWAs.
- 22. Deficiency:** Efficacy of existing prophylaxes varies widely.  
**Non-Materiel Solutions:** *Doctrine:* Establish overarching single common standard for prophylaxes efficacy.
- 23. Deficiency:** Not all prophylaxes are FDA approved.  
**Non-Materiel Solutions:** *Doctrine:* Require FDA approval of all prophylaxes, including medications potentially applied as prophylaxes. The latter requires specific approval as prophylactic treatment.
- 24. Deficiency:** Forces have, and may in the future, require medical prophylaxis administration/issue upon arrival in the AOR.  
**Non-Materiel Solutions:** *Doctrine:* Emphasize in doctrine, policies, and procedures for preparation of the force for CBRND protection during and throughout deployment, redeployment, relocation, and en route phases of movement. *Organization:* Ensure resources, taskings, and staff are in place or available to perform CBRND operations within a

CBRN/TIM environment by deploying, redeploying, relocating, and en route forces.

*Training:* Train, exercise, and evaluate the force for CBRND operations within a CBRN/TIM environment while deploying, redeploying, relocating, and en route. *Leadership:* Recognize criticality of readiness of the force for potential CBRND operations within a CBRN/TIM environment while deploying, redeploying, relocation, and en route; training providing the skills to manage the force in these circumstances; and willingness and ability to implement necessary changes and activities to prepare and appropriately protect the force. *Facilities:* Develop supporting infrastructure for CBRND operations of the force while preparing, deploying, redeploying, relocating, and en route.

- 25. Deficiency:** CBRND equipment is often not issued and available to deploying forces until after arrival in the AO.

**Non-Materiel Solutions:** *Doctrine:* Emphasize in doctrine, policies, and procedures for preparation of the force for CBRND protection throughout deployment, redeployment, relocation, and en route phases of movement. *Organization:* Ensure resources, taskings, and staff are in place or available to perform CBRND operations within a CBRN/TIM environment by deploying, relocating, and en route forces. *Training:* Train, exercise, and evaluate the force for CBRND operations within a CBRN/TIM environment while deploying, redeploying, relocating, and en route. *Leadership:* Recognize criticality of readiness of the force for potential CBRND operations within a CBRN/TIM environment while deploying, relocating, and en route. *Facilities:* Develop supporting infrastructure for CBRND operations of the force while deploying, redeploying, relocating, and en route.

- 26. Deficiency:** The individual combat load places limitations upon weight and type of equipment and consumables. Protective equipment may be reduced or eliminated despite threat level.

**Non-Materiel Solutions:** *Doctrine:* Emphasize in doctrine, policies, and procedures for preparation of the force for CBRND protection throughout deployment, redeployment, relocation, and en route phases of movement. *Leadership:* Recognize impact upon mission success and force survivability for reduction of CBRND measures not consistent with threat.

- 27. Deficiency:** Available CBRND systems are not stockpiled and prepositioned in sufficient quantities to support concurrent military operations.

**Non-Materiel Solutions:** *Doctrine:* Institute in doctrine, policy, and procedures the central correlation of national and strategic theater plans and taskings to identify CBRN/TIM support requirements for two or more concurrent operations with threat with comparison to existing and programmed quantities and types of CBRND systems and resources, to include replenishment. *Leadership:* Implement development of plans and taskings consistent with stockpile and prepositioning support capabilities. *Facilities:* Develop supporting infrastructure for CBRND stockpile and prepositioning supporting plans and taskings. Stockpile and preposition as necessary to support determined requirements.

### 13.8.3.2 IMA Assessment Summary

Table 13.8-2 is a list of ideas for material approaches and a corresponding description of each idea. Approaches focus on procurement of existing systems, and development of field-expedient

and modular systems. Vaccines and antidote programs need to be tied to current need projected threats; sufficient quantities need to be procured. Table 13.8-3 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 13.8-2. TASHLD 8: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Assess CBRND material	Test and assess all CBRND material for protective abilities against future threat agents, including TIM.
Chemical air generation	Integrated compounds within warfighter's IPE applying chemical reaction to generate oxygen without reliance upon external sources.
Chemical treatment	Develop solution for treatment of existing MOPP suit and other warfighter clothing fabric that neutralizes or block the effect of CBRN/TIM agents, including future agents.
Combinatorial prophylaxes	Develop prophylaxes affording protection or minimizing the impact from a broad range of CBRN/TIM agents.
Develop COLPRO kits	Develop COLPRO kits containing all necessary supplies to construct field-expedient COLPRO that is easily stored and maintained in ready condition, easily and safely erected, operated, maintained, and struck within a CBRN/TIM environment by IPE-encumbered personnel using minimal resources and supports COLPRO requirements.
Develop and establish generic unit CBRND kits	Develop, preposition, and maintain reserve stocks of generic CBRND kits for a standard unit. Components are adjusted as necessary for specific operations involving threat.
Develop/adapt MWA transport system with pressure/filtration	Develop or adapt MWA transport systems to provide COLPRO protection from CBRN/TIM agents.
Disposable COLPRO	Develop one-time-use COLPRO that is rapidly erected with little instruction, training, and effort and affords term protection for critical activities and functions, maintenance and repair activities, prelocated consumables, as well as personnel associated with this task.
Equipment and supplies protective packaging and containment systems	Investigate and develop standardized CBRN/TIM protective packaging and containment systems (includes sprays, boxes, envelopes, drapes, etc.) for the protection of equipment and supplies from contact with CBRN/TIM agents
Field-expedient COLPRO kits	Develop field-expedient COLPRO kits designed to adapt existing structures, tentage, etc., for the expansion of COLPRO field capabilities and mission support and the provision of collective protection to the force, critical functions and activities, maintenance and repair activities and functions, resources, etc.
Field-expedient COLPRO materials	Identify commonly available materials (duct tape, plastic sheeting, wooden crate, plywood, tarps, coverings, wraps, caulk, sealant gels/sprays, etc.) for application in the construction of expedient COLPRO needed to construct field-expedient COLPRO when COLPRO availability is limited or not advantageous.

Future prophylaxes	Some preexposure prophylaxes for biological agents require several administrations, immunity attainment is time-consuming, or the period of coverage does not address the full operational period. Future prophylaxes should provide immunity against all known threat CBRN and high-risk TIM agents, as well as potential future threat agents, and be FDA approved. CBRND medical countermeasures are needed providing a sustained level of protection over an extended period of time (minimally the operational period), do not require multiple administrations, are easily disseminated and administered, support a minimum level of protection, protect against a broad range of agents, cover the range of preexposure to post-exposure/presymptomatic application needs, and are applicable to the protected population (including eligible civilians).
Improved IPE garments and accessories	Develop new generation of IPE garments and accessories (e.g., boots/boot covers, gloves, hoods, etc.) using modern materials permitting greater range of motion, longer wear without performance degradation, increased durability, integrated into warfighter personal equipment, and protects against all threat CBRN and high-risk TIM agents.
Integrate CBRN/TIM protective features into functional garments	Develop materials integrating CBRN/TIM protective capabilities and design standard functional garments using these materials for protection of the force.
Modular COLPRO	Develop modular COLPRO that can be erected in various configurations to protect various groups of people separately by their designation (EPW, civilian, etc.); accommodates small to large numbers of people; protects all critical activities and functions, MWAs, prelocated consumables, and maintenance/repair activities; and addresses the commander's intent.
Prepositioned/reserve CBRN medical resources	Establish and maintain sufficient stocks of prepositioned and reserve CBRND medical resources identified in plans and required to support multiple operations with threat and ensure availability for expeditious movement to the and within the AO in the event of a CBRN event.
Regenerative filtration	CBRN regenerative filters able to flush retained agent, neutralize agent, or by other inherent means affords extended period of protection.
Topical	Develop topical barrier that is easily applied (i.e., spray), acts as a contact hazard barrier, and affords protection from CBRN/TIM.

Table 13.8-3. TASHLD 8: IMA Assessment

Identified Gaps	Ideas for Material Approaches (IMA)									
	Assess CBRND Material	Chemical Air Generation	Chemical Treatment	Combinatorial Prophylaxes	Develop COLPRO Kits	Develop and Establish Generic Unit CBRND Kits	Develop/Adapt MWA Transport System with Pressure/Filtration	Disposable COLPRO	Equipment and Supplies Protective Packaging and Containment Systems	Field-Expedient COLPRO Kits
CBRND protective equipment and measures do not protect against all CBRN/TIM agents.	X				X	X		X	X	X

### **13.9 Task TASHLD 9: Perform protective measures to prevent or mitigate CBRN/TIM contamination of equipment and supplies**

#### **13.9.1 Functional Area Analysis**

##### **13.9.1.1 Definition**

CBRN/TIM protection can be provided to equipment and supplies by using packaging, coverings, and coatings/materials. Packaging is use of containers to preclude infiltration of agents into protected assets. Includes boxes, bags, cans, enclosed trailers, plastic bottles, shipping containers, etc. Coverings are specifically designed to place over critical assets to protect them from contamination. CBRN/TIM protective features may be added to standard environmental protective qualities. Includes plastic wraps, tarps, and similar covering. Coatings/material encompasses application of protective features to, or incorporation in equipment design to resist penetration/retention of CBRN/TIM agents. Includes films, paints, sprays, etc.

##### **13.9.1.2 Derivation**

*Joint Enabling Concept for CBRN Operations, Protection Joint Functional Concept, UJTL (TA 7, TA 7.1).*

**13.9.1.2.1 Supported Tasks:** OPSHLD 7, OPSHLD 10, OPSHLD 12

**13.9.1.2.2 Lateral Task:** TASHA 15

**13.9.1.2.3 Supporting Task:** N/A

##### **13.9.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Undeveloped to highly developed land. (C1.1.1)
2. Riverine to open sea. (C1.2)
3. Natural and induced air. (C1.3)
4. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

##### **Military**

1. Partially completed mission preparation. (C2.1.3)
2. Negligible personnel experience. (C2.2.4.5)
3. Limited staff expertise. (C2.3.1.3)
4. Abundant deployed supplies. (C2.8.2)
5. Limited CONUS resupply. (C2.8.3)
6. Extensive prepositioned materiel. (C2.8.4)

7. No host-nation support. (C2.8.5)
8. Negligible to limited commercial procurement. (C2.8.6)

**Civil.** N/A

### **13.9.2 Functional Needs Analysis**

#### **13.9.2.1 Capability and Deficiency Assessment Summary**

This task deals with the protection of equipment and supplies against CBRN/TIM using packaging, coverings, and coatings/material. Packaging includes the use of boxes, bags, cans, enclosed trailers, plastic bottles, and shipping containers. Covering includes the use of plastic wraps, tarps, and similar coverings. Coatings/material includes the use of films, paints, and sprays. Table 13.9-1 shows the assessment of these capabilities. The overall capabilities for current, near/mid, and far term are rated “red.” Existing programs are inadequate or nonexistent for this task, and none are currently projected into the near/mid and far terms.

#### **Current Capability and Deficiency**

Current capabilities are limited for the protection of equipment and supplies from CBRN/TIM contamination. Existing DOTLPF addresses protection through the application of policies, standards, and criteria providing for the housing of materiel within structures, multiple layers of plastic wrapping for in-transit materiel, two protective coatings (volatile and nonvolatile chemical agent-resistant coating [CARC]), and limited specific purpose packagings. Open stored materiel is not adequately addressed. Open stored and operationally ready materiel and equipment (e.g., ground support equipment for aircraft, munitions, large equipment asset shipments, etc.) are present in all force operations. Current practices are predominantly the application of coverings such as tarps, tents, buildings, etc., when available. CARC is applied to combat vehicles for easing of decontamination. Not all supplies and equipment are inherently protected or packaged to protect against CBRN/TIM contamination. Certain materials used in the packaging or construction of equipment and supplies may absorb CBRN/TIM agents in vapor form and are not generally known to the force. DOTLPF is limited or nonexistent for the application of commonly available materials for CBRN/TIM protection of assets, capabilities and procedures for handling exposed/contaminated equipment/supplies other than decontamination, protection of open stored material, and training to preclude contamination of assets. There is an absence of doctrine, policy, and procedures establishing protective pack, containerization, packaging, coverings, and coatings for equipment and supplies that conceivably may encounter contamination within a CBRN/TIM environment and address protection of all classes of supply within a CBRN/TIM environment. Further, there is a finite and limited ability to perform containment of contaminated material for storage, handling, and movement.

#### **Projected Near/Mid-Term Capability and Deficiency**

No change is projected for this task.

**Projected Far-Term Capability and Deficiency**

No change is projected for this task.

**13.9.2.2 Resource Systems**

**Individual Protection—Percutaneous Protection—COTS:** Commercially available systems of protection, manufactured and tested meeting OSHA standards for the United States or equivalent organization in other nations.

**Protective Posture Methodology:** Stepped level of CBRND protective measures. Standardized levels permit the rapid increase or decrease of unit protective posture level.

**Unit Staff:** The application of DOTLPF for all phases of operations with threat from preplanning to post-force return to home stations. Includes all aspects of C2 and supporting staff activities/functions (e.g., logistics, intelligence, etc.) enabling mission and task accomplishment.

----	--	---

<sup>1</sup> Not all supplies and equipment are inherently protected or packaged to protect against CBRN/TIM contamination. Specific assets may include CBRN/TIM protection through deliberate requirements for acquisition or the nature of the enclosing packaging. CBRN/TIM protective coverings are limited in coverage and quantities. CBRN/TIM protective coatings are limited to two variants of CARC. CBRN/TIM protective packaging are limited or not identified. Doctrine, policy, and procedures for application of commonly available materials for CBRN/TIM protection are limited or nonexistent.

<sup>2</sup> Equipment and supplies protection is generally seen as placement under coverings (e.g., buildings, tents, tarps, etc.). Unit-level training for protection of equipment and supplies is generally a short briefing on covering, and not adequate to preclude unnecessary loss of assets.

<sup>3</sup> There is inadequate DOTLPF to protect equipment and supplies from CBRN/TIM contamination.

<sup>4</sup> Unit plans and procedures integrate protective posture levels and methodologies for the protection of the force. Included in these documents is generally guidance addressing the protection of equipment and supplies at different levels of protective posture. This guidance is disseminated to subordinate units by the command staff for implementation and application as a means of reducing decontamination requirements and/or potential asset loss.

<sup>5</sup> Personnel are briefed on equipment and supplies protective activities as part of their protective posture training for operations.

<sup>6</sup> Doctrine, policy, and procedures for the development and adjustment of protective posture levels and methodologies do include instructions for addressing protection of equipment and supplies.

<sup>7</sup> Unit plans and procedures address the protection of equipment and supplies from CBRN/TIM contamination through the application of coverings (e.g., buildings, tents, tarps, etc.). However, certain materials used in the construction or packaging of equipment and supplies may absorb a CBRN or TIM agent in vapor form. Assets affected in this manner are not generally known to the force and command staff. Doctrine, policy, and procedures do not identify commonly available materials providing CBRN/TIM protection which might be applied to provide barrier and containment protection of equipment and supplies, particularly assets in transit or stored in the open.

### 13.9.3 Functional Solution Analysis

#### 13.9.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** Not all supplies and equipment are inherently protected or packaged to protect against CBRN/TIM contamination.  
**Partial Non-Materiel Solution:** *Doctrine:* Integrate protective measures, assets, and activities for CBRND of all classes of supplies into doctrine, policy, and procedures. *Leadership:* Implement, manage, and enforce the application of CBRND protective measures, assets, and activities for all classes of supplies. Also, awareness of need for materiel protection.
- 2. Deficiency:** CBRN/TIM protective coverings are limited in coverage and quantities.  
**Partial Non-Materiel Solution:** *Doctrine:* Establish in doctrine and policy requirement for application of coverings providing CBRN/TIM protection to equipment and supplies and implement through TTPs knowledge and application of these resources. *Training:* Institute in initial, recurring, and unit training effective application of CBRN/TIM protective coverings.
- 3. Deficiency:** CBRN/TIM protective coatings are limited to two variants of CARC.  
**Partial Non-Materiel Solution:** *Doctrine:* Establish in doctrine and policy requirement for full range of CBRN/TIM protective coatings for assets and resources with application to operations with threat. *Organization:* Organizational structures to effectively apply and maintain CBRN/TIM protective coatings. *Training:* Implement institutional, recurring, and unit training for the effective application and maintenance of CBRN/TIM protective coatings. *Leadership:* Awareness protectant coatings support OPTEMPO by reducing decontamination and/or replacement requirements. *Facilities:* Necessary infrastructure enabling force use of CBRN/TIM protectant coatings.
- 4. Deficiency:** CBRN/TIM protective packagings are limited or not identified for other than specialized functions.  
**Partial Non-Materiel Solution:** *Doctrine:* Include the application of CBRN/TIM containment packaging/systems designed to prevent contamination of equipment and supplies. *Organization:* Identify organizational resources and support requirements for the application of CBRN/TIM protective containment packaging/systems. *Training:* Train, exercise, and evaluate the application of CBRN/TIM protective containment packaging/systems. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the application of CBRN/TIM protective containment packaging/systems.
- 5. Deficiency:** The predominant means of protection of supporting assets is generally limited to decontamination of the asset following secondary exposure/contamination.

**Partial Non-Materiel Solution:** *Doctrine:* Include the application of CBRN/TIM protective containment packaging/systems and other alternative methods to preclude exposure/contamination of resources in doctrine, policy, and procedures.

*Training:* Train, exercise, and evaluate the application of CBRN/TIM protective containment packaging/systems and other alternatives precluding exposure/contamination. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the application of CBRN/TIM containment packaging/systems and other alternatives to prevent exposure/contamination.

6. **Deficiency:** Doctrine, policy, procedures for application of commonly available materials for CBRN/TIM protection are limited or nonexistent.

**Non-Materiel Solution:** *Doctrine:* Include the application of commonly available materials with CBRN/TIM protective capabilities into doctrine, policy, and procedures. *Training:* Include the application of commonly available materials with CBRN/TIM protective capabilities in institutional and unit level training, exercises, and evaluations.

7. **Deficiency:** Unit-level training for protection of equipment and supplies is generally limited to a short briefing on covering, and not adequate to preclude unnecessary loss of assets.

**Non-Materiel Solution:** *Training:* Establish standards and train, exercise, and evaluate the force for protection of equipment and supplies. *Leadership:* Enforce compliance with established standards for CBRN/TIM protective measures and activities for all classes of materiel.

8. **Deficiency:** There is inadequate or limited DOTMLPF to protect equipment and supplies from CBRN/TIM contamination.

**Non-Materiel Solution:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing protection of material and supplies from CBRN/TIM contamination and the operational application of contaminated resources. *Organization:* Identify organization services and activities necessary to provide CBRND protection of equipment and supplies. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for protection of all classes of supply and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, protective measures, and exercising.

9. **Deficiency:** Doctrine addressing the protection of open stored material is limited.

**Non-Materiel Solution:** *Doctrine:* Establish and enforce doctrine, policies, procedures, and standards for CBRND protection of open stored materiel.

10. **Deficiency:** Certain materials used in the construction or packaging of equipment and supplies may absorb CBRN/TIM agent in vapor form. Affected assets are not generally known to the force and command staff.

**Non-Materiel Solution:** *Doctrine:* Restrict through doctrine and policy the application of known CBRN/TIM absorbent materials for warfighter equipment and supplies to applications with no other reasonable alternative and require, in such instances, information regarding decontamination/weathering and safe handling if contaminated. Include in TTPs identification of these materials, the assets/components they are part, and doctrine/policy required information on decontamination/weathering and safe handling when contaminated.

*Organization:* Identify organization services and activities necessary to effectively manage absorbent materials. *Training:* Include doctrine/policy required information in training of the force. *Leadership:* Awareness any number of assets or components used by the force may contain CBRN/TIM absorbent materials which may constitute a post-event hazard to the force.

### **13.9.3.2 IMA Assessment Summary**

Table 13.9-2 is a list of ideas for material approaches and a corresponding description of each idea. Approaches focus on procurement of existing systems, and development of field-expedient systems. Table 13.9-3 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 13.9-4. TASHLD 9: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Assess CBRND material	Test and assess all CBRND material for protective abilities against future threat agents, including TIM.
Develop and establish generic unit CBRND kits	Develop, preposition, and maintain reserve stocks of generic CBRND kits for a standard unit. Components are adjusted as necessary for specific operations involving threat.
Equipment and supplies protective packaging and containment systems	Investigate and develop standardized CBRN/TIM protective packaging and containment systems (includes sprays, boxes, envelopes, drapes, etc.) for the protection of equipment and supplies from contact with CBRN/TIM agents
Topical	Develop topical barrier that is easily applied (i.e., spray), acts as a contact hazard barrier, and affords protection from CBRN/TIM.

Table 13.9-5. TASHLD 9: IMA Assessment

## **13.10 Task TASHLD 10: Employ expedient and improvised CBRN/TIM protective resources and measures**

### **13.10.1 Functional Area Analysis**

#### **13.10.1.1 Definition**

Includes the application of processes, methods, adaptive resources, available and individual ingenuity to create and provide COLPRO when COLPRO is not available. Includes the use of adaptation kits to enable structures (e.g. cave, room, building, bunker, underground chamber, vehicle, airframe, vessel, etc) to provide COLPRO. Also includes the use of plywood, dirt, tape, spray sealants, metal sheeting, etc. to create protection for personnel, supplies, and equipment.

#### **13.10.1.2 Derivation**

*Joint Enabling Concept for CBRN Operations, Protection Joint Functional Concept, UJTL (TA 7, TA 7.1).*

##### **13.10.1.2.1 Supported Task: OPSHLD 11**

##### **13.10.1.2.2 Lateral Task: TASHA 15**

##### **13.10.1.2.3 Supporting Task: N/A**

#### **13.10.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Undeveloped to highly developed land. (C1.1.1)
2. Riverine to open sea. (C1.2)
3. Natural and induced air. (C1.3)
4. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

##### **Military**

1. Partially completed mission preparation. (C2.1.3)
2. Marginal forces. (C2.2)
3. Marginal to adequate forces allocated. (C2.2.3)
4. Negligible personnel experience. (C2.2.4.5)
5. Limited deployed supplies. (C2.8.2)
6. Limited CONUS resupply. (C2.8.3)
7. No prepositioned materiel. (C2.8.4)
8. No host-nation support. (C2.8.5)
9. Negligible to limited commercial procurement. (C2.8.6)

Civil. N/A

### **13.10.2 Functional Needs Analysis**

#### **13.10.2.1 Capability and Deficiency Assessment Summary**

This section assesses current and projected capabilities to perform the task. The overall capabilities for current, near/mid, and far term are rated “red.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

#### **Current Capability and Deficiency**

This task recognizes limitations in existing COLPRO systems as well as circumstances not supportable by existing and projected COLPRO. These circumstances may include situations in which current systems would adversely impact operations (e.g., supporting logistics footprints, time to establish, etc.). Current site COLPRO generally requires extensive site preparation and resources to erect, operate, and strike but cannot be erected/striking in a CBRN/TIM environment. Mobile COLPRO is a diversity of systems ranging from forced clean air systems to full COLPRO. However, their application is limited. In general, current COLPRO is limited in quantity and does not adequately support expeditionary and highly mobile maneuver operations, particularly those in an austere environment with reduced logistical footprints. Most mobile platforms (including land, sea, and air) are not equipped with COLPRO. This circumstance requires prioritization of available assets and the application of IPE for CBRND. However, although prioritization is applied for critical activities and functions, not all such requirements can be satisfied with current COLPRO. The application of expedient COLPRO measures and systems would provide flexibility to the force to meet differing requirements and needs. Expedient COLPRO measures and systems are not addressed in DOTLPP. ECP kits, procedures, and training do not currently exist. Doctrine, policy, procedures, and TTPs do not identify commonly available materials (e.g., wraps, tarps, gels, caulks, plywood, etc.) for application in the construction of ECP by field forces. Training is not provided in the conduct of establishing and constructing ECP against the effects of CBRN/TIM agents. The potential ability does exist for ECP to address COLPRO needs not otherwise considered (e.g., USCG, hospital ships, merchant vessels, initial forced entry support, detainee housing, etc.). However, current DOTLPP is constrained to fielded COLPRO systems. The Services currently field a variety of CBRND assets providing COLPRO protection. This diversity of assets complicates the logistical support of operations with threat for joint operations. The assets protect against known chemical and biological warfare agents and particulate radiologicals. Protection is afforded to a select number of TIMs.

#### **Projected Near/Mid-Term Capability and Deficiency**

JECP is projected to initially field during the mid term with three COLPRO systems primarily addressing expeditionary operations. The P3I upgraded CBPS, JTCOPS, CP-DEPMEDS, fielding of the JSLNBCRS variants, and backfit of LHA/LHD vessels are projected to include

COLPRO in the mid term. These systems, depending upon the quantity fielded, may provide additional COLPRO to address critical needs. Otherwise, changes from current capabilities and deficiencies are not projected.

### Projected Far-Term Capability and Deficiency

The potential for COLPRO in the Future Tactical Lift Option builds upon the mid-term COLPRO capabilities. Additional changes in capabilities from the mid term are not projected.

#### 13.10.2.2 Resource Systems

### COLPRO

#### 1. Mobile COLPRO

**CBPS:** M1113 HMMWV-mounted COLPRO system consisting of a hardshell filtration, power, and transport and expandable softshell tentage with contamination control area/entry. The COLPRO unit is designated the Lightweight Multipurpose shelter (LMS).

**Crewed Combat Vehicles (Ground):** Two types of COLPRO. First supplies filter air using forced clean air supply system. Requires wear of IPE and connection to crew mask. This is the type of system in the M1A1 Abrams MBT. Second system is incorporates full COLPRO and permits reduction of IPE during operation. JSLNBCLR is an example of the second type of system.

**Airframe Air Supply System:** Provides clean air from compressed air storage system either until aircraft is outside of contamination and airframe interior is flushed of vapor contaminants or throughout flight operations.

**CITADEL:** System of protection installed with USN vessels to afford protection to selected connected spaces including C4ISR, medical, and R2.

#### 2. Fixed-Site COLPRO

**MGPTS:** USMC Medium General Purpose Tent System (MGPTS) with CB Protective Liner System designed for support of USMC operational C4ISR and R2.

**CP-DEPMEDS:** Component-based system of tentage, connective corridors, ISO containers, etc., with COLPRO liners for configuration into field hospitals and includes supporting power and utility systems, lighting, engine control units, and filtration systems. Large system requiring extensive use of resources to prepare location, erect/strike, operate, and maintain.

**JTCOPS:** Similar to CP-DEPMEDS, but for critical functions and activities of the force (e.g., staff operations, aircrew housing and briefing, etc.).

**CP-EMEDS:** USAF air-transportable system similar to CP-DEPMEDS on a smaller scale and configurable from one medical shelter to a 25-bed field hospital.

**CP-SSS:** USAF small-scale COLPRO transportable system designed to support C2 functions.

**JECP:** Projected program of COLPRO designed for application in highly mobile operations, expeditionary operations, forced-entry operations, and/or to supplement larger-scale

COLPRO systems in support of operations. Consists of building/room and tentage insert kits and small-unit stand-alone COLPRO kits.

**M20/M20A1 SCPE:** Lightweight and modular COLPRO system consisting of an inflatable liner for insert into rooms or buildings.

**Building integrated COLPRO systems:** COLPRO systems designed and installed into buildings as integral systems, usually facility construction. Post-construction installation is based upon building design and COLPRO requirements. Varies between buildings based upon applied technology, date of construction/installation, system engineering, facility function, etc. Most existing facility COLPRO was established during Cold War period.

**MOPP Methodology:** Stepped level of CBRND protective measures. Standardized levels permit the rapid increase or decrease of unit MOPP level.

**Unit Staff:** The application of DOTLPF for all phases of operations with threat from preplanning to post-force return to home stations. Includes all aspects of C2 and supporting staff activities/functions (e.g., logistics, intelligence, etc.) enabling mission and task accomplishment.

<b>Near/Mid-Term Overall Capability</b>	5	5	0	0	4
<b>Far-Term Overall Capability</b>	5	5	0	0	4

	FAA Measure	Scale
M1	Force possesses access to COLPRO including ECP sheltering.	<b>8–10:</b> Force is adequately equipped with or have sufficient access to COLPRO for all functions and activities. <b>3–7:</b> Force is equipped with or have sufficient access to COLPRO for the performance of critical functions and activities. <b>1–3:</b> Force is equipped with or have access to COLPRO for selected functions and activities. <b>0:</b> Force is inadequately equipped and possesses insufficient access to COLPRO for support of operations.
M2	Critical mission activities are accommodated by COLPRO sheltering including ECP sheltering.	<b>8–10:</b> All critical facilities and activities are equipped with operational COLPRO. <b>4–7:</b> Selected critical facilities and activities possess are equipped or possess access to operational COLPRO. <b>1–3:</b> Selected key critical facilities and activities are equipped or possess access to COLPRO. <b>0:</b> Critical facilities and activities are not equipped or possess access to COLPRO.

M3	ECP sheltering is considered in planning.	<b>8–10:</b> ECP is an integral consideration and resource for all CBRND planning and operations. <b>4–7:</b> ECP is considered and resourced for selected operations with threat. <b>1–3:</b> Planning of selected operations with threat considers expedient COLPRO for specific activities. <b>0:</b> ECP is not considered and resourced for operations with threat.
M4	Adequate ECP materials are readily available.	<b>8–10:</b> The full range of expedient COLPRO kits and materials are readily available for application by the force. <b>4–7:</b> ECP kits and materials are generally available for force application. <b>1–3:</b> ECP kits and materials are available for selected force applications. <b>0:</b> ECP kits and materials do not exist.
M5	There is effective DOTMLPF in place to conduct task.	<b>8–10:</b> DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations. <b>4–7:</b> Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds. <b>1–3:</b> DOTLPF is inadequate for accomplishment of this task. <b>0:</b> DOTLPF does not exist for this task.

<sup>1</sup> Inadequate quantities of mobile COLPRO systems exist to support highly mobile and expeditionary operations with reduced footprint. Further, there is insufficient quantities of COLPRO to protect all critical activities and functions within the force. Prioritization is required of the available resources. Current mobile COLPRO systems are predominantly integrated into selected combat vehicles/vessels. Selected U.S. Naval combat vessels may be equipped with full COLPRO (CITADEL). However, these systems are generally restricted to critical operations areas of the ships. The critical areas are contiguous in that they share common bulkheads and movement between areas is not prevented. CCAs are operated in areas located between the covered areas and the remainder of the ship. These areas are designated. The remainder of the interior of the vessel uses the Circle William concept. Circle William requires prior warning of the presence of a CBRN/TIM in the path of the ship or knowledge of an impending attack to be fully effective. This concept requires the shutdown of the ventilation system and sealing of hatches, bulkheads, and other such openings to seal the interior of the vessel from intrusion by a CBRN/TIM. However, the majority of these actions are performed manually and are initiated upon detection of the potential CBRN/TIM agent. There are concerns about the potential for large amounts of a CBRN/TIM agent to be drawn in by the high-velocity ventilation systems and dispersed throughout the interior of the ship during the period between agent encounter and completion of Circle William. There are concerns about the ability of the vessel to remain in Circle William until it is determined the vessel is no longer exposed to a CBRN/TIM. U.S. Naval combat vessels with full COLPRO of their critical functions currently include the DDG-51 class of destroyers, selected LSDs (vessel hulls 44 through 52), LHDs (vessel hulls 1 through 6), LHAs (vessel hulls 1 through 5), and four of the AOE-6 (vessel hulls 6 through 8 and 10) class ships. Submarines are considered fully protected so long as they remain sealed and do not take in air. The LHD and LHA Amphibious Assault Ships are undergoing a COLPRO Backfit of SCPE for their critical functions. Other areas of these ships will use the Circle William Concept. Carriers, frigates, cruisers, DD-963 class destroyers, and other vessels not discussed earlier in note, do not currently afford their critical functions full COLPRO. Naval hospital ships, U.S. Naval auxiliaries, and USCG vessels are not equipped with COLPRO. Areas critical to the safe operation of the ship may not be protected against CBRN/TIMs. Ability of these vessels to successfully incorporate a concept similar to Circle William is a concern. There are also concerns about the ability of these vessels to prevent infiltration of CBRN/TIM into their interior. Infiltration of vapors can cause a build up of concentrations within the vessel that could exceed the levels surrounding the ship. USCG vessels are under the control and direction of DoD during a declared war. The USCG, however, is under the auspices of the Department of Homeland Security during peacetime. USCG vessels are often attached to U.S. operations overseas for port security, coastal patrol, and similar functions. USCG personnel are also dispatched with military forces deploying overseas for peacekeeping and other operations. USCG vessels and personnel served in Vietnam, Haiti, Granada, and other force deployments. The ability of USCG resources to effectively integrate into DoD operations involving potential CBRN/TIM events is a concern. Mobile COLPRO are armored or soft-skinned vehicle-supported and -based systems. They include both ground and air platforms. The operation of the COLPRO may not be supported while the vehicle is in motion. They may or may not include CBRN/TIM filtration systems. Mobile COLPRO run the full range of protective capabilities from passive to fully protective COLPRO. The majority of vehicles qualify as passive COLPRO, provided the exchange of air between the interior and the exterior is limited. Mobile COLPRO systems generally do not provide protection for large numbers of personnel. Currently, the M1A1 Abrams MBT and the M93A1 FOX NBC Reconnaissance System Block I provide full COLPRO for their crews. The CBPS is a general use fully protective COLPRO system mounted on an ECV HMMWV. The CBPS may be used for C4 operations, as aid stations, or for other needs. A variety of ESRCBH CPSs exist in a small percentage aircraft and other vehicles. The majority of these provide clean filtered air through piping or hose systems. In both the ESRCBH CPS and passively protective COLPRO systems, the occupants must wear a minimum of respiratory/ocular protection. Combat-crewed vehicles are not generally

equipped with CBRN/TIM filtration systems. These vehicles are not able to provide clean filtered air to crew and passengers and thereby extend the operational capabilities of the force. Support vehicles are similar to combat vehicles in that they do not routinely have CBRN/TIM filtration systems. Operators and passengers must, as with the combat vehicles, depend upon their IPE for clean air and protection. Unlike the combat-crewed vehicles, support vehicles generally are more open for infiltration by CBRN/TIM agents. Most airframes are also not equipped with CBRN/TIM filtration systems. They are either open exchange (normally lower altitude airframes) or provide the ability to switch to bottled air (usually jet aircraft). The concern is the aircrew are dependent upon the filtration systems of their IPE to provide clean filtered air. This situation reduces the extended operational time of the aircrew to that of their IPE. A concern is the inability to conduct mobile combat operations and to move large numbers of troops throughout a CBRN/TIM hazard area without the need to maintain them in IPE. Degradation of performance is a factor after a period of time wearing IPE. Expedient COLPRO for mobile assets does not exist.

<sup>2</sup> ECP kits, procedures, and training do not currently exist. Doctrine, policy, procedures, and TTPs do not identify commonly available materials (e.g., wraps, tarps, gels, caulks, plywood, etc.) for application in the construction of ECP by field forces. Training is not provided in the conduct of establishing and constructing ECP against the effects of CBRN/TIM agents.

<sup>3</sup> Inadequate quantities of mobile COLPRO systems exist to support highly mobile and expeditionary operations with reduced footprint. Further, there are insufficient quantities of COLPRO to protect all critical activities and functions within the force. Prioritization is required of the available resources. Expedient COLPRO systems and measures, as well as training, do not currently exist and are not addressed in current doctrine, policy, and TTPs.

<sup>4</sup> There are insufficient quantities of COLPRO to protect all critical activities and functions within the force. Prioritization is required of the available resources. The USMC MGPTS with CB Protective Liner System provides a positive-pressure, filtered-air, toxic-free shelter for protection against CBRN agents. However, there are insufficient quantities to protect all critical activities and functions from CBRN/TIM effects. The CP-DEPMEDS provides a clean, toxic-free, environmentally controlled, patient treatment area and the components are designed to integrate as field hospitals. They are packaged as a set for deployment to threat areas for hospital operations. The entire composite hospital consists of expandable tentage, passageways, environmental control units, and ISO shelters. The CP-DEPMEDS exist in very limited quantities. Although it could be applied to provide COLPRO to the task identified groups, its designed and primary function is that of medical care. A similar COLPRO is the USAF's CP-EMEDS, which is an air-transportable medical facility deployable in various configurations from a single shelter to a 25-bed patient hospital. The CP-EMEDS is in a very limited number and, like the CP-DEPMEDS, is designed for its primary function of the provision of medical care. The USAF CP-SSS is a small-scale CPS applied for the conduct of C2 operations, maintenance of critical equipment, force beddown, and the provision of R2 for sortie generators and key leadership. This shelter is in limited supply and unlikely sufficient quantities would be available to support a group of any size, especially during operations against an adversary. The M20/M20A1 SCPE is a lightweight, modular system involving a liner designed for inflation within a room or building. The M20A1 serves to bridge the gap between the M20 SCPE and CBPS. Quantities are limited and are not likely to be available in any large quantity during operations against an adversary. Current COLPRO systems are not available in the quantities and types necessary to support the protection of eligible civilians and detainees. Current plans generally do not address the application of COLPRO to nonforce personnel and do not allocate the limited COLPRO resources to this activity. Fixed-site COLPRO within the United States and its territories is predominantly designed for nuclear fallout and does not address other CBRN/TIM hazards and threats arising after September 11, 2001. Selected critical key facilities are equipped with CBRN COLPRO, but are not available to other than designated personnel and specific functions and activities. Fixed-site CBRN COLPRO is installed in facilities housing selected activities and functions within HTAs. However, these are not present for all critical activities and functions. However, the Guardian Program is reviewing FP protective measures at U.S. installations and facilities and will address COLPRO for critical activities/functions. The Guardian Program, however, is not likely to address field COLPRO operations. Expedient systems and measures for COLPRO are limited or nonexistent.

<sup>5</sup> There are insufficient quantities of COLPRO to protect all critical activities and functions within the force. Prioritization is required of the available resources. Expedient COLPRO systems and measures, as well as training, do not currently exist and are not addressed in current doctrine, policy, and TTPs.

<sup>6</sup> Doctrine, policy, procedures, and TTPs combined with staff experience, training, and knowledge provide the basis for prioritization of allocation of limited COLPRO resources. Not all critical activities and functions can currently be allocated COLPRO. Requirements must be balanced with operational needs, available resources, and alternative protective capabilities. The staff functions formulate the allocation collaboratively and make recommendations to the commander for decisioning. The determinations are identified in plans and disseminated to the force. Adjustments are made when necessary during operations or upon changes in available resources. Expedient COLPRO systems and measures are not addressed in doctrine, policy, and TTPs and are not included in consideration by planners and the force.

<sup>7</sup> Expedient COLPRO systems and measures are not considered in planning as they are not addressed in existing doctrine, policy, and TTPs.

<sup>8</sup> Current doctrine, policy, and TTPs are reliant upon existing COLPRO systems. Expedient COLPRO systems and measures are not addressed and are, therefore, not considered when planning for operations with threat.

<sup>9</sup> Fielding of the P3I upgraded CBPS for heavy/airborne use is projected for the mid term, as are two variants of the JSLNBCRS, and the M93A1 Fox NBCRS Block II.

<sup>10</sup> JTCOPS Block I is projected for initial fielding during the mid term. The projected initial capabilities fielding of JECF is within the mid term and will include adaptive insertable COLPRO systems (including liner) for existing buildings/rooms and stand-alone COLPRO for small groups of personnel. JECF may provide the capability to provide COLPRO for critical activities and functions; however, JECF acquisition quantities have not as yet been determined.

<sup>11</sup> The projected Future Tactical Lift Option is under evaluation for the potential addition of COLPRO in the design and production specifications. A decision on the inclusion of COLPRO in the LHA(R) is expected in the mid term.

<sup>12</sup> JTCOPS Block II is projected for the far term. Continued fielding of JECF.

### 13.10.3 Functional Solution Analysis

#### 13.10.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Current doctrine, the *UJTL*, and operational planning do not adequately address sustained operations within a CBRN/TIM environment.  
**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, procedures, and *UJTL* sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.
2. **Deficiency:** Expeditionary operations are a particular concern as most CBRND systems and associated logistics are not designed for a highly mobile force, with a reduced logistical footprint, and for the initial period of operations until the theater matures (usually the first 30–90 days).  
**Non-Materiel Solutions:** *Doctrine:* Complete the JCIDS process and central correlation/ comparison of national and strategic plans to identify CBRND resources necessary and available to support expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct expeditionary operations while possessing reduced logistical footprint and during the first 30–90 days of operations following commencement of hostilities. *Training:* Train, exercise, and evaluate expeditionary capabilities of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operations using CBRND resources supporting expeditionary operations. *Leadership:* Recognize differences and challenges associated with expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint, training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.
3. **Deficiency:** Inadequate COLPRO to support expeditionary and highly mobile forces.  
**Partial Non-Materiel Solutions:** *Doctrine:* Develop and disseminate appropriate doctrine, policy, and procedures for the application of common materials for COLPRO and for COLPRO kits and components. *Organization:* Develop organizational structures, resources, staffing, and capabilities to enable effective application of available COLPRO and implementation of expedient COLPRO capabilities. *Training:* Establish initial and recurring

training of all members of the force on the conduct of expedient COLPRO. Exercises and evaluations incorporate criteria challenging this capability. *Leadership*: Recognize potential for expedient COLPRO to improve force capabilities and survivability. *Facilities*: Develop supporting infrastructure enabling expedient COLPRO and the effective application of available COLPRO.

4. **Deficiency**: Quantities and availability of mobile COLPRO is inadequate.

**Non-Materiel Solutions**: *Doctrine*: Complete analysis and central correlation/comparison of national and strategic plans to identify quantities and types of mobile COLPRO (and supporting consumables) necessary and available to support highly mobile forces for envisioned plans and taskings. *Organization*: Develop organizational structures, resources, staffing, and capabilities to conduct CBRND, including mobile COLPRO, of highly mobile forces. *Training*: Train, exercise, and evaluate CBRND, including mobile COLPRO, capabilities of the force in a CBRN/TIM threat during highly mobile force operations. *Leadership*: Recognize differences and challenges associated with CBRND operations by highly mobile forces, training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities*: Develop supporting infrastructure for CBRND of highly mobile forces.

5. **Deficiency**: Not all critical facilities and activities are equipped with COLPRO.

**Non-Materiel Solutions**: *Doctrine*: Enforce existing doctrine and policy.

6. **Deficiency**: Most naval vessels (including supply and transport vessels, carriers, and others) do not possess COLPRO.

**Partial Non-Materiel Solutions**: *Doctrine*: Incorporate into doctrine, policy, and procedures the provision of COLPRO for at-risk vessels (civilian contract and military). *Organization*: Develop organizational structures, resources, staffing, and capabilities to support COLPRO operations on vessels supporting operations and at-risk. *Training*: Train, exercise, and evaluate crews for vessel COLPRO operations for CBRND. *Leadership*: Recognize differences and challenges associated with CBRND operations by at-risk vessels (both military and contract civilian) supporting operations. *Facilities*: Develop supporting infrastructure (e.g., logistics, maintenance, power systems, etc.) for vessel COLPRO.

7. **Deficiency**: USCG assets supporting operations are not adequately equipped with CBRND assets and resources.

**Partial Non-Materiel Solutions**: *Doctrine*: Establish with doctrine, policy, and procedures responsibilities for equipping, training, and supporting USCG assets supporting force operations during periods of other than declared war. *Organization*: Develop organizational structures, agreements, resources, and staffing to support and ensure survivability of supporting USCG resources. *Training*: Train, exercise, and evaluate USCG CBRND capabilities as integral component of force. *Leadership*: Recognize differences and challenges associated with CBRND operations by USCG assets and personnel; training providing skills and knowledge to managed operations involving these assets; and the ability and willingness to implement necessary changes and activities to prepare for and conduct

operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for CBRND of the force, including allocated USCG assets and personnel.

**8. Deficiency:** Airlift assets (both tactical and strategic) are not equipped with COLPRO.

**Partial Non-Materiel Solutions:** *Doctrine:* Incorporate into doctrine, policy, and procedures the provision of COLPRO to aircrew and passengers in appropriate airframes (military and civilian). *Training:* Train, exercise, and evaluate aircrews and supporting entities for airframe COLPRO operations for CBRND. *Leadership:* Recognize criticality of protecting aircrew and passengers of appropriate tactical and strategic airframes from the effects of CBRN/TIM agents. *Facilities:* Develop supporting infrastructure (e.g., logistics, aircraft maintenance, etc.) for airframe COLPRO.

**9. Deficiency:** Current mobile COLPRO is inadequate to support operations by highly mobile forces.

**Non-Materiel Solutions:** *Doctrine:* Complete analysis and central correlation/comparison of national and strategic plans to identify quantities and types of mobile COLPRO (and supporting consumables) necessary and available to support highly mobile forces for envisioned plans and taskings. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct CBRND, including mobile COLPRO, of highly mobile forces. *Training:* Train, exercise, and evaluate CBRND, including mobile COLPRO, capabilities of the force in a CBRN/TIM threat during highly mobile force operations. *Leadership:* Recognize differences and challenges associated with CBRND operations by highly mobile forces, training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for CBRND of highly mobile forces.

**10. Deficiency:** Maneuvering forces are inadequately equipped with COLPRO capabilities.

**Non-Materiel Solutions:** *Doctrine:* Complete the JCIDS process and central correlation/comparison of national and strategic plans to identify CBRND resources necessary and available to support maneuver operations, particularly expeditionary operations during the first 30–90 days following commencement of hostilities, with a reduced logistical footprint. *Organization:* Develop organizational structures, resources, staffing, and capabilities to conduct maneuver operations, particularly expeditionary operations during the first 30–90 days of operations following commencement of hostilities, while possessing reduced logistical footprint. *Training:* Train, exercise, and evaluate maneuver capabilities (particularly expeditionary capabilities) of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operations using organic, prepositioned, and planned CBRND resources supporting operations. *Leadership:* Recognize differences and challenges associated with maneuver operations, particularly expeditionary operations during the first 30–90 days following commencement of hostilities, with a reduced logistical footprint; training providing skills and knowledge to manage operations in these circumstances; and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary operations with a CBRN/TIM threat. *Facilities:* Develop supporting infrastructure for expeditionary operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.

**11. Deficiency:** ECP kits, procedures, and training do not currently exist.

**Partial Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, procedures, and TTPs the use and application of ECP for CBRND. *Organization:* Organizational structures supporting the application of ECP for CBRND. *Training:* Develop institutional and unit-level training on the application of ECP to support operations and provide for CBRND of the force. *Leadership:* Ensure awareness and knowledge of versatility and application of ECP for operations within a CBRN/TIM environment. *Facilities:* Develop infrastructure to support ECP (e.g., logistics, training, etc.).

#### **13.10.3.1 IMA Assessment Summary**

Table 13.10-2 is a list of ideas for material approaches and a corresponding description of each idea. Approaches focus on procurement of existing systems, and development of field-expedient systems. Table 13.10-3 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 13.10-4. TASHLD 10: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Develop COLPRO kits.	Develop COLPRO kits containing all necessary supplies to construct field-expedient COLPRO that is easily stored and maintained in ready condition, easily and safely erected, operated, maintained, and struck within a CBRN/TIM environment by IPE-encumbered personnel using minimal resources and supports COLPRO requirements.
Develop and establish generic unit CBRND kits.	Develop, preposition, and maintain reserve stocks of generic CBRND kits for a standard unit. Components are adjusted as necessary for specific operations involving threat.
Equipment and supplies protective packaging and containment systems.	Investigate and develop standardized CBRN/TIM protective packaging and containment systems (includes sprays, boxes, envelopes, drapes, etc.) for the protection of equipment and supplies from contact with CBRN/TIM agents
Field-expedient COLPRO kits.	Develop field-expedient COLPRO kits designed to adapt existing structures, tentage, etc., for the expansion of COLPRO field capabilities and mission support and the provision of collective protection to the force, critical functions and activities, maintenance and repair activities and functions, resources, etc.
Field-expedient COLPRO materials.	Identify commonly available materials (duct tape, plastic sheeting, wooden crate, plywood, tarps, coverings, wraps, caulk, sealant gels/sprays, etc.) for application in the construction of expedient COLPRO needed to construct field-expedient COLPRO when COLPRO availability is limited or not advantageous.
Topical.	Develop topical barrier that is easily applied (i.e., spray), acts as a contact hazard barrier, and affords protection from CBRN/TIM.

Table 13.10-5. TASHLD 10: IMA Assessment

Identified Gaps	Ideas for Material Approaches (IMA)					
	Develop COLPRO Kits	Develop and Establish Generic Unit CBRND Kits	Equipment and Supplies Protective Packaging and Containment Systems	Field-Expedient COLPRO Kits	Field-Expedient COLPRO Materials	Topical
Inadequate COLPRO to support expeditionary and highly mobile forces.	X	X	X	X	X	
Most naval vessels (including supply and transport vessels, carriers, and others) do not possess COLPRO.	X		X	X	X	
USCG assets supporting operations are not adequately equipped with CBRND assets and resources.	X		X	X	X	X
Airlift assets (both tactical and strategic) are not equipped with COLPRO.	X		X		X	
ECP kits, procedures, and training do not currently exist.	X	X	X	X	X	

**13.11 Task TASHLD 11: Protect decontaminating personnel from decontaminants, contamination, and off-gassing****13.11.1 Functional Area Analysis****13.11.1.1 Definition**

Includes standard (e.g., super tropical bleach) and nonstandard decontaminants (e.g., solvents and disinfectant chlorine). The large quantities of water and other decontaminants required for decontamination of facilities, equipment and supplies produce runoff containing both contaminants and decontaminants. Most decontaminants have negative effects on personnel skin and respiratory systems. This task includes protective measures to protect individuals charged with decontamination as well as those who come in contact with the decontaminants.

**13.11.1.2 Derivation**

*Joint Enabling Concept for CBRN Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (TA 7, TA 7.1).*

**13.11.1.2.1 Supported Task:** N/A

**13.11.1.2.2 Lateral Task:** TASHA 15

**13.11.1.2.3 Supporting Task:** N/A

**13.11.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Undeveloped to highly developed land. (C1.1.1)
2. Riverine to open sea. (C1.2)
3. Natural and induced Air. (C1.3)
4. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Partially completed mission preparation. (C2.1.3)
2. Marginal forces. (C2.2)
3. Marginal to adequate forces allocated. (C2.2.3)
4. Negligible personnel experience. (C2.2.4.5)
5. Limited staff expertise. (C2.3.1.3)
6. Limited deployed supplies. (C2.8.2)
7. No prepositioned materiel. (C2.8.4)

Civil. N/A

### 13.11.2 Functional Needs Analysis

#### 13.11.2.1 Capability and Deficiency Assessment Summary

Table 13.11-1 discusses current and projected capabilities to accomplish this task. The overall capabilities for current, near/mid, and far term are rated “yellow.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

#### Current Capability and Deficiency

The current capabilities include both materiel and non-materiel capabilities. The Services currently field a variety of CBRND assets providing respiratory/ocular and percutaneous protection. This diversity of assets complicates the logistical support of operations with threat for joint operations. Existing Service-specific IPE is limited in the period and scope of protection afforded the warfighter. Respiratory/ocular and percutaneous CBRND assets protect against known chemical and biological warfare agents and particulate radiologicals. Protection is afforded to a select number of TIMs. Physiological and psychological encumbrances increase with prolonged wear. Regular exercising and wear to acclimate and adjust the wearer to enable performance of assigned functions and activities is necessary and performed to reduce the impact of encumbrances and subsequent degradation of performance. Splash protection is afforded through the use of CBRND assets designed for this purpose or the application of wet-weather gear (including severe-weather gear). Splash protection is worn with respiratory/ocular and percutaneous CBRND assets. COTS protective assets are applied for selected eligible civilians such as hazardous materials, firefighters, EMS, etc. Detailed doctrine, policy, processes, and TTPs exist for the performance of this task and are effective for the protection of military personnel and selected eligible civilians (whose duties and responsibilities include decontamination operations) designated to conduct decontamination operations. Doctrine, policy, processes, and TTPs are also adequate and effective for personnel required to perform decontamination of assigned equipment and resources. However, other eligible civilians, particularly non-U.S. personnel, with potential decontamination operations responsibilities and requirements are not adequately addressed. Military decontamination unit/team personnel and selected eligible civilians (e.g., hazardous materials, firefighters, etc.) are trained using doctrine and Material Safety Data Sheet (MSDS) information on standard decontaminants to include their hazardous effects, associated protective measures, and, if necessary, Self-Aid/Buddy-Aid actions. This training is performed upon initial designation and is performed on a recurring basis. CBRND exercises and evaluations include decontamination operations and may include circumstances for implementation of Self-Aid/Buddy-Aid measures and actions.

#### Projected Near/Mid-Term Capability and Deficiency

Future configurations focus on reducing psychological and physiological stresses associated with the wearing of IPE, as well as striving for commonality of form factor among all services to

reducing the logistics burden, development cost, and improved availability. The JSLIST and JSGPM are projected to be initially fielded during the mid term. The JSLIST is under review for NIOSH certification for compliance with OSHA protective standards. The certification will permit application of the garment for AT/FP installation activities within CONUS and selected OCONUS. The possibility exists for potential application by requiring eligible civilians. Legacy Service-specific IPE will remain in the inventory throughout the mid term and into the far term during the transition to the joint IPE systems. Otherwise, changes from current capabilities and deficiencies are not projected.

### Projected Far-Term Capability and Deficiency

Future configurations focus upon reducing psychological and physiological stresses associated with the wearing of IPE, as well as striving for commonality of form factor among all Services. The standardization of CBRND respiratory/ocular and percutaneous protection which will reduce the logistics burden and development cost and subsequently improve availability. Legacy Service-specific IPE will continue to be replaced by the joint systems of CBRND protective equipment until fielding is complete to all Service units, including Guard and Reserve, early in the far term. Next-generation IPE assets are in R&D and are expected to be fielded sometime in the far term. However, specifics of design, characteristics, and protective capabilities are not as yet determined for these systems. Additional changes in capabilities from the mid term are not projected.

#### 13.3.2.2 Resource Systems

### Individual Protection

#### 1. Respiratory/Ocular Protection:

**COTS:** Commercially available systems of protection, manufactured and tested meeting OSHA standards for the United States or equivalent organization in other nations.

**M40/M42 CB Protective Mask:** U.S. Army mask system designed for military standard profile and uses standard C-2 canister. M42 integrates with combat vehicle clean air supply system and has a connectable dynamic microphone for combat vehicle intercom system.

**M45 Aircrew Aviator Mask:** Replaces M42 and M49 systems for U.S. Army. Available with a canister-compatible hose assembly and a valve cassette that enables use of supplied air (from aircraft, SCBA or PAPR). The M45 is used by military personnel who cannot fit the M40A1, M42A2, or MCU-2/P masks.

**MCU-2A/P:** Mainstay USAF and USN system for nonaviator personnel and aircrew personnel not performing flight operations, except for aircrew personnel not issued aviator systems and noncombat platforms/airframes without clean air supply systems. Applies C-2 filter for filter air.

**Joint Service General Purpose Mask (JSGPM):** Initial fielding projected in the mid term replacing Service-specific standard respiratory/ocular protective systems. Provides respiratory/ocular protection from CBRN agents and selected TIMs. Improves field-of-vision and encumbrances associated with existing Service systems.

**Joint Service Chemical Environment Survival Mask (JCESM):** COTS one-time use, one-size-fits-all, respiratory/ocular protective system affording two hours of protection in low-level CBRN vapor, aerosol, and particulate environments. Selected force element application only.

## 2. Percutaneous Protection:

**COTS:** Commercially available systems of protection, manufactured and tested meeting OSHA standards for the United States or equivalent organization in other nations.

**Battle Dress Overgarment (BDO):** U.S. Army/USAF two-piece camouflage-patterned garment (top and trousers) providing 24-hour protection against CBRN agents in vapor, liquid, droplet, and particulate forms.

**Saratoga:** USMC two-piece camouflage-patterned garment (top and trousers) providing 24-hour protection against CBRN agents in vapor, liquid, droplet, and particulate forms. Launderable for hygiene.

**CPOG:** Legacy two-piece green garment currently in use with USN providing limited-term protection against CBRN agents in vapor, liquid, droplet, and particulate forms.

**Chemical Protective Undergarment (CPU):** Worn under standard IPE as additional layer of protection against contact with CBRN agents.

**BVO/GVO:** Vinyl overboots (VO) worn over wearer's standard footwear and protects against contact with CBRN agents. Available in black (BVO) and green (GVO).

**Chemical Protective Footwear Cover (CPFC):** Legacy system of CBRN protective footwear cover in use by USN. Requires wearer to pull protective sole tabs up and wrap/tie laces around cover to secure over footwear.

**Chemical Protective Glove (CPG):** Standard CBRN protective glove. Available in 7-, 14-, and 25-mil thicknesses addressing functional requirements for durability, dexterity, and tactile sensitivity.

**Chemical Protective Helmet System (CPHS):** CBRN protective camouflage-patterned helmet cover to protect helmet from contact with CBRN contaminants.

**SCALP:** Disposable, lightweight, impermeable overgarment designed for wear over IPE for additional protection in grossly contaminated environments. Applied by personnel required to leave protective sheltering in these environments to perform mission-critical tasks. Also applied by decontamination units/teams and medical personnel performing decontamination or potentially at risk for prolonged contact with liquids.

**Wet-Weather Gear: Includes Severe-Weather Gear (USN).** Provides barrier against contact with liquids potentially damaging to protective abilities of IPE.

**M-2 Apron:** Butyl rubber-coated sleeved apron worn over IPE and applied by decontamination units/teams and other designated personnel performing decontamination or potentially at risk for contact with liquids. Provides barrier against contact with liquids potentially damaging to protective abilities of IPE. Can be decontaminated.

**Joint Service Lightweight Integrated Suit Technology (JSLIST):** Two-piece (jacket and trousers) CBRN risk-taking protective garment with integrated hood. Affords protection against selected TIM agents. Reduces physiological and psychological encumbrances associated with existing Service-specific systems it replaces with initial fielding in the mid term. Under review for NIOSH certification for OSHA protection standards.

***Joint Block I/II Glove Upgrade (JB1/2GU):*** Projected fielding in near mid term replacing CPG for designated force elements requiring increased tactility/durability for mission performance. Various configurations under consideration.

***Joint Firefighter Integrated Response Ensemble (JFIRE):*** Incorporates JSLIST into firefighter bunker gear, permitting firefighters to conduct firefighting operations within a CBRN/TIM environment.

***Multi-purpose Overboot (MULO):*** Projected initial fielding in mid term and replacing legacy CBRN footwear covers.

**MOPP Methodology:** Stepped level of CBRND protective measures. Standardized levels permit the rapid increase or decrease of unit MOPP level.

**Unit Staff:** The application of DOTLPF for all phases of operations with threat from preplanning to post-force return to home stations. Includes all aspects of C2 and supporting staff activities/functions (e.g., logistics, intelligence, etc.) enabling mission and task accomplishment.

<b>Far-Term Overall Capability</b>	6	6	7	7

	FAA Measure	Scale
M1	Force is trained on hazardous effects of decontaminants	<p><b>8–10:</b> Force possesses and is trained using doctrine and MSDS information on hazardous effects and protective measures associated with decontaminants.</p> <p><b>4–8:</b> Force possesses and is trained using doctrine and MSDS information on hazardous effects and protective measures associated with standard decontaminants.</p> <p><b>1–3:</b> Selected force elements possess and are trained using doctrine and MSDS information on hazardous effects and protective measures associated with standard decontaminants.</p> <p><b>0:</b> Force does not possess and are not trained using doctrine and MSDS information on hazardous effects and protective measures associated with decontaminants.</p>
M2	Self-Aid and Buddy-Aid procedures include treatment for exposure to decontaminants.	<p><b>8–10:</b> Self-Aid and Buddy-Aid procedures provide specific instructions and processes for the identification of, and immediate field treatment for, exposure to hazardous decontaminants. All force members receive initial and recurring Self-Aid and Buddy-Aid training encompassing these procedures and are challenged in regularly scheduled exercises and evaluations.</p> <p><b>4–7:</b> Self-Aid and Buddy-Aid procedures provide general instructions and processes for the identification of, and immediate field treatment for, exposure to hazardous decontaminants. All force members receive initial and recurring Self-Aid and Buddy-Aid training including these procedures and are periodically exercised and evaluated.</p> <p><b>1–3:</b> Self-Aid and Buddy-Aid procedures provide limited guidance for the identification and field treatment of exposure to hazardous decontaminants. Force members receive initial and recurring Self-Aid and Buddy-Aid training including discussion of this guidance.</p> <p><b>0:</b> Self-Aid and Buddy-Aid procedures and training do not address the identification and field treatment of exposure to hazardous decontaminants.</p>
M3	Decontamination unit/team personnel are equipped with IPE to include splash protective coverings.	<p><b>8–10:</b> Decontamination unit and team personnel are equipped with adequate splash and CBRN/TIM IPE protection.</p> <p><b>4–7:</b> Decontamination unit and team personnel are equipped with CBRN/TIM IPE protection and limited splash protection.</p> <p><b>1–3:</b> Decontamination unit and team personnel are equipped with CBRN/TIM IPE protection and selected members are equipped with splash protection.</p> <p><b>0:</b> Decontamination unit and team personnel are not equipped with CBRN/TIM IPE and splash protection.</p>
M4	There is effective DOTMLPF in place to conduct task.	<p><b>8–10:</b> DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations.</p> <p><b>4–7:</b> Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds.</p> <p><b>1–3:</b> DOTLPF is inadequate for accomplishment of this task.</p> <p><b>0:</b> DOTLPF does not exist for this task.</p>

<sup>1</sup> Personnel designated to perform decontamination operations are trained on the proper wear of protective respiratory/ocular protection as outlined in doctrine, policy, procedures, and TTPs. Expelled air from an exposed/contaminated casualty equipped with standard ocular/respiratory protection is not filtered and may present a potential secondary hazard or contamination source for handling and transporting personnel and resources. The application of standard warfighter IPE to exposed/contaminated casualties provides containment of the potential contamination within the IPE, a requirement that may not be achievable for certain types of casualties. Respiratory/ocular protection is diverse across the Services and performed functions. The M40/M42 CB Protective Mask is in service with the U.S. Army. The mask uses the C-2 canister for filtration of CBRN contaminants. The M45 Aircrew Aviator Mask replaced the U.S. Army M43 Type II and M49 Mask Systems. The system uses a low-profile canister compatible hose assembly for both hose and face-mounted configurations. The mask system incorporates selectable filtration for support both during aircraft systems activation and using the connectable filter pack. The mask also is applied to personnel who cannot be fitted with the standard M40A1, M42A2, or MCU-2A/P masks. The MCU-2A/P is the mainstay USAF and USN mask employed by

personnel not equipped with aircrew masks and by aircrew when not performing flight operations. The MCU-2A/P is also used by aircrew during flight operations who are not equipped with aircrew masks. COTS equipment meeting OSHA requirements (and NFPA for firefighters) is applied by selected civilian personnel performing specific functions such as firefighting, EMS, hazardous materials, etc. Eligible civilians are inadequately addressed in DOTLPF.

<sup>2</sup> Detailed doctrine, policy, processes, and TTPs exist for the performance of this task and are effective for the protection of military personnel and selected eligible civilians (whose duties and responsibilities include decontamination operations) designated to conduct decontamination operations. Doctrine, policy, processes, and TTPs are also adequate and effective for personnel required to perform decontamination of assigned equipment and resources. However, other eligible civilians, particularly non-U.S. personnel, with potential decontamination operations responsibilities and requirements are not adequately addressed.

<sup>3</sup> Personnel designated to perform decontamination operations are trained on the proper wear of percutaneous protective protection as outlined in doctrine, policy, procedures, and TTPs. Military personnel performing decontamination operations are required to wear CBRND percutaneous protection against the potential for secondary exposure/contamination. Doctrine, policy, procedures, and TTPs do not adequately address the protection of nonmilitary personnel performing decontamination operations in the AO. However, OSHA and CDC requirements may apply and should be addressed as applicable. Non-U.S. personnel subject to these functions are not addressed. Service-specific CBRND percutaneous protection is currently applied for the protection of the force. The BDO, used by the USAF and U.S. Army, is a two-piece garment providing protection for a 24-hour period against chemical agent vapors, liquids, and droplets; biological agents and toxins and contact with radioactive particles. The BDO's protective abilities are lost if the suit is torn, ripped, splashed with POL, or is saturated with water and is designed for a one-time use and is worn by ground and most flight personnel (non-high-performance aircraft). The USMC uses the Saratoga COLPRO suit similar in design to the BDO, but launderable for personnel hygiene. The CPOG is a legacy two-piece garment for protection against CBRN agents. The CPOG is in use with the USN. The USAF CWU-66/P (and 77/P) is a one-piece flightsuit providing protection for a 24-hour period against standard CBRN agents and is designed for compatibility with aircrew lift support equipment. The BVO/GVO overboots are applied over the wearer's standard footwear to protect against contact with CBRND. The USN uses the CPFC, commonly called the "fishtail" for its design, to protect the wearer's footwear. The CPFC, considered obsolete, does provide a measure of antislip protection shipboard. Decontamination units/teams apply the CB Protective Boot (similar to firefighter boots) for decontamination operations. Hand protection is provided by the CPG in 7-, 14-, and 25-mil thicknesses to meet warfighter hand protection and dexterity needs. SCALP provides a disposable, lightweight, impermeable layer of protection for personnel against gross liquid contamination and is worn over the warfighter's protective ensemble. SCALP is applied by units performing decontamination operations where personnel may become soaked by decontaminants and Medical Services personnel with potential for prolonged contact with body fluids. Standard wet-weather gear (e.g., poncho, rain parka, rain suit, etc.) is also applied as a barrier against saturation of the warfighter's protective ensemble by contact with liquids such as rain, sea spray, etc. The M-2 apron is applied by personnel performing decontamination aprons and is worn over the ensemble. The apron is full length and sleeve to maximize coverage, although the back is open. COTS assets meeting OSHA requirements (and NFPA for firefighters) is applied by selected civilian personnel performing specific functions such as firefighting, EMS, hazardous materials, etc.

<sup>4</sup> Military decontamination unit/team personnel and selected eligible civilians (e.g., hazardous materials, firefighters, etc.) are trained using doctrine and MSDS information on standard decontaminants to include their hazardous effects, associated protective measures, and, if necessary, Self-Aid/Buddy-Aid actions. This training is performed upon initial designation and is performed on a recurring basis. CBRND exercises and evaluations include decontamination operations and may include circumstances for implementation of Self-Aid/Buddy-Aid measures and actions.

<sup>5</sup> Plans incorporate MOPP levels and methodologies are adjustable to meet local operations and threat needs. MOPP levels and methodologies apply to military personnel and are generally considered to apply to equipped nonmilitary personnel (although doctrine, policy, procedures, and TTPs do not address application to these personnel). The MOPP methodologies in planning and operations include CBRND actions, activities, and requirements to mitigate or prevent the effects of CBRN/TIM agents.

<sup>6</sup> MOPP instructions for personnel performing decontamination operations include appropriate adjustments to include provisions addressing splash protective equipment worn by military personnel over CBRND individual protective equipment to preclude saturation and potential secondary exposure/contamination.

<sup>7</sup> Unit plans, SOPs, and guidance incorporate MOPP levels and methodologies under existing doctrine, policy, and TTPs. Adjustments for local threat and requirements, such as decontamination operations, are addressed and disseminated.

<sup>8</sup> Unit SOPs, processes, and guidelines address the performance of decontamination of contaminated resources. Military decontamination units/team personnel and selected eligible civilians (e.g., hazardous materials, firefighters, etc.) designated to perform decontamination operations are trained based upon doctrine and MSDS data for standard decontaminants to include their hazardous effects and associated protective measures. Other military force members are provided training for the conduct of field decontamination of their equipment and assigned resources.

<sup>9</sup> Unit SOPs, processes, and guidelines include treatment instructions for exposure to decontaminants in Self-Aid/Buddy-Aid for personnel designated to perform decontamination operations. Initial and recurring training is performed and tracked of training. Unit exercises and evaluations are conducted to maintain expertise and readiness to perform decontamination operations.

<sup>10</sup> Unit command staff plan, allocate, position, and provide individual protective equipment assets to protect the force. These actions include the identification, acquisition, readiness, and application of assets required to protect Decontamination Unit/Team personnel, including splash protection. Doctrine, however, does not adequately address the provision of protective assets to nonmilitary personnel, particularly non-U.S. personnel, with decontamination operations responsibilities and tasks.

<sup>11</sup> Legacy systems will remain in the inventory throughout the mid term. These systems will be gradually replaced by new joint systems of respiratory/ocular protection as they are fielded. The JSGPM also replaces current Service-specific ocular/respiratory protection. The system provides respiratory and ocular protection from CBRN agents and selected TIMs. The field-of-vision is improved and encumbrances associated with legacy systems are reduced. The JSGPM incorporates state of the art technology and is designed to integrate with future warfighter CBRND IPE and function equipment/assets. The Guardian Program is projected to review, assess, and implement protection for critical members of the installation/facility populace during the mid term. This will predominantly be COTS-based assets for respiratory/ocular protection. However, the Guardian Program is not expected to address eligible civilian protection within the AO for other than existing U.S. military installations and facilities.

<sup>12</sup> Legacy systems will remain in the inventory throughout the mid term. These systems will be gradually replaced by new joint systems of percutaneous protection as they are fielded. The JSLIST NBC Protective Garment is a two-piece, risk-taking, overgarment with integrated hood affording protection against CBRN agents and selected TIMs. The garment reduces the physiological and psychological encumbrances associated with legacy systems. The JSLIST is under evaluation by NIOSH for application to OSHA protection requirements. Joint Service glove upgrades are provided under the Joint Block 1 and 2 Glove Upgrade Program (JB1/2GU) in the near and mid term. The JB1GU responds to an urgent need by designated elements of the force for increased tactility/durability supporting mission requirements. The JFIRE addresses protection of military firefighters within a CBRN/TIM environment conducting firefighting operations involving structural and crash/firefighting/rescue. The JFIRE incorporates the JSLIST into firefighter bunker gear. The JB1GU is expected to meet most of the requirements within the JSLIST ORD and is viewed as an evolutionary approach in the development of the JB2GU. Versions under consideration include a protective inner glove worn under existing warfighter gloves, a replacement glove for existing hand wear, or a combination of glove shell and liner affording CBRN protection of the legacy gloves they are projected to replace. The MULO is projected to replace legacy footwear covers. The ability of the MULO to provide adequate antislip protection for USN personnel asea is under review. The Guardian Program is projected to review, assess, and implement protection for critical members of the installation/ facility populace during the mid term. This will predominantly be COTS-based assets for percutaneous protection. However, the Guardian Program is not expected to address eligible civilian protection within the AO for other than existing U.S. military installations and facilities.

<sup>13</sup> The next-generation series of nonaviator masks is in R&D. The capabilities and fielding of these masks are not as yet determined.

<sup>14</sup> The next-generation series of nonaviator percutaneous protective assets is in R&D. The capabilities and fielding of these assets are not as yet determined.

### 13.11.3 Functional Solution Analysis

#### 13.11.3.1 DOTLPF Assessment Summary

1. **Deficiency:** The command staff do not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to eligible civilians, detainees, evacuees, and other non-U.S. military identified groups.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing civilian personnel, detainees, non-U.S. personnel, and other groups and operations for CBRND. *Organization:* Identify organizational services and activities supporting the mission performed by civilian personnel and operations. Address organizational issues (e.g., who provides the equipment, support forces to train and equip, etc.) related to the provision of CBRN/TIM protection to eligible civilians, detainees, evacuees, and other identified groups. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians, detainees, and other designated personnel. Conduct CBRN/TIM training, exercises, and evaluations including these groups, where appropriate. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilians, detainees, and other designated personnel. *Personnel:* Ensure that eligible civilians supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities:* Develop supporting infrastructure for eligible civilian, detainees, and other designated group CBRND (e.g., logistics, medical, training, communications, security, etc.).

#### 13.11.3.2 IMA Assessment Summary

Not required. No materiel deficiencies identified.

**13.12 Task TASHLD 12: Implement large-scale medical CBRN operations****13.12.1 Functional Area Analysis****13.12.1.1 Definition**

Establish and implement the efficient and consistent application of medical care and measures preparing and protecting the force against the debilitating effects of CBRN/TIM hazards (threat or actual). Includes the identification, movement, application, and management of resources to perform immunizations of the force and eligible civilians. Also includes the isolation of infected or contaminated personnel and/or MWA until risk is resolved, the restriction of movement to, and the conduct of quarantine to prevent the spread of infectious disease, and the evacuation of casualties to medical facilities. Addresses the full range of necessary resources required to attend to and resolve the circumstances.

**13.12.1.2 Derivation**

*Joint Enabling Concept for CBRN Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (TA 7, TA 7.1).*

**13.12.1.2.1 Supported Task: OPSHLD 13****13.12.1.2.2 Lateral Tasks: TASHA 15, TASHA 24****13.12.1.2.3 Supporting Task: N/A****13.12.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Undeveloped to highly developed land. (C1.1.1)
2. Riverine to open sea. (C1.2)
3. Natural and induced air. (C1.3)
4. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Partially completed mission preparation. (C2.1.3)
2. Marginal forces. (C2.2)
3. Marginal to adequate forces allocated. (C2.2.3)
4. Poor personnel nutrition and health. (C2.2.4.1)
5. Good personnel physical conditioning. (C2.2.4.3)
6. Poor mission-essential government-service civilian physical conditioning. (C2.2.4.3 – NEW)

7. Poor mission-essential contract-service civilian physical conditioning. (C2.2.4.3 – NEW)
8. Negligible personnel experience. (C2.2.4.5)
9. Some interoperability. (C2.2.6)
10. Partial multinational integration. (C2.3.1.2)
11. Limited staff expertise. (C2.3.1.3)
12. Limited deployed supplies. (C2.8.2)
13. Limited CONUS resupply. (C2.8.3)
14. No prepositioned materiel. (C2.8.4)
15. No host-nation support. (C2.8.5)
16. Negligible to limited commercial procurement (C2.8.6)

### Civil

1. Negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)
3. Uncertain international organization support. (C3.1.2.5)
4. Poor civil health. (C3.3.1.4)
5. High health risk. (C3.3.1.5)
6. Moderate to severe refugee impact. (C3.3.2)

## 13.12.2 Functional Needs Analysis

### 13.12.2.1 Capability and Deficiency Assessment Summary

Table 13.12-1 discusses current and projected capabilities to accomplish this task. The task requires the application of the full range of Shield CBRND activities and resources for successful accomplishment. The overall capabilities for current, near/mid, and far term are rated “yellow.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

### Current Capability and Deficiency

Limited capabilities currently exist for large-scale medical operations, particularly circumstances involving unanticipated threats/hazards within the AOR once military operations have commenced. Preplanning for large-scale medical operations is performed when the need is anticipated upon evaluation of adversary threat capabilities. However, preplanning for the conduct of these operations within the AOR for unanticipated threats/hazards is generally not performed until there is a determination of need. The ability to adequately respond to circumstances improves as operations are established, resources are applied, and supporting structures are in place. However, the initial period of operations is expected to be a reflection of attempts to ascertain the scope of the situation, identify resources, and coordinate necessary actions. Resources within the AOR are initially applied, in these circumstances, until additional resources are allocated and in place. Close coordination and cooperation between operational and medical services units/elements are essential to the rapid and accurate response and support of necessary large-scale medical operations. DOTLPF for the protection of U.S. military personnel

is adequate when involving contaminated casualties. However, DOTLPF is inadequate to address large numbers of eligible civilians, particularly non-U.S. personnel such as indigenous populations, third-party nationals, detainees, and others. Additionally, DOTLPF does not adequately address the protection of casualties unable to wear CBRND protection and the application of negative-pressure COLPRO for the transport and mass sheltering of infectious/contaminated casualties. DOTLPF is inadequate to address force actions associated with medical quarantine and/or enforcement of medical isolation involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nations, etc.). The distinction between medical infectious disease control equipment and measures by medical care providers and MOPP application to supporting force members is not identified in MOPP DOTLPF. Training for large-scale medical operations involving CBRN/TIM agents is inadequate. AMEDD institutional training for the treatment of contaminated/infectious casualties is not mandatory for medical practitioners identified for deployment or assignment where there exists a CBRN/TIM threat. The ability of the command staff to ensure medical capabilities for CBRND is limited by routine medical operations and requirements prior to deployment. Generally, until completion of decontamination, casualty care is performed by medical corpsmen and not medical practitioners. Mass medical operations may not be possible until the theater matures or additional resources are allocated to force. Additionally, deploying eligible civilians and MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment. The force staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians and MWA. Current doctrine and policy do not adequately address sustained operations within a CBRN/TIM environment. The Services currently field a variety of CBRND assets providing respiratory/ocular, percutaneous, and collective protection. This diversity of assets complicates the logistical support of operations with threat for joint operations. The assets protect against known chemical and biological warfare agents and particulate radiologicals. Protection is afforded to a select number of TIMs. Existing Service-specific IPE is limited on the period and scope of protection afforded the warfighter. Physiological and psychological encumbrances increase with prolonged wear. This tendency requires regular exercising and wear to acclimate and adjust the wearer to enable performance of assigned functions and activities. Current site COLPRO generally requires extensive site preparation and resources to erect, operate, and strike but cannot be erected/striking in a CBRN/TIM environment. Mobile COLPRO runs a diversity from forced clean air systems to full COLPRO, but are limited on their application. In general, current COLPRO is limited in quantity and does not adequately support expeditionary and highly mobile maneuver operations, particularly those in an austere environment with reduced logistical footprints. Many mobile platforms (including land, sea, and air) are not equipped with COLPRO. This circumstance requires the application of IPE to offset the situation. Medical prophylaxes do exist for the protection of the warfighter against a limited number of biological and chemical agents. However, few are FDA approved. A number possess IND authorization for application. Medications are considered for their potential prophylactic value, but are not always approved for this purpose by the FDA. Not all threat CBRN agents are addressed by CBRND medical countermeasures. Efficacy, time to achieve a level of protection, and the number of administrations vary between prophylaxes. COTS protective assets are applied for selected eligible civilians such as hazardous materials, firefighters, EMS, etc. However, eligible civilians and MWAs are not adequately addressed by DOTLPF for CBRND. Clear DOTLPF addressing the provisioning and training of eligible civilians with CBRND is inadequate. MWAs are not

afforded protection against the effects of CBRN/TIM agents, including COLPRO. MOPP DOTLPF is adequate for military personnel and operations. The establishment of adjustable MOPP levels, reflective of local operations and threat, are well defined, as are continuing evaluation for change/adjustments. However, operations increasingly involve U.S. and non-U.S. civilians. MOPP DOTLPF does not adequately address their presence and inclusion into MOPP methodologies and levels, particularly when these personnel may (or may not) be equipped with nonstandard IPE.

### **Projected Near/Mid-Term Capability and Deficiency**

Future configurations focus on reducing psychological and physiological stresses associated with the wearing of IPE, as well as striving for commonality of form factor among all services to reduce the logistics burden, development cost and improve availability. The JPACE, JSLIST, JSAM, and JSGPM are projected to be fielded during the mid term. Legacy Service-specific IPE will remain in the inventory throughout the mid term and into the far term during the fielding of the joint systems of IPE. Ongoing R&D into medical prophylaxes will provide additional prophylactic measures but still fail to address all threat CBRN agents. JECF is projected to initially field during the mid term with three COLPRO systems primarily addressing expeditionary operations. These systems, depending upon the quantity fielded, may provide additional COLPRO to address critical needs.

### **Projected Far-Term Capability and Deficiency**

Future configurations focus on reducing psychological and physiological stresses associated with the wearing of IPE, as well as striving for commonality of form factor among all services which will reduce the logistics burden, development cost and improve availability. Legacy Service-specific IPE will continue to be replaced by the joint systems of IPE until complete fielding to all Service units, including Guard and Reserve, early in the far term. Next-generation IPE assets are in R&D and are expected to be fielded sometime in the far term. However, specifics of design, characteristics, and protective capabilities are not as yet determined for these systems. Continued R&D into potential medical prophylaxes may result in additional protective measures for the force. However, specifics are unknown at this time.

#### **13.12.2.2 Resource Systems**

##### **Individual Protection**

##### **1. Respiratory/Ocular Protection:**

**COTS:** Commercially available systems of protection, manufactured and tested meeting OSHA standards for the United States or equivalent organization in other nations.

**M17 Series Masks w/M13 Series Filters:** Obsolescent warfighter system of protection. Retained in selected HTAs for NEO application. Designed for adults.

**MBU-19/P Chemical-Biological Aircrew Eye/Respiratory Protection (AERP):** USAF combat aircrew protection. Includes protective hood, MBU-12/P mask, C-2 canister, intercom for ground communications, and blower assembly.

**A/P22P-14(V) Respirator Assembly:** USN/USMC system for rotary-wing (Version 1 for USN) and fixed-wing (Versions 2–4 for USN/USMC) aircrews. Includes CB filter, dual air/oxygen supply, and crossover manifold for dual protective capabilities in air or on ground. Version 1 is not compatible with aircraft oxygen supply systems; Version 2 applied to EA-6B and F18A airframes; Version 3 to AV-8B and F-18C/D aircraft; and Version 4 is used for C-130 airframes.

**M40/M42 CB Protective Mask:** U.S. Army mask system designed for military standard profile and uses standard C-2 canister. M42 integrates with combat vehicle clean air supply system and has a connectable dynamic microphone for combat vehicle intercom system.

**M45 Aircrew Aviator Mask:** Replaces M42 and M49 systems for U.S. Army. Available with a canister-compatible hose assembly and a valve cassette that enables use of supplied air (from aircraft, SCBA or PAPR). The M45 is used by military personnel who cannot fit the M40A1, M42A2, or MCU-2/P masks.

**M48 CB Apache Aviator Mask:** Used by Apache aviator and flight support personnel. Replaced M43 Type 1 mask system and uses blower assembly with C-2 filter canister.

**MCU-2A/P:** Mainstay USAF and USN system for nonaviator personnel and aircrew personnel not performing flight operations, except for aircrew personnel not issued aviator systems and noncombat platforms/airframes without clean air supply systems. Applies C-2 filter for filter air.

**Joint Service Aviator Mask (JSAM):** Initial fielding projected in the mid term replacing Service-specific aviator respiratory/ocular protective systems. Provides CBRN protection under high-G conditions, compatible with existing and projected aviator CBRN IPE, flame and thermal protective, reduces stress associated with existing aviator IPE, and may be donned/doffed during flight.

**Joint Service General Purpose Mask (JSGPM):** Initial fielding projected in the mid term replacing Service-specific standard respiratory/ocular protective systems. Provides respiratory/ocular protection from CBRN agents and selected TIMs. Improves field-of-vision and encumbrances associated with existing Service systems.

**Joint Service Chemical Environment Survival Mask (JCESM):** COTS one-time use, one-size-fits-all, respiratory/ocular protective system affording two hours of protection in low-level CBRN vapor, aerosol, and particulate environments. Selected force element application only.

## 2. Percutaneous Protection:

**COTS:** Commercially available systems of protection, manufactured and tested meeting OSHA standards for the United States or equivalent organization in other nations.

**Battle Dress Overgarment (BDO):** U.S. Army/USAF two-piece camouflage-patterned garment (top and trousers) providing 24-hour protection against CBRN agents in vapor, liquid, droplet, and particulate forms.

**Saratoga:** USMC two-piece camouflage-patterned garment (top and trousers) providing 24-hour protection against CBRN agents in vapor, liquid, droplet, and particulate forms. Launderable for hygiene.

**CPOG:** Legacy two-piece green garment currently in use with USN providing limited-term protection against CBRN agents in vapor, liquid, droplet, and particulate forms.

***Chemical Protective Undergarment (CPU):*** Worn under standard IPE as additional layer of protection against contact with CBRN agents.

***CWU-66/P:*** One-piece USAF green flightsuit providing 24-hour protection against CBRN agents in vapor, liquid, droplet, and particulate forms. Available in tan as CWU-77/P flightsuit.

***Disposal Aircrew Protective Cape:*** Transparent disposable cape covering head and shoulders of aviator during periods between aircraft mounting/dismounting and shelter.

***BVO/GVO:*** Vinyl overboots (VO) worn over wearer's standard footwear and protects against contact with CBRN agents. Available in black (BVO) and green (GVO).

***Chemical Protective Footwear Cover (CPFC):*** Legacy system of CBRN protective footwear cover in use by USN. Requires wearer to pull protective sole tabs up and wrap/tie laces around cover to secure over footwear.

***Disposable Aircrew Footwear Cover:*** Transparent disposable footwear covers worn over aviator footwear to protect aviator during periods between aircraft mounting/dismounting and shelter.

***Chemical Protective Glove (CPG):*** Standard CBRN protective glove. Available in 7-, 14-, and 25-mil thicknesses addressing functional requirements for durability, dexterity, and tactile sensitivity.

***Disposable Aircrew Hand Protection:*** Transparent disposable hand coverings applied by USAF, USN, and USMC over aviator gloves during periods between aircraft mounting/dismounting and shelter. Also applied as between aviator inner and outer gloves enabling essential functional requirements for dexterity and tactile sensitivity.

***Chemical Protective Helmet System (CPHS):*** CBRN protective camouflage-patterned helmet cover to protect helmet from contact with CBRN contaminants.

***SCALP:*** Disposable, lightweight, impermeable overgarment designed for wear over IPE for additional protection in grossly contaminated environments. Applied by personnel required to leave protective sheltering in these environments to perform mission-critical tasks. Also applied by decontamination units/teams and medical personnel performing decontamination or potentially at risk for prolonged contact with liquids.

***Wet-Weather Gear: Includes Severe-Weather Gear (USN).*** Provides barrier against contact with liquids potentially damaging to protective abilities of IPE.

***M-2 Apron:*** Butyl rubber-coated sleeved apron worn over IPE and applied by decontamination units/teams and other designated personnel performing decontamination or potentially at risk for contact with liquids. Provides barrier against contact with liquids potentially damaging to protective abilities of IPE. Decontaminable.

***Medical Barrier Assets:*** Standard barrier assets applied by Medical Services personnel against contact with biohazards. May provide a degree of additional barrier protection against CBRN hazards when applied with IPE.

***Patient Protective Wrap (PPW):*** Enclosed casualty bag made of CBRN protective materials. Incorporates small flexible transparent window positioned over casualties face for viewing by medical practitioners. Uses cardboard stays to maintain separation of bag from casualty's face. Does not permit head-to-toe viewing of casualty. Supports limited medical assistance. Requires the wear of standard warfighter respiratory/ocular protection. Two wraps currently in stock. Legacy system provides protection up to 3 hours and newer system up to 6 hours.

**Joint Service Lightweight Integrated Suit Technology (JSLIST):** Two-piece (jacket and trousers) CBRN risk-taking protective garment with integrated hood. Affords protection against selected TIM agents. Reduces physiological and psychological encumbrances associated with existing Service-specific systems it replaces with initial fielding in the mid term. Under review for NIOSH certification for OSHA protection standards.

**Joint Protective Aircrew Ensemble (JPACE):** CBRN protective aviator flightsuit projected for initial fielding in the mid term and replacing Service-specific CBRN protective flightsuits. Provides JSLIST equivalent protection and provides protection when subject to rotor, propeller, and jetwash. Flame-retardant and self-extinguishing properties. Supports escape and evasion requirements.

**Joint Block I/II Glove Upgrade (JB1/2GU):** Projected fielding in near mid term replacing CPG for designated force elements requiring increased tactility/durability for mission performance. Various configurations under consideration.

**Joint Firefighter Integrated Response Ensemble (JFIRE):** Incorporates JSLIST into firefighter bunker gear, permitting firefighters to conduct firefighting operations within a CBRN/TIM environment.

**Multi-purpose Overboot (MULO):** Projected initial fielding in mid term and replacing legacy CBRN footwear covers.

### 3. Medical Protection:

**Vaccines:** Immunizations providing a level of acquired immunity against the effects of CBRN agents.

**Topicals:** Protective barrier products applied to the skin to enhance protection of wear against contact with CBRN/TIM agents. Includes both inert and reactive materials.

**Medications:** Medical materials taken to mitigate or prevent the effects of exposure to CBRN/TIM agents. Includes medications taken routinely or upon exposure (but prior to symptom display) to build resistance/immunity or to mitigate/resolve medical impacts of CBRN/TIM agent exposure/contamination.

## COLPRO

### 1. Mobile COLPRO

**CBPS:** M1113 HMMWV-mounted COLPRO system consisting of a hardshell filtration, power, and transport and expandable softshell tentage with contamination control area/entry. The COLPRO unit is designated the Lightweight Multipurpose shelter (LMS).

**Crewed Combat Vehicles (Ground):** Two types of COLPRO. First supplies filter air using forced clean air supply system. Requires wear of IPE and connection to crew mask. This is the type of system in the M1A1 Abrams MBT. Second system is incorporates full COLPRO and permits reduction of IPE during operation. JSLNBCLR is an example of the second type of system.

**Airframe Air Supply System:** Provides clean air from compressed air storage system until aircraft is outside of contamination and airframe interior is flushed of vapor contaminants or throughout flight operations.

**CITADEL:** System of protection installed with USN vessels to afford protection to selected connected spaces including C4ISR, medical, and R2.

## 2. Fixed-Site COLPRO

**MGPTS:** USMC Medium General Purpose Tent System (MGPTS) with CB Protective Liner System designed for support of USMC operational C4ISR and R2.

**CP-DEPMEDS:** Component-based system of tentage, connective corridors, ISO containers, etc., with COLPRO liners for configuration into field hospitals and includes supporting power and utility systems, lighting, engine control units, and filtration systems. Large system requiring extensive use of resources to prepare location, erect/strike, operate, and maintain.

**JTCOPS:** Similar to CP-DEPMEDS, but for critical functions and activities of the force (e.g., staff operations, aircrew housing and briefing, etc.).

**CP-EMEDS:** USAF air-transportable system similar to CP-DEPMEDS on a smaller scale and configurable from one medical shelter to a 25-bed field hospital.

**CP-SSS:** USAF small-scale COLPRO transportable system designed to support C2 functions.

**JECP:** Projected program of COLPRO designed for application in highly mobile operations, expeditionary operations, forced-entry operations, and/or to supplement larger-scale COLPRO systems in support of operations. Consists of building/room and tentage insert kits and small-unit stand-alone COLPRO kits.

**M20/M20A1 SCPE:** Lightweight and modular COLPRO system consisting of an inflatable liner for insert into rooms or buildings.

**Building integrated COLPRO systems:** COLPRO systems designed and installed into buildings as integral systems, usually facility construction. Post-construction installation is based upon building design and COLPRO requirements. Varies between buildings based upon applied technology, date of construction/installation, system engineering, facility function, etc. Most existing facility COLPRO was established during Cold War period.

**MOPP Methodology:** Stepped level of CBRND protective measures. Standardized levels permit the rapid increase or decrease of unit MOPP level.

**Unit Staff:** The application of DOTLPF for all phases of operations with threat from preplanning to post-force return to home stations. Includes all aspects of C2 and supporting staff activities/functions (e.g., logistics, intelligence, etc.) enabling mission and task accomplishment.

Table 13.12-1. TASHLD 12: Capability and Deficiency Assessment

System/Measure	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10	M11
<b>Current</b>											
<b>Individual Protection</b>	2	5.7	4	8	N/A	3	6	6.7	5.5	5	3

	FAA Measure	Scale
M1	Plans address large-scale medical operations resulting from CBRN/TIM exposure/contamination.	<p><b>8–10:</b> Detailed plans exist and are coordinated between operational and medical services staffs for large-scale CBRN/TIM medical operations within the AO involving the forces and non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).</p> <p><b>4–7:</b> Plans exist and are coordinated between operational and medical services staffs for Medical Services support of operations within the AO involving CBRN/TIM threat and address large-scale medical operations involving the force and non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).</p> <p><b>1–3:</b> Plans exist and are coordinated between operational and medical services staffs for Medical Services support of operations within the AO involving CBRN/TIM threat and address large-scale medical operations involving the force.</p> <p><b>0:</b> Operational and Medical Services staff coordinated plans do not exist for the AO addressing large-scale medical operations involving CBRN/TIM threats.</p>
M2	Tactical medical facilities are able to treat and isolate contaminated/infectious casualties.	<p><b>8–10:</b> All tactical medical facilities are equipped and exercised for the reception, decontamination, treatment, and protection of contaminated/infectious casualties. All assigned medical practitioners and medical support personnel (including EMS, medical aides, etc.) are formally trained, receive recurring training, and are equipped with CBRND protective assets/materials, for the evaluation/care and protection of contaminated/infectious casualties safely and effectively. Medical provider medical treatment is provided, when needed, throughout the medical process.</p> <p><b>4–7:</b> Tactical medical facilities are equipped and exercised for the reception, decontamination, treatment, and protection of contaminated/infectious casualties. Formal training and CBRND protective assets/materials are available for the evaluation/care and protection of contaminated/infectious casualties. Medical support personnel are trained on the evaluation, decontamination, care, and protection of contaminated/infectious casualties.</p> <p><b>1–3:</b> Tactical medical facilities are equipped for the reception, decontamination, limited treatment, and COLPRO protection of contaminated/infectious casualties. Medical personnel are equipped with CBRND protective assets/materials to conduct the evaluation/care and COLPRO protection of contaminated/infectious casualties. General medical training of medical practitioners and medical support staff is the basis for the performance of evaluation, decontamination, and treatment of contaminated/infectious casualties.</p> <p><b>0:</b> Tactical medical facilities are not adequately equipped to conduct reception, decontamination, treatment, and protection of contaminated/infectious casualties.</p>

M3	Forces are immunized against threat agents.	<p><b>8–10:</b> Medical CBRND countermeasures and preventative medical measures exist and are employed for all threat agents and encompass all eligible at-risk populations.</p> <p><b>4–7:</b> Medical CBRND countermeasures and preventative medical measures exist and are employed for the protection of U.S. military and eligible civilians supporting the mission for threat agents.</p> <p><b>1–3:</b> Medical CBRND countermeasures and preventative medical measures exist and are employed for the protection of U.S. military personnel for threat agents.</p> <p><b>0:</b> Medical CBRND countermeasures and preventative medical measures are not employed for threat agents.</p>
M4	Forces completed deployment medical preparation.	<p><b>8–10:</b> All eligible at-risk force populations are medically prepared for operations with threat.</p> <p><b>4–7:</b> U.S. military and eligible civilians supporting the mission are medically prepared for operations with threat.</p> <p><b>1–3:</b> U.S. military personnel are medically prepared for operations with threat.</p> <p><b>0:</b> Forces are not medically prepared for operations with threat.</p>
M5	In-place system is operational for tracking status of personnel and MWA immunizations, pre-treatments, antidotes, and medical treatment.	<p><b>8–10:</b> Tactical Medical Information Systems (MISs) incorporate automated tracking of the status, issuance, and administration of vaccines, pretreatments, antidotes, and medical treatment for all force personnel (U.S. military, MWAs, and eligible civilians). Systems are integrated and interoperable with higher-echelon MISs.</p> <p><b>4–7:</b> Tactical MISs and/or manual processes provide for the tracking of the status, issuance, and administration of vaccines, pretreatments, antidotes, and medical treatment for U.S. military and eligible civilians.</p> <p><b>1–3:</b> Predominantly manual processes are applied for the tracking of the status, issuance, and administration of vaccines, pretreatments, antidotes, and medical treatment for U.S. military personnel.</p> <p><b>0:</b> Processes and systems do not exist to track the status, issuance, and administration of vaccines, pretreatments, antidotes, and medical treatment to the force.</p>
M6	Disease and CBRN/TIM countermeasures are issued.	<p><b>8–10:</b> Medical CBRND countermeasures exist for all threat CBRN and high-risk TIM agents and encompass all eligible at-risk populations.</p> <p><b>4–7:</b> Medical CBRND countermeasures exist for selected high-threat CBRN and high-risk TIM agents for U.S. military and eligible civilian members.</p> <p><b>1–3:</b> Medical CBRND countermeasures are inadequate for high-threat CBRN and/or high-risk TIM agents and/or application by U.S. military and/or eligible civilian members.</p> <p><b>0:</b> Medical CBRND countermeasures do not exist for high-threat CBRN and/or high-risk TIM agents and/or application by U.S. military and/or eligible civilian members.</p>
M7	Contaminated/infectious personnel and MWAs are safely transported	<p><b>8–10:</b> In-place doctrine, protective assets, and training provide for the safe handling and transport of exposed, infectious, or contaminated personnel/MWAs without potential for secondary exposure, infection, or contamination of personnel, activities, transport assets, and resources performing the handling and transport.</p> <p><b>4–7:</b> Doctrine and training address the safe handling and transport of exposed, infectious, or contaminated personnel/MWAs and protective assets are applied to prevent secondary exposure, infection, or contamination of personnel and assets performing the handling and transport.</p> <p><b>1–3:</b> Doctrine generally addresses the safe handling and transport of exposed or contaminated casualties and protective assets are applied to prevent secondary exposure or contamination of personnel performing the handling and transport.</p> <p><b>0:</b> Doctrine and assets do not exist to safely handle and transport exposed, infectious, or contaminated personnel/MWAs.</p>

M8	Large-scale quarantine sheltering and treatment operations are established in accordance with medical plans	<p><b>8–10:</b> Plan identified coordination and required directions are accomplished, policies, and processes appropriately implemented, resources are in place, and operations are established and maintained for large-scale quarantine sheltering and treatment as outlined in established coordinated medical plans for the AO.</p> <p><b>4–7:</b> Plan identified coordination and directives are accomplished, policies, and processes are adjusted to reflect available and in-place resources, and operations are established for large-scale quarantine sheltering and treatment using prior established and coordinated medical plans for the AO as guidance.</p> <p><b>1–3:</b> Coordination and directives are accomplished, policies, and processes are developed, available resources are applied, and limited operations are established for initial large-scale quarantine sheltering and treatment based upon general guidance in medical plans for the AO.</p> <p><b>0:</b> Large-scale medical operations are not established in accordance with medical plans or medical plans for the AO do not exist for quarantine sheltering and treatment operations.</p>
M9	Large-scale quarantine sheltering and treatment operations possess sufficient capability to meet needs.	<p><b>8–10:</b> Detailed plans exist and are coordinated between operational and medical services staffs for large-scale CBRN/TIM medical operations within the AO involving the forces and non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.). Planned operations are developed to address reasonable expectations of needs and are scalable to support unanticipated demands.</p> <p><b>4–7:</b> Plans exist and are coordinated between operational and medical services staffs for Medical Services support of operations within the AO involving CBRN/TIM threat and address large-scale medical operations involving the force and non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.). Planned operations are developed to address reasonable expectations of needs and are scalable to support unanticipated demands.</p> <p><b>1–3:</b> Plans exist and are coordinated between operational and medical services staffs for Medical Services support of operations within the AO involving CBRN/TIM threat and address large-scale medical operations involving the force. Planned operations are developed to address expectations of needs and are scalable to support unanticipated demands.</p> <p><b>0:</b> Operational and Medical Services staff coordinated plans do not exist for the AO addressing large-scale medical operations involving CBRN/TIM threats.</p>
M10	Required resources are available to perform mass medical operations.	<p><b>8–10:</b> Plans, taskings, and resources exist and are available for the effective implementation and support of large-scale CBRN/TIM medical operations within the AO involving forces and non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).</p> <p><b>4–7:</b> Plans exist and identify taskings and resources for the implementation and support of large-scale medical operations within the AO.</p> <p><b>1–3:</b> Plans exist and generally identify taskings and resources for the implementation and/or support of large-scale medical operations within the AO.</p> <p><b>0:</b> Plans do not exist identifying taskings and resources for the implementation and support of large-scale medical operations within the AO.</p>
M11	There is effective DOTMLPF in place to conduct task.	<p><b>8–10:</b> DOTMLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations.</p> <p><b>4–7:</b> Most critical aspects of DOTMLPF for this task are addressed. Task can be performed with limitations requiring work-arounds.</p> <p><b>1–3:</b> DOTMLPF is inadequate for accomplishment of this task.</p> <p><b>0:</b> DOTMLPF does not exist for this task.</p>

<sup>1</sup> Plans for operations with threat incorporate MOPP levels and methodologies are adjustable to meet local operations and threat needs. MOPP levels and methodologies apply to military personnel and are generally considered to apply to equipped nonmilitary personnel (although doctrine, policy, procedures, and TTPs do not address application to these personnel). The MOPP methodologies in planning and operations include CBRND individual protective equipment and measures to mitigate or prevent the effects of CBRN/TIM agents upon critical functions, activities, and operations. However, preplanning for the conduct of large-scale medical operations within the AO for unanticipated threats/hazards is generally not performed. Planning and operations addressing events of this nature occur upon determination of need.

<sup>2</sup> Medical personnel are trained on the proper wear of protective respiratory/ocular protection as outlined in doctrine, policy, procedures, and TTPs. Expelled air from an exposed/contaminated casualty equipped with standard ocular/respiratory protection is not filtered and may present a potential secondary hazard or contamination source for handling and transporting personnel and resources. The application of standard warfighter IPE to exposed/contaminated casualties provides containment of the potential contamination within the IPE, a requirement that may not be achievable for certain types of casualties. Respiratory/ocular protection is diverse across the Services and performed functions. The M40/M42 CB Protective Mask is in service with the U.S. Army. The mask uses the C-2 canister for filtration of CBRN contaminants. The M45 Aircrew Aviator Mask replaced the U.S. Army M43 Type II and M49 Mask Systems. The system uses a low-profile canister compatible hose assembly for both hose and face-mounted configurations. The mask system incorporates selectable filtration for support both during aircraft systems activation and using the connectable filter pack. The mask also is applied to personnel who cannot be fitted with the standard M40A1, M42A2, or MCU-2A/P masks. The MCU-2A/P is the mainstay USAF and USN mask employed by personnel not equipped with aircrew masks and by aircrew when not performing flight operations. The MCU-2A/P is also used by aircrew during flight operations who are not equipped with aircrew masks. COTS equipment meeting OSHA requirements (and NFPA for firefighters) is applied by selected civilian personnel performing specific functions such as firefighting, EMS, hazardous materials, etc. Limited quantities of COTS may be available within HTAs for known NEO requirements for the protection of populace members unable to wear the M17 series or standard warfighter respiratory/ocular protective devices. MWAs are not afforded respiratory/ocular protection. Eligible civilians are inadequately addressed in DOTLPF.

<sup>3</sup> Doctrine, policy, procedures, and TTPs exist for the movement of infectious/contaminated casualties to medical treatment. Military personnel performing handling and transport are required to wear CBRND ocular/respiratory protection against the potential for secondary exposure/contamination. Casualties able to wear standard IPE are not placed into PPWs. Doctrine requires the individual's unit of assignment provide individual protective assets when the individual is received. However, the ability of any unit to pull and transfer equipment with each casualty, especially during operations, is generally not considered. Medical units, however, are not equipped with additional protective material for existing patients and replacement assets for casualties. Noninfectious/uncontaminated casualties unable to wear standard IPE are placed into PPWs to protect against exposure/contamination when moving through a hazard/contaminated area. Contaminated casualties must be able to wear standard IPE to protect against secondary contamination by transporting and handling personnel, a requirement that may not be achievable for certain types of casualties. Standard warfighter respiratory/ocular protection is worn by the casualty and requires the ability to provide a seal and obtain a draw against filter resistance. Further, military personnel handling and transporting casualties in PPWs, whether infectious/contaminated or not, are required to wear CBRND IPE. Doctrine, policy, procedures, and TTPs do not adequately address the protection of nonmilitary personnel performing handling and transport activities potentially involving infectious/contaminated personnel. However, OSHA and CDC requirements may apply and should be addressed as applicable. Non-U.S. personnel subject to these functions are not addressed.

<sup>4</sup> Doctrine, policy, and procedures are adequate for planning, movement, management, and positioning of materiel (including CBRND materiel) in support of operations. CBRND materiel for an operation addresses the identified threat. The allocation and dissemination of CBRND materiel is managed by the staff based upon plans, operational requirements, anticipated or experienced threat, available resources, and the maturity of the theater. However, preplanning for the allocation, positioning, and tasking of resources for the conduct of large-scale medical operations within the AO for unanticipated threats/hazards is generally not performed. Planning and operations addressing events of this nature occur upon determination of need and are coordinated with the JTF and Medical Services staffs.

<sup>5</sup> DOTLPF does not adequately address the provision of individual protection of non-U.S. military personnel supporting or are otherwise addressed by this task. Additionally, DOTLPF does not adequately address the protection of casualties unable to wear respiratory/ocular CBRND protection. Expelled air from an exposed/contaminated casualty equipped with standard ocular/respiratory protection is not filtered and may present a potential secondary hazard or contamination source for handling and transporting personnel and resources. The application of PPW to exposed/contaminated casualties provides containment of the potential contamination within the wrap.

<sup>6</sup> Medical personnel are trained on the proper wear of percutaneous protective protection as outlined in doctrine, policy, procedures, and TTPs. Doctrine, policy, procedures, and TTPs exist for the handling of contaminated casualties for medical treatment. Military personnel performing handling and transport are required to wear CBRND percutaneous protection against the potential for secondary exposure/contamination. Casualties able to wear standard IPE are not placed into PPWs. Uncontaminated/noninfectious casualties unable to wear standard IPE are placed into PPWs to protect against exposure/contamination when moving through a contaminated area. Contaminated casualties must be able to wear standard IPE to protect against secondary contamination by transporting and handling personnel, a requirement that may not be achievable for certain types of casualties.

Further, military personnel handling and transporting casualties in PPWs, whether infectious/contaminated or not, are required to wear CBRND IPE. Doctrine, policy, procedures, and TTPs do not adequately address the protection of nonmilitary personnel performing handling and transport activities potentially involving infectious/contaminated personnel. However, OSHA and CDC requirements may apply and should be addressed as applicable. Non-U.S. personnel subject to these functions are not addressed. Service-specific CBRND percutaneous protection is currently applied for the protection of the force. The BDO, used by the USAF and U.S. Army, is a two-piece garment providing protection for a 24-hour period against chemical agent vapors, liquids, and droplets; biological agents and toxins and contact with radioactive particles. The BDO's protective abilities are lost if the suit is torn, ripped, splashed with POL, or is saturated with water and is designed for a one-time use and is worn by ground and most flight personnel (non-high-performance aircraft). The USMC uses the Saratoga COLPRO suit similar in design to the BDO, but launderable for personnel hygiene. The CPOG is a legacy two-piece garment for protection against CBRN agents. The CPOG is in use with the USN. The USAF CWU-66/P (and 77/P) is a one-piece flightsuit providing protection for a 24-hour period against standard CBRN agents and is designed for compatibility with aircrew lift support equipment. The BVO/GVO overboots are applied over the wearer's standard footwear to protect against contact with CBRND. The USN uses the CPFC, commonly called the "fishtail" for its design, to protect the wearer's footwear. The CPFC, considered obsolete, does provide a measure of antislip protection shipboard. Hand protection is provided by the CPG in 7-, 14-, and 25-mil thicknesses to meet warfighter hand protection and dexterity needs. SCALP provides a disposable, lightweight, impermeable layer of protection for personnel against gross liquid contamination and is worn over the warfighter's protective ensemble. SCALP is applied by units performing decontamination operations where personnel may become soaked by decontaminants and Medical Services personnel with potential for prolonged contact with body fluids. Standard wet-weather gear (e.g., poncho, rain parka, rain suit, etc.) is also applied as a barrier against saturation of the warfighter's protective ensemble by contact with liquids such as rain, sea spray, etc. The M-2 apron is applied by personnel performing decontamination aprons and is worn over the ensemble. The apron is full length and sleeve to maximize coverage, although the back is open. COTS assets meeting OSHA requirements (and NFPA for firefighters) is applied by selected civilian personnel performing specific functions such as firefighting, EMS, hazardous materials, etc. Medical barrier impermeable barrier protective assets may also be applied by Medical Services practitioners potentially at risk for contact with fluids. Protective measures and application of medical protective resources are applied by medical practitioners and supporting staff during treatment and quarantine/isolation operations. These measures and resources generally follow standard medical requirements and guidance for infectious disease control medical practices and are not applicable to MOPP and CBRND. Standard warfighter individual protection may continue to be applied by medical unit personnel during treatment and management of isolated/quarantined personnel but is the decision of the conducting medical services unit commander. Nonmedical personnel supporting these operations (e.g., security, transport, administration, etc.), are considered subject to MOPP methodologies and level requirements. The distinction is not adequately addressed in existing DOTLPF between protection for medical care and supporting activities.

<sup>7</sup> Doctrine, policy, procedures, and TTPs require the application of percutaneous protection by handling and transporting personnel against the potential for secondary exposure/contamination. Standard warfighter percutaneous protection is worn by military personnel performing these functions. Doctrine, policy, procedures, and TTPs do not adequately address the protection of nonmilitary personnel performing handling and transport activities potentially involving infectious/contaminated personnel. However, OSHA and CDC requirements may apply and should be addressed, as applicable. Non-U.S. personnel subject to these functions are not addressed. Infectious and contaminated casualties (human and MWA) unable to wear percutaneous protection are not adequately addressed in doctrine, policy and standards. Protective equipment is not available for these casualties. The PPW may not be medically advisable for all casualties. Standard warfighter respiratory/ocular protection is worn by the casualty and requires the ability to provide a seal and obtain a draw against filter resistance. Further, the PPW is limited in the number of hours of afforded protection, depending upon date of manufacture. PPWs in stock prior to 2004 have a maximum protection time period of 3 hours. PPWs obtained for stockage in 2004 and subsequently provide protection up to 6 hours. This period is considered adequate for most initial casualty movements within the AO. Casualties able to wear standard percutaneous protection assets are required to apply the equipment outside of CPSs. However, medical units are not provided stocks of this equipment for use by patients. Medical policy is the patient's unit is responsible for providing the material to the medical unit for use by the patient. Operationally involved units may be delayed, at best, in providing the assets.

<sup>8</sup> Forces are not protected against all identified threat CBRN/TIM capabilities. Medical prophylaxis does not exist for all threat CBRN/TIM agents. Current prophylaxis and supporting doctrine, policy, and procedures do not address presymptomatic medical CBRND protective countermeasures by other than U.S. forces, excluding MWAs and eligible civilians. Prophylaxis against most high-threat TIMs are not currently available due to the relatively recent consideration of these agents as a potential threat. Additionally, the efficacy of existing prophylaxis, particularly vaccines, widely varies. Military personnel are administered and/or issued CBRND medical countermeasures for operations with threat. Vaccines for selected biological agents, topicals, and preexposure and/or post-exposure/presymptomatic medications are applied to mitigate or preclude the effects of specific CBRN/TIM agents. Currently, preexposure prophylaxis is available for nerve agents (G and V series), and vesicants (H, HD, HN, L, CX), topical only. SERPACWA is the preexposure countermeasure for vesicants and one nerve agent. TSP is approved by the FDA as a supplement for SERPACWA. Post-exposure prophylaxis is available for pulmonary (CG) agent, but is not FDA approved. Radioprotective steroids and neutraceuticals may be effective as pre- and post-exposure prophylactics. 5-androstenediol is an IND preexposure treatment for radiological exposure. Iodide/potassium iodide is FDA approved for application against Iodine 131, 132, 134, and 135. Post-exposure radiological

exposure prophylaxis consists of neutraceuticals, plant isoflavone genistein, and alpha tocopherol (Vitamin E) but are not approved by the FDA for prophylaxis against radiation. FDA-approved preexposure medical countermeasures are available for anthrax, cholera, HFRS (Haantan), Rift Valley fever, yellow fever, HFRS (Haantan), and smallpox. IND status vaccines are currently available for Q-fever, tularemia (although use has been placed on hold by the FDA), Botulinum, Junin hemorrhagic fever, and VEE/WEE/EEE. Antiviral/bacterial medications may be administered and/or issued to provide a level of protection against biological agents. Medical prophylaxes are developed for the military force. Prophylaxes for MWAs are virtually nonexistent. Prophylaxis for eligible civilians is not addressed. Availability of prophylaxis is questionable for issue and administration to eligible civilians. The issue and administration of prophylaxis to eligible civilians requires review due to questions regarding applicability to the range of body types, ages, and physical/medical factors inherent within a potential population, as well as long-term health issues and legal implications.

<sup>9</sup> Medical screening and preparation of deploying personnel include the administration of immunizations addressing the anticipated threats. Military members tasked to participate in operations with threat are briefed on the threat agents and associated CBRND measures, including medical prophylaxes. If pre- and/or post-exposure/presymptomatic prophylaxes are issued, the force is trained on the use of the medication. However, CBRND prophylaxes for MWAs do not exist, and DOTLPF is inadequate for the training of non-U.S. military personnel for prophylactic treatment of CBRN/TIM agent exposure.

<sup>10</sup> CBRND medical countermeasures are issued/administered to address the threat. Military members tasked to participate in operations with threat are briefed on the threat agents and associated CBRND measures, including medical prophylaxes. If pre- and/or post-exposure/presymptomatic prophylaxes are issued, the force is trained on the use of the CBRND medical countermeasures. However, CBRND prophylaxes for MWAs do not exist, and DOTLPF is inadequate for the training of non-U.S. military personnel for prophylactic treatment of CBRN/TIM agent exposure.

<sup>11</sup> Plans for operations with threat incorporate MOPP levels and methodologies are adjustable to meet local operations and threat needs. MOPP levels and methodologies apply to military personnel and are generally considered to apply to equipped nonmilitary personnel (although doctrine, policy, procedures, and TTPs do not address application to these personnel). The MOPP methodologies in planning and operations include CBRND COLPRO to mitigate or prevent the effects of CBRN/TIM agents upon critical functions, activities, and operations. However, preplanning for the conduct of large-scale medical operations within the AO for unanticipated threats/hazards is generally not performed. Planning and operations addressing events of this nature occur upon determination of need.

<sup>12</sup> Negative-pressure COLPRO with filtered expelled air does not exist within the inventory for the transport and housing of numbers of infectious/contaminated casualties. Hospital ships are not equipped with COLPRO. All current COLPRO systems in land, air, and sea assets are not designed for the containment and transport of infectious/contaminated casualties. Casualties must be decontaminated before entry into COLPRO. COLPRO, however, may be applied for the protection of noninfectious/uncontaminated casualties against exposure/contamination to CBRN/TIM agents. Current mobile COLPRO systems are predominantly integrated into selected combat vehicles/vessels and do not support transport of exposed/contaminated casualties. The only currently fielded land-based mobile COLPRO is CBPS. The CBPS system is available on a mobile platform and can provide a limited number of people protection. The CBPS consists of a dedicated M1113 HMMWV with an LMS mounted on the back and provides a highly mobile, contamination-free, environmentally controlled work area for forward deployed medical units. The CBPS has been fielded to treatment squads, forward surgical teams, and medical companies. Four personnel are required to operate the CBPS. However, these systems are limited in supply and cannot provide COLPRO during movement. Selected U.S. Naval combat vessels may be equipped with full COLPRO (CITADEL). However, these systems are generally restricted to critical operations areas of the ships. The critical areas are contiguous in that they share common bulkheads and movement between areas is not prevented. The application of these COLPRO systems for the treatment and isolation/quarantine of infectious/contaminated casualties is not operationally acceptable. Naval hospital ships, U.S. Naval auxiliaries, and USCG vessels are not equipped with COLPRO. None of the identified COLPRO systems provide negative pressure environments with filtered exhausting air exchange.

<sup>13</sup> Mobile casualty COLPRO does not exist for the transport of infectious/contaminated casualties precluding or mitigating the potential for secondary exposure/contamination of handling and transport personnel and resources. Handling and transport personnel must wear IPE and the transporting resource is considered contaminated until decontaminated and verified.

<sup>14</sup> DOTLPF does not adequately address the application of negative-pressure COLPRO for the transport and mass sheltering of infectious/contaminated casualties.

<sup>15</sup> The USMC MGPTS with CB Protective Liner System provides a positive-pressure, filtered-air, toxic-free shelter for protection against CBRN agents. However, there are insufficient quantities to meet all operational requirements for protection from CBRN/TIM effects. The CP-DEPMEDS provides a clean, toxic-free, environmentally controlled, patient treatment area and the components are designed to integrate as field hospitals. They are packaged as a set for deployment to threat areas for hospital operations. The entire composite hospital consists of expandable tentage, passageways, environmental control units, and ISO shelters. The CP-DEPMEDS exist in very limited quantities. Although it could be applied to provide COLPRO to the task identified groups, its designed and primary function is that of medical care. A similar COLPRO is the USAF's CP-EMEDS, which is an air-transportable medical facility deployable in various configurations from a single shelter to a 25-bed patient hospital. The CP-EMEDS is in a very limited number and, like the CP-DEPMEDS, is designed for its primary function of the provision of medical care. The USAF CP-SSS is a small-scale CPS applied for the conduct of C2

operations, maintenance of critical equipment, force beddown, and the provision of R2 for sortie generators and key leadership. This shelter is in limited supply and unlikely sufficient quantities would be available to support a group of any size, especially during operations against an adversary. The M20/M20A1 SCPE is a lightweight, modular system involving a liner designed for inflation within a room or building. The M20A1 serves to bridge the gap between the M20 SCPE and CBPS. These systems are designed for standard room configurations and, like other COLPRO systems, are in limited number. Fixed-site COLPRO within the United States and its territories is predominantly designed for nuclear fallout and does not address other CBRN/TIM hazards and threats arising after September 11, 2001. Selected critical key facilities are equipped with CBRN COLPRO, but are not available to other than designated personnel and are not installed in medical treatment facilities. Fixed-site CBRN COLPRO is installed in facilities housing selected activities and functions within HTAs. However, these facilities are dedicated to critical operational requirements and restricted to assigned and designated personnel and do not generally include medical treatment facilities. However, the Guardian Program is reviewing FP protective measures at U.S. installations and facilities will be addressing these issues. The projected mid-term fielding of JECF may alleviate COLPRO shortages but will likely be insufficient to satisfy all COLPRO requirements. Prior planning and prioritization of COLPRO allocation is critical. However, none of these systems provide negative pressure environments with filtered exhausting air exchange.

<sup>16</sup> Plans incorporate MOPP levels and methodologies are adjustable to meet local operations and threat needs. MOPP levels and methodologies apply to military personnel and are generally considered to apply to equipped nonmilitary personnel (although doctrine, policy, procedures, and TTPs do not address application to these personnel). The MOPP methodologies in planning and operations include CBRND actions, activities, and requirements to mitigate or prevent the effects of CBRN/TIM agents.

<sup>17</sup> Plans incorporate MOPP levels and methodologies are adjustable to meet local operations and threat needs. MOPP levels and methodologies outlined in doctrine, policy, procedures, and TTPs require levels of protection readiness based upon the threat and/or presence of contaminants. Full protection is required in the presence of CBRN/TIM agents/contamination. This includes protective measures and the wear of protective equipment when the possibility exists for secondary exposure/contamination to personnel and equipment, such as the movement of infectious/contaminated casualties. MOPP levels and methodologies are generally considered to apply to equipped nonmilitary personnel. Plans within HTAs may incorporate this perception. However, doctrine, policy, procedures, and TTPs do not address their application to nonmilitary personnel. Protective measures and application of medical protective resources are applied by medical practitioners and supporting staff during treatment and quarantine/isolation operations. These measures and resources generally follow standard medical requirements and guidance for infectious disease control medical practices and are not applicable to MOPP and CBRND. Standard warfighter individual protection may continue to be applied by medical unit personnel during treatment and management of isolated/quarantined personnel but is the decision of the conducting medical services unit commander. Nonmedical personnel supporting these operations (e.g., security, transport, administration, etc.), are considered subject to MOPP methodologies and level requirements. The distinction is not adequately addressed in existing DOTLPF between protection for medical care and supporting activities.

<sup>18</sup> Plans incorporate MOPP levels and methodologies and are adjustable to meet local operations and threat needs. MOPP levels and methodologies apply to military personnel and are generally considered to apply to equipped nonmilitary personnel (although doctrine, policy, procedures, and TTPs do not address application to these personnel). The MOPP methodologies in planning and operations include CBRND medical countermeasures, including vaccination/immunization to mitigate or prevent the effects of CBRN/TIM agents.

<sup>19</sup> Plans incorporate MOPP levels and methodologies are adjustable to meet local operations and threat needs. MOPP levels and methodologies outlined in doctrine, policy, procedures, and TTPs require levels of protection readiness based upon the threat and/or presence of contaminants. Full protection is required in the presence of CBRN/TIM agents/contamination. This includes protective measures and the wear of protective equipment when the possibility exists for secondary exposure/contamination to personnel and equipment, such as the movement of infectious/contaminated casualties. MOPP levels and methodologies are generally considered to apply to equipped nonmilitary personnel. Plans within HTAs may incorporate this perception. However, doctrine, policy, procedures, and TTPs do not address their application to nonmilitary personnel.

<sup>20</sup> DOTLPF adequately addresses MOPP methodologies and levels for military force members. DOTLPF does not address the application of MOPP to eligible civilians. The distinction between medical infectious disease control equipment and measures by medical care providers and MOPP application to supporting force members is not identified in MOPP DOTLPF.

<sup>21</sup> Command staff plans include predeployment medical screening and the stockpiling, allocation, and distribution of CBRND protective resources. Unit plans address medical activities by referring to appropriate JTF and medical plans, policies, and procedures. Medical Service unit staff plan and develop associated plans and policies addressing medical activities and procedures to support force operations within the AO. The invocation of quarantine and enforcement of medical isolation are within the purview of medical authorities. The command staff provides support as defined in the coordinated and appropriate medical (AO and JOA) and JTF plans. DOTLPF is inadequate to address large-scale medical CBRN/TIM operations, particularly sustained operations within a CBRN/TIM environment and/or command staff and Medical Services action associated with large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party nations, etc.).

<sup>22</sup> Existing medical facilities within an HTA exercise the reception and treatment of contaminated/infectious casualties. Voluntary institutional training for the treatment contaminated/infectious casualties is available through AMEDD. Periodic exercises are performed with medical activities, but on a limited basis, to provide training opportunities

and to assess capabilities. Treatment of casualties is currently performed following completion of casualty decontamination. AMEDD institutional training for the treatment of contaminated/infectious casualties is not mandatory for medical practitioners identified for deployment or assignment where there exists a CBRN/TIM threat. The ability of the command staff to ensure medical capabilities for CBRND is limited by routine medical operations and requirements prior to deployment. Generally, casualty care, until completion of decontamination, is performed by medical corpsmen and not medical practitioners. Isolation of large-scale numbers of contaminated/infectious casualties is not adequately addressed in DOTLPF and current medical operations are limited in their isolation abilities.

<sup>23</sup> Force protection using medical prophylaxis is dependent upon identification of the threat, preplanning for the threat, positioning of stocks for issue and administration, timing of notification to administer/issue prophylaxis, availability of medical personnel to perform administration (if required), ongoing operational requirements, and the available quantity of sufficient medical prophylaxis to meet requirements. Vaccination to achieve acquired immunity by force personnel prior to entry into the theater or completion of an adequate level of acquired immunity prior to adversary biological agent employment is a function of the preplanning and deployment operations. The command staff directs the implementation of these measures when and as appropriate based upon established plans and JTF/Medical Services guidance. Medical prophylaxis does not exist for all threat biological agents. Current prophylaxis and supporting doctrine, policy, and procedures do not address presymptomatic medical CBRND protective countermeasures by other than U.S. forces, excluding MWAs and eligible civilians. Additionally, the efficacy of existing prophylaxis, particularly vaccines, widely varies. The application of medical prophylaxis is not adequately addressed for eligible civilians and MWAs within the force.

<sup>24</sup> JTF and unit plans include the medical review of personnel identified against deployment taskings. Screenings of deployable personnel are periodically performed for potential limitations. Often, these are associated with annual medical physicals. The routine rotation and movement of personnel to and from units require the application of screenings to ensure personnel are qualified for deployment. The unit and Medical Services staff plans attempt to provide for early (prior to deployment notice) and continued medical screening of the force. Plans also include provisions for the conduct of predeployment screenings by medical personnel upon notification of deployment. Often, a record review is conducted of the period following the physical for indications of issues precluding deployment. Predeployment medical screenings do not consider prior presymptomatic low-dose CBRN/TIM exposures, associated potential cumulative long-term effects, and the potential threat. Timing of notice of deployment and the availability of medical personnel impact the conduct of predeployment screenings. Short-notice operations and reallocated taskings may also impact the conduct of predeployment medical screenings. However, annual physicals, when used to meet deployment screening requirements, may be conducted several months before a deployment.

<sup>25</sup> Automated systems to track medical treatment and the movement of casualties exist at Echelon 3 and higher levels of care. Unit reporting includes CBRND readiness. Reliance is placed upon the individual's vaccination and health records (both manual records) to reflect the most recent status of the individual. Current medical systems are stovepiped and require manual intervention to share information. Medical treatment recording below Echelon 3 is limited and not linked to higher-echelon systems. Outpatient care is not generally recorded and aggregate information is reported. Unit reporting is not linked to medical information systems. Individual manual vaccination and health records are not always available or complete.

<sup>26</sup> Medical prophylaxis is issued/administered for identified CBRN/TIM threats to the military force. The administration and issuance of prophylaxis is addressed by the command and Medical Services staffs during the planning and support for operations. Prophylaxis for MWAs is virtually nonexistent. Prophylaxis for eligible civilians is not adequately addressed in current doctrine, policy, and procedures.

<sup>27</sup> Existing standards and procedures provide adequate protection of handling and transporting personnel against secondary exposure/contamination and require the application of protective equipment and measures if the potential exists for contamination/exposure. Casualties able to wear standard IPE are required to apply the equipment outside of CPSs. Medical policy is the patient's unit is responsible for providing the equipment to the medical unit for use by the patient. Unit-level training is limited to the movement of casualties to the medical facility/station and is predominantly reliant upon tactical ground transport. Air transport (tactical rotary-wing) is a last resort due to concerns about asset contamination. Tactical and strategic fixed-wing air transport is not considered an acceptable means of transport. Air and sea transport resources are inadequately equipped and prepared to transport exposed and contaminated human and MWA casualties. Exposed and contaminated casualties (human and MWA) unable to wear IPE are not adequately addressed in doctrine, policy, and standards. Protective equipment is not available for these casualties. However, medical units are not provided stocks of standard IPE for use by patients. Operationally involved units may be delayed, at best, in providing the equipment. Large-scale medical activities and actions are not adequately addressed in DOTLPF, especially those involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>28</sup> Operational warfighter unit plans address medical activities by referring to appropriate medical plans, policies, and procedures. The staff of the Medical Services unit plans and develops associated policies addressing medical activities and procedures to support force operations. The invocation of quarantine and enforcement of medical isolation are within the purview of medical authorities. The operational warfighter unit provides support as defined in the coordinated and appropriate medical plans. The Medical Services unit staff coordinates with the operational warfighter unit command and JTF staffs for Medical Services support requirements and associated tasking and their inclusion in force planning.

DOTLPF is inadequate to address force actions associated with medical quarantine and/or enforcement of medical isolation involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nations, etc).

<sup>29</sup> Operational warfighter unit plans address medical activities by referring to appropriate medical plans, policies, and procedures. The staff of the Medical Services unit plans and develops associated policies addressing medical activities and procedures to support force operations. The implementation and operation of large-scale quarantine sheltering and treatment operations are in the purview of medical authorities. The operational warfighter command staff provides support and resources as defined in the coordinated and appropriate medical plans and as adjusted and requested by appropriate medical authorities, with JTF concurrence, to meet specific circumstances. Large-scale medical activities and actions are not adequately addressed in DOTLPF, especially those involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>30</sup> The unit staff, in coordination with the JTF and Medical Services staffs, conduct coordinated planning for operations for the potential threat. Equipping the force and Medical Services elements are an integral part of planning preparation. The combination of established force and Medical Services element organic assets, material acquisitions, prepositioned material, and movement of identified CBRND resources from unit designated stockpiles and reallocation activities are pursued by the command staff with the JTF and Medical Services staff to prepare and support the force as outlined by the appropriate plan. Mass medical operations may not be possible until the theater matures or additional resources are allocated to force. Additionally, deploying eligible civilians and MWAs (particularly MWDs) are not equipped and trained to survive a CBRN/TIM environment. The force staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to deploying eligible civilians and MWAs. Current doctrine and policy does not adequately address sustained operations within a CBRN/TIM environment. Large-scale medical activities and actions are not adequately addressed in DOTLPF, especially those involving large numbers of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>31</sup> Legacy systems will remain in the inventory throughout the mid term. These systems will be gradually replaced by new joint systems of respiratory/ocular protection as they are fielded. The JSAM replaces the Service-specific systems. When incorporated with anti-G protection of high-performance aircraft aviators, the JSAM will provide simultaneous CBRN and anti-G protection. The JSAM is compatible with existing and programmed CBRN IPE, provides flame and thermal protection, and reduces the heat stress associated with existing systems of ocular/respiratory protection. Further, the JSAM may be donned and doffed during flight. The JSGPM also replaces current Service-specific ocular/respiratory protection. The system provides respiratory and ocular protection from CBRN agents and selected TIMs. The field-of-vision is improved and encumbrances associated with legacy systems are reduced. The JSGPM incorporates state of the art technology and is designed to integrate with future warfighter CBRND IPE and function equipment/assets. The JCESM is a COTS one-time use, one-size-fits-all, respiratory/ocular protective system affording 2 hours of protection and is lightweight and disposable. The system is designed to provide low-level CBRN vapor, aerosol, and particulate protection to the wearer for egressing the contaminated environment. The JCESM is projected for use when standard respiratory/ocular protection is not practical. The JCESM is not programmed for general dissemination. The Guardian Program is projected to review, assess, and implement protection for critical members of the installation/facility populace during the mid term. This will predominantly be COTS-based assets for respiratory/ocular protection. However, the Guardian Program is not expected to address eligible civilian protection within the AO for other than existing U.S. military installations and facilities. MWA respiratory/ocular protection is not programmed or forecasted.

<sup>32</sup> Legacy systems will remain in the inventory throughout the mid term. These systems will be gradually replaced by new joint systems of percutaneous protection as they are fielded. The JSLIST NBC Protective Garment is a two-piece, risk-taking, overgarment with integrated hood affording protection against CBRN agents and selected TIMs. The garment reduces the physiological and psychological encumbrances associated with legacy systems. The JSLIST is under evaluation by NIOSH for application to OSHA protection requirements. The JPACE replaces the Service-specific systems. The JPACE provides aircrew members with equivalent protection to the JSLIST ensemble. The JPACE is designed to not interfere with emergency ejection from a combat aircraft and continues to provide CBRN percutaneous protection following ejection and during escape and evasion operations. The ensemble is both flame-retardant and self-extinguishing to permit emergency egress from a burning aircraft. Further, the ensemble provides CBRN protection when subject to rotor, propeller, and jet wash. Joint Service glove upgrades are provided under the Joint Block 1 and 2 Glove Upgrade Program (JB1/2GU) in the near and mid term. The JB1GU responds to an urgent need by designated elements of the force for increased tactility/durability supporting mission requirements. The JFIRE addresses protection of military firefighters within a CBRN/TIM environment conducting firefighting operations involving structural and crash/firefighting/rescue. The JFIRE incorporates the JSLIST into firefighter bunker gear. The JB1GU is expected to meet most of the requirements within the JSLIST ORD and is viewed as an evolutionary approach in the development of the JB2GU. Versions under consideration include a protective inner glove worn under existing warfighter gloves, a replacement glove for existing hand wear, or a combination of glove shell and liner affording CBRN protection of the legacy gloves they are projected to replace. The MULO is projected to replace legacy footwear covers. The ability of the MULO to provide adequate antislip protection for USN personnel asea is under review. The Guardian Program is projected to review, assess, and implement protection for critical members of the installation/facility populace during the mid term. This will predominantly be COTS-based assets for percutaneous protection. However, the Guardian Program is not expected to address eligible civilian protection within the AO for other than existing U.S. military installations and facilities. MWA percutaneous protection is not programmed or forecasted.

<sup>33</sup> Cell Culture Derived Vaccinia is projected for production during the near-term. Clostridium Botulinum Toxin Medical Defense System is projected for availability during the mid term for Serotypes A, B, C, E, and F. The SERPACWA Active TSP is also projected for production during the late mid term.

<sup>34</sup> Fielding of the P3I upgraded CBPS for heavy/airborne use is projected for the mid term.

<sup>35</sup> The projected initial fielding of JECF within the mid term provides additional capabilities for the COLPRO protection of casualties within CBRN/TIM contaminated areas. JECF includes COLPRO adaptive inserts for buildings/rooms and legacy tentage and stand-alone COLPRO sheltering for small units. The projected mid-term fielding of JECF may alleviate COLPRO shortages but will likely be insufficient to satisfy all COLPRO requirements. Quantities to be fielded of these systems have not been determined. JTCOPS Block I is projected for initial fielding during the mid term. Prior planning and prioritization of COLPRO allocation is critical.

<sup>36</sup> The next-generation series of nonaviator respiratory/ocular protective assets is in R&D. The capabilities and fielding of these assets are not as yet determined.

<sup>37</sup> The next-generation series of nonaviator percutaneous protective assets is in R&D. The capabilities and fielding of these assets are not as yet determined.

<sup>38</sup> Active TSPs are projected for replacement of SERPACWA TSP and SERPACWA Active TSP in the far term. The Chemical Agent Prophylaxis and Cyanide Pretreatment are also projected for the far term. The Multivalent VEE Vaccine is projected to begin production in FY2013. The Next-Generation Anthrax Vaccine, Tularemia Vaccine, and Plague Vaccine are projected for production beginning in FY2010. Serotypes A and B are addressed in the Recombinant Bivalent Botulinum Vaccine projected for production in FY2012. A number of R&D efforts are under way for the development of pre- and post-exposure prophylaxes. Potentially, these efforts may produce viable prophylaxes within the mid and far term resulting in fielded material. However, possible resulting prophylaxes cannot be predicted at this time.

<sup>39</sup> A decision on the inclusion of COLPRO in the LHA(R) is expected in the mid term.

<sup>40</sup> JTCOPS Block II is projected for the far term. Continued fielding of JECF.

### 13.12.3 Functional Solution Analysis

#### 13.12.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** DOTLPF for Protective Posture Protocols is inadequate or nonexistent addressing CBRND of eligible civilians.  
**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing eligible civilian personnel for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of eligible civilian personnel within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians; and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilian personnel.
2. **Deficiency:** DOTLPF for Protective Posture Protocols is inadequate or nonexistent addressing CBRND of MWAs.  
**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing MWAs, particularly MWDs, for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of MWDs within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWDs and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWDs.
3. **Deficiency:** Expelled air from an exposed/contaminated casualty equipped with standard ocular/respiratory protection is not filtered and may present a potential secondary hazard or contamination source or handling and transporting personnel and resources.  
**Partial Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing the safe management of potentially hazardous expelled air by exposed/contaminated casualties wearing standard ocular/respiratory protection to preclude the potential for secondary exposure/contamination of handling/transporting personnel and resources. *Training:* Establish institutional, recurring, and unit training, exercise, and evaluation criteria and programs addressing potentially hazardous expelled air by exposed/contaminated casualties wearing standard ocular/respiratory protection.
4. **Deficiency:** Existing DOTLPF is inadequate, or nonexistent, for eligible civilians.  
**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing eligible civilian personnel for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of eligible civilian personnel within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians; and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilian personnel.

- 5. Deficiency:** Existing DOTLPF is inadequate, or nonexistent, for MWAs.  
**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing MWAs, particularly MWDs, for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of MWAs within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWAs.
- 6. Deficiency:** Medical units are not equipped with additional protective material for existing patients and replacement assets for casualties.  
**Non-Materiel Solutions:** *Doctrine:* Adjust joint doctrine to require force planning of IPE support and resupply of Medical Services for patients and casualties. Disconnect requirement with operational unit. *Organization:* Develop organizational structures, resources, staffing, and stock management capabilities to support IPE requirements for patients and casualties.
- 7. Deficiency:** Casualties unable to wear respiratory/ocular protection are not addressed.  
**Partial Non-Materiel Solutions:** *Doctrine:* Establish alternative procedures and processes within doctrine, policy, and procedures for casualties unable to wear respiratory/ocular protection and who must be moved within or through a CBRN/TIM contaminated zone. *Organization:* Develop organizational structures, resources, staffing, and stock management capabilities to support casualties unable to wear respiratory/ocular protection. *Training:* Implement institutional, recurring, and unit training on established procedures and processes (see Doctrine) for the protection of casualties unable to wear respiratory/ocular protection.
- 8. Deficiency:** Distinction between MOPP and medical protection requirements not adequately addressed in existing DOTLPF.  
**Non-Materiel Solution:** *Doctrine:* Clarify in doctrine, policy, and procedures the distinction between MOPP and medical protection requirements as relates to this task.
- 9. Deficiency:** CBRND protective equipment and measures do not protect against all CBRN/TIM agents.  
**Partial Non-Materiel Solutions:** *Doctrine:* Requirement for development of CBRND protective equipment and measures to protect against all CBRN/TIM agents, particularly high-risk/high-threat agents. *Leadership:* Enforce compliance with established standards (see Doctrine) for prophylactic CBRND protection.
- 10. Deficiency:** Medical prophylaxis does not exist for all threat CBRN/TIM and TIM agents.  
**Partial Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards for prophylactic CBRND protection against all threat agents. *Training:* Train, exercise, and evaluate personnel (military and eligible civilians) on the use of prophylactic CBRND protection against threat agents. *Leadership:* Enforce compliance with established standards (see Doctrine) for prophylactic CBRND protection. Implement and ensure training is adequate and conduct exercises and evaluations to ensure readiness.

- 11. Deficiency:** Current doctrine, the *UJTL*, and operational planning do not adequately address sustained operations within a CBRN/TIM environment.  
**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, procedures, and *UJTL* sustained operations within a CBRN/TIM environment. *Training:* Train, exercise, and evaluate the force for sustained operations within a CBRN/TIM environment. *Leadership:* Recognize criticality of readiness of the force for potential sustained operations within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply the force.
- 12. Deficiency:** Prophylaxes against most high-threat TIMs are not currently available due to the relatively recent consideration of these agents as a potential threat.  
**Partial Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of metrics for standards and criteria for protection against all high-threat TIM agents. *Training:* Train, exercise, and evaluate personnel (military and eligible civilians) on the use of prophylactic CBRND protection against threat agents. *Leadership:* Enforce compliance with established metrics for standards and criteria. Implement and ensure training is adequate and conduct exercises and evaluations to ensure readiness.
- 13. Deficiency:** Efficacy of existing prophylaxes varies widely.  
**Non-Materiel Solutions:** *Doctrine:* Establish overarching single common standard for prophylaxes efficacy.
- 14. Deficiency:** Not all prophylaxes are FDA approved.  
**Non-Materiel Solutions:** *Doctrine:* Require FDA approval of all prophylaxes, including medications potentially applied as prophylaxes. The latter requires specific approval as prophylactic treatment.
- 15. Deficiency:** Prophylaxis for eligible civilians is not addressed.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures requirement to address the administration, provision, and application of medical CBRND protective countermeasures by other than U.S. forces (e.g., civilians, non-U.S. forces, etc.). *Organization:* Address organizational issues (e.g., who provides the equipment, support forces to train and equip, etc.) related to the provision of CBRN/TIM protection to eligible civilians and non-U.S. forces. *Training:* Include eligible civilians in CBRND training, exercises, and evaluations. Identify training requirements and responsibilities for non-U.S. forces. *Leadership:* Ensure leadership awareness of criticality of resources and increased dependence of military operations upon civilians. *Personnel:* Require eligible civilians supporting the mission to meet minimum standards for safe use of CBRND resources.
- 16. Deficiency:** Prophylaxis for MWAs is not addressed.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures requirement to address the administration, provision, and application of medical CBRND protective countermeasures for MWAs, particularly MWDs. *Organization:* Address organizational issues (e.g., who provides the equipment, support forces to train and equip, etc.) related to the provision of CBRN/TIM protection to MWAs. *Training:* Include MWA

handlers in CBRND training, exercises, and evaluations. *Leadership*: Ensure leadership awareness of criticality of MWA resources.

- 17. Deficiency:** The issue and administration of prophylaxis to eligible civilians requires review due to questions regarding applicability to the range of body types, ages, and physical/medical factors inherent within a potential population, as well as possible long-term health issues and legal implications.

**Non-Materiel Solutions:** *Doctrine*: Establish in doctrine, policy, and procedures the application of standards and measures for protection of eligible civilians addressing the variation within the potential protected population. *Leadership*: Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRN/TIM training, exercises, and evaluations.

- 18. Deficiency:** Prophylaxis for MWAs is virtually nonexistent.

**Partial Non-Materiel Solutions:** *Doctrine*: Establish doctrine, policy, and procedures CBRND protection of MWAs, particularly MWDs, and training for CBRN/TIM environment survival. *Organization*: Ensure organizational consideration for maintenance and support of MWA CBRND protective equipment, measures, and activities. *Training*: Establish institutional and unit training of handlers and MWAs for CBRND measures and activities. *Leadership*: Ensure awareness and planning for CBRND measures and requirements for MWA survivability. *Facilities*: Develop supporting infrastructure for MWA CBRND (e.g., logistics, veterinary surveillance, etc.).

- 19. Deficiency:** Negative-pressure COLPRO with filtered expelled air does not exit within the inventory for the transport and sheltering of numbers of exposed, infectious, and/or contaminated casualties.

**Partial Non-Materiel Solutions:** *Doctrine*: Promulgate doctrine, policy, and procedures addressing negative-pressure COLPRO and the safe management of potentially hazardous exhausted air to preclude the potential for secondary exposure/contamination of uncontaminated/unexposed personnel and resources. *Training*: Establish institutional, recurring, and unit training, exercise, and evaluation criteria and programs addressing the operation and application of negative-pressure COLPRO and management of potentially hazardous exhaust air.

- 20. Deficiency:** Mobile COLPRO that operates and provides protection while moving is not available for the protection of casualties.

**Partial Non-Materiel Solutions:** *Doctrine*: Establish in doctrine methods and processes enabling the transport of multiple casualties safely and without risk of secondary exposure/contamination by transporting personnel and resources (if casualties are contaminated) or exposure/contamination of casualties (if casualties are uncontaminated). *Training*: Implement institutional, recurring, and unit training of the safe transport (see Doctrine) of multiple casualties.

- 21. Deficiency:** DOTLPF for Protective Posture Protocols is inadequate or nonexistent addressing CBRND of eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing eligible civilian personnel for CBRND. *Organization:* Identify organization services and activities necessary to support survivability eligible civilian personnel within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilian personnel.

- 22. Deficiency:** DOTLPF for Protective Posture Protocols is inadequate or nonexistent addressing CBRND of MWAs.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing MWAs, particularly MWDs, for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of MWAs within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWAs.

- 23. Deficiency:** DOTLPF is inadequate to address large-scale medical CBRN/TIM operations, particularly sustained operations within a CBRN/TIM environment and/or command staff and Medical Services action associated with large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, procedures, and *UJTL* sustained operations (medical and nonmedical) within a CBRN/TIM environment. Include command and Medical Services activities associated with the planning, coordination, implementation, operation, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Organization:* Ensure resources, taskings, and staff are in place or available to plan and perform sustained operations (medical and nonmedical) within a CBRN/TIM environment and/or operations addressing command and Medical Services actions associated with the planning, coordination, implementation, operation, support, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Training:* Train, exercise, and evaluate the force for sustained operations (medical and nonmedical) within a CBRN/TIM environment and/or operations addressing command and Medical Services actions associated with the planning, coordination, implementation, operation, support, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Leadership:* Recognize criticality of readiness of the force for potential sustained operations (medical and nonmedical) within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare the force and appropriately support large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Personnel:* Eligible civilian personnel and operations supporting the mission/military operations (medical and nonmedical) are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM

environment. *Facilities*: Develop supporting infrastructure for sustained operations within a CBRN/TIM environment and operations associated with large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.).

- 24. Deficiency:** Timing of notice of deployment and the availability of medical personnel impact the conduct of predeployment screenings.

**Non-Materiel Solutions:** *Doctrine*: Establish in doctrine, policy, and procedures requirements for ongoing automated and manual medical screenings to ensure baseline standards are maintained in support of potential deployment taskings. *Leadership*: Enforce compliance with established requirements for predeployment medical screenings.

- 25. Deficiency:** Short-notice operations and reallocated taskings may also impact the conduct of predeployment medical screenings.

**Non-Materiel Solutions:** *Doctrine*: Enforce doctrinal requirements for alternative planning and unit readiness for potential deployment taskings. *Leadership*: Enforce compliance with established requirements for planning for predeployment medical screenings.

- 26. Deficiency:** Annual physicals, when used to meet deployment screening requirements, may be conducted several months before a deployment.

**Non-Materiel Solutions:** *Doctrine*: Establish in doctrine, policy, and procedures requirements for ongoing automated and manual medical screenings to ensure baseline standards are maintained in support of potential deployment taskings. *Leadership*: Enforce compliance with established requirements for predeployment medical screenings.

- 27. Deficiency:** Current medical systems are stovepiped and require manual intervention to share information.

**Non-Materiel Solutions:** *Doctrine*: Enforce doctrine, policy, and procedures for integrated automated systems and application of data systems standards.

- 28. Deficiency:** Medical treatment recording below Echelon 3 is limited and not linked to higher echelon systems.

**Non-Materiel Solutions:** *Doctrine*: Enforce doctrine, policy, and procedures for integrated automated systems and application of data systems standards.

- 29. Deficiency:** Outpatient care is not generally recorded and aggregate information is reported.

**Non-Materiel Solutions:** *Doctrine*: Enforce doctrine, policy, and procedures for integrated automated systems, application of data systems standards, and the timely and accurate reporting of medical treatment information.

- 30. Deficiency:** Unit reporting is not linked to medical information systems.

**Non-Materiel Solutions:** *Doctrine*: Enforce doctrine, policy, and procedures for integrated automated systems and application of data systems standards.

- 31. Deficiency:** Individual manual vaccination and health records are not always available or complete.

**Non-Materiel Solutions:** *Doctrine:* Enforce doctrine, policy, and procedures for integrated automated systems, application of data systems standards, and the timely and accurate reporting of medical treatment information.

- 32. Deficiency:** The AMEDD training for the treatment of contaminated/exposed casualties is not mandatory for medical practitioners identified for deployment or assignment where there exists a CBRN/TIM threat.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures the application of institutional and unit training standards for the handling of exposed and contaminated casualties/MWAs. *Training:* Establish training, exercise, and evaluation standards for the safe handling of exposed and contaminated casualties/MWAs. *Leadership:* Implement and manage training and equipping of functions and activities handling exposed and contaminated casualties/MWAs.

- 33. Deficiency:** The ability of the command and Medical Services staff to ensure medical capabilities for CBRND is limited by routine medical operations and requirements.

**Non-Materiel Solutions:** *Doctrine:* Incorporate the safe handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties into doctrine, policy and procedures and requires specific exercising and evaluation for these operations and activities that includes all activities and functions conducting these functions including nonmedical activities and functions. *Organization:* Ensure resources, taskings, and trained personnel are in place or available to support the handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties by all activities and functions conducting these functions including nonmedical activities and functions. *Training:* Train, exercise, and evaluate the handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties by all activities and functions conducting these functions including nonmedical activities and functions, including the prevention of secondary exposure/contamination. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe handling, transport, medical reception and triage, and treatment of contaminated casualties by all activities and functions conducting these functions including nonmedical activities and functions.

- 34. Deficiency:** Generally, casualty care, until completion of decontamination, is performed by medical corpsmen, not medical practitioners.

**Non-Materiel Solutions:** *Doctrine:* Incorporate the safe handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties into doctrine, policy and procedures and requires specific exercising and evaluation for these operations and activities that includes all activities and functions conducting these functions including nonmedical activities and functions. *Organization:* Ensure resources, taskings, and trained personnel are in place or available to support the handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties by all activities and functions conducting these functions including nonmedical activities and functions. *Training:* Train, exercise, and evaluate the handling, transport, protective measures, medical reception and triage, and treatment of contaminated casualties by all activities and functions conducting these functions including nonmedical activities and

functions, including the prevention of secondary exposure/contamination. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe handling, transport, medical reception and triage, and treatment of contaminated casualties by all activities and functions conducting these functions including nonmedical activities and functions.

- 35. Deficiency:** Generally, MWA casualty care, until completion of decontamination, is performed by medical corpsmen, not veterinary/medical practitioners.

**Non-Materiel Solutions:** *Doctrine:* Incorporate the safe handling, transport, protective measures, medical reception and triage, and treatment of contaminated MWA casualties into doctrine, policy and procedures and requires specific exercising and evaluation for these operations and activities that includes all activities and functions conducting these functions including nonmedical activities and functions. *Organization:* Ensure resources, taskings, and trained personnel are in place or available to support the handling, transport, protective measures, medical reception and triage, and treatment of contaminated MWA casualties by all activities and functions conducting these functions including nonmedical activities and functions. *Training:* Train, exercise, and evaluate the handling, transport, protective measures, medical reception and triage, and treatment of contaminated MWA casualties by all activities and functions conducting these functions including nonmedical activities and functions, including the prevention of secondary exposure/contamination. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe handling, transport, medical reception and triage, and treatment of contaminated MWA casualties by all activities and functions conducting these functions including nonmedical activities and functions.

- 36. Deficiency:** Medical Services doctrine, policy, and procedures are inadequate for the provision of medical care by medical providers in a CBRN/TIM environment.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing the provision of medical care by medical providers within a CBRN/TIM environment (both with and without CPSs). *Organization:* Identify organization services and activities necessary to support the provision of medical care by medical providers within a CBRN/TIM environment (both with and without CPSs). *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for medical care by medical providers within a CBRN/TIM environment (both with and without CPSs) and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of medical providers and supporting medical staff. *Personnel:* Require eligible civilians supporting the mission to meet minimum standards for safe use of CBRND resources.

- 37. Deficiency:** Isolation of large-scale numbers of contaminated/infectious casualties is not adequately addressed in DOTMLPF and current medical operations are limited in their isolation abilities.

**Non-Materiel Solutions:** *Doctrine:* Include in doctrine, policy, procedures, and *UJTL* combatant command (COCOM) and Medical Services activities associated with the planning, coordination, implementation, operation, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians,

third-party nationals, displaced persons, detained persons, etc.). *Organization:* Ensure resources, taskings, and staff are in place or available for operations addressing COCOM and Medical Services actions associated with the planning, coordination, implementation, operation, support, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Training:* Train, exercise, and evaluate the force for COCOM and Medical Services actions associated with the planning, coordination, implementation, operation, support, and termination of large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Leadership:* Recognize criticality of readiness of the force for potential operations (medical and nonmedical) within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare the force and appropriately support large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Personnel:* Eligible civilian personnel and operations supporting the mission/military operations (medical and nonmedical) are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities:* Develop supporting infrastructure for operations associated with large-scale medical operations involving non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.).

- 38. Deficiency:** Predeployment medical screenings do not consider prior presymptomatic low-dose CBRN/TIM exposures, associated potential cumulative long-term effects, and the potential threat.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of low-dose exposure limits and cumulative long-term low-dose exposures in predeployment medical screenings. *Leadership:* Enforce compliance with established doctrine, policy, and procedures for low-dose exposure limits and cumulative long-term low-dose exposures in predeployment medical screenings.

- 39. Deficiency:** Air transport (tactical rotary-wing) is a last resort due to concerns about asset contamination. Tactical and strategic fixed-wing air transport is not considered an acceptable means of transport. Air and sea transport resources are inadequately equipped and prepared to transport exposed and contaminated casualties.

**Partial Non-Materiel Solutions:** *Doctrine:* Promulgate and implement doctrine, policy, standards, and procedures for the safe transport by air and sea of exposed and contaminated casualties, including the prevention of secondary exposure/contamination of the airframe and aircrew. Establish in doctrine methods and processes enabling the transport of multiple casualties safely and without risk of secondary exposure/contamination by transporting personnel and resources. *Organization:* Organizational resources, taskings, and trained personnel are in place or available to support the safe air and sea transport of exposed and contaminated casualties, including the prevention of secondary exposure/contamination of the airframe and aircrew. *Training:* Implement institutional, recurring, and unit training of the safe transport (see Doctrine) of multiple contaminated casualties. Develop institutional and unit-level training for application of standards for the safe transport by air and sea of

exposed and contaminated casualties. Exercising and evaluations to assess capabilities and prepare for the conduct of safe transport by air of exposed and contaminated casualties. Training, exercising, and evaluation include measures to prevent secondary exposure/contamination of the airframe and aircrew. *Leadership*: Recognize criticality for the protection of air transport resources from secondary contamination/exposure to CBRN/TIM agents while providing safe air/sea transport of exposed and contaminated casualties. *Facilities*: Develop supporting infrastructure for the safe air transport of contaminated casualties, including the prevention of secondary exposure/contamination to airframe/vessel and crews.

- 40. Deficiency:** Air transport (tactical rotary-wing) is a last resort due to concerns about asset contamination. Tactical and strategic fixed-wing air transport is not considered an acceptable means of transport. Air and sea transport resources are inadequately equipped and prepared to transport exposed and contaminated MWA casualties.

**Partial Non-Materiel Solutions:** *Doctrine*: Promulgate and implement doctrine, policy, standards, and procedures for the safe transport by air and sea of exposed and contaminated MWA casualties, including the prevention of secondary exposure/contamination of the airframe and aircrew. Establish in doctrine methods and processes enabling the transport of multiple casualties safely and without risk of secondary exposure/contamination by transporting personnel and resources. *Organization*: Organizational resources, taskings, and trained personnel are in place or available to support the safe air and sea transport of exposed and contaminated MWA casualties, including the prevention of secondary exposure/contamination of the airframe and aircrew. *Training*: Implement institutional, recurring, and unit training of the safe transport (see Doctrine) of multiple contaminated casualties. Develop institutional and unit-level training for application of standards for the safe transport by air and sea of exposed and contaminated MWA casualties. Exercising and evaluations to assess capabilities and prepare for the conduct of safe transport by air of exposed and contaminated MWA casualties. Training, exercising, and evaluation include measures to prevent secondary exposure/contamination of the airframe and aircrew. *Leadership*: Recognize criticality for the protection of air transport resources from secondary contamination/exposure to CBRN/TIM agents while providing safe air/sea transport of exposed and contaminated MWA casualties. *Facilities*: Develop supporting infrastructure for the safe air transport of contaminated MWA casualties, including the prevention of secondary exposure/contamination to airframe/vessel and crews.

- 41. Deficiency:** Expeditionary operations are a particular concern. Mass medical operations may not be possible until the theater matures or additional resources are allocated to the AOR.

**Partial Non-Materiel Solutions:** *Doctrine*: Complete the JCIDS process and central correlation/comparison of operations plans to identify CBRND resources necessary and available to support expeditionary medical operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint. *Organization*: Develop organizational structures, resources, staffing, and capabilities to conduct expeditionary medical operations while possessing reduced logistical footprint and during the first 30–90 days of operations following commencement of hostilities. *Training*: Train, exercise, and evaluate expeditionary capabilities of the force in a CBRN/TIM threat with reduced logistical footprint during the initial 30–90 days of operations using CBRND resources supporting

expeditionary medical operations. *Leadership*: Recognize differences and challenges associated with expeditionary medical operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint, training providing skills and knowledge to manage operations in these circumstances, and ability and willingness to implement necessary changes and activities to prepare for and conduct expeditionary medical operations with a CBRN/TIM threat. *Facilities*: Develop supporting infrastructure for expeditionary medical operations during the first 30–90 days following commencement of hostilities and with a reduced logistical footprint.

- 42. Deficiency:** The command staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to eligible civilians.  
**Non-Materiel Solutions:** *Doctrine*: Promulgate doctrine, policy, and procedures addressing civilian personnel and operations for CBRND. *Organization*: Identify organizational services and activities supporting the mission performed by civilian personnel and operations. *Training*: Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians; and conduct CBRND training, exercises, and evaluations. *Leadership*: Implement and manage CBRND training, equipping, and protection of eligible civilians. *Personnel*: Ensure that eligible civilians supporting the mission/military operations are qualified in CBRND and capable of performing their responsibilities in a CBRN/TIM environment. *Facilities*: Develop supporting infrastructure for eligible civilian CBRND (e.g., logistics, medical, training, communications, etc.).
- 43. Deficiency:** The command staff does not possess clear guidance for planning and providing CBRN/TIM protection training and CBRND protection resources to MWA.  
**Non-Materiel Solutions:** *Doctrine*: Promulgate doctrine, policy, and procedures addressing MWAs, particularly MWDs, and operations for CBRND. *Organization*: Identify organizational services and activities supporting MWA survivability and CBRN/TIM environment operations. *Training*: Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations. *Leadership*: Implement and manage CBRND training, equipping, and protection of MWAs. *Facilities*: Develop supporting infrastructure for MWA CBRND (e.g., logistics, medical, veterinary surveillance, training, communications, etc.).

### 13.12.3.2 IMA Assessment Summary

Table 13.12-2 is a list of ideas for material approaches and a corresponding description of each idea. Approaches primarily focus on adapting currently fielded equipment/systems and technology studies to determine specific requirements. Also identifies the need for Battle Management systems to assist in tracking CBRN casualties. Table 13.12-3 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 13.12-2. TASHLD 12: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Assess CBRND material	Test and assess all CBRND material for protective abilities against future threat agents, including TIM.
Broad-application above-the-neck respiratory protection	Develop above-the-neck respiratory protection with broad application for the general population, including MWAs.
Casualty protective system with integrated pseudomask	Develop a new-generation PPWs with an integrated mask area that is contact-free of the face area and applies positive air flow.
Chemical air generation	Integrated compounds within warfighter's IPE applying chemical reaction to generate oxygen without reliance upon external sources.
Chemical treatment	Develop solution for treatment of existing MOPP suit and other warfighter clothing fabric that neutralizes or block the effect of CBRN/TIM agents, including future agents.
Combinatorial prophylaxes	Develop prophylaxes affording protection or minimizing the impact from a broad range of CBRN/TIM agents.
Contaminated casualty transport system	Develop/adapt clear, head-to-toe view of casualty, medical systems supporting, airtight and self-flushing system with positive/negative pressure capabilities and access ports for medical treatment.
COTS sample containers and equipment	Adapt/modify (as necessary) COTS sample containers and equipment for the containment of CBRN/TIM samples and material for their safe handling, storage, and transport.
Current prophylaxes	There currently exists a variety of prophylaxes used for protection against CBRN. FDA testing and necessary modifications of prophylactics must be made to obtain FDA approval. Review available medical material and prophylaxes for application to high-risk TIMs.
Develop CBRN/TIM samples and material containment packaging/systems	Investigate and develop CBRN/TIM containment packaging and systems for the safe containment, handling, storage, and transport of CBRN/TIM samples and material.
Develop COLPRO kits	Develop COLPRO kits containing all necessary supplies to construct field-expedient COLPRO that is easily stored and maintained in ready condition, easily and safely erected, operated, maintained, and struck within a CBRN/TIM environment by IPE-encumbered personnel using minimal resources and supports COLPRO requirements.
Develop and establish generic unit CBRND kits	Develop, preposition, and maintain reserve stocks of generic CBRND kits for a standard unit. Components are adjusted as necessary for specific operations involving threat.
Develop/adapt MWA transport system with pressure/filtration	Develop or adapt MWA transport systems to provide COLPRO protection from CBRN/TIM agents.

Disposable COLPRO	Develop one-time-use COLPRO that is rapidly erected with little instruction, training, and effort and affords term protection for critical activities and functions, maintenance and repair activities, prelocated consumables, as well as personnel associated with this task.
Disposable IPE	Develop low-cost disposable IPE providing protection for transport aircrew members and/or determine available COTS protection to support air operations in a contaminated environment or while carrying contaminated cargo.
Field-expedient COLPRO kits	Develop field-expedient COLPRO kits designed to adapt existing structures, tentage, etc., for the expansion of COLPRO field capabilities and mission support and the provision of collective protection to the force, critical functions and activities, maintenance and repair activities and functions, resources, etc.
Field-expedient COLPRO materials	Identify commonly available materials (duct tape, plastic sheeting, wooden crate, plywood, tarps, coverings, wraps, caulk, sealant gels/sprays, etc.) for application in the construction of expedient COLPRO needed to construct field-expedient COLPRO when COLPRO availability is limited or not advantageous.
Filtration system lowering inhalation pressure requirement	Improve current mask systems by reducing the inhalation effort required. Options may include air streaming into the mask from a contained system that either has a stored supply or generates air flow.
Future prophylaxes	Some preexposure prophylaxes for biological agents require several administrations, immunity attainment is time-consuming, or the period of coverage does not address the full operational period. Future prophylaxes should provide immunity against all known threat CBRN and high-risk TIM agents, as well as potential future threat agents, and be FDA approved. CBRND medical countermeasures are needed providing a sustained level of protection over an extended period of time (minimally the operational period), do not require multiple administrations, are easily disseminated and administered, support a minimum level of protection, protect against a broad range of agents, cover the range of preexposure to post-exposure/presymptomatic application needs, and are applicable to the protected population (including eligible civilians).
Improved IPE garments and accessories	Develop new generation of IPE garments and accessories (e.g., boots/boot covers, gloves, hoods, etc.) using modern materials permitting greater range of motion, longer wear without performance degradation, increased durability, integrated into warfighter personal equipment, and protects against all threat CBRN and high-risk TIM agents.
Integrate CBRN/TIM protective features into functional garments	Develop materials integrating CBRN/TIM protective capabilities and design standard functional garments using these materials for protection of the force.

Topical	Develop topical barrier that is easily applied (i.e., spray), acts as a contact hazard barrier, and affords protection from CBRN/TIM.

**13.13 Task TASHLD 13: Perform mortuary activities for CBRN/TIM contaminated remains****13.13.1 Functional Area Analysis****13.13.1.1 Definition**

Contaminated remains of personnel and animals may require storage and transport to another location. The safe handling, storage, and movement of contaminated remains require they be fully and completely sealed to minimize the potential for release of contaminants. Contaminated remains IPE must be impermeable and not permit release of the contaminants. The design must be functional and easy to transport, store, support, and dispose. Decontamination capability is required at all points where contaminated remains may be located.

**13.13.1.2 Derivation**

*Joint Enabling Concept for CBRN Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (TA 7, TA 7.1).*

**13.13.1.2.1 Supported Task: OPSHLD 14****13.13.1.2.2 Lateral Task: TASHA 24****13.13.1.2.3 Supporting Task: N/A****13.13.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Undeveloped to highly developed land. (C1.1.1)
2. Riverine to open sea. (C1.2)
3. Natural and induced air. (C1.3)
4. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Partially completed mission preparation. (C2.1.3)
2. Marginal forces. (C2.2)
3. Marginal to adequate forces allocated. (C2.2.3)
4. Negligible personnel experience. (C2.2.4.5)
5. Limited staff expertise. (C2.3.1.3)
6. Limited deployed supplies. (C2.8.2)
7. No prepositioned materiel. (C2.8.4)
8. No host-nation support. (C2.8.5)

9. Negligible to limited commercial procurement. (C2.8.6)

Civil. N/A

### **13.13.2 Functional needs Analysis**

#### **13.13.2.1 Capability and Deficiency Assessment Summary**

Table 13.13-1 discusses current and projected capabilities to accomplish this task. The overall capabilities for current, near/mid, and far term are rated “yellow.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

#### **Current Capability and Deficiency**

This task encompasses the extent of operations involving remains from collection to final internment and involves a range of force elements and resources. The primary actors are Mortuary Affairs units/elements. These personnel are trained and equipped to decontaminate and process human remains. Existing Service CBRND assets are worn to protect against secondary exposure/contamination of personnel and resources. However, this task is not limited to Mortuary Affairs. Personnel performing transport and handling of remains throughout the process are considered in the task. Splash protection is afforded through the use of COTS mortuary and CBRND assets designed for this purpose or the application of wet-weather gear (including severe-weather gear). Splash protection is worn with respiratory/ocular and percutaneous CBRND assets. The Services currently field a variety of CBRND assets providing respiratory/ocular, percutaneous, and COLPRO protection. This diversity of assets complicates the logistical support of operations with threat for joint operations. Existing Service-specific IPE is limited in the period and scope of protection afforded the warfighter. Respiratory/ocular and percutaneous CBRND assets protect against known chemical and biological warfare agents and particulate radiologicals. Protection is afforded to a select number of TIMs. Physiological and psychological encumbrances increase with prolonged wear. Regular exercising and wear to acclimate and adjust the wearer to enable performance of assigned functions and activities is necessary and performed to reduce the impact of encumbrances and subsequent degradation of performance. Medical prophylaxes do exist for the protection of the warfighter against a limited number of biological and chemical agents. However, few are FDA approved. A number possess IND authorization for application. Medications are considered for their potential prophylactic value, but are not always FDA approved for this purpose. Not all threat CBRN agents are addressed by CBRND medical countermeasures. Efficacy, time to achieve a level of protection, and the number of administrations vary between prophylaxes. COTS protective assets are applied for selected eligible civilians such as hazardous materials, firefighters, EMS, etc. However, eligible civilians are not adequately addressed by DOTLPF for CBRND. Clear DOTLPF addressing the CBRND provisioning and training of eligible civilians is inadequate. MOPP DOTLPF is adequate for military personnel and operations. The establishment of adjustable MOPP levels, reflective of local operations and threat, are well defined, as are continuing evaluation for change/adjustments. However, operations increasingly involve U.S.

and non-U.S. civilians. MOPP DOTLPF does not adequately address their presence and inclusion into MOPP methodologies and levels, particularly when these personnel may (or may not) be equipped with nonstandard IPE. DOTLPF is adequate for the application of CBRND respiratory/ocular and percutaneous personal protection by personnel transporting, handling, decontaminating, or otherwise potentially at risk for secondary exposure/contamination from infectious/contaminated remains. However, DOTLPF is inadequate to address the containment of contaminated/infectious remains for transport out of the AOR for final internment. DOTLPF is inadequate for the processing of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.). Prior decontamination of exposed/contaminated remains is the only identified means for protecting transportation assets against secondary contamination. The predominant means is decontamination of the asset following secondary exposure/contamination. Tactical and strategic fixed-wing air transport is not considered an acceptable means of transport. Decontaminated and contained remains may not be considered a secondary risk by air asset managers. However, containment systems providing adequate protection and safeguards against secondary contamination/exposure of personnel and resources during storage, handling, transport, and potentially through final internment do not exist.

### **Projected Near/Mid-Term Capability and Deficiency**

Future configurations focus on reducing psychological and physiological stresses associated with the wearing of IPE, as well as striving for commonality of form factor among all services to reducing the logistics burden, development cost, and improved availability. The JPACE, JSLIST, JSAM, and JSGPM are projected to be initially fielded during the mid term. The JSLIST is under review for NIOSH certification for compliance with OSHA protective standards. The certification will permit application of the garment for AT/FP installation activities within CONUS and selected OCONUS. The possibility exists for potential application by requiring eligible civilians. Legacy Service-specific IPE will remain in the inventory throughout the mid term and into the far term during the transition to the joint IPE systems. Ongoing R&D into medical prophylaxes will provide additional prophylactic measures but still fail to address all threat CBRN agents and high-threat/high risk TIMs (particularly TICs). Otherwise, changes from current capabilities and deficiencies are not projected.

### **Projected Far-Term Capability and Deficiency**

Future configurations focus upon reducing psychological and physiological stresses associated with the wearing of IPE, as well as striving for commonality of form factor among all Services. The standardization of CBRND respiratory/ocular and percutaneous protection will reduce the logistics burden and development cost and subsequently improve availability. Legacy Service-specific IPE will continue to be replaced by the joint systems of CBRND protective equipment until fielding is complete to all Service units, including Guard and Reserve, early in the far term. Next-generation IPE assets are in R&D and are expected to be fielded sometime in the far term. However, specifics of design, characteristics, and protective capabilities are not as yet determined for these systems. Continued R&D into potential medical prophylaxes may result in additional protective measures for the force. However, specifics are unknown at this time. Additional changes in capabilities from the mid term are not projected.

### 13.13.2.2 Resource Systems

#### Individual Protection

##### 1. Respiratory/Ocular Protection:

**COTS:** Commercially available systems of protection, manufactured and tested meeting OSHA standards for the United States or equivalent organization in other nations.

**M17 Series Masks w/M13 Series Filters:** Obsolescent warfighter system of protection. Retained in selected HTAs for NEO application. Designed for adults.

**MBU-19/P Chemical-Biological Aircrew Eye/Respiratory Protection (AERP):** USAF combat aircrew protection. Includes protective hood, MBU-12/P mask, C-2 canister, intercom for ground communications, and blower assembly.

**A/P22P-14(V) Respirator Assembly:** USN/USMC system for rotary-wing (Version 1 for USN) and fixed-wing (Versions 2–4 for USN/USMC) aircrews. Includes CB filter, dual air/oxygen supply, and crossover manifold for dual protective capabilities in air or on ground. Version 1 is not compatible with aircraft oxygen supply systems; Version 2 applied to EA-6B and F18A airframes; Version 3 to AV-8B and F-18C/D aircraft; and Version 4 is used for C-130 airframes.

**M40/M42 CB Protective Mask:** U.S. Army mask system designed for military standard profile and uses standard C-2 canister. M42 integrates with combat vehicle clean air supply system and has a connectable dynamic microphone for combat vehicle intercom system.

**M45 Aircrew Aviator Mask:** Replaces M42 and M49 systems for U.S. Army. Available with a canister-compatible hose assembly and a valve cassette that enables use of supplied air (from aircraft, SCBA or PAPR). The M45 is used by military personnel who cannot fit the M40A1, M42A2, or MCU-2/P masks.

**M48 CB Apache Aviator Mask:** Used by Apache aviator and flight support personnel. Replaced M43 Type 1 mask system and uses blower assembly with C-2 filter canister.

**MCU-2A/P:** Mainstay USAF and USN system for nonaviator personnel and aircrew personnel not performing flight operations, except for aircrew personnel not issued aviator systems and noncombat platforms/airframes without clean air supply systems. Applies C-2 filter for filter air.

**Joint Service Aviator Mask (JSAM):** Initial fielding projected in the mid term replacing Service-specific aviator respiratory/ocular protective systems. Provides CBRN protection under high-G conditions, compatible with existing and projected aviator CBRN IPE, flame and thermal protective, reduces stress associated with existing aviator IPE, and may be donned/doffed during flight.

**Joint Service General Purpose Mask (JSGPM):** Initial fielding projected in the mid term replacing Service-specific standard respiratory/ocular protective systems. Provides respiratory/ocular protection from CBRN agents and selected TIMs. Improves field-of-vision and encumbrances associated with existing Service systems.

**Joint Service Chemical Environment Survival Mask (JCESM):** COTS one-time use, one-size-fits-all, respiratory/ocular protective system affording two hours of protection in low-level CBRN vapor, aerosol, and particulate environments. Selected force element application only.

## 2. Percutaneous Protection:

**COTS:** Commercially available systems of protection, manufactured and tested meeting OSHA standards for the United States or equivalent organization in other nations.

**Battle Dress Overgarment (BDO):** U.S. Army/USAF two-piece camouflage-patterned garment (top and trousers) providing 24-hour protection against CBRN agents in vapor, liquid, droplet, and particulate forms.

**Saratoga:** USMC two-piece camouflage-patterned garment (top and trousers) providing 24-hour protection against CBRN agents in vapor, liquid, droplet, and particulate forms. Launderable for hygiene.

**CPOG:** Legacy two-piece green garment currently in use with USN providing limited-term protection against CBRN agents in vapor, liquid, droplet, and particulate forms.

**Chemical Protective Undergarment (CPU):** Worn under standard IPE as additional layer of protection against contact with CBRN agents.

**CWU-66/P:** One-piece USAF green flightsuit providing 24-hour protection against CBRN agents in vapor, liquid, droplet, and particulate forms. Available in tan as CWU-77/P flightsuit.

**Disposal Aircrew Protective Cape:** Transparent disposable cape covering head and shoulders of aviator during periods between aircraft mounting/dismounting and shelter.

**BVO/GVO:** Vinyl overboots (VO) worn over wearer's standard footwear and protects against contact with CBRN agents. Available in black (BVO) and green (GVO).

**Chemical Protective Footwear Cover (CPFC):** Legacy system of CBRN protective footwear cover in use by USN. Requires wearer to pull protective sole tabs up and wrap/tie laces around cover to secure over footwear.

**Disposable Aircrew Footwear Cover:** Transparent disposable footwear covers worn over aviator footwear to protect aviator during periods between aircraft mounting/dismounting and shelter.

**Chemical Protective Glove (CPG):** Standard CBRN protective glove. Available in 7-, 14-, and 25-mil thicknesses addressing functional requirements for durability, dexterity, and tactile sensitivity.

**Disposable Aircrew Hand Protection:** Transparent disposable hand coverings applied by USAF, USN, and USMC over aviator gloves during periods between aircraft mounting/dismounting and shelter. Also applied as between aviator inner and outer gloves enabling essential functional requirements for dexterity and tactile sensitivity.

**Chemical Protective Helmet System (CPHS):** CBRN protective camouflage-patterned helmet cover to protect helmet from contact with CBRN contaminants.

**SCALP:** Disposable, lightweight, impermeable overgarment designed for wear over IPE for additional protection in grossly contaminated environments. Applied by personnel required to leave protective sheltering in these environments to perform mission-critical tasks. Also applied by decontamination units/teams and medical personnel performing decontamination or potentially at risk for prolonged contact with liquids.

**Wet-Weather Gear: Includes Severe-Weather Gear (USN):** Provides barrier against contact with liquids potentially damaging to protective abilities of IPE.

**M-2 Apron:** Butyl rubber-coated sleeved apron worn over IPE and applied by decontamination units/teams and other designated personnel performing decontamination

or potentially at risk for contact with liquids. Provides barrier against contact with liquids potentially damaging to protective abilities of IPE. Decontaminable.

***Patient Protective Wrap (PPW):*** Enclosed casualty bag made of CBRN protective materials. Incorporates small flexible transparent window positioned over casualties face for viewing by medical practitioners. Uses cardboard stays to maintain separation of bag from casualty's face. Does not permit head-to-toe viewing of casualty. Supports limited medical assistance. Requires the wear of standard warfighter respiratory/ocular protection. Two wraps currently in stock. Legacy system provides protection up to 3 hours and newer system up to 6 hours.

***Joint Service Lightweight Integrated Suit Technology (JSLIST):*** Two-piece (jacket and trousers) CBRN risk-taking protective garment with integrated hood. Affords protection against selected TIM agents. Reduces physiological and psychological encumbrances associated with existing Service-specific systems it replaces with initial fielding in the mid term. Under review for NIOSH certification for OSHA protection standards.

***Joint Protective Aircrew Ensemble (JPACE):*** CBRN protective aviator flightsuit projected for initial fielding in the mid term and replacing Service-specific CBRN protective flightsuits. Provides JSLIST equivalent protection and provides protection when subject to rotor, propeller, and jetwash. Flame-retardant and self-extinguishing properties. Supports escape and evasion requirements.

***Joint Block I/II Glove Upgrade (JB1/2GU):*** Projected fielding in near mid term replacing CPG for designated force elements requiring increased tactility/durability for mission performance. Various configurations under consideration.

***Joint Firefighter Integrated Response Ensemble (JFIRE):*** Incorporates JSLIST into firefighter bunker gear, permitting firefighters to conduct firefighting operations within a CBRN/TIM environment.

***Multi-purpose Overboot (MULO):*** Projected initial fielding in mid term and replacing legacy CBRN footwear covers.

### 3. Medical Protection:

***Vaccines:*** Immunizations providing a level of acquired immunity against the effects of CBRN agents.

***Topicals:*** Protective barrier products applied to the skin to enhance protection of wear against contact with CBRN/TIM agents. Includes both inert and reactive materials.

***Medications:*** Medical materials taken to mitigate or prevent the effects of exposure to CBRN/TIM agents. Includes medications taken routinely or upon exposure (but prior to symptom display) to build resistance/immunity or to mitigate/resolve medical impacts of CBRN/TIM agent exposure/contamination.

**MOPP Methodology:** Stepped level of CBRND protective measures. Standardized levels permit the rapid increase or decrease of unit MOPP level.

**Unit Staff:** The application of DOTLPF for all phases of operations with threat from preplanning to post-force return to home stations. Includes all aspects of C2 and supporting staff activities/functions (e.g., logistics, intelligence, etc.) enabling mission and task accomplishment.

	FAA Measure	Scale
M1	Coordination is performed with Mortuary Affairs for handling, decontaminating, and transporting of human and MWA remains.	<p><b>8–10:</b> Mortuary Affairs units/activities coordinate with the command and Medical Services staffs to facilitate the recovery, handling, decontamination, and internment of human remains.</p> <p><b>4–7:</b> Mortuary Affairs units/activities coordinate with the command with the command and Medical Services staffs to facilitate the recovery, decontamination, and internment of human remains.</p> <p><b>1–3:</b> Mortuary Affairs units/activities coordinate with the command staff to facilitate the recovery and internment of human remains.</p> <p><b>0:</b> Mortuary Affairs units/activities do not coordinate with command and Medical Services staffs for the recovery and internment of human remains.</p>
M2	Mortuary Affairs is rapidly prepared upon notification to handle contaminated remains.	<p><b>8–10:</b> Mortuary Affairs units/activities maintain readiness to implement operations involving CBRN/TIM exposed/contaminated remains; possess in-place operational CBRN systems, components, and consumables; have detailed doctrine, policies, procedures, and TTPs; and are trained (formal and recurring) to commence coordination and operations upon notification by command staff or receipt of CBRN event alerting/warning.</p> <p><b>4–7:</b> Mortuary Affairs units/activities possess access to CBRN systems, components, and consumables; have guiding doctrine, policies, procedures, and TTPs; and are trained (formal and recurring) to establish and conduct operations involving CBRN/TIM exposed/contaminated remains upon notification by command staff.</p> <p><b>1–3:</b> Mortuary Affairs units/activities possess access to CBRN systems, components, and consumables through the command staff; possess limited doctrine, policy, and procedures; and are trained by their assigned units for the conduct of operations involving CBRN/TIM exposed/contaminated remains.</p> <p><b>0:</b> Mortuary Affairs units/activities do not possess access to necessary CBRND resources, training, and do not possess adequate doctrine, policy, and procedures to establish and conduct operations involving CBRN/TIM exposed/contaminated remains.</p>
M3	Mortuary Affairs personnel are trained in handling contaminated remains.	<p><b>8–10:</b> Detailed doctrine, policy, procedures, processes, and training (formal and recurring) exist for the safe handling of CBRN/TIM exposed/contaminated remains by Mortuary Affairs personnel and activities.</p> <p><b>4–7:</b> General doctrine, policy, procedures, and training exist for the handling of CBRN/TIM exposed/contaminated remains by Mortuary Affairs personnel.</p> <p><b>1–3:</b> Limited doctrine, policy, and procedures exist for the handling of CBRN/TIM exposed/contaminated remains by Mortuary Affairs personnel. Training is limited to unit-based training program.</p> <p><b>0:</b> Doctrine, policy, procedures, and training do not exist for the handling of CBRN/TIM exposed/contaminated remains.</p>
M4	Contaminated/infectious human and MWA remains are safely processed, transported, and disposition completed.	<p><b>8–10:</b> Doctrine, policy, procedures, TTPs, training, and plans address the application of protective assets and the safe handling and transport of exposed or contaminated human/MWA remains, and specify requirements and measures for the protection of personnel, activities, and resources performing the handling and transport.</p> <p><b>4–7:</b> Doctrine, policy, procedures, TTPs, training, and plans address the safe handling and transport of exposed or contaminated remains and identify general measures and resources for the protection of personnel, activities, and resources performing the handling and transport.</p> <p><b>1–3:</b> Doctrine, policy, procedures, TTPs, training, and plans provide general instructions and guidance for the handling and transport of exposed or contaminated remains and provides limited information on measures and resources to apply for the protection of personnel, activities, and resources performing the handling and transport.</p> <p><b>0:</b> Doctrine, policy, procedures, TTPs, training, and plans do not address the handling and transport of exposed or contaminated remains and the measures and resources necessary for the protection of personnel, activities, and resources performing the handling and transport.</p>

M5	Mortuary Affairs units/activities are trained and equipped to operate CBRN/TIM detection and monitoring devices.	<p><b>8–10:</b> Mortuary Affairs units and activities are equipped and trained to operate CBRN/TIM detection devices and sensors for application to remains.</p> <p><b>4–7:</b> Mortuary Affairs units and activities are trained and equipped to apply radiation detection, identification, and computation and standard individual CBRN/TIM detection/monitoring devices for application to remains.</p> <p><b>1–3:</b> Mortuary Affairs units and activities are trained and equipped to apply standard individual CBRN detection devices for application to remains.</p> <p><b>0:</b> Training and equipping Mortuary Affairs units and activities to perform CBRN/TIM detection and monitoring of remains is nonexistent.</p>
M6	Mortuary Affairs personnel possess IPE and splash protective coverings.	<p><b>8–10:</b> Mortuary Affairs personnel are equipped with adequate splash and CBRN/TIM IPE protection.</p> <p><b>4–7:</b> Mortuary Affairs personnel are equipped with CBRN/TIM IPE protection and limited splash protection.</p> <p><b>1–3:</b> Mortuary personnel are equipped with CBRN/TIM IPE protection and selected members are equipped with splash protection.</p> <p><b>0:</b> Mortuary Affairs personnel are not equipped with CBRN/TIM IPE and splash protection.</p>
M7	Mortuary Affairs possess sufficient containment IPE for contaminated remains.	<p><b>8–10:</b> Adequate types and quantities of CBRN/TIM containment IPE, storage, and transport containers for contaminated remains are on hand and readily available for the sealed containment of CBRN/TIM exposed/contaminated remains.</p> <p><b>4–7:</b> CBRN/TIM exposed/contaminated remains containment IPE, storage, and transport containers are available for the sealed containment of CBRN/TIM exposed/contaminated remains.</p> <p><b>1–3:</b> CBRN/TIM exposed/contaminated remains containment IPE, storage, and transport containers are available in limited quantities for the sealed containment of CBRN/TIM exposed/contaminated remains.</p> <p><b>0:</b> CBRN/TIM exposed/contaminated remains containment IPE, storage, and transport containers are not available or are nonexistent.</p>
M8	Adequate decontamination supplies and equipment are on hand	<p><b>8–10:</b> CBRND systems, resources, and consumables are available and in place in plan-identified quantities and types to conduct decontamination of CBRN/TIM exposed/contaminated remains.</p> <p><b>4–7:</b> CBRND systems, components, and consumables are available and in place supporting operations but reflect adjusted plan quantities and types for limitations and constraints in availability. Adjustments to operations are made without serious impact.</p> <p><b>1–3:</b> Limitations and constraints upon available CBRND systems, components, and consumable quantities and types require changes and delays in the conduct of decontamination of CBRN/TIM exposed/contaminated remains.</p> <p><b>0:</b> Systems, components, and consumables availability and allocation do not support remains decontamination activities.</p>
M9	There is effective DOTMLPF in place to conduct task	<p><b>8–10:</b> DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations</p> <p><b>4–7:</b> Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds.</p> <p><b>1–3:</b> DOTLPF is inadequate for accomplishment of this task.</p> <p><b>0:</b> DOTLPF does not exist for this task.</p>

<sup>1</sup> Mortuary Affairs personnel designated to perform handling and decontamination of human remains activities are trained on the proper wear of protective respiratory/ocular protection as outlined in doctrine, policy, procedures, and TTPs. Respiratory/ocular protection is diverse across the Services and performed functions. The M40/M42 CB Protective Mask is in service with the U.S. Army. The mask uses the C-2 canister for filtration of CBRN contaminants. The M45 Aircrew Aviator Mask replaced the U.S. Army M43 Type II and M49 Mask Systems. The system uses a low-profile canister compatible hose assembly for both hose and face-mounted configurations. The mask system incorporates selectable filtration for support both during aircraft systems activation and using the connectable filter pack. The mask also is applied to personnel who cannot be fitted with the

standard M40A1, M42A2, or MCU-2A/P masks. The MCU-2A/P is the mainstay USAF and USN mask employed by personnel not equipped with aircrew masks and by aircrew when not performing flight operations. The MCU-2A/P is also used by aircrew during flight operations who are not equipped with aircrew masks. COTS equipment meeting OSHA requirements (and NFPA for firefighters) is applied by selected civilian personnel performing specific functions such as firefighting, EMS, hazardous materials, etc. Eligible civilians are inadequately addressed in DOTLPF.

<sup>2</sup> CBRND IPE is currently Service-specific. Respiratory/ocular protection is diverse across the Services and performed functions. USAF combat aircrews conduction operations within a CBRN environment are equipped with the MBU-19/P Chemical-Biological AERP that includes protective hood, MBU-12/P mask, C-2 filter canister, an intercom for ground communications, and a blower assembly. The AERP provides protection whether or not supplemental oxygen is present. USN and USMC aviators use the A/P22P-14(V) Respirator Assembly that is a self-contained protective system deployed for rotary-wing (Version 1 for USN) and fixed-wing (Versions 2–4 for USN and USMC) aircrews. The system incorporates a CB filter, dual air/oxygen supply, and a crossover manifold with dual protective capabilities for flight and ground protection. The A/P 22P-14(V) 1 is not compatible with aircraft with oxygen delivery systems and supports helicopter crew use. Version 2 is used for the EA-6B and F-18A, Version 3 for AV-8B and F-18C/D, and Version 4 is applied for C-130 aircrews. The M17 series mask is obsolete and is relegated to NEO support in selected HTAs. The mask is designed for the military standard profile (ground) and does not adequately protect all potential nonmilitary populace members, for which is retained. The M40/M42 CB Protective Mask is in service with the U.S. Army. The mask uses the C-2 canister for filtration of CBRN contaminants. The M42 integrates with combat vehicle filtration protection system and has a dynamic microphone with cable for connection to vehicle communications systems. The M43 CB Aircraft Mask is applied by U.S. Army aircrew members and applies a motor blower unit with C-2 canister for filtration. The system is a stand-alone system that accompanies the user. The M45 Aircrew Aviator Mask replaced the U.S. Army M43 Type II and M49 Mask Systems. The system uses a low-profile canister compatible hose assembly for both hose and face-mounted configurations. The mask system incorporates selectable filtration for support both during aircraft systems activation and using the connectable filter pack. The mask also is applied to personnel who cannot be fitted with the standard M40A1, M42A2, or MCU-2A/P masks. The M48 CB Apache Aviator Mask protects AH-64 Apache helicopter aviators and flight support personnel. The blower assembly uses the C-2 filter canister to provide filtered, breathable air. The M-48 replaces the M43 Type I mask. The MCU-2A/P is the mainstay USAF and USN mask employed by personnel not equipped with aircrew masks and by aircrew when not performing flight operations. The MCU-2A/P is also used by aircrew during flight operations who are not equipped with aircrew masks. COTS equipment meeting OSHA requirements (and NFPA for firefighters) is applied by selected civilian personnel performing specific functions such as firefighting, EMS, hazardous materials, etc. Limited quantities of COTS may be available within HTAs for known NEO requirements for the protection of populace members unable to wear the M17 series or standard warfighter respiratory/ocular protective devices. MWAs are not afforded respiratory/ocular protection.

<sup>3</sup> DOTLPF is adequate for the application of CBRND respiratory/ocular protection by personnel transporting, handling, decontaminating, or otherwise potentially at risk for secondary exposure/contamination from infectious/contaminated remains.

<sup>4</sup> Mortuary Affairs personnel designated to perform handling and decontamination of human remains activities are trained on the proper wear of percutaneous protective protection as outlined in doctrine, policy, procedures, and TTPs. Military personnel performing decontamination operations are required to wear CBRND percutaneous protection against the potential for secondary exposure/contamination. Doctrine, policy, procedures, and TTPs do not adequately address the protection of nonmilitary personnel performing decontamination operations in the AO. However, OSHA and CDC requirements may apply and should be addressed as applicable. Non-U.S. personnel subject to these functions are not addressed. Service-specific CBRND percutaneous protection is currently applied for the protection of the force. The BDO, used by the USAF and U.S. Army, is a two-piece garment providing protection for a 24-hour period against chemical agent vapors, liquids, and droplets; biological agents and toxins and contact with radioactive particles. The BDO's protective abilities are lost if the suit is torn, ripped, splashed with POL, or is saturated with water and is designed for a one-time use and is worn by ground and most flight personnel (non-high-performance aircraft). The USMC uses the Saratoga COLPRO suit similar in design to the BDO, but launderable for personnel hygiene. The CPOG is a legacy two-piece garment for protection against CBRN agents. The CPOG is in use with the USN. The USAF CWU-66/P (and 77/P) is a one-piece flightsuit providing protection for a 24-hour period against standard CBRN agents and is designed for compatibility with aircrew lift support equipment. The BVO/GVO overboots are applied over the wearer's standard footwear to protect against contact with CBRND. The USN uses the CPFC, commonly called the "fishtail" for its design, to protect the wearer's footwear. The CPFC, considered obsolete, does provide a measure of antislip protection shipboard. Decontamination units/teams apply the CB Protective Boot (similar to firefighter boots) for decontamination operations. Hand protection is provided by the CPG in 7-, 14-, and 25-mil thicknesses to meet warfighter hand protection and dexterity needs. SCALP provides a disposable, lightweight, impermeable layer of protection for personnel against gross liquid contamination and is worn over the warfighter's protective ensemble. SCALP is applied by units performing decontamination operations where personnel may become soaked by decontaminants and Medical Services personnel with potential for prolonged contact with body fluids. Standard wet-weather gear (e.g., poncho, rain parka, rain suit, etc.) is also applied as a barrier against saturation of the warfighter's protective ensemble by contact with liquids such as rain, sea spray, etc. The M-2 apron is applied by personnel performing decontamination aprons and is worn over the ensemble. The apron is full length and

sleeve to maximize coverage, although the back is open. COTS assets meeting OSHA requirements (and NFPA for firefighters) is applied by selected civilian personnel performing specific functions such as firefighting, EMS, hazardous materials, etc.

<sup>5</sup> Service-specific CBRND percutaneous protection is currently applied for the protection of the force. The BDO, used by the USAF and U.S. Army, is a two-piece garment providing protection for a 24-hour period against chemical agent vapors, liquids, and droplets; biological agents and toxins and contact with radioactive particles. The BDO's protective abilities are lost if the suit is torn, ripped, splashed with POL, or is saturated with water and is designed for a one-time use and is worn by ground and most flight personnel (non-high-performance aircraft). The USMC uses the Saratoga COLPRO suit similar in design to the BDO, but launderable for personnel hygiene. The CPOG is a legacy two-piece garment for protection against CBRN agents. The CPOG is in use with the USN. The CPU is designed to provide an additional layer of protection for the warfighter and is worn under standard IPE. The USAF CWU-66/P (and 77/P) is a one-piece flightsuit providing protection for a 24-hour period against standard CBRN agents and is designed for compatibility with aircrew lift support equipment. The USN, USAF, and USMC use the disposable aircrew protective cape to protect aircrew between sheltering and the combat aircraft. The cape drapes over the wearer and is removed during entry into the aircraft to prevent transfer of contamination into the aircraft interior. The BVO/GVO overboots are applied over the wearer's standard footwear to protect against contact with CBRND. The USN uses the CPFC, commonly called the "fishtail" for its design, to protect the wearer's footwear. The CPFC, considered obsolete, does provide a measure of antislip protection shipboard. The disposable aircrew boot cover is worn by USAF, USN, and USMC aviators over aircrew footwear while en route and mounting combat aircraft. The covers are removed during aircraft entry and are designed to prevent contamination transfer into the aircraft. Hand protection is provided by the CPG in 7-, 14-, and 25-mil thicknesses to meet warfighter hand protection and dexterity needs. Disposable aircrew hand protection is applied by the USAF, USMC, and USN for aviators over their gloves (and may be worn between glove layers for additional protection) during movement between shelter and aircraft. When used as an overglove, the gloves are removed during aircraft mounting during aircraft entry to preclude the potential for transfer of contamination into the aircraft interior. Medical Services practitioners performing treatment The CPHS is designed to prevent contact of the warfighter's helmet with liquid contamination which may be absorbed, impact helmet integrity, and/or constitute a potential secondary hazard to the wearer. SCALP provides a disposable, lightweight, impermeable layer of protection for personnel against gross liquid contamination and is worn over the warfighter's protective ensemble. SCALP is commonly applied to protect armor and EOD personnel who may be required to leave sheltering to perform duties and functions. SCALP is also applied by units performing decontamination operations where personnel may become soaked by decontaminants and Medical Services personnel with potential for prolonged contact with body fluids. Standard wet-weather gear (e.g., poncho, rain parka, rain suit, etc.) is also applied as a barrier against saturation of the warfighter's protective ensemble by contact with liquids such as rain, sea spray, etc. The M-2 apron is applied by personnel performing decontamination aprons and is worn over the ensemble. The apron is full length and sleeve to maximize coverage, although the back is open. COTS assets meeting OSHA requirements (and NFPA for firefighters) is applied by selected civilian personnel performing specific functions such as firefighting, EMS, hazardous materials, etc. Medical barrier impermeable barrier protective assets may also be applied by Medical Services practitioners potentially at risk for contact with fluids.

<sup>6</sup> Containment CBRND individual protective systems do not currently exist for the storage and transport of contaminated/ infectious remains.

<sup>7</sup> DOTLPF is adequate for the application of CBRND percutaneous personal protection by personnel transporting, handling, decontaminating, or otherwise potentially at risk for secondary exposure/contamination from infectious/contaminated remains. However, DOTLPF is inadequate to address the containment of contaminated/infectious remains for transport out of the AOR for final internment.

<sup>8</sup> Forces are not protected against all identified threat CBRN/TIM capabilities. Medical prophylaxis does not exist for all threat CBRN/TIM agents. Current prophylaxis and supporting doctrine, policy, and procedures do not address presymptomatic medical CBRND protective countermeasures by other than U.S. forces, excluding MWAs and eligible civilians. Prophylaxis against most high-threat TIMs are not currently available due to the relatively recent consideration of these agents as a potential threat. Additionally, the efficacy of existing prophylaxis, particularly vaccines, widely varies. Military personnel are administered and/or issued CBRND medical countermeasures for operations with threat. Vaccines for selected biological agents, topicals, and preexposure and/or post-exposure/presymptomatic medications are applied to mitigate or preclude the effects of specific CBRN/TIM agents. Currently, preexposure prophylaxis is available for nerve agents ( G and V series), and vesicants (H, HD, HN, L, CX), topical only. SERPACWA is the preexposure countermeasure for vesicants and one nerve agent. TSP is approved by the FDA as a supplement for SERPACWA. Post-exposure prophylaxis is available for pulmonary (CG) agent, but is not FDA approved. Radioprotective steroids and neutraceuticals may be effective as pre- and post-exposure prophylactics. 5-androstenediol is an IND preexposure treatment for radiological exposure. Iodide/potassium iodide is FDA approved for application against Iodine 131, 132, 134, and 135. Post-exposure radiological exposure prophylaxis consists of neutraceuticals, plant isoflavone genistein, and alpha tocopherol (Vitamin E) but are not approved by the FDA for prophylaxis against radiation. FDA-approved preexposure medical countermeasures are available for anthrax, cholera, HFRS (Haantan), Rift Valley fever, yellow fever, HFRS (Haantan), and smallpox. IND status vaccines are currently available for Q-fever, tularemia (although use has been placed on hold by the FDA), Botulinum, Junin hemorrhagic fever, and VEE/WEE/EEE. Antiviral/bacterial medications may be administered and/or issued to provide a level of protection against biological agents. Medical prophylaxes are developed for the military force. Prophylaxes for MWAs are virtually nonexistent. Prophylaxis for eligible civilians is not addressed. Availability of prophylaxis is questionable for issue and administration

to eligible civilians. The issue and administration of prophylaxis to eligible civilians requires review due to questions regarding applicability to the range of body types, ages, and physical/medical factors inherent within a potential population, as well as long-term health issues and legal implications.

<sup>9</sup> DOTLPF is adequate for the application of CBRND medical countermeasures by personnel transporting, handling, decontaminating, or otherwise potentially at risk for secondary exposure/contamination from infectious/contaminated remains.

<sup>10</sup> Plans incorporate MOPP levels and methodologies are adjustable to meet local operations and threat needs. MOPP levels and methodologies outlined in doctrine, policy, procedures, and TTPs require levels of protection readiness based upon the threat and/or presence of contaminants. Full protection is required in the presence of CBRN/TIM agents/contamination. This includes protective measures and the wear of protective equipment when the possibility exists for secondary exposure/contamination to personnel and equipment, such as the movement, handling, decontamination, and preparation of contaminated remains. MOPP levels and methodologies are generally considered to apply to equipped nonmilitary personnel. Plans within HTAs may incorporate this perception. However, doctrine, policy, procedures, and TTPs do not address their application to nonmilitary personnel.

<sup>11</sup> DOTLPF is adequate for the protection of personnel handling, transporting, and decontaminating remains.

<sup>12</sup> Mortuary Affairs units/activities coordinate with the JTF/JOA Medical Services and unit Command/AOR Medical Services staffs to facilitate the recovery, preparation, and final internment of human remains. MWA remains are not processed by these units; rather, they are managed by the respective Services Veterinary support elements. However, DOTLPF is inadequate for the processing of non-U.S. personnel (e.g., indigenous civilians, third-party nationals, etc.).

<sup>13</sup> Mortuary Affairs units/elements establish readiness to conduct operations upon arrival within the AOR. Operations are established in field and site locations as necessary to support operations. Unit planned, allocated, and positioned resources are placed into readiness for operations as outlined in established doctrine, policies, procedures, and TTPs. Personnel are formally trained in the performance of their tasks and responsibilities and possess doctrinal materials for reference upon activation by command staff or receipt of CBRN event alerting/warning.

<sup>14</sup> Primary duty mortuary affairs personnel possess adequate doctrine, policy, procedures, and training to reduce the potential for secondary exposure/contamination. Existing doctrine, policy, and procedures provide adequate protection of personnel against secondary exposure/contamination. Doctrine, policy, and procedures require the application of protective equipment and measures if the potential exists for contamination/exposure.

<sup>15</sup> Doctrine, policy, and procedures exist for Mortuary Affairs activities within the AOR. Prior decontamination of exposed/contaminated remains is the only identified means for protecting transportation assets against secondary contamination. The predominant means is decontamination of the asset following secondary exposure/contamination. Tactical and strategic fixed-wing air transport is not considered an acceptable means of transport. Decontaminated and contained remains may not be considered a secondary risk by air asset managers.

<sup>16</sup> Mortuary Affairs units/activities are not equipped and trained to operate and apply CBRN/TIM detection and monitoring devices other than standard individual warfighter detection devices (e.g., M9 paper, etc.).

<sup>17</sup> Mortuary Affairs unit/element planning and preparations includes the provision of protection to personnel performing unit activities and operations. Existing protective equipment provides adequate protection of personnel against secondary exposure/contamination. The application of protective equipment and measures if the potential exists for contamination/exposure is a standard practice and incorporated into unit plans and procedures. Mortuary personnel performing decontamination and remains preparation require splash protection against decontaminants and body fluids. Unit planning addresses splash protection for these personnel.

<sup>18</sup> Mortuary Affairs doctrine, policies, TTPs, plans, and processes require the full decontamination of remains, cremation, or final internment within the AOR; each of which are no longer considered acceptable by DoD. However, containment systems providing adequate protection and safeguards against secondary contamination/exposure of personnel and resources during storage, handling, transport, and potentially through final internment do not exist.

<sup>19</sup> Mortuary Affairs doctrine, policy, and TTPs are adequate for within AOR actions and activities for operations involving contaminated/infectious remains. However, DOTLPF is inadequate for the containment of remains and for transport from the AOR to CONUS and internment within CONUS.

<sup>20</sup> Legacy systems will remain in the inventory throughout the mid term. These systems will be gradually replaced by new joint systems of respiratory/ocular protection as they are fielded. The JSGPM also replaces current Service-specific ocular/respiratory protection. The system provides respiratory and ocular protection from CBRN agents and selected TIMs. The field-of-vision is improved and encumbrances associated with legacy systems are reduced. The JSGPM incorporates state of the art technology and is designed to integrate with future warfighter CBRND IPE and function equipment/assets. The Guardian Program is projected to review, assess, and implement protection for critical members of the installation/facility populace during the mid term. This will predominantly be COTS-based assets for respiratory/ocular protection. However, the Guardian Program is not expected to address eligible civilian protection within the AO for other than existing U.S. military installations and facilities.

<sup>21</sup> Legacy systems will remain in the inventory throughout the mid term. These systems will be gradually replaced by new joint systems of respiratory/ocular protection as they are fielded. The JSAM replaces the Service-specific systems. When incorporated with anti-G protection of high-performance aircraft aviators, the JSAM will provide simultaneous CBRN and anti-G protection. The JSAM is compatible with existing and programmed CBRN IPE, provides flame and thermal protection, and reduces the heat stress associated with existing systems of ocular/respiratory protection. Further, the JSAM may be donned and doffed during flight. The JSGPM also replaces current Service-specific ocular/respiratory protection. The system provides respiratory and ocular protection from CBRN agents and selected TIMs. The field-of-vision is improved and encumbrances associated with legacy systems are reduced. The JSGPM incorporates state of the art technology and is designed to integrate with future warfighter CBRND IPE and function equipment/assets. The JCESM is a COTS one-time use, one-size-fits-all, respiratory/ocular protective system affording 2 hours of protection and is lightweight and disposable. The system is designed to provide low-level CBRN vapor, aerosol, and particulate protection to the wearer for egressing the contaminated environment. The JCESM is projected for use when standard respiratory/ocular protection is not practical. The JCESM is not programmed for general dissemination. The Guardian Program is projected to review, assess, and implement protection for critical members of the installation/facility populace during the mid term. This will predominantly be COTS-based assets for respiratory/ocular protection. However, the Guardian Program is not expected to address eligible civilian protection within the AO for other than existing U.S. military installations and facilities. MWA respiratory/ocular protection is not programmed or forecasted.

<sup>22</sup> Legacy systems will remain in the inventory throughout the mid term. These systems will be gradually replaced by new joint systems of percutaneous protection as they are fielded. The JSLIST NBC Protective Garment is a two-piece, risk-taking, overgarment with integrated hood affording protection against CBRN agents and selected TIMs. The garment reduces the physiological and psychological encumbrances associated with legacy systems. The JSLIST is under evaluation by NIOSH for application to OSHA protection requirements. Joint Service glove upgrades are provided under the Joint Block 1 and 2 Glove Upgrade Program (JB1/2GU) in the near and mid term. The JB1GU responds to an urgent need by designated elements of the force for increased tactility/durability supporting mission requirements. The JFIRE addresses protection of military firefighters within a CBRN/TIM environment conducting firefighting operations involving structural and crash/firefighting/rescue. The JFIRE incorporates the JSLIST into firefighter bunker gear. The JB1GU is expected to meet most of the requirements within the JSLIST ORD and is viewed as an evolutionary approach in the development of the JB2GU. Versions under consideration include a protective inner glove worn under existing warfighter gloves, a replacement glove for existing hand wear, or a combination of glove shell and liner affording CBRN protection of the legacy gloves they are projected to replace. The MULO is projected to replace legacy footwear covers. The ability of the MULO to provide adequate antislip protection for USN personnel asea is under review. The Guardian Program is projected to review, assess, and implement protection for critical members of the installation/facility populace during the mid term. This will predominantly be COTS-based assets for percutaneous protection. However, the Guardian Program is not expected to address eligible civilian protection within the AO for other than existing U.S. military installations and facilities.

<sup>23</sup> Legacy systems will remain in the inventory throughout the mid term. These systems will be gradually replaced by new joint systems of percutaneous protection as they are fielded. The JSLIST NBC Protective Garment is a two-piece, risk-taking, overgarment with integrated hood affording protection against CBRN agents and selected TIMs. The garment reduces the physiological and psychological encumbrances associated with legacy systems. The JSLIST is under evaluation by NIOSH for application to OSHA protection requirements. The JPACE replaces the Service-specific systems. The JPACE provides aircrew members with equivalent protection to the JSLIST ensemble. The JPACE is designed to not interfere with emergency ejection from a combat aircraft and continues to provide CBRN percutaneous protection following ejection and during escape and evasion operations. The ensemble is both flame-retardant and self-extinguishing to permit emergency egress from a burning aircraft. Further, the ensemble provides CBRN protection when subject to rotor, propeller, and jet wash. Joint Service glove upgrades are provided under the Joint Block 1 and 2 Glove Upgrade Program (JB1/2GU) in the near and mid term. The JB1GU responds to an urgent need by designated elements of the force for increased tactility/durability supporting mission requirements. The JFIRE addresses protection of military firefighters within a CBRN/TIM environment conducting firefighting operations involving structural and crash/firefighting/rescue. The JFIRE incorporates the JSLIST into firefighter bunker gear. The JB1GU is expected to meet most of the requirements within the JSLIST ORD and is viewed as an evolutionary approach in the development of the JB2GU. Versions under consideration include a protective inner glove worn under existing warfighter gloves, a replacement glove for existing hand wear, or a combination of glove shell and liner affording CBRN protection of the legacy gloves they are projected to replace. The MULO is projected to replace legacy footwear covers. The ability of the MULO to provide adequate antislip protection for USN personnel asea is under review. The Guardian Program is projected to review, assess, and implement protection for critical members of the installation/facility populace during the mid term. This will predominantly be COTS-based assets for percutaneous protection. However, the Guardian Program is not expected to address eligible civilian protection within the AO for other than existing U.S. military installations and facilities. MWA percutaneous protection is not programmed or forecasted.

<sup>24</sup> Cell Culture Derived Vaccinia is projected for production during the near-term. Clostridium Botulinum Toxin Medical Defense System is projected for availability during the mid term for Serotypes A, B, C, E, and F. The SERPACWA Active TSP is also projected for production during the late mid term.

<sup>25</sup> The next-generation series of nonaviator masks is in R&D. The capabilities and fielding of these masks are not as yet determined.

<sup>26</sup> The next-generation series of aviator and nonaviator masks is in R&D. The capabilities and fielding of these masks are not as yet determined.

<sup>27</sup> The next-generation series of nonaviator percutaneous protective assets is in R&D. The capabilities and fielding of these assets are not as yet determined.

<sup>28</sup> The next-generation series of aviator and nonaviator percutaneous protective assets is in R&D. The capabilities and fielding of these assets are not as yet determined.

<sup>29</sup> Active TSPs are projected for replacement of SERPACWA TSP and SERPACWA Active TSP in the far term. The Chemical Agent Prophylaxis and Cyanide Pretreatment are also projected for the far term. The Multivalent VEE Vaccine is projected to begin production in FY2013. The Next-Generation Anthrax Vaccine, Tularemia Vaccine, and Plague Vaccine are projected for production beginning in FY2010. Serotypes A and B are addressed in the Recombinant Bivalent Botulinum Vaccine projected for production in FY2012. A number of R&D efforts are under way for the development of pre- and post-exposure prophylaxes. Potentially, these efforts may produce viable prophylaxes within the mid and far term resulting in fielded material. However, possible resulting prophylaxes cannot be predicted at this time.

### 13.13.3 Functional Solution Analysis

#### 13.13.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** Existing DOTLPF is inadequate, or nonexistent, for eligible civilians.  
**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing eligible civilian personnel for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of eligible civilian personnel within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians; and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilian personnel.
- 2. Deficiency:** Existing DOTLPF is inadequate, or nonexistent, for MWAs.  
**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing MWAs, particularly MWDs, for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of MWAs within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWAs.
- 3. Deficiency:** MWDs are not equipped, trained, and prepared to survive a CBRN/TIM environment.  
**Partial Non-Materiel Solution:** *Doctrine:* Establish doctrine, policy, and procedures for CBRND protection of MWD and training enabling CBRN/TIM environment survival. *Organization:* Ensure organizational consideration for maintenance and support of MWD CBRND protective equipment, measures, and activities. *Training:* Establish institutional and unit training of MWD handlers and MWDs for CBRND measures and activities. Integrate into CBRND exercises and evaluations. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for MWD survivability. *Facilities:* Develop supporting infrastructure for MWD CBRND (e.g., logistics, veterinary surveillance, communications, training, etc.).
- 4. Deficiency:** CBRND protective equipment and measures do not protect against all CBRN/TIM agents.  
**Partial Non-Materiel Solutions:** *Doctrine:* Requirement for development of CBRND protective equipment and measures to protect against all CBRN/TIM agents, particularly high-risk/high-threat agents. *Leadership:* Enforce compliance with established standards (see Doctrine) for prophylactic CBRND protection.
- 5. Deficiency:** Medical prophylaxis does not exist for all threat CBRN/TIM and TIM agents.

**Partial Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards for prophylactic CBRND protection against all threat agents.

*Training:* Train, exercise, and evaluate personnel (military and eligible civilians) on the use of prophylactic CBRND protection against threat agents. *Leadership:* Enforce compliance with established standards (see Doctrine) for prophylactic CBRND protection. Implement and ensure training is adequate and conduct exercises and evaluations to ensure readiness.

6. **Deficiency:** Current prophylaxes and supporting DOTLPF do not address presymptomatic medical CBRND protective countermeasures for eligible civilians and non-U.S. forces.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and TTPs guidance and instructions for the application of presymptomatic medical CBRND protective countermeasures for eligible civilians, non-U.S. forces. *Organization:* Ensure resources, taskings, and staff are in place or available to plan, disseminate/administer, and monitor presymptomatic medical CBRND protective countermeasures for eligible civilians, non-U.S. forces. *Training:* Train, potential eligible civilians on presymptomatic medical CBRND protective countermeasures. *Leadership:* Recognize criticality of protection of eligible civilians within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply force resources. *Facilities:* Develop supporting infrastructure to support presymptomatic medical CBRND protective countermeasures of eligible civilians.
7. **Deficiency:** Current prophylaxes and supporting DOTLPF do not address presymptomatic medical CBRND protective countermeasures for MWAs.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and TTPs guidance and instructions for the application of presymptomatic medical CBRND protective countermeasures for MWA, particularly MWD. *Organization:* Ensure resources, taskings, and staff are in place or available to plan, disseminate/administer, and monitor presymptomatic medical CBRND protective countermeasures for MWAs. *Training:* Train, potential MWA handlers on presymptomatic medical CBRND protective countermeasures. *Leadership:* Recognize criticality of protection of MWAs within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply force resources. *Facilities:* Develop supporting infrastructure to support presymptomatic medical CBRND protective countermeasures of MWAs.
8. **Deficiency:** Efficacy of existing prophylaxes varies widely.  
**Non-Materiel Solutions:** *Doctrine:* Establish overarching single common standard for prophylaxes efficacy.
9. **Deficiency:** Prophylaxis against most high-threat TIMs are not currently available due to the relatively recent consideration of these agents as a potential threat.  
**Partial Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of metrics for standards and criteria for protection against all high-threat TIM agents. *Training:* Train, exercise, and evaluate personnel (military and eligible civilians) on the use of prophylactic CBRND protection against threat agents. *Leadership:* Enforce

compliance with established metrics for standards and criteria. Implement and ensure training is adequate and conduct exercises and evaluations to ensure readiness.

**10. Deficiency:** Not all prophylaxes are FDA approved.

**Non-Materiel Solutions:** *Doctrine:* Require FDA approval of all prophylaxes, including medications potentially applied as prophylaxes. The latter requires specific approval as prophylactic treatment.

**11. Deficiency:** The issue and administration of prophylaxis to eligible civilians requires review due to questions regarding applicability to the range of body types, ages, and physical/medical factors inherent within a potential population, as well as possible long-term health issues and legal implications.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards and measures for protection of eligible civilians addressing the variation within the potential protected population. *Leadership:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRN/TIM training, exercises, and evaluations.

**12. Deficiency:** Prophylaxis for MWAs is virtually nonexistent.

**Partial Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of MWAs, particularly MWDs, and training for CBRN/TIM environment survival. *Organization:* Ensure organizational consideration for maintenance and support of MWA CBRND protective equipment, measures, and activities. *Training:* Establish institutional and unit training of handlers and MWAs for CBRND measures and activities. *Leadership:* Ensure awareness and planning for CBRND measures and requirements for MWA survivability. *Facilities:* Develop supporting infrastructure for MWA CBRND (e.g., logistics, veterinary surveillance, etc.).

**13. Deficiency:** Prophylaxis for eligible civilians is not addressed.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures requirement to address the administration, provision, and application of medical CBRND protective countermeasures by other than U.S. forces (e.g., civilians, non-U.S. forces, etc.). *Organization:* Address organizational issues (e.g., who provides the equipment, support forces to train and equip, etc.) related to the provision of CBRN/TIM protection to eligible civilians and non-U.S. forces. *Training:* Include eligible civilians in CBRND training, exercises, and evaluations. Identify training requirements and responsibilities for non-U.S. forces. *Leadership:* Ensure leadership awareness of criticality of increased dependence of military operations upon civilians. *Personnel:* Require eligible civilians supporting the mission to meet minimum standards for safe use of CBRND resources.

**14. Deficiency:** Availability of prophylaxis is questionable for issue and administration to eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of CBRND standards and prophylaxis for protection of eligible civilians addressing the variation within a potential protected population. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct

CBRN/TIM training, exercises, and evaluations, where appropriate. *Leadership*: Implement and manage CBRND training, equipping, and protection of eligible civilians.

- 15. Deficiency:** DOTLPF is inadequate for the processing of non-U.S. personnel (e.g., indigenous civilians, third-party nations, etc.).

**Non-Materiel Solutions:** *Doctrine*: Address in doctrine, policy, and procedures Mortuary Affairs operations and activities involving CBRN/TIM contaminated or exposed remains of non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Organization*: Ensure resources, taskings, and staff are in place or available for Mortuary Affairs operations and activities addressing CBRN/TIM contaminated or exposed remains of non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Training*: Train, exercise, and evaluate Mortuary Affairs activities and supporting force elements addressing CBRN/TIM contaminated or exposed remains of non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.). *Leadership*: Ensure awareness of international and national implications of transport of contaminated or exposed remains and the public desire for final internment in homeland. *Facilities*: Develop supporting infrastructure for operations associated with Mortuary Affairs involving CBRN/TIM contaminated or exposed remains of non-U.S. personnel (e.g., indigenous civilians, third-party civilians, third-party nationals, displaced persons, detained persons, etc.).

- 16. Deficiency:** Prior decontamination of exposed/contaminated remains is the only identified means for protecting transportation assets against secondary contamination.

**Partial Non-Materiel Solutions:** *Doctrine*: Include the application of CBRN/TIM containment packaging/systems designed for exposed/contaminated remains (as well as other alternative methods to preclude secondary exposure/contamination of resources) in doctrine, policy, and procedures. *Training*: Train, exercise, and evaluate the application of CBRN/TIM containment packaging/systems and other alternatives for exposed/contaminated remains. *Leadership*: Implement and manage training, equipping, protective measures, and exercising for the safe application of CBRN/TIM containment packaging/systems and other alternatives for exposed/contaminated remains.

- 17. Deficiency:** Air transport is limited to tactical rotary-wing as a last resort. Tactical and strategic fixed-wing is generally not considered an acceptable means of transport. These are due to concerns about asset contamination.

**Partial Non-Materiel Solutions:** *Doctrine*: Include the application of CBRN/TIM containment packaging/systems designed for exposed/contaminated remains (as well as other alternative methods to preclude secondary exposure/contamination of resources) in doctrine, policy, and procedures. *Training*: Train, exercise, and evaluate the application of CBRN/TIM containment packaging/systems and other alternatives for exposed/contaminated remains to preclude secondary exposure/contamination of airframes and aircrew. *Leadership*: Implement and manage training, equipping, protective measures, and exercising for the safe application of CBRN/TIM containment packaging/systems and other alternatives for exposed/contaminated remains to preclude secondary exposure/contamination of airframe and aircrew.

**18. Deficiency:** Mortuary Affairs units/activities are not equipped and trained to operate and apply CBRN/TIM detection and monitoring devices other than standard individual warfighter detection devices (e.g., M9 paper, etc.).

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing CBRN/TIM detection and monitoring of human remains. *Training:* Establish CBRN/TIM detection/monitoring training, exercise, and evaluation criteria and programs for Mortuary Affairs and conduct training, exercises, and evaluations. *Leadership:* Implement and manage CBRN/TIM detection/monitoring training, equipping, and protection of Mortuary Affairs personnel.

**19. Deficiency:** Protective containment systems are inadequate or nonexistent.

**Partial Non-Materiel Solutions:** *Doctrine:* Include the application of CBRN/TIM containment packaging/systems and other alternatives designed for exposed/contaminated remains in doctrine, policy, and procedures. *Training:* Train, exercise, and evaluate the application of CBRN/TIM containment packaging/systems and other alternatives for exposed/contaminated remains. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe application of CBRN/TIM containment packaging/systems for exposed/contaminated remains.

**20. Deficiency:** DOTMLPF is inadequate for the containment and transport of contaminated remains for final internment outside the AOR.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing the safe handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM exposed/contaminated casualties. *Organization:* Organization structures, resources, taskings, and trained staff availability to enable and support the safe handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM exposed/contaminated casualties. *Training:* Develop institutional and unit-level training for the safe handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM exposed/contaminated casualties. *Leadership:* Recognize importance of the safe handling, preparation, transport, protective measures, mortuary activities, storage, and final disposition of CBRN/TIM exposed/contaminated casualties and ensure personnel are properly equipped, adequately trained, fully comply with requirements, and are prepared and ready to perform the necessary tasks and activities. *Facilities:* Develop supporting infrastructure for the handling, movement, storage, and final disposition of exposed/contaminated remains resulting from a CBRN/TIM agent.

### 13.13.3.2 IMA Assessment Summary

Table 13.13-2 is a list of ideas for material approaches and a corresponding description of each idea. Approaches primarily focus on adapting current detectors and developing new detectors based on current and future threat agents. Table 13.13-3 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 13.13-2. TASHLD 13: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Assess CBRND material	Test and assess all CBRND material for protective abilities against future threat agents, including TIM.
Broad-application above-the-neck respiratory protection	Develop above-the-neck respiratory protection with broad application for the general population, including MWAs.
Chemical air generation	Integrated compounds within warfighter's IPE applying chemical reaction to generate oxygen without reliance upon external sources.
Chemical treatment	Develop solution for treatment of existing MOPP suit and other warfighter clothing fabric that neutralizes or block the effect of CBRN/TIM agents, including future agents.
Combinatorial prophylaxes	Develop prophylaxes affording protection or minimizing the impact from a broad range of CBRN/TIM agents.
Contaminated material/equipment protective packaging and containment systems	Investigate and develop CBRN/TIM protective packaging and containment systems for contamination/exposed material and equipment which must be stored, handled, and/or transported in a contaminated/exposed state.
Contaminated remains containment systems	Investigate and develop sealable containment system for CBRN/TIM remains permitting their safe handling, storage, transport, and internment by unprotected personnel and equipment.
COTS CBRND IPE materiel for MWD protection	Adapt COTS protective equipment, where necessary and desirable, for CBRND of MWDs.
COTS sample containers and equipment	Adapt/modify (as necessary) COTS sample containers and equipment for the containment of CBRN/TIM samples and material for their safe handling, storage, and transport.
Current prophylaxes	There currently exists a variety of prophylaxes used for protection against CBRN. FDA testing and necessary modifications of prophylactics must be made to obtain FDA approval. Review available medical material and prophylaxes for application to high-risk TIMs.
Develop and establish generic unit CBRND kits	Develop, preposition, and maintain reserve stocks of generic CBRND kits for a standard unit. Components are adjusted as necessary for specific operations involving threat.
Develop CBRN/TIM samples and material containment packaging/systems	Investigate and develop CBRN/TIM containment packaging and systems for the safe containment, handling, storage, and transport of CBRN/TIM samples and material.
Disposable COLPRO	Develop one-time-use COLPRO that is rapidly erected with little instruction, training, and effort and affords term protection for critical activities and functions, maintenance and repair activities, prelocated consumables, as well as personnel associated with this task.

Disposable IPE	Develop low-cost disposable IPE providing protection for transport aircrew members and/or determine available COTS protection to support air operations in a contaminated environment or while carrying contaminated cargo.
Field-expedient COLPRO kits	Develop field-expedient COLPRO kits designed to adapt existing structures, tentage, etc., for the expansion of COLPRO field capabilities and mission support and the provision of collective protection to the force, critical functions and activities, maintenance and repair activities and functions, resources, etc.
Field-expedient COLPRO materials	Identify commonly available materials (duct tape, plastic sheeting, wooden crate, plywood, tarps, coverings, wraps, caulk, sealant gels/sprays, etc.) for application in the construction of expedient COLPRO needed to construct field-expedient COLPRO when COLPRO availability is limited or not advantageous.
Filtration system lowering inhalation pressure requirement	Improve current mask systems by reducing the inhalation effort required. Options may include air streaming into the mask from a contained system that either has a stored supply or generates air flow.
Future prophylaxes	Some preexposure prophylaxes for biological agents require several administrations, immunity attainment is time-consuming, or the period of coverage does not address the full operational period. Future prophylaxes should provide immunity against all known threat CBRN and high-risk TIM agents, as well as potential future threat agents, and be FDA approved. CBRND medical countermeasures are needed providing a sustained level of protection over an extended period of time (minimally the operational period), do not require multiple administrations, are easily disseminated and administered, support a minimum level of protection, protect against a broad range of agents, cover the range of pre- to post-exposure/presymptomatic application needs, and are applicable to the protected population (including eligible civilians).
GOTS CBRND IPE materiel for MWD protection	Adapt existing GOTS CBRND materiel (e.g., PPW, etc.) for application to CBRND of MWDs.
Improved IPE garments and accessories	Develop new generation of IPE garments and accessories (e.g., boots/boot covers, gloves, hoods, etc.) using modern materials permitting greater range of motion, longer wear without performance degradation, increased durability, integrated into warfighter personal equipment, and protects against all threat CBRN and high-risk TIM agents.
Integrate CBRN/TIM protective features into functional garments	Develop materials integrating CBRN/TIM protective capabilities and design standard functional garments using these materials for protection of the force.

Integrated mobile COLPRO	Develop warfighting platforms (air, land, and sea) with COLPRO that is an integral part of the operational system and protects against current and future/advanced agents.
MWA prophylaxes	Develop or adapt CBRND medical countermeasures and Veterinary Medicine for preexposure and post-exposure/presymptomatic protection of MWD from CBRN/TIM. Develop topical that is easy to apply and provides shielding from CBRN/TIM, preventing agent absorption through hair or skin.
Prepositioned/reserve CBRN medical resources	Establish and maintain sufficient stocks of prepositioned and reserve CBRND medical resources identified in plans and required to support multiple operations with threat and ensure availability for expeditious movement to the and within the AO in the event of a CBRN event.
Prophylactic administration to diverse groups	Prophylaxes address dosage range for eligible civilians (e.g., children, elderly, overweight, underweight subjects, etc.). Stabilize prophylactic effects over a wide range of dosages to address diverse applications of targeted populations.
Rebreathing	Closed circuit mechanism to permit an individual's exhaled air to be filtered, CO <sub>2</sub> removed and recirculated for breathing, allowing user to make use of all available oxygen in a closed environment.
Regenerative filtration	CBRN regenerative filters able to flush retained agent, neutralize agent, or by other inherent means affords extended period of protection.
Respiratory protection for MWAs	Modify existing technology for application by MWAs to provide some protection from CBRN/TIM. Specific masks would be desirable that are comparable to the human form factor.
Topical	Develop topical barrier that is easily applied (i.e., spray), acts as a contact hazard barrier, and affords protection from CBRN/TIM.

**13.14 Task TASHLD 14: Ensure containment of samples and residues to prevent spread of contamination****13.14.1 Functional Area Analysis****13.14.1.1 Definition**

Provides safe, efficient, and consistent collection and handling of all CBRN/TIM samples, including those taken from personnel and MWAs following exposure. Samples and residues must be identified, marked, segregated, transported, and handled to ensure no contamination is inadvertently spread.

**13.14.1.2 Derivation**

*Joint Enabling Concept for CBRN Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (TA 7, TA 7.1).*

**13.14.1.2.1 Supported Task: N/A****13.14.1.2.2 Lateral Task: TASHA 24****13.14.1.2.3 Supporting Task: N/A****13.14.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Undeveloped to highly developed land. (C1.1.1)
2. Riverine to open sea. (C1.2)
3. Natural and induced air. (C1.3)
4. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Partially completed mission preparation. (C2.1.3)
2. Marginal forces. (C2.2)
3. Marginal to adequate forces allocated. (C2.2.3)
4. Negligible personnel experience. (C2.2.4.5)
5. Limited staff expertise. (C2.3.1.3)
6. Limited deployed supplies. (C2.8.2)
7. No prepositioned materiel. (C2.8.4)

Civil. N/A

## 13.14.2 Functional Needs Analysis

### 13.14.2.1 Capability and Deficiency Assessment Summary

This task deals with ensuring the containment of samples and residues to prevent the spread of contamination. It is concerned with the safe, efficient, and consistent collection and handling of all CBRN/TIM samples. The overall capabilities for current, near/mid, and far term are rated “yellow.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

#### Current Capability and Deficiency

Selected specialized functions and activities exist and are trained, equipped, and prepared to perform these activities. They include field laboratory and medical services personnel, among others. Specialized containment systems for the movement of hazardous samples and residues for these functions and activities exist. However, these systems and materials are not available to the force for application to reduce the potential for secondary exposure/contamination resulting from retained contaminated assets or for the collection and transport of directed samples and residues. This task covers the full spectrum of protective requirements of personnel and resources involved in the collection, handling, storage, processing, and transport of potentially contaminated/infectious samples and residues. Services currently field a variety of CBRND assets providing respiratory/ocular and percutaneous protection. This diversity of assets complicates the logistical support of operations with threat for joint operations. The assets protect against known chemical and biological warfare agents and particulate radiologicals. Protection is afforded to a select number of TIMs. Existing Service-specific IPE is limited on the period and scope of protection afforded the warfighter. Physiological and psychological encumbrances increase with prolonged wear. This tendency requires regular exercising and wear to acclimate and adjust the wearer to enable performance of assigned functions and activities. Medical barrier impermeable barrier protective assets may also be applied by Medical Services practitioners potentially at-risk for contact with fluids. COTS assets may be applied meeting requirements for the protection of personnel performing the handling and processing of high-risk samples and materials. Medical prophylaxes do exist for the protection of the warfighter against a limited number of biological and chemical agents. However, few are FDA approved. A number possess IND authorization for application. Medications are considered for their potential prophylactic value, but are not always approved for this purpose by the FDA. Not all threat CBRN agents are addressed by CBRND medical countermeasures. Efficacy, time to achieve a level of protection, and the number of administrations vary between prophylaxes. COTS protective assets are applied for selected eligible civilians such as hazardous materials, firefighters, EMS, etc. However, eligible civilians and MWAs are not adequately addressed by DOTLPF for CBRND. Clear DOTLPF addressing the provisioning and training of eligible civilians with CBRND is inadequate. MWAs are not afforded protection against the effects of CBRN/TIM agents. MOPP DOTLPF is adequate for military personnel and operations. The establishment of adjustable MOPP levels, reflective of local operations and threat, are well

defined, as are continuing evaluation for change/adjustments. However, operations increasingly involve U.S. and non-U.S. civilians. MOPP DOTLPF does not adequately address their presence and inclusion into MOPP methodologies and levels, particularly when these personnel may (or may not) be equipped with nonstandard IPE. DOTLPF does support the general movement and transport of hazardous materials within the logistics system. DOTLPF incorporates requirements detailed by the U.S. Department of Transportation (DOT), OSHA, and CDC regulations and requirements. The correct packaging, containment, marking, and identification are dependent upon notification and initial material/sample packaging/containment, marking, and identification actions by the preparing activity. These personnel may, or may not, be trained in required packaging, containment, handling, marking, and identification of collected material and samples. DOTLPF incorporates requirements detailed by DOT, OSHA, and CDC regulations and requirements. However, only primary duty personnel performing these functions are trained, knowledgeable, and able to apply the standards. Primary duty personnel whose field does not include these tasks in their specialty description may not be trained to perform these functions. Training to recognize a potential hazard through identification of standard markings is not provided to the general force. Training of augmentation and additional duty personnel to accomplish these tasks is generally minimal and inadequate.

### **Projected Near/Mid-Term Capability and Deficiency**

Future configurations focus on reducing psychological and physiological stresses associated with the wearing of IPE, as well as striving for commonality of form factor among all services to reducing the logistics burden, development cost, and improved availability. The JPACE, JSLIST, JSAM, and JSGPM are projected to be initially fielded during the mid term. The JSLIST is under review for NIOSH certification for compliance with OSHA protective standards. The certification will permit application of the garment for AT/FP installation activities within CONUS and selected OCONUS. The possibility exists for potential application by requiring eligible civilians. Legacy Service-specific IPE will remain in the inventory throughout the mid term and into the far term during the transition to the joint IPE systems. Ongoing R&D into medical prophylaxes will provide additional prophylactic measures but still fail to address all threat CBRN agents and high-threat/high risk TIMs (particularly TICs). Otherwise, changes from current capabilities and deficiencies are not projected.

### **Projected Far-Term Capability and Deficiency**

Future configurations focus upon reducing psychological and physiological stresses associated with the wearing of IPE, as well as striving for commonality of form factor among all Services. The standardization of CBRND respiratory/ocular and percutaneous protection which will reduce the logistics burden and development cost and subsequently improve availability. Legacy Service-specific IPE will continue to be replaced by the joint systems of CBRND protective equipment until fielding is complete to all Service units, including Guard and Reserve, early in the far term. Next-generation IPE assets are in R&D and are expected to be fielded sometime in the far term. However, specifics of design, characteristics, and protective capabilities are not as yet determined for these systems. Continued R&D into potential medical prophylaxes may result in additional protective measures for the force. However, specifics are unknown at this time. Additional changes in capabilities from the mid term are not projected.

### 13.14.2.2 Resource Systems

#### Individual Protection

##### 1. Respiratory/Ocular Protection:

**COTS:** Commercially available systems of protection, manufactured and tested meeting OSHA standards for the United States or equivalent organization in other nations.

**M17 Series Masks w/M13 Series Filters:** Obsolete warfighter system of protection. Retained in selected HTAs for NEO application. Designed for adults.

**MBU-19/P Chemical-Biological Aircrew Eye/Respiratory Protection (AERP):** USAF combat aircrew protection. Includes protective hood, MBU-12/P mask, C-2 canister, intercom for ground communications, and blower assembly.

**A/P22P-14(V) Respirator Assembly:** USN/USMC system for rotary-wing (Version 1 for USN) and fixed-wing (Versions 2–4 for USN/USMC) aircrews. Includes CB filter, dual air/oxygen supply, and crossover manifold for dual protective capabilities in air or on ground. Version 1 is not compatible with aircraft oxygen supply systems; Version 2 applied to EA-6B and F18A airframes; Version 3 to AV-8B and F-18C/D aircraft; and Version 4 is used for C-130 airframes.

**M40/M42 CB Protective Mask:** U.S. Army mask system designed for military standard profile and uses standard C-2 canister. M42 integrates with combat vehicle clean air supply system and has a connectable dynamic microphone for combat vehicle intercom system.

**M43 CB Aircraft Mask:** U.S. Army aircrew system, is a stand-alone portable system, and uses motor blower unit with C-2 filter.

**M45 Aircrew Aviator Mask:** Replaces M42 and M49 systems for U.S. Army. Available with a canister-compatible hose assembly and a valve cassette that enables use of supplied air (from aircraft, SCBA or PAPR). The M45 is used by military personnel who cannot fit the M40A1, M42A2, or MCU-2/P masks.

**M48 CB Apache Aviator Mask:** Used by Apache aviator and flight support personnel. Replaces M43 Type 1 mask system and uses blower assembly with C-2 filter canister.

**MCU-2A/P:** Mainstay USAF and USN system for nonaviator personnel and aircrew personnel not performing flight operations, except for aircrew personnel not issued aviator systems and noncombat platforms/airframes without clean air supply systems. Applies C-2 filter for filter air.

**Joint Service Aviator Mask (JSAM):** Initial fielding projected in the mid term replacing Service-specific aviator respiratory/ocular protective systems. Provides CBRN protection under high-G conditions, compatible with existing and projected aviator CBRN IPE, flame and thermal protective, reduces stress associated with existing aviator IPE, and may be donned/doffed during flight.

**Joint Service General Purpose Mask (JSGPM):** Initial fielding projected in the mid term replacing Service-specific standard respiratory/ocular protective systems. Provides respiratory/ocular protection from CBRN agents and selected TIMs. Improves field-of-vision and encumbrances associated with existing Service systems.

**Joint Service Chemical Environment Survival Mask (JCESM):** COTS one-time use, one-size-fits-all, respiratory/ocular protective system affording two hours of protection in low-level CBRN vapor, aerosol, and particulate environments. Selected force element application only.

## 2. Percutaneous Protection:

**COTS:** Commercially available systems of protection, manufactured and tested meeting OSHA standards for the United States or equivalent organization in other nations.

**Battle Dress Overgarment (BDO):** U.S. Army/USAF two-piece camouflage-patterned garment (top and trousers) providing 24-hour protection against CBRN agents in vapor, liquid, droplet, and particulate forms.

**Saratoga:** USMC two-piece camouflage-patterned garment (top and trousers) providing 24-hour protection against CBRN agents in vapor, liquid, droplet, and particulate forms. Launderable for hygiene.

**CPOG:** Legacy two-piece green garment currently in use with USN providing limited-term protection against CBRN agents in vapor, liquid, droplet, and particulate forms.

**Chemical Protective Undergarment (CPU):** Worn under standard IPE as additional layer of protection against contact with CBRN agents.

**CWU-66/P:** One-piece USAF green flightsuit providing 24-hour protection against CBRN agents in vapor, liquid, droplet, and particulate forms. Available in tan as CWU-77/P flightsuit.

**Disposal Aircrew Protective Cape:** Transparent disposable cape covering head and shoulders of aviator during periods between aircraft mounting/dismounting and shelter.

**BVO/GVO:** Vinyl overboots (VO) worn over wearer's standard footwear and protects against contact with CBRN agents. Available in black (BVO) and green (GVO).

**Chemical Protective Footwear Cover (CPFC):** Legacy system of CBRN protective footwear cover in use by USN. Requires wearer to pull protective sole tabs up and wrap/tie laces around cover to secure over footwear.

**Disposable Aircrew Footwear Cover:** Transparent disposable footwear covers worn over aviator footwear to protect aviator during periods between aircraft mounting/dismounting and shelter.

**Chemical Protective Glove (CPG):** Standard CBRN protective glove. Available in 7-, 14-, and 25-mil thicknesses addressing functional requirements for durability, dexterity, and tactile sensitivity.

**Disposable Aircrew Hand Protection:** Transparent disposable hand coverings applied by USAF, USN, and USMC over aviator gloves during periods between aircraft mounting/dismounting and shelter. Also applied as between aviator inner and outer gloves enabling essential functional requirements for dexterity and tactile sensitivity.

**Chemical Protective Helmet System (CPHS):** CBRN protective camouflage-patterned helmet cover to protect helmet from contact with CBRN contaminants.

**SCALP:** Disposable, lightweight, impermeable overgarment designed for wear over IPE for additional protection in grossly contaminated environments. Applied by personnel required to leave protective sheltering in these environments to perform mission-critical tasks. Also applied by decontamination units/teams and medical personnel performing decontamination or potentially at risk for prolonged contact with liquids.

**Wet-Weather Gear: Includes Severe-Weather Gear (USN).** Provides barrier against contact with liquids potentially damaging to protective abilities of IPE.

**M-2 Apron:** Butyl rubber-coated sleeved apron worn over IPE and applied by decontamination units/teams and other designated personnel performing decontamination or potentially at risk for contact with liquids. Provides barrier against contact with liquids potentially damaging to protective abilities of IPE. Can be decontaminated.

**Joint Service Lightweight Integrated Suit Technology (JSLIST):** Two-piece (jacket and trousers) CBRN risk-taking protective garment with integrated hood. Affords protection against selected TIM agents. Reduces physiological and psychological encumbrances associated with existing Service-specific systems it replaces with initial fielding in the mid term. Under review for NIOSH certification for OSHA protection standards.

**Joint Protective Aircrew Ensemble (JPACE):** CBRN protective aviator flightsuit projected for initial fielding in the mid term and replacing Service-specific CBRN protective flightsuits. Provides JSLIST equivalent protection and provides protection when subject to rotor, propeller, and jetwash. Flame-retardant and self-extinguishing properties. Supports escape and evasion requirements.

**Joint Block I/II Glove Upgrade (JB1/2GU):** Projected fielding in near mid term replacing CPG for designated force elements requiring increased tactility/durability for mission performance. Various configurations under consideration.

**Joint Firefighter Integrated Response Ensemble (JFIRE):** Incorporates JSLIST into firefighter bunker gear, permitting firefighters to conduct firefighting operations within a CBRN/TIM environment.

**Multi-purpose Overboot (MULO):** Projected initial fielding in mid term and replacing legacy CBRN footwear covers.

### 3. Medical Protection:

**Vaccines:** Immunizations providing a level of acquired immunity against the effects of CBRN agents.

**Topicals:** Protective barrier products applied to the skin to enhance protection of wear against contact with CBRN/TIM agents. Includes both inert and reactive materials.

**Medications:** Medical materials taken to mitigate or prevent the effects of exposure to CBRN/TIM agents. Includes medications taken routinely or upon exposure (but prior to symptom display) to build resistance/immunity or to mitigate/resolve medical impacts of CBRN/TIM agent exposure/contamination.

**MOPP Methodology:** Stepped level of CBRND protective measures. Standardized levels permit the rapid increase or decrease of unit MOPP level.

**Unit Staff:** The application of DOTLPF for all phases of operations with threat from preplanning to post-force return to home stations. Includes all aspects of C2 and supporting staff activities/functions (e.g., logistics, intelligence, etc.) enabling mission and task accomplishment.

M1	Forces are trained on hazards associated with CBRN/TIM samples and materials.	<p><b>8–10:</b> Forces are trained on the application of protective barrier materials and assets, identification and marking, associated hazards, and the safe handling and transport of CBRN/TIM samples and material.</p> <p><b>4–7:</b> Personnel assigned specific functions are trained on the application of protective barrier materials and assets, identification and marking, associated hazards, and the safe handling and transport of CBRN/TIM samples and material.</p> <p><b>1–3:</b> Primary duty personnel assigned specific functions are trained on the application of protective barrier materials and assets, identification and marking, associated hazards, and the safe handling and transport of CBRN/TIM samples and material.</p> <p><b>0:</b> Personnel are not trained on the application of protective barrier materials and assets, identification and marking, associated hazards, and the safe handling and transport of CBRN/TIM samples and material.</p>
M2	Specific designated personnel/teams are trained to handle samples.	<p><b>8–10:</b> Force activities and functions with responsibilities to prepare, store, handle, transport, or in any manner may be in proximity to or contact with CBRN/TIM samples and materials (contained and uncontained) maintain designated and fully trained, equipped, and prepared teams/personnel for the safe conduct of their responsibilities and duties.</p> <p><b>4–7:</b> Force activities and functions with responsibilities to prepare, store, handle, transport, or in any manner may be in proximity to or contact with CBRN/TIM samples and materials (contained and uncontained) maintain designated, trained, and equipped teams/personnel for the safe conduct of their responsibilities and duties</p> <p><b>1–3:</b> Force activities and functions with responsibilities to prepare, store, handle, transport, or in any manner may be in proximity to or contact with CBRN/TIM samples and materials (contained and uncontained) maintain designated trained individuals with augmenting unit personnel drawn upon need, and equipment for the accomplishment of essential related activities.</p> <p><b>0:</b> Force activities and functions possessing the potential for contact with or proximity to CBRN/TIM samples and materials (contained and uncontained) do not maintain trained designated personnel and equipment for the safe accomplishment of their tasks.</p>
M3	CBRN/TIM protective packaging materials (e.g., wraps, envelopes, bags, etc.) are available to wrap or otherwise contain CBRN/TIM samples and materials to prevent secondary contamination/exposure.	<p><b>8–10:</b> Adequate types and quantities of effective CBRN/TIM material protective packaging and containment resources are readily available to the force for the packaging and containment of CBRN/TIM samples and materials and to preclude the potential for secondary contamination/exposure of handling, storing, and transporting resources/activities.</p> <p><b>4–7:</b> CBRN/TIM material protective packaging and containment resources are readily available to selected force elements for the packaging and containment of CBRN/TIM samples and materials to prevent secondary contamination/exposure of handling and transporting resources/activities.</p> <p><b>1–3:</b> Selected force elements possess access to CBRN/TIM material protective packaging and containment resources for CBRN/TIM samples and materials reducing the potential for secondary contamination/exposure of handling and transporting resources/activities.</p> <p><b>0:</b> CBRN/TIM material protective packaging and containment resources do not exist for the safe handling and transport of CBRN/TIM samples and materials.</p>

M4	Procedures detail the handling and processing of CBRN/TIM samples and materials.	<p><b>8–10:</b> Doctrine, policy, procedures, TTPs, and processes provide detailed requirements and guidance for the identification, accounting, packaging, containment, monitoring, protective equipment, and associated actions for the safe handling and processing of CBRN/TIM samples and materials.</p> <p><b>4–7:</b> Doctrine, policy, procedures, TTPs, and processes provide general requirements and guidance for the identification, accounting, packaging, containment, monitoring, protective equipment, and associated actions for the safe handling and processing of CBRN/TIM samples and materials.</p> <p><b>1–3:</b> Doctrine, policy, procedures, TTPs, and processes provide limited guidance for the identification, accounting, packaging, containment, monitoring, protective equipment, and associated actions for the safe handling and processing of CBRN/TIM samples and materials.</p> <p><b>0:</b> Doctrine, policy, procedures, TTPs, and processes do not address the identification, accounting, packaging, containment, monitoring, protective equipment, and associated actions for the safe handling and processing of CBRN/TIM samples and materials.</p>
M5	CBRN/TIM protective packages and containers are available to safely package and contain CBRN/TIM samples and materials for safe handling and transport.	<p><b>8–10:</b> CBRN/TIM protective barrier movement and storage materials (e.g., packaging, containers, etc.) are readily available for the safe movement of hazardous or contaminated material and samples.</p> <p><b>4–7:</b> CBRN/TIM protective barrier movement and storage materials (e.g., packaging, containers, etc.) are available for the movement of selected material and samples.</p> <p><b>1–3:</b> Limited CBRN/TIM protective barrier and storage materials (e.g., packaging, containers, etc.) are available for the movement of specific material and samples.</p> <p><b>0:</b> CBRN/TIM protective barrier and storage materials (e.g., packaging, containers, etc.) are nonexistent.</p>
M6	There is effective DOTMLPF in place to conduct task.	<p><b>8–10:</b> DOTMLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations.</p> <p><b>4–7:</b> Most critical aspects of DOTMLPF for this task are addressed. Task can be performed with limitations requiring work-arounds.</p> <p><b>1–3:</b> DOTMLPF is inadequate for accomplishment of this task.</p> <p><b>0:</b> DOTMLPF does not exist for this task.</p>

<sup>1</sup> CBRND IPE is currently Service-specific. Respiratory/ocular protection is diverse across the Services and performed functions. USAF combat aircrews conduction operations within a CBRN environment are equipped with the MBU-19/P Chemical-Biological AERP that includes protective hood, MBU-12/P mask, C-2 filter canister, an intercom for ground communications, and a blower assembly. The AERP provides protection whether or not supplemental oxygen is present. USN and USMC aviators use the A/P22P-14(V) Respirator Assembly that is a self-contained protective system deployed for rotary-wing (Version 1 for USN) and fixed-wing (Versions 2–4 for USN and USMC) aircrews. The system incorporates a CB filter, dual air/oxygen supply, and a crossover manifold with dual protective capabilities for flight and ground protection. The A/P 22P-14(V) 1 is not compatible with aircraft with oxygen delivery systems and supports helicopter crew use. Version 2 is used for the EA-6B and F-18A, Version 3 for AV-8B and F-18C/D, and Version 4 is applied for C-130 aircrews. The M17 series mask is obsolete and is relegated to NEO support in selected HTAs. The mask is designed for the military standard profile (ground) and does not adequately protect all potential nonmilitary populace members, for which is retained. The M40/M42 CB Protective Mask is in service with the U.S. Army. The mask uses the C-2 canister for filtration of CBRN contaminants. The M42 integrates with combat vehicle filtration protection system and has a dynamic microphone with cable for connection to vehicle communications systems. The M43 CB Aircraft Mask is applied by U.S. Army aircrew members and applies a motor blower unit with C-2 canister for filtration. The system is a stand-alone system that accompanies the user. The M45 Aircrew Aviator Mask replaced the U.S. Army M43 Type II and M49 Mask Systems. The system uses a low-profile canister compatible hose assembly for both hose and face-mounted configurations. The mask system incorporates selectable filtration for support both during aircraft systems activation and using the connectable filter pack. The mask also is applied to personnel who cannot be fitted with the standard M40A1, M42A2, or MCU-2A/P masks. The M48 CB Apache Aviator Mask protects AH-64 Apache helicopter aviators and flight support personnel. The blower assembly uses the C-2 filter canister to provide filtered, breathable air. The M-48 replaces the M43 Type 1 mask. The MCU-2A/P is the mainstay USAF and USN mask employed by personnel not equipped with aircrew

masks and by aircrew when not performing flight operations. The MCU-2A/P is also used by aircrew during flight operations who are not equipped with aircrew masks. COTS equipment meeting OSHA requirements (and NFPA for firefighters) is applied by selected civilian personnel performing specific functions such as firefighting, EMS, hazardous materials, etc. Limited quantities of COTS may be available within HTAs for known NEO requirements for the protection of populace members unable to wear the M17 series or standard warfighter respiratory/ocular protective devices. MWAs are not afforded respiratory/ocular protection.

<sup>2</sup> COTS assets may be applied meeting requirements for the protection of personnel performing the handling and processing of high-risk samples and materials.

<sup>3</sup> DOTLPF does adequately address the requirement for individual protection (including application of CBRN medical prophylaxis when appropriate and available) whenever there is a potential for secondary exposure or contamination. DOTLPF does address, for select specialized functions and activities, the application of specialized COTS individual protection when handling and preparing certain high-risk category samples and materials. However, DOTLPF is inadequate for the protective packaging and containment systems for enclosing and containing potential hazards associated with the contained samples and material throughout the line of communications process (includes handling, storing, transporting, etc.).

<sup>4</sup> Service-specific CBRND percutaneous protection is currently applied for the protection of the force. The BDO, used by the USAF and U.S. Army, is a two-piece garment providing protection for a 24-hour period against chemical agent vapors, liquids, and droplets; biological agents and toxins and contact with radioactive particles. The BDO's protective abilities are lost if the suit is torn, ripped, splashed with POL, or is saturated with water and is designed for a one-time use and is worn by ground and most flight personnel (non-high-performance aircraft). The USMC uses the Saratoga COLPRO suit similar in design to the BDO, but launderable for personnel hygiene. The CPOG is a legacy two-piece garment for protection against CBRN agents. The CPOG is in use with the USN. The CPU is designed to provide an additional layer of protection for the warfighter and is worn under standard IPE. The USAF CWU-66/P (and 77/P) is a one-piece flightsuit providing protection for a 24-hour period against standard CBRN agents and is designed for compatibility with aircrew lift support equipment. The USN, USAF, and USMC use the disposable aircrew protective cape to protect aircrew between sheltering and the combat aircraft. The cape drapes over the wearer and is removed during entry into the aircraft to prevent transfer of contamination into the aircraft interior. The BVO/GVO overboots are applied over the wearer's standard footwear to protect against contact with CBRND. The USN uses the CPFC, commonly called the "fishtail" for its design, to protect the wearer's footwear. The CPFC, considered obsolete, does provide a measure of antislip protection shipboard. The disposable aircrew boot cover is worn by USAF, USN, and USMC aviators over aircrew footwear while en route and mounting combat aircraft. The covers are removed during aircraft entry and are designed to prevent contamination transfer into the aircraft. Hand protection is provided by the CPG in 7-, 14-, and 25-mil thicknesses to meet warfighter hand protection and dexterity needs. Disposable aircrew hand protection is applied by the USAF, USMC, and USN for aviators over their gloves (and may be worn between glove layers for additional protection) during movement between shelter and aircraft. When used as an overglove, the gloves are removed during aircraft mounting during aircraft entry to preclude the potential for transfer of contamination into the aircraft interior. Medical Services practitioners performing treatment The CPHS is designed to prevent contact of the warfighter's helmet with liquid contamination which may be absorbed, impact helmet integrity, and/or constitute a potential secondary hazard to the wearer. SCALP provides a disposable, lightweight, impermeable layer of protection for personnel against gross liquid contamination and is worn over the warfighter's protective ensemble. SCALP is commonly applied to protect armor and EOD personnel who may be required to leave sheltering to perform duties and functions. SCALP is also applied by units performing decontamination operations where personnel may become soaked by decontaminants and Medical Services personnel with potential for prolonged contact with body fluids. Standard wet-weather gear (e.g., poncho, rain parka, rain suit, etc.) is also applied as a barrier against saturation of the warfighter's protective ensemble by contact with liquids such as rain, sea spray, etc. The M-2 apron is applied by personnel performing decontamination aprons and is worn over the ensemble. The apron is full length and sleeve to maximize coverage, although the back is open. COTS assets meeting OSHA requirements (and NFPA for firefighters) is applied by selected civilian personnel performing specific functions such as firefighting, EMS, hazardous materials, etc. Medical barrier impermeable barrier protective assets may also be applied by Medical Services practitioners potentially at risk for contact with fluids.

<sup>5</sup> COTS assets may be applied for the containment of these samples for shipment. However, these are not identified for use by other than specialized functions and teams. Otherwise, containment and packaging systems to preclude the potential for secondary exposure/contamination of resources are not addressed in DOTLPF and are not identified and available for force use.

<sup>6</sup> Forces are not protected against all identified threat CBRN/TIM capabilities. Medical prophylaxis does not exist for all threat CBRN/TIM agents. Current prophylaxis and supporting doctrine, policy, and procedures do not address presymptomatic medical CBRND protective countermeasures by other than U.S. forces, excluding MWAs and eligible civilians. Prophylaxis against most high-threat TIMs are not currently available due to the relatively recent consideration of these agents as a potential threat. Additionally, the efficacy of existing prophylaxis, particularly vaccines, widely varies. Military personnel are administered and/or issued CBRND medical countermeasures for operations with threat. Vaccines for selected biological agents, topicals, and preexposure and/or post-exposure/presymptomatic medications are applied to mitigate or preclude the effects of specific CBRN/TIM agents. Currently, preexposure prophylaxis is available for nerve agents (G and V series), and vesicants (H, HD, HN, L, CX), topical only. SERPACWA is the preexposure countermeasure for vesicants and one nerve agent. TSP is approved by the FDA as a supplement for SERPACWA. Post-exposure prophylaxis is available for

pulmonary (CG) agent, but is not FDA approved. Radioprotective steroids and neutraceuticals may be effective as pre- and post-exposure prophylactics. 5-androstenediol is an IND preexposure treatment for radiological exposure. Iodide/potassium iodide is FDA approved for application against Iodine 131, 132, 134, and 135. Post-exposure radiological exposure prophylaxis consists of neutraceuticals, plant isoflavone genistein, and alpha tocopherol (Vitamin E) but are not approved by the FDA for prophylaxis against radiation. FDA-approved preexposure medical countermeasures are available for anthrax, cholera, HFRS (Haantan), Rift Valley fever, yellow fever, HFRS (Haantan), and smallpox. IND status vaccines are currently available for Q-fever, tularemia (although use has been placed on hold by the FDA), Botulinum, Junin hemorrhagic fever, and VEE/WEE/EEE. Antiviral/bacterial medications may be administered and/or issued to provide a level of protection against biological agents. Medical prophylaxes are developed for the military force. Prophylaxes for MWAs are virtually nonexistent. Prophylaxis for eligible civilians is not addressed. Availability of prophylaxis is questionable for issue and administration to eligible civilians. The issue and administration of prophylaxis to eligible civilians requires review due to questions regarding applicability to the range of body types, ages, and physical/medical factors inherent within a potential population, as well as long-term health issues and legal implications.

<sup>7</sup> DOTLPP incorporate MOPP levels, methodologies, and requirements and require levels of protection readiness based upon the potential for exposure/contamination (including secondary). Full protection is required in the presence of contamination. This includes protective measures and the wear of protective equipment when the possibility exists for secondary exposure/contamination to personnel and equipment, such as the processing, handling, and movement of CBRN/TIM samples and materials. MOPP levels and methodologies are generally considered to apply to equipped nonmilitary personnel. Nonmilitary personnel often perform tasks associated with these activities. DOTLPP does not address the application of MOPP to nonmilitary personnel.

<sup>8</sup> Specialized activities, including medical, are identified for the collection, handling, and processing of hazardous materials and samples. These include, but are not limited to, activities such as laboratory, hazardous materials, forensics, evidentiary, Technical Escort Units (TEUs), selected R&D, and similar designated functions and activities. Units with these responsibilities designate, train, and equip these functions and activities to perform their tasks. Planning, resource identification, preparations, and operations are performed by the responsible unit command/Medical Services staff for taskings related to operations with threat. DOTLPP for these specialized functions and activities is adequate to support their operations. Specific resources are applied and are often limited in availability and type. Medical Services DOTLPP provides specific instructions and detailed training for most activities, predominantly those performed routinely. However, other functions and activities potentially performing sample and detection activities, particularly those related to operations involving local events of a possible criminal nature or when directed by proper authorities, are often not prepared, trained, and equipped to perform these functions. DOTLPP does support the general movement and transport of hazardous materials within the logistics system. Training standards exist for primary duty personnel performing cargo movement activities. However, primary packaging and safe containment of hazardous material and samples is the responsibility of the initiating activity (e.g., TEUs, Medical, CBRN/TIM survey and sampling, field laboratories, etc.). The correct packaging, containment, marking, and identification is dependent upon notification and initial material/sample packaging/containment, marking, and identification actions by the preparing activity. These personnel may or may not be trained in required packaging, containment, handling, marking, and identification of collected material and samples. DOTLPP incorporates requirements detailed by DOT, OSHA, and CDC regulations and requirements. However, only primary duty personnel performing these functions are trained, knowledgeable, and able to apply the standards. Primary duty personnel whose field does not include these tasks in their specialty description may not be trained to perform these functions. Specialized packaging and containment materials are generally available for designated specialized functions and activities whose primary function includes the preparation of these materials for safe handling and transport. These assets are specialized, limited in availability, and not generally available to other functions and activities with potential need. Training to recognize a potential hazard through identification of standard markings is not provided to the general force. Training of augmentation and additional duty personnel to accomplish these tasks is generally minimal and inadequate.

<sup>9</sup> Legacy systems will remain in the inventory throughout the mid term. These systems will be gradually replaced by new joint systems of respiratory/ocular protection as they are fielded. The JSAM replaces the Service-specific systems. When incorporated with anti-G protection of high-performance aircraft aviators, the JSAM will provide simultaneous CBRN and anti-G protection. The JSAM is compatible with existing and programmed CBRN IPE, provides flame and thermal protection, and reduces the heat stress associated with existing systems of ocular/respiratory protection. Further, the JSAM may be donned and doffed during flight. The JSGPM also replaces current Service-specific ocular/respiratory protection. The system provides respiratory and ocular protection from CBRN agents and selected TIMs. The field-of-vision is improved and encumbrances associated with legacy systems are reduced. The JSGPM incorporates state of the art technology and is designed to integrate with future warfighter CBRND IPE and function equipment/assets. The JCESM is a COTS one-time use, one-size-fits-all, respiratory/ocular protective system affording 2 hours of protection and is lightweight and disposable. The system is designed to provide low-level CBRN vapor, aerosol, and particulate protection to the wearer for egressing the contaminated environment. The JCESM is projected for use when standard respiratory/ocular protection is not practical. The JCESM is not programmed for general dissemination. The Guardian Program is projected to review, assess, and implement protection for critical members of the installation/facility populace during the mid term. This will predominantly be COTS-based assets for respiratory/ocular protection. However, the Guardian Program is not expected to address eligible civilian protection within the AO for other than existing U.S. military installations and facilities. MWA respiratory/ocular protection is not programmed or forecasted.

<sup>10</sup> Legacy systems will remain in the inventory throughout the mid term. These systems will be gradually replaced by new joint systems of percutaneous protection as they are fielded. The JSLIST NBC Protective Garment is a two-piece, risk-taking, overgarment with integrated hood affording protection against CBRN agents and selected TIMs. The garment reduces the physiological and psychological encumbrances associated with legacy systems. The JSLIST is under evaluation by NIOSH for application to OSHA protection requirements. The JPACE replaces the Service-specific systems. The JPACE provides aircrew members with equivalent protection to the JSLIST ensemble. The JPACE is designed to not interfere with emergency ejection from a combat aircraft and continues to provide CBRN percutaneous protection following ejection and during escape and evasion operations. The ensemble is both flame-retardant and self-extinguishing to permit emergency egress from a burning aircraft. Further, the ensemble provides CBRN protection when subject to rotor, propeller, and jet wash. Joint Service glove upgrades are provided under the Joint Block 1 and 2 Glove Upgrade Program (JB1/2GU) in the near and mid term. The JB1GU responds to an urgent need by designated elements of the force for increased tactility/durability supporting mission requirements. The JFIRE addresses protection of military firefighters within a CBRN/TIM environment conducting firefighting operations involving structural and crash/firefighting/rescue. The JFIRE incorporates the JSLIST into firefighter bunker gear. The JB1GU is expected to meet most of the requirements within the JSLIST ORD and is viewed as an evolutionary approach in the development of the JB2GU. Versions under consideration include a protective inner glove worn under existing warfighter gloves, a replacement glove for existing hand wear, or a combination of glove shell and liner affording CBRN protection of the legacy gloves they are projected to replace. The MULO is projected to replace legacy footwear covers. The ability of the MULO to provide adequate antislip protection for USN personnel asea is under review. The Guardian Program is projected to review, assess, and implement protection for critical members of the installation/facility populace during the mid term. This will predominantly be COTS-based assets for percutaneous protection. However, the Guardian Program is not expected to address eligible civilian protection within the AO for other than existing U.S. military installations and facilities. MWA percutaneous protection is not programmed or forecasted.

<sup>11</sup> Cell Culture Derived Vaccinia is projected for production during the near-term. Clostridium Botulinum Toxin Medical Defense System is projected for availability during the mid term for Serotypes A, B, C, E, and F. The SERPACWA Active TSP is also projected for production during the late mid term.

<sup>12</sup> The next-generation series of aviator and nonaviator masks is in R&D. The capabilities and fielding of these masks are not as yet determined.

<sup>13</sup> The next-generation series of aviator and nonaviator percutaneous protective assets are in R&D. The capabilities and fielding of these assets are not as yet determined.

<sup>14</sup> Active TSPs are projected for replacement of SERPACWA TSP and SERPACWA Active TSP in the far term. The Chemical Agent Prophylaxis and Cyanide Pretreatment are also projected for the far term. The Multivalent VEE Vaccine is projected to begin production in FY2013. The Next-Generation Anthrax Vaccine, Tularemia Vaccine, and Plague Vaccine are projected for production beginning in FY2010. Serotypes A and B are addressed in the Recombinant Bivalent Botulinum Vaccine projected for production in FY2012. A number of R&D efforts are under way for the development of preexposure and post-exposure prophylaxes. Potentially, these efforts may produce viable prophylaxes within the mid and far term resulting in fielded material. However, possible resulting prophylaxes cannot be predicted at this time.

### 13.14.3 Functional Solution Analysis

#### 13.14.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** CBRN/TIM protective packagings are limited or not identified for other than specialized functions.  
**Partial Non-Materiel Solutions:** *Doctrine:* Include the application of CBRN/TIM containment packaging/systems designed to contain contamination and prevent secondary exposure/contamination during handling, storage, and transport. *Organization:* Identify organizational resources and support requirements for the application of CBRN/TIM containment packaging/systems. *Training:* Train, exercise, and evaluate the application of CBRN/TIM containment packaging/systems. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe application of CBRN/TIM containment packaging/systems.
- 2. Deficiency:** Movement of CBRN/TIM contaminated material is generally limited initially to tactical ground transport. Air transport (tactical rotary-wing) is a last resort due to concerns about asset contamination. Tactical and strategic fixed-wing air transport is not considered an acceptable means of transport.  
**Partial Non-Materiel Solutions:** *Doctrine:* Include the application of CBRN/TIM containment packaging/systems and other alternative methods to preclude secondary exposure/contamination in doctrine, policy, and procedures. *Training:* Train, exercise, and evaluate the application of CBRN/TIM containment packaging/systems and other alternatives precluding secondary exposure/contamination. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe application of CBRN/TIM containment packaging/systems and other alternatives to contain contamination and preclude secondary exposure/contamination.
- 3. Deficiency:** CBRND protective equipment and measures do not protect against all CBRN/TIM agents.  
**Partial Non-Materiel Solutions:** *Doctrine:* Requirement for development of CBRND protective equipment and measures to protect against all CBRN/TIM agents, particularly high-risk/high-threat agents. *Leadership:* Enforce compliance with established standards (see Doctrine) for prophylactic CBRND protection.
- 4. Deficiency:** Medical prophylaxis does not exist for all threat CBRN/TIM and TIM agents.  
**Partial Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards for prophylactic CBRND protection against all threat agents. *Training:* Train, exercise, and evaluate personnel (military and eligible civilians) on the use of prophylactic CBRND protection against threat agents. *Leadership:* Enforce compliance with established standards (see Doctrine) for prophylactic CBRND protection. Implement and ensure training is adequate and conduct exercises and evaluations to ensure readiness.

- 5. Deficiency:** Current prophylaxes and supporting DOTLPF do not address presymptomatic medical CBRND protective countermeasures for eligible civilians and non-U.S. forces.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and TTPs guidance and instructions for the application of presymptomatic medical CBRND protective countermeasures for eligible civilians and non-U.S. forces. *Organization:* Ensure resources, taskings, and staff are in place or available to plan, disseminate/administer, and monitor presymptomatic medical CBRND protective countermeasures for eligible civilians and non-U.S. forces. *Training:* Train, potential eligible civilians and non-U.S. forces on presymptomatic medical CBRND protective countermeasures. *Leadership:* Recognize criticality of protection of eligible civilians and non-U.S. forces within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply force resources. *Facilities:* Develop supporting infrastructure to support presymptomatic medical CBRND protective countermeasures of eligible civilians and non-U.S. forces.
- 6. Deficiency:** Current prophylaxes and supporting DOTLPF do not address presymptomatic medical CBRND protective countermeasures for MWAs.  
**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and TTPs guidance and instructions for the application of presymptomatic medical CBRND protective countermeasures for MWAs. *Organization:* Ensure resources, taskings, and staff are in place or available to plan, disseminate/administer, and monitor presymptomatic medical CBRND protective countermeasures for MWAs. *Training:* Train potential MWA handlers on presymptomatic medical CBRND protective countermeasures. *Leadership:* Recognize criticality of protection of MWAs within a CBRN/TIM environment, training providing the skills to manage the force in these circumstances, and willingness and ability to implement necessary changes and activities to prepare and appropriately apply force resources. *Facilities:* Develop supporting infrastructure to support presymptomatic medical CBRND protective countermeasures of MWAs.
- 7. Deficiency:** Efficacy of existing prophylaxes varies widely.  
**Non-Materiel Solutions:** *Doctrine:* Establish overarching single common standard for prophylaxes efficacy.
- 8. Deficiency:** Not all prophylaxes are FDA approved.  
**Non-Materiel Solutions:** *Doctrine:* Require FDA approval of all prophylaxes, including medications potentially applied as prophylaxes. The latter requires specific approval as prophylactic treatment.
- 9. Deficiency:** Prophylaxis for MWA is virtually nonexistent.  
**Partial Non-Materiel Solutions:** *Doctrine:* Establish doctrine, policy, and procedures CBRND protection of MWAs, particularly MWDs, and training for CBRN/TIM environment survival. *Organization:* Ensure organizational consideration for maintenance and support of MWD CBRND protective equipment, measures, and activities. *Training:* Establish institutional and unit training of handlers and MWAs for CBRND measures and activities.

*Leadership:* Ensure awareness and planning for CBRND measures and requirements for MWA survivability. *Facilities:* Develop supporting infrastructure for MWA CBRND (e.g., logistics, veterinary surveillance, etc.).

**10. Deficiency:** Prophylaxis for eligible civilians is not addressed.

**Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures requirement to address the administration, provision, and application of medical CBRND protective countermeasures by other than U.S. forces (e.g., civilians, non-U.S. forces, etc.). *Organization:* Address organizational issues (e.g., who provides the equipment, support forces to train and equip, etc.) related to the provision of CBRN/TIM protection to eligible civilians and non-U.S. forces. *Training:* Include eligible civilians in CBRND training, exercises, and evaluations. Identify training requirements and responsibilities for non-U.S. forces. *Leadership:* Ensure leadership awareness of criticality of increased dependence of military operations upon civilians. *Personnel:* Require eligible civilians supporting the mission to meet minimum standards for safe use of CBRND resources.

**11. Deficiency:** The predominant means of protection of supporting assets is decontamination of the asset following secondary exposure/contamination

**Partial Non-Materiel Solutions:** *Doctrine:* Include the application of CBRN/TIM containment packaging/systems and other alternative methods to preclude secondary exposure/contamination of resources in doctrine, policy, and procedures. *Training:* Train, exercise, and evaluate the application of CBRN/TIM containment packaging/systems and other alternatives precluding secondary exposure/contamination. *Leadership:* Implement and manage training, equipping, protective measures, and exercising for the safe application of CBRN/TIM containment packaging/systems and other alternatives to contain contamination and preclude secondary exposure/contamination.

**12. Deficiency:** The issue and administration of prophylaxis to eligible civilians requires review due to questions regarding applicability to the range of body types, ages, and physical/medical factors inherent within a potential population, as well as possible long-term health issues and legal implications.

**Partial Non-Materiel Solutions:** *Doctrine:* Establish in doctrine, policy, and procedures the application of standards and measures for protection of eligible civilians addressing the variation within the potential protected population. *Leadership:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians and conduct CBRN/TIM training, exercises, and evaluations.

**13. Deficiency:** DOTLPF for Protective Posture Protocols is inadequate or nonexistent addressing CBRND of eligible civilians.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing eligible civilian personnel for CBRND. *Organization:* Identify organization services and activities necessary to support survivability of eligible civilian personnel within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for eligible civilians; and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of eligible civilian personnel.

**14. Deficiency:** DOTLPF for Protective Posture Protocols is inadequate or nonexistent addressing CBRND of MWAs.

**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine, policy, and procedures addressing MWA, particularly MWD. *Organization:* Identify organization services and activities necessary to support survivability of MWAs within a CBRN/TIM environment. *Training:* Establish CBRND training, exercise, and evaluation criteria and programs for MWAs and conduct CBRND training, exercises, and evaluations. *Leadership:* Implement and manage CBRND training, equipping, and protection of MWAs.

**15. Deficiency:** Non-primary-duty personnel may or may not be trained in required packaging, containment, marking, and identification of collected material and samples.

**Non-Materiel Solutions:** *Training:* Personnel performing augmentation or direct support functions (e.g., storing, moving, handling, transporting, etc.) of hazardous, contaminated, or infectious material require training commensurate with their responsibilities. *Leadership:* Ensure all personnel identified in “Training” are trained and knowledgeable.

**16. Deficiency:** Generally, only primary duty personnel performing packing, containerization, storing, transporting, marking, and identification of hazardous or contaminated material and samples functions are trained, knowledgeable, and able to apply the standards.

**Non-Materiel Solutions:** *Training:* Train, exercise, and evaluate all personnel and activities performing tasks and functions, regardless of whether primary responsibility or support, associated with the preparation, storage, movement, handling, transport, and other tasks associated with hazardous, contaminated, or infectious material are trained to standards. *Leadership:* Recognize criticality for the safe preparation (including marking and identification), storage, movement, handling, transport, and other tasks associated with hazardous, contaminated, or infectious material and ensure personnel are trained and comply with requirements.

**17. Deficiency:** Personnel in a field possessing a task to pack, containerize/package, handle, and transport hazardous and contaminated material and samples in their specialty description may not be trained and equipped to accomplish the task.

**Non-Materiel Solutions:** *Training:* Train, exercise, and evaluate all personnel and activities performing tasks and functions, regardless of whether primary responsibility or support, associated with the preparation, storage, movement, handling, transport, and other tasks associated with hazardous, contaminated, or infectious material are trained to standards. *Leadership:* Recognize criticality for the safe preparation (including marking and identification), storage, movement, handling, transport, and other tasks associated with hazardous, contaminated, or infectious material and ensure personnel are trained and comply with requirements.

**18. Deficiency:** General knowledge DOTMLPF for recognition of a potential hazard using international markings is not provided to the general force.

**Non-Materiel Solutions:** *Training:* Recognition training of all force personnel of international markings identifying hazardous, contaminated, or infectious material. *Leadership:* Ensure all subordinate personnel are trained, knowledgeable, and are able to

correctly interpret international markings identifying hazardous, contaminated, or infectious material.

**19. Deficiency:** The correct marking and identification is dependent upon notification and initial marking/identification actions by the preparing activity.

**Non-Materiel Solutions:** *Doctrine:* Enforce existing doctrine, policies, and procedures for marking and identification actions by preparing activities. *Training:* Personnel performing preparation, storage, movement, handling, transport, etc., of hazardous, contaminated, or infectious material are fully trained and evaluated for correct marking and identification of these materials. *Leadership:* Ensure compliance with standards, procedures, and requirements for the preparation, storage, movement, handling, transport, and other associated actions for hazardous, contaminated, or infectious material, including marking and identification.

### 13.14.3.2 IMA Assessment Summary

Table 13.14-2 is a list of ideas for material approaches and a corresponding description of each idea. Approaches vary from use of current kit, or those under current development, development of new kits from those under commercial development. Table 13.14-3 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 13.14-2. TASHLD 14: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Assess CBRND material	Test and assess all CBRND material for protective abilities against future threat agents, including TIM.
Broad-application above-the-neck respiratory protection	Develop above-the-neck respiratory protection with broad application for the general population, including MWAs.
Chemical air generation	Integrated compounds within warfighter's IPE applying chemical reaction to generate oxygen without reliance upon external sources.
Chemical treatment	Develop solution for treatment of existing MOPP suit and other warfighter clothing fabric that neutralizes or block the effect of CBRN/TIM agents, including future agents.
Combinatorial prophylaxes	Develop prophylaxes affording protection or minimizing the impact from a broad range of CBRN/TIM agents.
Contaminated material/equipment protective packaging and containment systems	Investigate and develop CBRN/TIM protective packaging and containment systems for contamination/exposed material and equipment which must be stored, handled, and/or transported in a contaminated/exposed state.
Contaminated remains containment systems	Investigate and develop sealable containment system for CBRN/TIM remains permitting their safe handling, storage, transport, and internment by unprotected personnel and equipment.
COTS sample containers and equipment	Adapt/modify (as necessary) COTS sample containers and equipment for the containment of CBRN/TIM samples and material for their safe handling, storage, and transport.
Current prophylaxes	There currently exists a variety of prophylaxes used for protection against CBRN. FDA testing and necessary modifications of prophylactics must be made to obtain FDA approval. Review available medical material and prophylaxes for application to high-risk TIMs.
Develop CBRN/TIM samples and material containment packaging/systems	Investigate and develop CBRN/TIM containment packaging and systems for the safe containment, handling, storage, and transport of CBRN/TIM samples and material.
Develop COLPRO kits	Develop COLPRO kits containing all necessary supplies to construct field-expedient COLPRO that is easily stored and maintained in ready condition, easily and safely erected, operated, maintained, and struck within a CBRN/TIM environment by IPE-encumbered personnel using minimal resources and supports COLPRO requirements.
Disposable COLPRO	Develop one-time-use COLPRO that is rapidly erected with little instruction, training, and effort and affords term protection for critical activities and functions, maintenance and repair activities, prelocated consumables, as well as personnel associated with this task.

Disposable IPE	Develop low-cost disposable IPE providing protection for transport aircrew members and/or determine available COTS protection to support air operations in a contaminated environment or while carrying contaminated cargo.
Equipment and supplies protective packaging and containment systems	Investigate and develop standardized CBRN/TIM protective packaging and containment systems (includes sprays, boxes, envelopes, drapes, etc.) for the protection of equipment and supplies from contact with CBRN/TIM agents.
Field-expedient COLPRO kits	Develop field-expedient COLPRO kits designed to adapt existing structures, tentage, etc., for the expansion of COLPRO field capabilities and mission support and the provision of collective protection to the force, critical functions and activities, maintenance and repair activities and functions, resources, etc.
Filtration system lowering inhalation pressure requirement	Improve current mask systems by reducing the inhalation effort required. Options may include air streaming into the mask from a contained system that either has a stored supply or generates air flow.
Future prophylaxes	Some preexposure prophylaxes for biological agents require several administrations, immunity attainment is time-consuming, or the period of coverage does not address the full operational period. Future prophylaxes should provide immunity against all known threat CBRN and high-risk TIM agents, as well as potential future threat agents, and be FDA approved. CBRND medical countermeasures are needed providing a sustained level of protection over an extended period of time (minimally the operational period), do not require multiple administrations, are easily disseminated and administered, support a minimum level of protection, protect against a broad range of agents, cover the range of preexposure to post-exposure/presymptomatic application needs, and are applicable to the protected population (including eligible civilians).
Improved IPE garments and accessories	Develop new generation of IPE garments and accessories (e.g., boots/boot covers, gloves, hoods, etc.) using modern materials permitting greater range of motion, longer wear without performance degradation, increased durability, integrated into warfighter personal equipment, and protects against all threat CBRN and high-risk TIM agents.
Integrate CBRN/TIM protective features into functional garments	Develop materials integrating CBRN/TIM protective capabilities and design standard functional garments using these materials for protection of the force.
Integrated mobile COLPRO	Develop warfighting platforms (air, land, and sea) with COLPRO that is an integral part of the operational system and protects against current and future/advanced agents.
Procure additional COLPRO	Procure additional COLPRO of required types and in needed quantities to meet the increased operational requirements.

Prophylactic administration to diverse groups	Prophylaxes address dosage range for eligible civilians (e.g., children, elderly, overweight, underweight subjects, etc.). Stabilize prophylactic effects over a wide range of dosages to address diverse applications of targeted populations.
Rebreathing	Closed circuit mechanism to permit an individual's exhaled air to be filtered, CO <sub>2</sub> removed and recirculated for breathing, allowing user to make use of all available oxygen in a closed environment.
Regenerative filtration	CBRN regenerative filters able to flush retained agent, neutralize agent, or by other inherent means affords extended period of protection.
Topical	Develop topical barrier that is easily applied (i.e., spray), acts as a contact hazard barrier, and affords protection from CBRN/TIM.

14.12 Task SNSUST 12: Coordinate CBRN elimination operations .....	59

## 14.0 Strategic National Sustain

### 14.0.1 Introduction

At the strategic level of war, a nation, often as a member of a group of nations, determines national or multinational (alliance or coalition) security objectives and guidance, and develops and uses national resources to accomplish these objectives. Activities at this level establish national and multinational military objectives, sequence initiatives, define limits and assess risks for the use of military and other instruments of national power, develop global plans or theater war plans to achieve these objectives, and provide military forces and other capabilities in accordance with strategic plans. The Strategic National sublevel encompasses U.S. Department of Defense (DoD), service, and interagency tasks. Twelve Strategic National Sustain tasks were identified in the chemical, biological, radiological, and nuclear (CBRN) Functional Area Analysis (FAA), including a task for elimination operations. However, the detailed analysis of the elimination tasks has been deferred to the Joint Requirements Office for Chemical, Biological, Radiological, and Nuclear Defense (JRO-CBRND)-sponsored FAA/Functional Needs Analysis (FNA) of the weapons of mass destruction (WMD) elimination and interdiction functional areas.

This chapter, detailing the Strategic National (SN) Sustain (SUST) area, restates relevant information from the CBRND Defense (CBRND) FAA including a description of each of the 12 SNSUST tasks, derivation of the task, an indication of other linked tasks, and the pertinent conditions. The Functional Needs Analysis (FNA) section addresses the capability and deficiency analysis and a brief description of potential near-term changes. Once all the capabilities are considered, the assessment concludes with a separate, overarching look at the entire capability spectrum to identify remaining gaps and/or synergies. The FSA section addresses possible solutions for the deficiencies identified in the FNA section. These are categorized into materiel or non-materiel. The non-materiel solutions are addressed first and reflect one or more of the six areas of DOTLPF: doctrine, organization, training, leadership, personnel, and facilities. If there is no non-materiel solution to the deficiencies, then materiel solutions are considered. These encompass broad approaches that are not system-specific. These potential materiel approaches are addressed in the Ideas for Materiel Approaches (IMA) section. The IMAs provide a possible near- or far-term resolution to identified deficiencies within the individual capabilities.

Most of the SNSUST tasks involve required capabilities of major staffs or staff sections within DoD. In those areas where a DoD staff or agency needed to interact within the interagency, the task focused on DoD capabilities required to facilitate the interaction.

### 14.0.2 FNA Summary

Table 14.0-1 summarizes the overall current and projected capability to perform the SNSUST tasks identified in the CBRND FAA. The overall capability to conduct these tasks in the current time frame is assessed as “red.” The greatest deficiency is the lack of universally accepted standards of cleanliness for all types of decontamination operations and the development of policies for detection and verification of those standards. The Office of the Secretary of Defense

(OSD) and the Chairman of the Joint Chiefs of Staff (CJCS) are responsible for ensuring that military representatives are able to coordinate with allies, allied military organizations, potential host nations, and coalition partners for the development of policies and planning for restoration operations within an active theater under military control to limit potential CBRN hazards. The capability to establish restoration operation agreements and policies exists now administratively. Mechanisms currently used are North Atlantic Treaty Organization (NATO) working groups that develop Standardization Agreements (STANAGs) and Allied Joint Publications (AJPs) as well as American, British, Canadian, and Australian Armies Program (ABCA) Quadrapartite working groups. Ad hoc formations of coalitions can include establishment of policies, responsibilities, and procedures for restoration operations required from CBRN contamination if the threat situation warrants. While the current state of “tactical-level” agreements and policies is mature and robust, those agreements and policies do not reflect the needs of operational level and above multinational organizations, therefore no standardized agreements; doctrine; and tactics, techniques, and procedures (TTPs) have resulted for these levels of war. Tasks for establishing a variety of policies and guidelines for joint restoration operations and post-conflict remediation of restoration operation sites have not been accomplished. While the Joint Staff has the ability to perform these tasks, it has not yet done so. In addition, there is little in the way of operational level and above experience, doctrine, or TTPs to help guide the process. At a minimum, the projected capability will improve to “yellow” following a decision to act on these requirements.

**Table 14.0-1. Strategic National Sustain Summary FNA Findings**

Task Number	CBRN Strategic National Sustain Task Title	Capability		
		Current	Near/Mid	Far
SNSUST 1	Establish restoration operation agreements and policies with allies, allied military organizations, potential host nations, and coalition partners.	●	●	●
SNSUST 2	Establish international decontamination standards and policies.	●	●	●
SNSUST 3	Establish policies and guidelines for joint restoration operations.	●	●	●
SNSUST 4	Establish policies and guidelines for post-conflict remediation of restoration operation sites.	●	●	●
SNSUST 5	Establish policies and guidelines for interagency roles and responsibilities for restoration operations.	●	●	●

OVERALL		●	●	●

### 14.0.3 FSA Summary

The paragraphs below summarize the assessment of all potential doctrine, organization, training, materiel, leadership and education, personnel, and facilities (DOTMLPF) (non-materiel and materiel) solutions for the capability gaps identified in the FNA section.

#### 14.0.3.1 DOTLPF

The DOTLPF solutions identified in this chapter are associated primarily with actions that must include concept development to provide the basis for policy and guidelines for the majority of national-level tasks. The greatest need is the establishment of universally accepted standards of cleanliness for all types of decontamination operations and the development of policies for detection and verification of those standards. Concepts must also be developed that will guide operational and above conduct of multinational restoration operations and experimentation conducted to refine the concepts. Refined concepts must be tested in full-scale exercises and lessons learned applied to the writing of and revision of concepts, doctrine, and TTPs. Other solutions include the development of leader education programs and increasing the capability of CBRND staffs at all levels. CJCS and interagency partners must work out procedures and exercise scenarios for the complex interactions between agencies required before, during, and after CBRND restoration operations. The Emergency Support Functions (ESF) in the Federal Response Plan provide a framework for defining these responsibilities. The current version of the *Universal Joint Task List (UJTL)* does not apply outside DoD although future editions are intended for the interagency audience. Interagency roles and responsibilities must be defined, especially for post-conflict aspects of restoration operations. Other solutions include the development of leader education programs for interagency, CBRND, and non-CBRND leaders. Few exercises and little experimentation have taken place to facilitate the formulation of data useful for Joint Capabilities Integration and Development System (JCIDS) analysis at the operational level and above. It is imperative that these exercises/experiments take place and lessons learned be integrated into doctrine, TTPs, and guidance and further tested through exercises. Only then can JCIDS analysis truly identify capability gaps and requirements. Other

solutions include the development of leader education programs for both CBRND and non-CBRND leaders and automated system enhancements and tools that will help with the integration of decontamination tasks into exercises and the follow-on gathering of data for analysis.

#### **14.0.3.2 IMA**

The Global Command and Control System (GCCS) does not provide useful information on restoration operations for deployment, sustainment, and redeployment considerations and does not receive information from the Joint Warning and Reporting Network (JWARN). An automated system must be developed to provide location (global positioning system [GPS]) and unit/activity restoration operation status through component command unit communication systems into the NBC (Nuclear, Biological, and Chemical) Battle Management System and from there into JWARN and GCCS. Systems must be automatic and provide analysis of impact of restoration operations on strategic deployment, sustainment, and redeployment. Automated tools must be developed that take the relevant data (when gathered) and provide a means to forecast strategic force restoration operation requirements.

**14.1 Task SNSUST 1: Establish restoration operation agreements and policies with allies, allied military organizations, potential host nations, and coalition partners**

**14.1.1 Functional Area Analysis**

**14.1.1.1 Definition**

To seek out those countries with which the United States will cooperate during potential military operations. Prearranged agreements prior to combat operations will facilitate restoration operations in the event of CBRN/toxic industrial material (TIM) contamination of forces, equipment, and facilities. Per *QDR 2001*, U.S. alliances, as well as a wide range of bilateral security relationships, are a centerpiece of U.S. security. In conjunction with interagency partners, CJCS will establish agreements with allies and potential coalition host nations to establish policy, responsibilities, and procedures for restoration operations required from CBRN/TIM contamination. As circumstances change, the agreements are subsequently reworked and maintained to include international agreements for post-conflict remediation of restoration operation sites.

**14.1.1.2 Derivation**

*UJTL (SN 9.2.2, SN 7.5, SN 8.1.12), QDR 2001*

**14.1.1.2.1 Supported Task: N/A**

**14.1.1.2.2 Lateral Task: SNSHA 3**

**14.1.1.2.3 Supporting Tasks: STSUST 4, STSUST 7**

**14.1.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Partial preexisting arrangements. (C2.1.1.2)
2. Limited personnel expertise. (C2.2.4.5)
3. Ambiguous threat. (C2.9.3)

**Civil**

1. Limited foreign government support. (C3.1.2.3)
2. Moderately opposed foreign public opinion. (C3.1.2.4)

## **14.1.2 Functional Needs Analysis**

### **14.1.2.1 Capability and Deficiency Assessment Summary**

Table 14.1-1 discusses the only capabilities that currently exist to perform the task to the designated standards. No other capabilities are projected that will accomplish this task.

#### **Current Capability and Deficiency**

The current assessment is “yellow.” OSD and the CJCS are responsible for ensuring that military representatives are able to coordinate with allies, allied military organizations, potential host nations, and coalition partners for the development of policies and planning for restoration operations within an active theater under military control to limit potential CBRN hazards. The capability to establish restoration operation agreements and policies exists now administratively. Mechanisms currently used are NATO working groups that develop STANAGs and AJP as well as ABCA Quadrapartite working groups. Ad hoc formations of coalitions can include establishment of policies, responsibilities, and procedures for restoration operations required from CBRN contamination if the threat situation warrants. The ABCA Coalition Operations Handbook provides a good point of departure for establishing restoration operations policies within newly formed coalitions. Combatant command (COCOM) staffs can formulate these types of ad hoc agreements (with State Department permission/cooperation in peacetime) or through Theater Engagement Plans that conform to CBRND initiatives in the “Global Family of Engagement Plans” (see Task SNSUST 11).

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capabilities are currently projected for the near/mid term. No capability improvements are forecast for the near/mid term.

#### **Projected Far-Term Capability and Deficiency**

No other capabilities are currently projected for the far-term future. DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. Joint TTPs (JTTPs), training and exercises, and education will all improve leading to a far-term assessment of “green.”

**Table 14.1-1. SNSUST 1: Capability and Deficiency Assessment**

Capability/Measure	M1	M2	M3
<b>Current</b>			
COCOMs (U.S. Forces, Korea [USFK]) using Theater Engagement.	Y <sup>1</sup>	R <sup>2</sup>	R <sup>3</sup>
American, British, Canadian, and Australian Armies Program (ABCA) (Quadripartite)	Y <sup>4</sup>	G <sup>5</sup>	R <sup>6</sup>
NATO Working Group	Y <sup>7</sup>	G <sup>8</sup>	R <sup>9</sup>
<b>Near/Mid</b>			
COCOMs (USFK) using Theater Engagement.	Y <sup>10</sup>	R	R
American, British, Canadian, and Australian Armies Program (ABCA) (Quadripartite)	Y <sup>11</sup>	G	R
NATO Working Group	Y <sup>12</sup>	G	R
<b>Far</b>			
COCOMs (USFK) using Theater Engagement.	G <sup>13</sup>	G	G
American, British, Canadian, and Australian Armies Program (ABCA) (Quadripartite)	G <sup>14</sup>	G	G
NATO Working Group	G <sup>15</sup>	G	G
<b>Current Overall Capability</b>	Y	Y	R
<b>Near/Mid-Term Overall Capability</b>	Y	G	R
<b>Far-Term Overall Capability</b>	G	G	G

	FAA Measure	Scale
M1	Restoration operation agreements and policies have been established with all nonadversary nations prior to combat operations.	G – Yes, Y – Limited, R – No
M2	Existing agreements and policy statements are updated regularly.	G – Yes, Y – Limited, R – No
M3	International exercises/experimentation provide feedback on efficacy of agreements and policy.	G – Yes, Y – Limited, R – No

<sup>1</sup> Nothing precludes COCOM staff from accomplishing this task, and in other areas of CBRND, particularly within Central Command and USFK, engagement and cooperation have taken place to varying degrees. USFK has the most robust cooperation on CBRND. But broadly speaking, restoration operation theater engagement plan (TEP) has so far not been initiated. The Joint Forces Staff College is interested in using CBRND issues in its TEP training curriculum.

<sup>2</sup> There are no restoration operation agreements or policy statements within the framework of TEP at this time.

<sup>3</sup> While there have been many international exercises, an exercise focused on restoration of operations has not been conducted. The Restoration Operations (RESTOPS) Advanced Concept Technology Demonstration (ACTD) (USFK), when published, will provide information about fixed-site restoration but does not focus on multinational restoration operations.

<sup>4</sup> Basic agreements and policies relating to many aspects of CBRND interoperability have been established for the four-member Quadripartite Armies. Many interoperability issues for restoration operations remain, particularly issues at higher than tactical level

<sup>5</sup> Working groups update agreements and policies on a regular basis. The updates to agreements and policies relating to restoration are limited to the comprehensiveness of the initial products.

<sup>6</sup> While Quadripartite exercises usually take place every two years, many focusing on interoperability, an exercise focused on restoration of operations has not been conducted.

<sup>7</sup> Basic agreements and policies relating to many aspects of CBRND interoperability and common policies have been established (primarily in the form of STANAGs) for all of the 26 member nations that will provide military forces. Cooperation with Russia and other “partner” countries on defense against CBRN is also increasing. Many interoperability issues for restoration operations remain, particularly issues at higher than tactical level.

<sup>8</sup> Working groups update agreements and policies on a regular basis. The updates to agreements and policies relating to restoration are limited to the comprehensiveness of the initial products.

<sup>9</sup> While there have been many international exercises, an exercise focused exclusively on restoration of operations has not been conducted. When published, the RESTOPS ACTD (USFK) will provide information about fixed sites.

<sup>10</sup> Limited changes/improvements are expected in the near/mid term.

<sup>11</sup> Limited changes/improvements are expected in the near/mid term.

<sup>12</sup> Limited changes/improvements are expected in the near/mid term.

<sup>13</sup> Continual improvements are expected across the board as COCOM exercises/experimentation efforts provide valuable lessons learned at appropriate levels.

<sup>14</sup> Continual improvements are expected across the board as ABCA exercises/experimentation efforts provide valuable lessons learned at appropriate levels.

<sup>15</sup> Continual improvements are expected across the board as NATO exercises/experimentation efforts provide valuable lessons learned at appropriate levels.

### 14.1.3 Functional Solution Analysis

#### 14.1.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** No restoration operation agreements and policies with allies, allied military organizations, potential host nations, and coalition partners that focus at operational level and above.

**Non-Materiel Solutions:** *Doctrine:* Establish agreements and policies with allies, allied military organizations, potential host nations, and coalition partners to include restoration operations considerations at operational level and above. This task will likely have to be done in conjunction with new exercises and experiments.

2. **Deficiency:** No international exercises focused on restoration operations.

**Non-Materiel Solutions:** *Doctrine:* Provide input to working groups and councils to establish policies and guidelines to include operational-level and above restoration operations in international exercises. *Training:* Develop exercises that focus on multinational restoration operations considerations at operational level and above. Multinational and coalition training exercises at the Joint National Training Center (JNTC) must test and capture lessons learned on joint and combined restoration operations. *Facilities:* Incorporate telemetrics and infrastructure to support operational-level and above multinational restoration operation training at JNTC.

3. **Deficiency:** No concepts/doctrine have been established for operational level and above.

**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, i.e., staff guidance, that focuses on operational-level and above restoration operations considerations (Chairman of the Joint Chiefs of Staff Instruction [CJCSI], Chairman of the Joint Chiefs of Staff Manual [CJCSM], or JTTPs). This task will likely have to be done in conjunction with new exercises and experiments. Doctrinal publications provide no guidance useful for developing international restoration policies at this level. *Joint Publication (JP) 3-11* provides operational-/tactical-level decontamination considerations only. *STANAG 2426 (NBC Contamination Control Policy for NATO Forces)*, a successful example of the process, still has flaws. The progress of *Quadripartite Standardization Agreement (QSTAG) 1335 (NBC Decontamination, Following ABCA Operations, For Redeployment And/Or Recovery)* has been hampered by an inability to develop international standards for contamination levels. Key to defining restoration policies is reaching agreement among subject matter experts as to what constitutes an acceptable level of contamination. Debate on how clean is “clean” will continue until international standards are developed and codified. International standards on acceptable levels of contamination must be developed. Medical experts must define acceptable levels of hazard to permit development of sensitive detection devices and effective decontaminants. As lessons are learned from JNTC and theater-level multinational exercises, doctrine must be developed that can be incorporated into pertinent joint publications.

- 4. Deficiency:** There is no Joint Professional Military Education (JPME) leader education on multinational restoration operations or TEP.

**Non-Materiel Solutions:** *Leadership:* Once concepts and doctrine are developed, include as learning areas in JPME requirements. Work with the Joint Forces Staff College (JFSC) to integrate restoration operations into TEP curriculum.

- 5. Deficiency:** CBRND Staffs do not have adequate capability, experience, or education.

**Non-Materiel Solutions:** *Organization:* Analyze CBRND staffing in all organizations in light of the tasks required of them in this JCIDS. Recommend staffing/organizational changes, enhancements, or alternative fixes as required. *Leadership:* Analyze training/education received by CBRND specialists assigned to joint staffs. Recommend training/education changes, enhancements, or alternative fixes as required. *Personnel:* Analyze experience base of CBRND specialists assigned to joint staffs. Recommend career track changes, prerequisites, enhancements, or alternative fixes as required.

#### **14.1.3.2 IMA Assessment Summary**

N/A

**14.2 Task SNSUST 2: Establish international decontamination standards and policies****14.2.1 Functional Area Analysis****14.2.1.1 Definition**

To determine internationally accepted standards of decontamination and establish globally accepted policy for determining compliance and enforcement of the standards. Decontamination standards and policy must be established prior to combat operations and maintained with allies and potential coalition hosts and partners. Further, it is important to have globally accepted standards to facilitate international cooperation during periods of CBRN/TIM emergencies resulting in widespread contamination and to clarify when once contaminated assets may be returned to unrestricted utility. Decontamination standards will provide common measures for assessing levels of decontamination. Furthermore, it is important to have globally accepted standards to facilitate international cooperation during CBRN/TIM emergencies with widespread contamination. As circumstances change (e.g., sensitive detection devices needed for hazardous low-dosage agents), the standards will need to be subsequently reworked and maintained.

**14.2.1.2 Derivation**

*UJTL (SN 9.2.2, SN 7.5, SN 8.1.12)*

**14.2.1.2.1 Supported Task: N/A****14.2.1.2.2 Lateral Task: SNSHA 3****14.2.1.2.3 Supporting Task: STSUST 4****14.2.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. No preexisting arrangements. (C2.1.1.2)
2. Limited personnel expertise. (C2.2.4.5)
3. Restricted information exchange. (C2.3.1.8)
4. Ambiguous threat. (C2.9.3)

**Civil**

1. Mixed support for political policies. (C3.1)
2. Limited foreign government support. (C3.1.2.3)

**14.2.2 Functional Needs Analysis****14.2.2.1 Capability and Deficiency Assessment Summary**

Table 14.2-1 discusses the only capabilities that currently exist to perform the task to the designated standards. No other capabilities are projected that will accomplish this task.

**Current Capability and Deficiency**

The current assessment is “red.” OSD and the CJCS are responsible for ensuring that military representatives are able to coordinate with allies, allied military organizations, potential host nations, and coalition partners for establishing decontamination standards and policies. The capability to establish decontamination standards and policies exists now administratively. Mechanisms currently used are NATO working groups that develop Standardization Agreements (STANAGs) and Allied Joint Publications (AJPs) as well as ABCA Quadrapartite working groups. The most significant technical hurdle is the lack of agreement about decontamination standards for movement of previously contaminated equipment.

**Projected Near/Mid-Term Capability and Deficiency**

No other capabilities are currently projected for the near/mid term. Limited changes /improvements are expected in the near/mid term.

**Projected Far-Term Capability and Deficiency**

No other capabilities are currently projected for the far-term future. Limited improvements are expected across the board although NATO exercises/experimentation efforts will provide valuable lessons learned at appropriate levels. Little progress is expected until standards that define how clean is “clean” are established and accepted throughout the international community.

**Table 14.2-1. SNSUST 2: Capability and Deficiency Assessment**

Capability/Measure	M1	M2	M3	M4	M5	M6
<b>Current</b>						
ABCA Quadrapartite Working Group	R <sup>1</sup>	R <sup>2</sup>	R <sup>3</sup>	R <sup>4</sup>	R <sup>5</sup>	R <sup>6</sup>
NATO Working Groups	R <sup>7</sup>	R <sup>8</sup>	R <sup>9</sup>	R <sup>10</sup>	R <sup>11</sup>	R <sup>12</sup>
<b>Near-Mid</b>						
ABCA Quadrapartite Working Group	R <sup>13</sup>	R	R	R	Y <sup>14</sup>	Y <sup>15</sup>
NATO Working Groups	R <sup>16</sup>	R	R	R	Y <sup>17</sup>	Y <sup>18</sup>
<b>Far</b>						
ABCA Quadrapartite Working Group	R <sup>19</sup>	R	R	R	Y	Y
NATO Working Groups	R <sup>20</sup>	R	R	R	Y	Y
<b>Current Overall Capability</b>	R	R	R	R	R	R
<b>Near/Mid-Term Overall Capability</b>	R	R	R	R	Y	Y
<b>Far-Term Overall Capability</b>	R	R	R	R	Y	Y

	FAA Measure	Scale
M1	Internationally accepted standards of decontamination are established.	G – Yes, Y – Limited, R – No
M2	Policy for determining compliance with and enforcement of standards is established.	G – Yes, Y – Limited, R – No
M3	Standards are modified after advances in detection technology enable lower levels of agent detection.	G – Yes, Y – Limited, R – No
M4	Existing policy is updated regularly.	G – Yes, Y – Limited, R – No
M5	International exercises/experimentation provide feedback on efficacy of standards and policy.	G – Yes, Y – Limited, R – No
M6	Mechanism/international body is established to facilitate agreement on decontamination standards.	G – Yes, Y – Limited, R – No

<sup>1</sup> No internationally accepted standards of decontamination are established. Standard agreements outlining doctrinal procedures for conducting decontamination at the tactical level do exist. But standards that define how clean is “clean” after decontamination do not currently exist.

<sup>2</sup> No policies for determining compliance with and enforcement of standards are established.

<sup>3</sup> No standards currently exist to be modified.

<sup>4</sup> No policies are in place to be updated.

<sup>5</sup> Because the standards do not exist, they have never been exercised or been part of experimentation.

<sup>6</sup> No doctrine has been developed other than defining tactical-level decontamination to be done to limit mission degradation.

<sup>7</sup> No internationally accepted standards of decontamination are established. Standard agreements outlining doctrinal procedures for conducting decontamination at the tactical level do exist. But standards that define how clean is “clean” after decontamination do not currently exist.

<sup>8</sup> No policies for determining compliance with and enforcement of standards are established.

<sup>9</sup> No standards currently exist to be modified.

<sup>10</sup> No policies are in place to be updated.

<sup>11</sup> Because the standards do not exist, they have never been exercised or been part of experimentation.

<sup>12</sup> No doctrine has been developed other than defining tactical-level decontamination to be done to limit mission degradation.

<sup>13</sup> Limited changes/improvements are expected in the near/mid term.

<sup>14</sup> Limited improvements and new experimental progress will yield usable data in the near/mid to far term.

<sup>15</sup> As a result of anticipated experimentation, DOTLPF will improve in the near/mid to far term.

<sup>16</sup> Limited changes/improvements are expected in the near/mid term.

<sup>17</sup> Limited improvements and new experimental progress will yield usable data in the near/mid to far term.

<sup>18</sup> As a result of anticipated experimentation, DOTLPF will improve in the near/mid to far term.

<sup>19</sup> Limited improvements are expected across the board as ABCA exercises/experimentation efforts provide valuable lessons learned at appropriate levels. Little progress is expected until standards that define how clean is “clean” are established and accepted throughout the international community.

<sup>20</sup> Limited improvements are expected across the board as NATO exercises/experimentation efforts provide valuable lessons learned at appropriate levels. Little progress is expected until standards that define how clean is “clean” are established and accepted throughout the international community.

### 14.2.3 Functional Solution Analysis

#### 14.2.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** No decontamination standards and policies (above tactical level) with allied military organizations, potential host nations, and coalition partners.  
**Non-Materiel Solutions:** *Doctrine:* Establish decontamination standards and policies with allied military organizations, potential host nations, and coalition partners to include detection standards for previously contaminated materiel and equipment.
2. **Deficiency:** No doctrine has been developed that would lead to a universally agreed upon standard of decontamination that would satisfy cross-border movement of previously contaminated equipment.  
**Non-Materiel Solutions:** *Doctrine:* JP 3-11 provides no definitive guidance for the establishment of international decontamination standards. Again, the problem is rooted primarily in a lack of internationally agreed-upon levels of decontamination/permissible level of contamination. The progress in the development of draft QSTAG 1335 (NBC Decontamination, Following ABCA Operations, for Redeployment and/or Recovery) has been hampered by an inability to develop international standards for contamination levels. The concept of “clearance decontamination” ideally describes the ultimate result of definitive guidance and standards. Clearance decontamination is defined in AJP 3-8 as “decontamination of equipment and/or personnel on temporary or permanent removal from an operation to a standard sufficient to allow unrestricted transportation, maintenance, employment and disposal.” The development of international standards would ideally provide a mechanism for the transport of previously contaminated military equipment across international borders once the equipment was certified as having met the standard. Complicating the establishment of these standards is the fact that establishment of contamination standards is a civil, as well as a military, problem. Civil authorities have a responsibility to safeguard their citizens and dare not allow previously contaminated material to enter their countries unless they meet (yet to be established) agreed upon and certifiable standards. Commercial industrial organizations, particularly in the transport sector, must be assured that neither transport personnel nor equipment will be harmed by hazards that cannot be detected by current technology or exists at levels that have not yet been determined to be hazardous.

#### 14.2.3.2 IMA Assessment Summary

N/A

**14.3 Task SNSUST 3: Establish policies and guidelines for joint restoration operations****14.3.1 Functional Area Analysis****14.3.1.1 Definition**

To establish, prior to combat operations, and then maintain policy and guidelines that will facilitate the planning and execution of joint restoration operations. CJCS, rather than individual commanders, must provide guidance on support to special operations forces (SOF) and foreign consequence management (CM) to facilitate intertheater standardization of restoration operations. This action must be accomplished by CJCS rather than individual combatant commands to facilitate intertheater standardization of restoration operations. Includes guidance on support to SOF and support required for foreign CM.

**14.3.1.2 Derivation**

*UJTL (SN 9.2.2, SN 7.5, SN 5.4.2, SN 8.1.12)*

**14.3.1.2.1 Supported Task: N/A****14.3.1.2.2 Lateral Task: SNSHA 8****14.3.1.2.3 Supporting Tasks: STSUST 1, STSUST 2****14.3.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. No preexisting arrangements. (C 2.1.1.2)
2. Limited personnel expertise. (C2.2.4.5)

**Civil.** N/A

**14.3.2 Functional Needs Analysis****14.3.2.1 Capability and Deficiency Assessment Summary**

Table 14.3-1 discusses the only capability that currently exists to perform the task to the designated standard. No other capability is projected that will accomplish this task.

### **Current Capability and Deficiency**

The current assessment is “red.” CJCS has numerous responsibilities to include but not limited to prepare strategic plans, prepare military strategy and assessments, prepare joint logistic and mobility plans, etc. The joint staff has the skill and experience to establish policies and guidelines for joint restoration operations but has not yet done so.

### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. No capability improvement is forecast for the near/mid term.

### **Projected Far-Term Capability and Deficiency**

DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. JTTPs, training and exercises, and education will all improve but lead to a far-term assessment of only “yellow.”

**Table 14.3-1. SNSUST 3: Capability and Deficiency Assessment**

<b>Capability: CJCS</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>R<sup>2</sup></b>	<b>R<sup>3</sup></b>	<b>R<sup>4</sup></b>	<b>R<sup>5</sup></b>
<b>Near/Mid-Term Overall Capability</b>	<b>R</b>	<b>R</b>	<b>R</b>	<b>R</b>
<b>Far-Term Overall Capability<sup>6</sup></b>	<b>Y<sup>7</sup></b>	<b>Y</b>	<b>Y</b>	<b>Y</b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Policies and guidelines for joint restoration operations are established.	G – Yes, Y – Limited, R – No
M2	Existing policies and guidelines are updated regularly.	G – Yes, Y – Limited, R – No
M3	Joint exercises/experimentation provides feedback on efficacy of policy and guidelines.	G – Yes, Y – Limited, R – No
M4	Guidelines on supporting SOF and foreign CM are established.	G – Yes, Y – Limited, R – No

<sup>1</sup> Little joint doctrine or TTPs have been developed above the tactical level. There is no experience factor in establishing guidance for joint restoration operations at the operational level and above.

<sup>2</sup> The joint staff has the basic capability to perform this task but there are currently no policies and guidelines for joint/multinational restoration operations above the tactical level. There are multi-Service and individual Service policies/tactical guidelines, but no definitive guidelines and policies for joint/multinational forces above the tactical level. Service/multinational terminology has developed different terms for similar concepts, resulting in potential operational confusion during complex combat operations.

<sup>3</sup> There are no policies and guidelines.

<sup>4</sup> An exercise focused on joint restoration operations has not been conducted. To preclude operational confusion during complex restoration operations, guidelines must be established and exercised to determine deficiencies.

<sup>5</sup> No guidelines on supporting SOF and foreign CM are established, but there is a requirement for COCOMs to develop plans to support requests for foreign CM.

<sup>5</sup> There are no policies and guidelines.

<sup>6</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>7</sup> The overall status should improve to “yellow” due to a multitude of initiatives but is not anticipated to improve more than that due to the length of time it will take for experimentation and DOTMLPF initiatives to provide feedback and lessons learned.

### 14.3.3 Functional Solution Analysis

#### 14.3.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** No policies and guidelines for joint restoration operations.  
**Non-Materiel Solutions:** *Doctrine:* Establish policies and guidelines for joint restoration operations.
2. **Deficiency:** No guidelines on supporting SOF and foreign CM are established.  
**Non-Materiel Solutions:** *Doctrine:* Establish policies and guidelines on supporting SOF and foreign CM.
3. **Deficiency:** No exercises focused on restoration operation.  
**Non-Materiel Solutions:** *Training:* Develop joint exercises that include or focus on joint restoration operations. *Facilities:* Incorporate required telemetrics and infrastructure to support joint restoration operation exercises and experiments at JNTC.
4. **Deficiency:** No doctrine has been established.  
**Non-Materiel Solutions:** *Doctrine:* Establish doctrine and TTPs at the operational level and above, i.e., staff guidance (CJCSI, CJCSM or JTTPs).
5. **Deficiency:** No JPME education on restoration of operations.  
**Non-Materiel Solutions:** *Leadership:* Develop JPME leader education on joint restoration operations. Provide focused education on joint restoration operations to CBRND leaders and staffers.

#### 14.3.3.2 IMA Assessment Summary

N/A

**14.4 Task SNSUST 4: Establish policies and guidelines for post-conflict remediation of restoration operation sites****14.4.1 Functional Area Analysis****14.4.1.1 Definition**

To establish, prior to combat operations, policy and guidelines that U.S. forces will adhere to under circumstances not covered by existing international agreements or agreements with allies, allied military organizations, potential host nations, and coalition partners. CJCS establishes and maintains policy/guidelines for post-conflict remediation of restoration operation sites for those circumstances. The importance of post-conflict CBRND considerations being developed prior to the conflict to facilitate planning and troop protection has been made patently clear by situations such as low-level CBRN/TIM hazard considerations during Desert Storm.

**14.4.1.2 Derivation**

*UJTL (SN 9.2.2, SN 5.4.2, SN 8.1.12)*

**14.4.1.2.1 Supported Task: N/A****14.4.1.2.2 Lateral Tasks: SNSHA 3, SNSHA 8****14.4.1.2.3 Supporting Task: STSUST 3****14.4.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

<b>Current Overall Capability<sup>1</sup></b>	<b>R<sup>2</sup></b>	<b>R<sup>3</sup></b>	<b>R<sup>4</sup></b>
<b>Near/Mid-Term Overall Capability<sup>5</sup></b>	<b>R</b>	<b>R</b>	<b>R</b>
<b>Far-Term Overall Capability</b>	<b>Y<sup>6</sup></b>	<b>Y</b>	<b>Y</b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Policies and guidelines for post-conflict remediation of restoration operation sites are established.	G – Yes, Y – Limited, R – No
M2	Policies and guidelines are updated regularly.	G – Yes, Y – Limited, R – No
M3	International/joint exercises or experimentation provide feedback on efficacy of policy and guidelines.	G – Yes, Y – Limited, R – No

<sup>1</sup> No joint doctrine or TTPs has been developed above the tactical level. There is no experience factor in establishing guidance for post-conflict remediation of restoration operation sites at the operational level and above.

<sup>2</sup> The joint staff has the basic capability to perform this task but there are currently no policies and guidelines for post-conflict remediation of restoration operation sites.

<sup>3</sup> There are no policies and guidelines.

<sup>4</sup> An exercise focused on joint restoration operations has not been conducted. To preclude operational confusion during post-conflict remediation of restoration operation sites, guidelines must be established and exercised to determine deficiencies.

<sup>5</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>6</sup> The overall status should improve to “yellow” due to a multitude of initiatives but is not anticipated to improve more than that due to the length of time it will take for experimentation and DOTMLPF initiatives to provide feedback and lessons learned.

### 14.4.3 Functional Solution Analysis

#### 14.4.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Policies and guidelines for post-conflict remediation of restoration operation sites do not exist.  
**Non-Materiel Solutions:** *Doctrine:* Establish policies and guidelines for post-conflict remediation of restoration operation sites.
2. **Deficiency:** No exercises have focused on restoration operations.  
**Non-Materiel Solutions:** *Training:* Develop exercises to include restoration operations.  
*Facilities:* Incorporate required infrastructure into JNTC.
3. **Deficiency:** No doctrine/TTPs have been established.  
**Non-Materiel Solutions:** *Doctrine:* Establish doctrine and TTPs at the operational level and above, i.e., staff guidance (CJCSI, CJCSM or JTTPs). Multinational working groups must develop policies/guidelines for post-conflict remediation (rather than just mitigation) of restoration operation sites resulting from Allied/coalition operations in conjunction with pertinent civilian organizations and agencies.
4. **Deficiency:** JPME education on restoration of operations does not exist.  
**Non-Materiel Solutions:** *Leadership:* Develop JPME leader education on joint restoration operations. Provide focused education on joint restoration operations to CBRND leaders and staffers.

#### 14.4.3.2 IMA Assessment Summary

N/A

## **14.5 Task SNSUST 5: Establish policies and guidelines for interagency roles and responsibilities for restoration operations**

### **14.5.1 Functional Area Analysis**

#### **14.5.1.1 Definition**

To establish, prior to combat operations, policy and guidelines that will facilitate interagency roles and responsibilities for restoration operations. To facilitate interagency coordination, CJCS, in conjunction with interagency partners, will define these roles and responsibilities prior to combat operations and will maintain them. DoD and interagency partners must work out procedures and train for the complex interactions between agencies required during CBRN/TIM restoration operations.

#### **14.5.1.2 Derivation**

*UJTL (SN 9.2.2, SN 8.3.1, SN 7.5)*

##### **14.5.1.2.1 Supported Task: N/A**

##### **14.5.1.2.3 Supporting Task: STSUST 4**

#### **14.5.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

##### **Military**

1. No preexisting arrangements. (C 2.1.1.2)
2. Limited personnel expertise. (C2.2.4.5)
3. Poor joint staff integration. (C2.3.1.1)

##### **Civil**

1. Correct interdepartmental/interagency relationships. (C3.1.1.3)

### **14.5.2 Functional Needs Analysis**

#### **14.5.2.1 Capability and Deficiency Assessment Summary**

Table 14.5-1 discusses the only capability that currently exists to perform the task to the designated standard. No other capability is projected that will accomplish this task.

### **Current Capability and Deficiency**

The current assessment is “red.” CJCS has numerous responsibilities, including but not limited to preparing strategic plans, military strategy and assessments, joint logistic and mobility plans, etc. The joint staff has the ability to establish policies and guidelines for interagency roles and responsibilities for restoration operations but has not yet done so.

### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Little capability improvement is forecast for the near/mid term except that DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

### **Projected Far-Term Capability and Deficiency**

The overall status should improve to “yellow” due to a multitude of initiatives but is not anticipated to improve more than that due to the length of time it will take for experimentation and DOTMLPF initiatives to provide feedback and lessons learned.

**Table 14.5-1. SNSUST 5: Capability and Deficiency Assessment**

<b>Capability: CJCS</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>R<sup>2</sup></b>	<b>R<sup>3</sup></b>	<b>R<sup>4</sup></b>
<b>Near/Mid-Term Overall Capability</b>	<b>R</b>	<b>R</b>	<b>R</b>
<b>Far-Term Overall Capability<sup>5</sup></b>	<b>Y<sup>6</sup></b>	<b>Y</b>	<b>Y</b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Policies and guidelines for interagency role and responsibilities for restoration operations are established.	G – Yes, Y – Limited, R – No
M2	Policies and guidelines are updated regularly.	G – Yes, Y – Limited, R – No
M3	National exercises/experimentation provide feedback on efficacy of policy and guidelines.	G – Yes, Y – Limited, R – No

<sup>1</sup> No joint doctrine or TTPs has been developed to address interagency roles and responsibilities for restoration operations. There is no experience factor in establishing guidance for interagency roles and responsibilities for restoration operations.

<sup>2</sup> The joint staff has the basic capability to perform this task, but there are currently no policies and guidelines for interagency roles and responsibilities for restoration operations.

<sup>3</sup> There are no policies and guidelines.

<sup>4</sup> An exercise focused on joint restoration operations has not been conducted. To preclude operational confusion about interagency roles and responsibilities for restoration operations, guidelines must be established and exercised in conjunction with interagency partners to determine deficiencies.

<sup>5</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>6</sup> The overall status should improve to “yellow” due to a multitude of initiatives but is not anticipated to improve more than that due to the length of time it will take for experimentation and DOTMLPF initiatives to provide feedback and lessons learned.

### 14.5.3 Functional Solution Analysis

#### 14.5.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Policies and guidelines for post-conflict remediation of restoration operation sites do not exist.  
**Non-Materiel Solutions:** *Doctrine:* Establish policies and guidelines for interagency roles and responsibilities for restoration operations.
2. **Deficiency:** No exercises have focused on restoration operations.  
**Non-Materiel Solutions:** *Training:* Develop exercises to include restoration operations.  
*Facilities:* National-level CBRN exercises must include as exercise objectives the testing of interagency roles and responsibilities in restoration operations. As plans are made for the establishment of a Joint National Training Center (QDR 2001), TTPs for testing interagency roles in restoration operations must be integrated into training center plans.
3. **Deficiency:** No doctrine/TTPs have been established.  
**Non-Materiel Solutions:** *Doctrine:* Establish doctrine and TTPs at the operational level and above, i.e., staff and interagency guidance (CJCSI, CJCSM, JTTPs and pertinent interagency publications). *UJTL 6.0* development must include defining interagency restoration operation tasks. JP 3-11 revisions must address in doctrine the interactions required between joint forces and interagency partners before, during, and after restoration operations resulting from CBRN contamination. The ESF in the Federal Response Plan provides a framework for defining these responsibilities.
4. **Deficiency:** JPME education on restoration of operations does not exist.  
**Non-Materiel Solutions:** *Leadership:* Develop JPME leader education on joint restoration operations that includes interagency roles and responsibilities. Work with interagency partners to develop leader education for their training/education venues. Provide focused education on joint restoration operation interagency roles and responsibilities to CBRND leaders and staffers.

#### 14.5.3.2 IMA Assessment Summary

N/A

**14.6 Task SNSUST 6: Establish multinational interoperability standards for restoration operations****14.6.1 Functional Area Analysis****14.6.1.1 Definition**

To establish, prior to combat operations, multinational interoperability standards for restoration operations. To facilitate multinational cooperation, CJCS, in conjunction with interagency partners, will establish these standards prior to combat operations and will maintain them. Standards must include common terminology, procedures, decontaminants, equipment, and replacement parts.

**14.6.1.2 Derivation**

*UJTL (SN 9.2.2, SN 7.5, SN 8.3.1), Allied Joint Publication (AJP) 3-8*

**14.6.1.2.1 Supported Task: N/A****14.6.1.2.2 Lateral Task: SNSHA 7****14.6.1.2.3 Supporting Task: STSUST 10****14.6.1.3 Condition**

Perform this task under conditions of:

**Physical. N/A****Military**

1. Partial preexisting arrangements. (C2.1.1.2)
2. Limited personnel expertise. (C2.2.4.5)

**Civil**

1. Mixed support for political policies. (C3.1)
2. Limited foreign government support. (C3.1.2.3)

**14.6.2 Functional Needs Analysis****14.6.2.1 Capability and Deficiency Assessment Summary**

Table 14.6-1 discusses the only capabilities that currently exist to perform the task to the designated standards. No other capabilities are projected that will accomplish this task.

**Current Capability and Deficiency**

Current capability is assessed as “yellow.” OSD and CJCS are responsible for ensuring that military representatives are able to coordinate with allies, allied military organizations, potential host nations, and coalition partners for the establishment of multinational interoperability standards for restoration operations. The capability to establish restoration operation interoperability agreements and policies exists now administratively. Mechanisms currently used are NATO working groups that develop STANAGs and AJP as well as ABCA Quadrapartite working groups. Ad hoc formations of coalitions can include establishment of policies, responsibilities, and procedures for restoration operations required from CBRN contamination if the threat situation warrants. The ABCA Coalition Operations Handbook provides a good point of departure for establishing restoration operations policies within newly formed coalitions. USFK has a mature relationship with South Korea. COCOM staffs can formulate these types of ad hoc agreements (with State Department permission/cooperation in peacetime) or through TEPs that conform to CBRND initiatives in the “Global Family of Engagement Plans” (see Task SNSUST 11).

**Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Little capability improvement is forecast for the near/mid term with the exception that DOTMLPF should improve in some areas as a result of initiatives that use data resulting from focused experimentation. Overall assessment will remain at “yellow.”

**Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. JTTPs, training and exercises, and education will all improve, leading to a far-term assessment of “green.”

**Table 14.6-1. SNSUST 6: Capability and Deficiency Assessment**

M2	Existing interoperability standards are updated regularly.	G – Yes, Y – Limited, R – No
M3	International/joint exercises or experimentation provide feedback on efficacy of interoperability standards.	G – Yes, Y – Limited, R – No

<sup>1</sup> Nothing precludes COCOM staff from accomplishing this task, and in other areas of CBRND interoperability, particularly within CENTCOM and USFK, engagement and cooperation has taken place to varying degrees. USFK has the most robust cooperation on CBRND. But broadly speaking, restoration operation TEP has so far not been initiated. JFSC is interested in using CBRND issues in its TEP training curriculum.

<sup>2</sup> Existing interoperability standards are updated on a regular basis.

<sup>3</sup> USFK exercises are usually conducted on a regular basis. An exercise specifically focused on restoration of operations has not been conducted. When published, the RESTOPS ACTD (USFK) will provide information about fixed-site restoration but does not focus on multinational restoration operations or operational interoperability.

<sup>4</sup> Basic tactical-level decontamination interoperability issues are addressed in varying levels of detail and are basically adequate. Interoperability standards for restoration operations considerations are virtually nonexistent above the tactical level.

<sup>5</sup> Existing interoperability standards are updated on a regular basis.

<sup>6</sup> ABCA Armies conduct interoperability exercises every two years. An exercise specifically focused on restoration of operations has not been conducted. There will be no exercise in 2004 due to operational commitments.

<sup>7</sup> Basic tactical-level decontamination interoperability issues are addressed in varying levels of detail and are basically adequate. Interoperability standards for restoration operations considerations are virtually nonexistent above the tactical level. Many interoperability issues for restoration operations remain, particularly issues at higher than tactical level.

<sup>8</sup> Existing interoperability standards are updated on a regular basis.

<sup>9</sup> NATO exercises are usually conducted on a regular basis. An exercise specifically focused on restoration of operations has not been conducted.

<sup>10</sup> Limited changes/improvements are expected in the near/mid term.

<sup>11</sup> Limited changes/improvements are expected in the near/mid term.

<sup>12</sup> Limited changes/improvements are expected in the near/mid term.

<sup>13</sup> Continual improvements are expected across the board as COCOM exercises/experimentation efforts provide valuable lessons learned at appropriate levels.

<sup>14</sup> Continual improvements are expected across the board as ABCA exercises/experimentation efforts provide valuable lessons learned at appropriate levels.

<sup>15</sup> Continual improvements are expected across the board as NATO exercises/experimentation efforts provide valuable lessons learned at appropriate levels.

### 14.6.3 Functional Solution Analysis

#### 14.6.3.1 DOTLPP Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** No multinational interoperability standards for restoration operations exist above tactical level.  
**Non-Materiel Solutions:** *Doctrine:* Establish multinational interoperability standards for restoration operations at operational level and above.
2. **Deficiency:** No exercises have focused on restoration operations.  
**Non-Materiel Solutions:** *Doctrine:* Establish working groups and councils to establish policies and guidelines to include restoration operations. *Training:* Develop exercises that include restoration operations. *Facilities:* Incorporate multinational restoration operation interoperability training capabilities into JNTC.
3. **Deficiency:** Multinational doctrine for restoration operations is virtually nonexistent above the tactical level.  
**Non-Materiel Solutions:** *Doctrine:* Establish interoperability doctrine, i.e., staff guidance, for operational level and above. Revision of disconnects in AJP 3-8 would be a first step in resolving multinational deficiencies.
4. **Deficiency:** There is a lack of standard communications equipment or compatibility.  
**Non-Materiel Solutions:** None.

#### 14.6.3.2 IMA Assessment Summary

Table 14.6-2 shows possible materiel approaches that address the remaining materiel requirements of the DOTMLPP assessment.

**Table 14.6-2. SNSUST 6: IMA Assessment**

<b>Capability Gap</b>	<b>Idea for Materiel Approach</b>	<b>Description</b>
Lack of standard communications equipment or compatibility	Command, control, communications, computers, intelligence equipment	Need to establish common standard equipment specifications, procedures, and doctrine to address the process and methods for providing accurate, timely, and relevant information distribution between ABCA coalition nations. Incompatibility between national applications of communications equipment hinders timely distribution of information or coordination for restoration operations. Work-arounds, software, or emerging technologies may facilitate interoperability of these systems in the future. Although establishing technical interoperability between systems must be the immediate near-term goal, it does not guarantee the full capability of feature sets, which certain staffs may require to conduct restoration operations. Also, U.S. forces internally do not have integrated capability between command and control systems and CBRND systems.

**14.7 Task SNSUST 7: Establish international infectious disease quarantine and isolation standards and policies for biological warfare attacks****14.7.1 Functional Area Analysis****14.7.1.1 Definition**

To establish, prior to combat operations, international infectious disease quarantine and isolation standards and policy for biological warfare attacks. To facilitate international cooperation, CJCS, in conjunction with interagency partners, will establish these standards and policy prior to combat operations and will maintain them and then seek and ensure international consensus. Biological attacks that occur during wartime are likely to be much more severe than peacetime epidemics. In addition, there will also be the complication of wartime conditions and requirements for moving or evacuating military personnel.

**14.7.1.2 Derivation**

*UJTL (SN 4.3.3, SN 7.5, SN 8.1.12)*

**14.7.1.2.1 Supported Task: N/A****14.7.1.2.2 Lateral Task: SNSHA 9****14.7.1.2.3 Supporting Task: STSUST 4****14.7.1.3 Condition**

Perform this task under conditions of:

**Physical. N/A****Military**

1. No preexisting arrangements. (C2.1.1.2)
2. Limited personnel expertise. (C2.2.4.5)
3. Restricted information exchange. (C2.3.1.8)
4. Ambiguous threat. (C2.9.3)

**Civil**

1. Mixed support for political policies. (C3.1)
2. Limited foreign government support. (C3.1.2.3)

**14.7.2 Functional Needs Analysis****14.7.2.1 Capability and Deficiency Assessment Summary**

Table 14.7-1 discusses the only capability that currently exists to perform the task to the designated standard. No other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The current assessment is “red.” CJCS has numerous responsibilities, including, but not limited to, preparing strategic plans, military strategy and assessments, joint logistic and mobility plans, etc. Although international agreements govern the establishment and control of infectious disease quarantine standards, these standards have not been developed with intentional biological warfare in mind. Standards and procedures for reception, staging, onward movement, and integration (RSOI) of forces through and in allied or coalition partner countries when biological warfare has been initiated have not been developed. The outbreak of a disease requiring international quarantine could prevent the projection of forces into a critical area. The joint staff has the capability to work with the Surgeon General and interagency partners and allies to establish international infectious disease quarantine and isolation standards and policies for biological warfare attacks but has not yet done so.

**Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Little capability improvement is forecast for the near/mid term.

**Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term. DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. JTTPs, training and exercises, and education will all improve but lead to a far-term assessment of only “yellow.”

**Table 14.7-1. SNSUST 7: Capability and Deficiency Assessment**

<b>Capability: CJCS</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>R<sup>2</sup></b>	<b>R<sup>3</sup></b>	<b>R<sup>4</sup></b>
<b>Near/Mid-Term Overall Capability</b>	<b>R<sup>5</sup></b>	<b>R</b>	<b>R</b>
<b>Far-Term Overall Capability<sup>6</sup></b>	<b>Y<sup>7</sup></b>	<b>Y</b>	<b>Y</b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	International infectious disease quarantine standards and policies for biological warfare attacks are established.	G – Yes, Y – Limited, R – No
M2	Policies and guidelines are updated regularly.	G – Yes, Y – Limited, R – No
M3	International/joint exercises or experimentation provide feedback on efficacy of standards and policies.	G – Yes, Y – Limited, R – No

<sup>1</sup> No doctrine or TTPs exist. Leader education does not address this issue.

<sup>2</sup> Although international agreements govern the establishment and control of infectious disease quarantine and isolation standards, these standards have not been developed with intentional biological warfare in mind. Standards and procedures for RSOI of forces through and in allied or coalition partner countries when biological warfare has been initiated have not been developed. Emerging problems resulting from Severe Acute Respiratory Syndrome (SARS) highlight problems that could be anticipated. The outbreak of a disease requiring international quarantine could prevent the projection of forces into a critical area.

<sup>3</sup> There are no standards and policies.

<sup>4</sup> While there have been many international/joint exercises, an exercise focused on infectious disease quarantine and isolation for biological warfare attacks has not been conducted.

<sup>5</sup> The overall status should improve to “yellow” due to a multitude of initiatives but is not anticipated to improve more than that due to the length of time it will take for experimentation and DOTMLPF initiatives to provide feedback and lessons learned. When an automated tool that integrates deployment, sustainment, and redeployment data with restoration operation impacts and projections is developed, the 2-hour time standard may be achievable.

<sup>6</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>7</sup> Although international agreements govern the establishment and control of infectious disease quarantine and isolation standards, these standards have not been developed with intentional biological warfare in mind. Standards and procedures for RSOI of forces through and in allied or coalition partner countries when biological warfare has been initiated have not been developed. Emerging problems resulting from SARS highlight problems that could be anticipated. The outbreak of a disease requiring international quarantine could prevent the projection of forces into a critical area.

### 14.7.3 Functional Solution Analysis

#### 14.7.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** There is no international infectious disease quarantine/isolation standard and policy for biological warfare attacks.  
**Non-Materiel Solutions:** *Doctrine:* Establish international infectious disease quarantine standard and policy for biological warfare attacks.
- 2. Deficiency:** No exercise focused on quarantine/isolation for biological warfare attacks has been conducted.  
**Non-Materiel Solutions:** *Training:* Develop exercises to include scenarios requiring biological warfare attacks that pose quarantine/isolation issues. *Facilities:* Incorporate ability to exercise/conduct experimentation into JNTC.
- 3. Deficiency:** No doctrine has been established.  
**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, i.e., staff guidance (CJCSI, CJCSM or JTTPs) for international infectious disease quarantine standard and policy for biological warfare attacks.
- 4. Deficiency:** No JPME courses address quarantine standards and policies for biological warfare attacks.  
**Non-Materiel Solutions:** *Leadership:* Establish JPME/interagency/multinational leader education on quarantine standards and policies for biological warfare attacks.

#### 14.7.3.2 IMA Assessment Summary

N/A

**14.8 Task SNSUST 8: Determine restoration operations impact on strategic deployment, sustainment, and redeployment****14.8.1 Functional Area Analysis****14.8.1.1 Definition**

To make a specific assessment of the impact that ongoing or planned restoration operations will have on the requirement to conduct strategic deployment, sustainment, and redeployment. CJCS receives input from deployment, sustainment, or redeployment locations that have been targeted by CBRN/TIM weapons concerning the status of restoration operations for key locations, facilities, and equipment that are required for strategic deployment, sustainment, or redeployment of forces and determines the impact. CJCS also receives input regarding key strategic forces and means that are contaminated as a result of CBRN/TIM attacks at their locations regarding the status of restoration operations designed to prepare them for strategic deployment/redeployment or for strategic sustainment activities.

**14.8.1.2 Derivation**

*UJTL (SN 9.2.2, SN 1.1.4, SN 1.1.5, SN 1.2.5)*

**14.8.1.2.1 Supported Task: N/A****14.8.1.2.2 Lateral Task: SNSHA 10****14.8.1.2.3 Supporting Task: STSUST 13****14.8.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Persistent CBRN/TIM effects. (C1.3.3.1-3)

**Military**

1. Stressful mission. (C2.1)
2. No mission preparation. (C2.1.3)
3. Weak forces assigned. (C2.2.1)
4. Negligible personnel experience. (C2.2.4.5)
5. Limited lift assets. (C2.5.2)
6. High rear-area security. (C2.7.1)
7. Limited host nation support. (C2.8.5)
8. Conventional and terrorist threat form. (C2.9.2)
9. Fully developed state of conflict. (C2.10.1)

## **Civil**

1. Limited foreign government support. (C3.1.2.3)

### **14.8.2 Functional Needs Analysis**

#### **14.8.2.1 Capability and Deficiency Assessment Summary**

Table 14.8-1 discusses the only capability that currently exists to perform the task to the designated standard. No other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The current assessment is “yellow.” CJCS has numerous responsibilities, including synchronizing and monitoring worldwide military operations and activities, including determining the restoration operation impact, whether on forces or facilities, on strategic deployment, sustainment, and redeployment. The joint staff likely has the skill and experience to manually conduct the task, but there are several obstacles that will prevent meeting the required timeline and hinder the process.

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Little capability improvement is forecast for the near/mid term.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term. DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. JTTPs, training and exercises, and education will all improve but lead to a far-term assessment of only “yellow.”

**Table 14.8-1. SNSUST 8: Capability and Deficiency Assessment**

<b>Capability: CJCS J-3</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>	<b>M6</b>	<b>M7</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>R<sup>2</sup></b>	<b>Y<sup>3</sup></b>	<b>Y<sup>4</sup></b>	<b>Y<sup>5</sup></b>	<b>R<sup>6</sup></b>	<b>R<sup>7</sup></b>	<b>Y<sup>8</sup></b>
<b>Near/Mid-Term Overall Capability</b>	<b>R</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>	<b>R</b>	<b>R</b>	<b>Y</b>
<b>Far-Term Overall Capability</b>	<b>Y<sup>9</sup></b>	<b>Y</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Determination of restoration operation impact on strategic deployment, sustainment, and redeployment is made within 2 hours.	G – Yes, Y – Limited, R – No
M2	Total force pending strategic deployment, sustainment, and redeployment is analyzed for impact due to restoration operations.	G – Yes, Y – Limited, R – No
M3	All restoration operations meet established deployment, sustainment, and redeployment priorities.	G – Yes, Y – Limited, R – No
M4	All key locations, facilities, and equipment required to facilitate deployment, sustainment, or redeployment of strategic forces and means that are affected by restoration operations are included in assessment.	G – Yes, Y – Limited, R – No
M5	National/joint exercises provide lessons learned on procedures for determining restoration operation impact on strategic deployment, sustainment, and redeployment.	G – Yes, Y – Limited, R – No
M6	National/joint experimentation provides data on efficacy of current/proposed procedures.	G – Yes, Y – Limited, R – No
M7	Operational and analytical/planning staffs have the training and experience to develop contingency plans in the event restoration operations are incomplete or inadequate for deployment, sustainment, or redeployment.	G – Yes, Y – Limited, R – No

<sup>1</sup> Concepts, doctrine and, TTPs focusing restoration operation impact on strategic deployment, sustainment, and redeployment are limited. CBRND staffs and staffing at all levels are not robustly manned making it difficult to apply CBRND subject matter expertise when required. CBRND staffs are not adequately trained/experienced on strategic CBRND issues. JPME does not currently address this issue.

<sup>2</sup> The J-3 staff would ultimately have the means to make a determination of the impact of ongoing or projected restoration operations on strategic deployment, sustainment, and redeployment. Although the J-3 staff is skilled and experienced, they would have little skill or experience with CBRND issues concerning restoration operations. For restoration operation issues, their current capability is does not receive information from JWARN. It is unlikely that assessments can be made manually within 2 hours, slowing down the process. The GCCS does not provide useful information on restoration operations for deployment/redeployment considerations and sustainment.

<sup>3</sup> Limited. Nothing precludes the J-3 staff from considering the total force involved, but because the current capability for analysis is manual accuracy may not be as dependable and might be subject to human errors.

<sup>4</sup> Limited. Nothing precludes the J-3 staff from developing strategic restoration operation priorities designed to meet established strategic deployment, sustainment, and redeployment priorities, but because the current capability for analysis is manual, accuracy may not be as dependable subject to human errors.

<sup>5</sup> Limited. Nothing precludes the J-3 staff from including all key locations, facilities, and equipment required to facilitate deployment of strategic forces and assets that are affected by restoration operations in the assessment, but because the current capability for analysis is manual, accuracy may not be as dependable subject to human errors.

<sup>6</sup> No exercise focused on restoration operation impact on strategic deployment, sustainment, and redeployment has been conducted.

<sup>7</sup> No experiment focused on restoration operation impact on strategic deployment, sustainment, and redeployment has been conducted.

<sup>8</sup> Limited. The J-3 staff (or sister planning staffs) have the skill and training to develop contingency plans or orders when strategic deployment, sustainment, or redeployment sites, facilities, or units are out of action. They do not have experience with restoration operations/CBRND issues causing the problem.

<sup>9</sup> The overall status should improve to “yellow” due to a multitude of initiatives but is not anticipated to improve more than that due to the length of time it will take for experimentation and DOTMLPF initiatives to provide feedback and lessons learned. When an automated tool that integrates deployment, sustainment, and redeployment data with restoration operation impacts and projections is developed, the 2-hour time standard may be achieved.

### 14.8.3 Functional Solution Analysis

#### 14.8.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** J-3 staff has little skill or experience with CBRND issues concerning restoration operations.  
**Non-Materiel Solutions:** *Doctrine:* Establish TTPs to assist the J-3 staff assess the restoration operation impact on strategic deployment. *Training:* Establish training to assist the J-3 staff assess the restoration operation impact on strategic deployment. *Personnel:* Provide at least one operator per watch with extensive experience in CBRND issues including restoration operation impacts.
- 2. Deficiency:** There are no procedures or checklists supporting this task.  
**Non-Materiel Solutions:** *Doctrine:* Develop procedures and checklist to facilitate manual determination of restoration operation impact on strategic deployment, sustainment, and redeployment.
- 3. Deficiency:** There are no exercises to support this task.  
**Non-Materiel Solutions:** *Training:* Develop joint exercises that include or focus on joint restoration operations impacts on strategic deployment, sustainment, and redeployment.
- 4. Deficiency:** There is no experimentation to support this task.  
**Non-Materiel Solutions:** *Training:* Integrate J-3 staff into JRO experimentation campaign plan for FY2009/10 UNIFIED ENDEAVOR and all work ups. Include this task for concept experimentation.
- 5. Deficiency:** Concepts, doctrine, and TTPs focusing restoration operation impact on strategic deployment, sustainment, and redeployment are limited.  
**Non-Materiel Solutions:** *Doctrine:* Develop concepts, doctrine, and TTPs focusing on restoration operation impact on strategic deployment, sustainment, and redeployment.
- 6. Deficiency:** CBRND staffs are not adequately trained/experienced on strategic CBRND issues.  
**Non-Materiel Solutions:** *Leadership:* Analyze training/education received by CBRND specialists assigned to joint staffs. Recommend training/education changes, enhancements, or alternative fixes as required. *Personnel:* Analyze experience base of CBRND specialists assigned to joint staffs. Recommend career track changes, prerequisites, enhancements, or alternative fixes as required.
- 7. Deficiency:** JPME does not currently address this issue.  
**Non-Materiel Solutions:** *Leadership:* Develop JPME leader training requirements and curriculum on restoration operations.

- 8. Deficiency:** CBRND staffs and staffing at all levels is inadequate.

**Non-Materiel Solutions:** *Organization:* Analyze CBRND staffing in all organizations in light of the capabilities required of them in this task. Recommend staffing/organizational changes, enhancements, or alternative fixes as required.

- 9. Deficiency:** GCCS does not provide useful information on restoration operations for deployment, sustainment, and redeployment considerations and does not receive information from JWARN.

**Non-Materiel Solutions:** None.

- 10. Deficiency:** The current capability for analysis is manual and slow and might be subject to human errors.

**Non-Materiel Solutions:** *Training (partial):* Additional operation training on current capability.

#### **14.8.3.2 IMA Assessment Summary**

Table 14.8-2 shows possible materiel approaches that address the remaining materiel requirements of the DOTMLPF assessment.

**Table 14.8-2. SNSUST 8: IMA Assessment**

<b>Capability Gap</b>	<b>Idea for Materiel Approach</b>	<b>Description</b>
GCCS does not provide useful information on restoration operations for deployment, sustainment, and redeployment considerations and does not receive information from JWARN.	Automated Systems	An automated system must be developed to provide location (GPS) and unit/activity restoration operation status through component command unit communication systems into the NBC Battle Management System and from there into JWARN and GCCS. System must be automatic and provide analysis of impact of restoration operations on strategic deployment, sustainment, and redeployment.
The current capability for analysis is manual and slow and might be subject to human errors.	Automated Tool	An automated tool that integrates deployment, sustainment, and redeployment data with restoration operation impacts and projections must be developed.

**14.9 Task SNSUST 9: Supply strategic forces and assets with adequate decontamination capability****14.9.1 Functional Area Analysis****14.9.1.1 Definition**

To ensure that strategic forces and assets are supplied with adequate decontamination capability in order to sustain operations critical to the execution of the National Military Strategy. CJCS manages the JCIDS process for restoration operations and decontamination. Complex decontamination issues, to include prioritization of austere decontamination capability, will require modeling, simulation, realistic exercises, and experimentation to determine both requirements and determinations of what constitutes “adequate decontamination capability.”

**14.9.1.2 Derivation**

*UJTL (SN 9.2.1, SN 5.3.5.3).*

**14.9.1.2.1 Supported Task: N/A****14.9.1.2.2 Lateral Task: SNSHA 6****14.9.1.2.3 Supporting Tasks: STSUST 5, STSUST 9****14.9.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Multiple competing apportionments. (C2.2.2)
2. Limited personnel experience. (C2.2.4.5)
3. Limited host nation support. (C2.8.5)

**Civil**

1. Limited foreign government support. (C3.1.2.3)

**14.9.2 Functional Needs Analysis****14.9.2.1 Capability and Deficiency Assessment Summary**

Table 14.9-1 discusses the only capability that currently exists to perform the task to the designated standard. No other capability is projected that will accomplish this task.

### **Current Capability and Deficiency**

The current assessment is “red.” JRO-CBRND is responsible for the planning, coordination, and oversight of joint CBRN defense requirements to include ensuring that strategic forces and assets are supplied with adequate decontamination capability. The JRO has the skill and experience to conduct the task, but there is a major shortfall of data at the operational level and above.

### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Little capability improvement is forecast for the near/mid term.

### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term. DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. JTTPs, training and exercises, and education will all improve but lead to a far-term assessment of only “yellow.”

**Table 14.9-1. SNSUST 9: Capability and Deficiency Assessment**

<b>Capability: CJCS JRO-CBRND</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>R<sup>2</sup></b>	<b>R<sup>3</sup></b>	<b>Y<sup>4</sup></b>	<b>R<sup>5</sup></b>	<b>R<sup>6</sup></b>
<b>Near/Mid-Term Overall Capability</b>	<b>R</b>	<b>R</b>	<b>Y</b>	<b>R</b>	<b>R</b>
<b>Far-Term Overall Capability</b>	<b>Y<sup>7</sup></b>	<b>Y</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	National/joint exercises provide lessons learned on supplying strategic forces and assets with adequate decontamination capability.	G – Yes, Y – Limited, R – No
M2	National/joint experimentation provides data on efficacy of current/proposed procedures for supplying strategic forces and means with adequate decontamination capability.	G – Yes, Y – Limited, R – No
M3	The JCIDS process includes a comprehensive examination of CBRN “Sustain” considerations at all levels of war (SN, ST, OP, and TA).	G – Yes, Y – Limited, R – No
M4	Required capability can be supplied.	G – Yes, Y – Limited, R – No
M5	Required capability is supplied when forecast.	G – Yes, Y – Limited, R – No

<sup>1</sup> Concepts, doctrine, and TTPs focusing on restoration operation requirements at the operational and strategic levels are very limited. CBRN staffs and staffing at all levels are not robustly manned, making it difficult to apply CBRND subject matter expertise to planning and evaluating exercises when required. CBRND staffs are not adequately trained/experienced on strategic CBRND issues. JPME does not currently address this issue.

<sup>2</sup> While there have been many national/joint exercises that have included some restoration operations issues, an exercise focused on restoration operations for a strategic force has not been conducted except in USFK. While many tactical-level issues have been captured from this and other exercises for examination, operational-/strategic-level issues are virtually nonexistent.

<sup>3</sup> The RESTOPS ACTD, conducted in USFK, has focused on restoration operations for fixed facilities. When published, the results are expected to provide abundant data for restoration operations for fixed facilities. There have been no experiments focusing on operational level and above warfighting restoration operations concepts and issues.

<sup>4</sup> Limited. The JCIDS process is currently being used to conduct a comprehensive examination of CBRN Sustain considerations at all levels of war (SN, ST, OP, and TA) within the limitations of currently available data. The issue is with the “comprehensiveness” of the data available for examination. While data at the tactical level are reasonably available, operational-level and above data are virtually nonexistent.

<sup>5</sup> Determination of what is required can not be made without realistic modeling, simulation, exercises and experimentation to determine both requirements and determinations of what constitutes “adequate decontamination capability.”

<sup>6</sup> Forecasting methods can not be developed until required capability can be determined. Determination of what is required can not be made without realistic modeling, simulation, exercises, and experimentation to determine both requirements and determinations of what constitutes “adequate decontamination capability.”

<sup>7</sup> The overall status should improve to “yellow” due to a multitude of initiatives but is not anticipated to improve more than that due to the length of time it will take for experimentation and DOTMLPF initiatives to provide feedback and lessons learned.

### 14.9.3 Functional Solution Analysis

#### 14.9.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** An exercise including fully integrated exercise objectives or focused on restoration operations for a strategic force has not been conducted.  
**Non-Materiel Solutions:** *Doctrine:* Establish guidelines, checklists, and exercise planning tools to integrate restoration operation objectives into joint exercises. *Training:* Facilitate the development of exercises that include fully integrated exercise objectives or are totally focused on restoration operations for joint strategic forces. *Facilities:* Incorporate infrastructure and telemetric requirements into development of JNTC.
- 2. Deficiency:** Relevant and comprehensive operational-/strategic-level issues are virtually nonexistent.  
**Non-Materiel Solutions:** *Doctrine:* Develop guides for observer/controllers (O/Cs) so that they are better able to capture relevant lessons learned from exercises. Integrate captured data into future JCIDS analysis. *Organization:* Ensure that organizations that conduct joint exercises likely to reveal relevant data are adequately staffed with CBRN subject matter experts or that external O/C teams (provided by JRO) can be easily integrated into the exercise control/data collection plan. *Training:* Provide assistance to joint exercise developers on restoration operation scenarios and objectives and develop CBRN-centric training for O/Cs. *Leadership:* Integrate techniques for developing joint exercise restoration operation training objectives into leader training. *Personnel:* Ensure that personnel chosen to be observer/controllers have requisite combination of technical expertise, operational/exercise experience, and CBRN-centric joint exercise O/C training.
- 3. Deficiency:** There have been no experiments focusing on operational-/strategic-level warfighting restoration operations concepts and issues.  
**Non-Materiel Solutions:** *Training:* Include this task for concept JRO experimentation campaign plan for FY2009/10 UNIFIED ENDEAVOR and all work-ups.
- 4. Deficiency:** There is no determination of what constitutes “adequate CBRND decontamination or medical capability” for strategic forces.  
**Non-Materiel Solutions:** *Doctrine:* Develop plan for how to determine (through modeling, simulation, or experimentation) what constitutes adequate CBRND decontamination or medical capability for strategic forces. *Training:* Determine (through modeling, simulation, or experimentation) what constitutes adequate CBRND decontamination or medical capability for strategic forces.
- 5. Deficiency:** There is no method of forecasting strategic force requirements.

**Non-Materiel Solutions:** *Doctrine (partial):* Develop methodology for how to forecast/determine adequate CBRND decontamination or medical capability for strategic forces.

6. **Deficiency:** Concepts, doctrine, and TTPs focusing on restoration operation requirements at the operational and strategic levels are very limited.

**Non-Materiel Solutions:** *Doctrine:* Develop robust concepts, doctrine, and TTPs focusing on restoration operation requirements at the operational and strategic levels.

7. **Deficiency:** CBRN staffs and staffing at all levels is not adequate.

**Non-Materiel Solutions:** *Doctrine:* Establish plans to support strategic forces with adequate decontamination capability. *Organization:* Establish plans to support strategic forces with adequate decontamination capability. *Leadership:* Establish plans to support strategic forces with adequate decontamination capability. *Personnel:* Establish plans to support strategic forces with adequate decontamination capability.

8. **Deficiency:** CBRND staffs are not adequately trained/experienced on strategic CBRND issues.

**Non-Materiel Solutions:** *Doctrine:* Develop guides and TTPs focusing on CBRND Staff roles, responsibilities, and procedures for planning and conducting restoration operation at the operational and strategic levels. *Training:* Analyze training received by CBRND specialists assigned to joint staffs. Recommend training changes, enhancements, or alternative fixes as required. *Leadership:* Analyze education received by CBRND specialists assigned to joint staffs. Recommend education changes, enhancements, or alternative fixes as required.

9. **Deficiency:** JPME does not currently address this issue.

**Non-Materiel Solutions:** *Leadership:* Commanders, staff directors, and leaders at all levels require extensive education on CBRND issues. Without a complete understanding of how CBRND issues can impact the warfight, they are unable to fully appreciate operational implication of CBRND and apply corrective or remedial actions.

#### 14.9.3.2 IMA Assessment Summary

Table 14.9-2 shows possible materiel approaches that address the remaining materiel requirements of the DOTMLPF assessment.

**Table 14.9-2. SNSUST 9: IMA Assessment**

<b>Capability Gap</b>	<b>Idea for Materiel Approach</b>	<b>Description</b>
There is no method of forecasting strategic force requirements.	Automated tools	Develop automated tools that take the relevant data (when gathered) and provide a means to forecast strategic force restoration operation requirements.

**14.10 Task SNSUST 10: Establish forward presence of decontamination units and facilities in theater****14.10.1 Functional Area Analysis****14.10.1.1 Definition**

To assess requirements for decontamination units and facilities in a specific theater prior to the initiation of hostilities and to conduct their deployment and employment. In conjunction with interagency partners, CJCS establishes this forward presence of decontamination units and facilities in theater. Deployments that demonstrate a capability to sustain operations despite use of CBRN/TIM weapons will rely on the visibility of a robust decontamination capability to help deter CBRN/TIM weapon use.

**14.10.1.2 Derivation**

*UJTL (SN 9.2.1, SN 3.1.1, SN 5.4, SN 7.1.3, ST 7.1.6), QDR 2001.*

**14.10.1.2.1 Supported Task: N/A****14.10.1.2.2 Lateral Task: SNSHA 6****14.10.1.2.3 Supporting Tasks: STSUST 5, STSUST 6, STSUST 9, STSUST 10, STSUST 11, STSUST 12, STSUST 14****14.10.1.3 Condition**

Perform this task under conditions of:

**Physical. N/A****Military**

1. Strong preexisting arrangements. (C2.1.1.2)
2. Major military commitments from other nations. (C2.1.1.7)
3. Abundant sustainment facilities. (C2.8.1)
4. Sufficient deployed supplies (30-90 days). (C2.8.2)
5. Extensive host nation support. (C2.8.5)

**Civil**

1. Limited lift assets available. (C2.5.2)
2. Limited foreign government support. (C3.1.2.3.)

## **14.10.2 Functional Needs Analysis**

### **14.10.2.1 Capability and Deficiency Assessment Summary**

Table 14.10-1 discusses the only capability that currently exists to perform the task to the designated standard. No other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The current assessment is “yellow.” CJCS has numerous responsibilities to establishing forward presence of decontamination units and facilities in theater. The joint staff likely has the skill and experience to conduct the task, but there are several obstacles that will hinder the process.

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Little capability improvement is forecast for the near/mid term.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term. Standard operating procedures (SOPs), guidelines, and DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. JTTPs, training and exercises, and education will all improve but only moderately. Experiments and exercises focused on theater restoration operations will be conducted. Lessons learned from RESTOPS ACTD will be integrated into future exercises and experimentation that looks at issues other than fixed sites. The overall assessment will remain at “yellow” in the far-term.

**Table 14.10-1. SNSUST 10: Capability and Deficiency Assessment**

<b>Capability: CJCS J-3</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>
<b>Current Overall Capability<sup>1</sup></b>	Y <sup>2</sup>	Y <sup>3</sup>	Y <sup>4</sup>	R <sup>5</sup>
<b>Near/Mid-Term Overall Capability</b>	Y	Y	Y	R
<b>Far-Term Overall Capability<sup>6</sup></b>	Y	Y	G <sup>7</sup>	Y <sup>8</sup>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Required decontamination units and facilities are in theater when required.	G – Yes, Y – Limited, R – No
M2	Required decontamination units and facilities in theater are prepared to conduct operations when required.	G – Yes, Y – Limited, R – No
M3	National/joint exercises provide lessons learned on coordinating forward presence of decontamination units and facilities in theater.	G – Yes, Y – Limited, R – No
M4	SOP and guidelines for structure and requirements for rapid deployable decontamination unit and facilities are established	G – Yes, Y – Limited, R – No

<sup>1</sup> Concepts, doctrine, and TTPs focusing on establishing forward presence of decontamination units are very limited. CBRN staffs and staffing at all levels are not robustly manned, making it difficult to apply CBRND subject matter expertise to planning and evaluating exercises when required. CBRND staffs are not adequately trained/experienced on strategic CBRND issues. JPME does not currently address this issue.

<sup>2</sup> Currently very limited units and facilities are available to deploy to theater. Data are currently unavailable to help determine what is “required” (see Task SNSUST 9).

<sup>3</sup> While individual units and capabilities conduct training, the integration of these units and capabilities into operational-level and above exercises is very limited. Therefore, there are few data on whether they will be able to conduct operations when required.

<sup>4</sup> The RESTOPS ACTD, conducted in USFK, has focused on restoration operations for fixed facilities. When published, the results are expected to provide abundant data for restoration operations for fixed facilities. There have been no experiments focusing on operational-level and above warfighting restoration operations concepts and issues to include establishing forward presence of decontamination units.

<sup>5</sup> SOPs and guidelines for structure and requirements for rapid deployable decontamination unit and facilities are not established.

<sup>6</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>7</sup> Experiments and exercises focused on theater restoration operations will be conducted. Lessons learned from RESTOPS ACTD will be integrated into future exercises and experimentation that looks at issues other than fixed sites.

<sup>8</sup> SOPs and guidelines should improve as a result of focused experimentation.

### 14.10.3 Functional Solution Analysis

#### 14.10.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Data are currently unavailable to help determine what is “required”.  
**Non-Materiel Solutions:** *Doctrine:* Establish TTPs and methodologies to assist the J-3 staff determine capability requirements when establishing forward presence of decontamination units. *Training:* Establish training to assist the J-3 staff to determine capability requirements when establishing forward presence of decontamination units.
2. **Deficiency:** There are few data on whether decontamination units will be able to conduct operations when required.  
**Non-Materiel Solutions:** *Training:* Integrate this task into exercises and experiments to develop reliable data.
3. **Deficiency:** There have been no experiments focusing on operational-level and above warfighting restoration operations concepts and issues to include establishing forward presence of decontamination units.  
**Non-Materiel Solutions:** *Training:* Integrate this task into exercises and experiments to develop reliable data.
4. **Deficiency:** Concepts, doctrine, and TTPs focusing on establishing forward presence of decontamination units are very limited.  
**Non-Materiel Solutions:** *Training:* Develop enhanced concepts, doctrine, and TTPs focusing on establishing forward presence of decontamination units based on data collected in exercises and experiments.
5. **Deficiency:** CBRN staffs and staffing at all levels are not robustly manned, making it difficult to apply CBRND subject matter expertise to planning and evaluating exercises when required.  
**Non-Materiel Solutions:** *Organization:* Analyze CBRN staffing in all organizations in light of the capabilities required of them in this task. Recommend staffing/organizational changes, enhancements, or alternative fixes as required.
6. **Deficiency:** CBRND staffs are not adequately trained/experienced on strategic CBRND issues.  
**Non-Materiel Solutions:** *Training:* Analyze training/education received by CBRND specialists assigned to joint staffs. Recommend training/education changes, enhancements, or alternative fixes as required.
7. **Deficiency:** JPME does not currently address this issue.

**Non-Materiel Solutions:** *Leadership:* Develop JPME leader training requirements and curriculum on restoration operations.

- 8. Deficiency:** SOPs and guidelines for structure and requirements for rapid deployable decontamination unit and facilities are not established.

**Non-Materiel Solutions:** *Doctrine:* Develop SOPs and guidelines for rapid deployable decontamination unit and facilities. *Organization:* Develop structure and requirements for rapid deployable decontamination unit and facilities.

#### **14.10.3.2 IMA Assessment Summary**

N/A

**14.11 Task SNSUST 11: Provide restoration operation “Global Family of Engagement Plan” policies and guidelines to combatant commanders****14.11.1 Functional Area Analysis****14.11.1.1 Definition**

To formulate policy for restoration operation “Global Family of Engagement Plans” and to provide this policy, as well as specific guidelines, to combatant commanders for execution. In conjunction with interagency partners, CJCS establishes and develops this policy and guidelines prior to combat operations. Because the threat of CBRN/TIM weapons is of concern to all nations and potential allies, offering assistance in establishing a restoration operational capability, through training or equipment, can help forge new friendships and cooperation. Decontamination operational issues will be easier to address in remote or austere areas if the host nation has a decontamination capability.

**14.11.1.2 Derivation**

*UJTL (SN 9.2.1, SN 8, SN 7.5, SN 5.4.3), CJCSM 3113.01a.*

**14.11.1.2.1 Supported Task: N/A****14.11.1.2.2 Lateral Task: SNSHA 11****14.11.1.2.3 Supporting Task: STSUST 8****14.11.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. No preexisting arrangements. (C 2.1.1.2)
2. Limited personnel expertise. (C2.2.4.5)

**Civil.** N/A

**14.11.2 Functional Needs Analysis****14.11.2.1 Capability and Deficiency Assessment Summary**

Table 14.11-1 discusses the only capability that currently exists to perform the task to the designated standard. No other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The current assessment is “red.” CJCS has numerous responsibilities, including, but not limited to, preparing and reviewing joint policies and guidelines, etc. The concept of “global family of engagement plans” is the phrase embodiment used in the Theater Engagement Planning (TEP) Joint Manual (*CJCSM 3113.01a*) to describe action mandated by *Defense Planning Guidance FY 2002–2007* (6 April 2000) to develop a process to globally integrate all military engagement activities. The TEPs from each geographic combatant commander or designated Executive Agent are integrated into the “Global Family of Engagement Plans,” which is approved by CJCS and forwarded to the Under Secretary of Defense for Policy for review. This process and the review and any guidance or support to aid the COCOM in the initial development of the TEP is a strategic national-level activity and—from the standpoint of Sense, Shape, Shield, and Sustain, as embodied in the CBRND Enabling Concept—must be accomplished, at a minimum, with the technical assistance and support of JRO-CBRND. When we say “Restoration Operation Global Family of Engagement Plans,” we mean the integration of Sustain CBRND Enabling Concept ideas into any policies and guidelines that would impact on COCOM development of TEPs.

**Projected Near/Mid-Term Capability and Deficiency**

No other capabilities are currently projected for the near/mid term. DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. JTTPs, training and exercises, and education will all improve but lead to a far-term assessment of only “yellow.”

**Projected Far-Term Capability and Deficiency**

No other capabilities are currently projected for the far term. No capability improvements are forecast for the far term. The overall status will remain “yellow” despite a multitude of initiatives and is not anticipated to improve more than that due to the inherent difficulties posed by international relations.

**Table 14.11-1. SNSUST 11: Capability and Deficiency Assessment**

<b>Capability: CJCS</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>R<sup>2</sup></b>	<b>R<sup>3</sup></b>	<b>R<sup>4</sup></b>
<b>Near/Mid-Term Overall Capability</b>	<b>Y<sup>5</sup></b>	<b>Y</b>	<b>Y</b>
<b>Far-Term Overall Capability</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Restoration operation “Global Family of Engagement Plan” policies and guidelines are established.	G – Yes, Y – Limited, R – No
M2	Policies and guidelines are updated regularly.	G – Yes, Y – Limited, R – No
M3	Joint exercises/experimentation provide feedback on efficacy of policy and guidelines.	G – Yes, Y – Limited, R – No

<sup>1</sup> No doctrine, i.e., staff guidance or JTTPs, has been established specifically for restoration operations.

<sup>2</sup> No. Although generic guidance exists in *CJCSM 3113.01a*, the “Global Family of Engagement Plans” does not include restoration operations.

<sup>3</sup> There are no policies or guidelines to update.

<sup>4</sup> While there have been many joint exercises, an exercise focused on restoration operations and the efficacy of restoration operation “Global Family of Engagement Plan” policies and guidelines has not been conducted.

<sup>5</sup> The overall status should improve to “yellow” due to a multitude of initiatives but is not anticipated to improve more than that due to the inherent difficulties posed by international relations.

### 14.11.3 Functional Solution Analysis

#### 14.11.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Restoration operation are not included in the “Global Family of Engagement Plans.”  
**Non-Materiel Solutions:** *Doctrine:* Ensure that “Global Family of Engagement Plan” policies and guidelines include restoration operations.
2. **Deficiency:** No exercises have focused on restoration operation.  
**Non-Materiel Solutions:** *Doctrine:* Establish working groups to establish policies and guidelines that include restoration operations. *Training:* Develop exercises that include restoration operations and focus on gathering information of the efficacy of global family of engagement planning. *Facilities:* Incorporate into JNTC.
3. **Deficiency:** No doctrine, i.e., staff guidance or JTTPs, has been established.  
**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, i.e., staff guidance/policies (CJCSI, CJCSM or JTTPs). Such policies and guidelines should be included in documents like CJCSM 3113.01A Theater Engagement Planning, Defense Planning Guidance, the Joint Staff Capabilities Plan, and any CBRN-specific publications might provide guidance on CBRN defense integration into TEP.
4. **Deficiency:** No training provides feedback.  
**Non-Materiel Solutions:** *Training:* Develop training on “Global Family of Engagement Plan” restoration operation considerations so that lessons learned can be gathered.
5. **Deficiency:** No JPME courses address “Global Family of Engagement Planning” including restoration operations.  
**Non-Materiel Solutions:** *Leadership:* Develop JPME leader education on “Global Family of Engagement Plan” restoration operation considerations. Provide materials to JFSC so it can use restoration operations as a TEP example.

#### 14.11.3.2 IMA Assessment Summary

N/A

**14.12 Task SNSUST 12: Coordinate CBRN elimination operations****14.12.1 Functional Area Analysis****14.12.1.1 Definition**

To coordinate global planning and execution of CBRN elimination operations. U.S. Armed Forces may conduct military operations for the explicit purpose of eliminating the CBRN weapons or capabilities held by an adversary. Specifically, U.S. military operations across the range of conflict and nonconflict situations (e.g., peace operations, humanitarian assistance, or military support to civil authorities) also may entail a requirement to eliminate, or support the elimination of, CBRN weapons or capabilities. CBRN elimination is the systematic removal of a capability within a nation or organization to develop, deploy, or employ CBRN weapons. The degree or extent of elimination is a strategic objective, defined by a strategic end state, and ranges from complete removal of all capability (including research, production, and training for any form of CBRN weapon) to the focused removal of specific capabilities. This task encompasses three primary subtasks: *Exploitation* (locating, characterizing, and securing CBRN materiel, weapons, equipment, personnel, and infrastructure, and developing appropriate forensic evidence); *Disposition* (destroying, dismantling, rendering safe, removing, transferring, or otherwise verifiably disposing of CBRN materiel, weapons, equipment, and infrastructure); and *Monitoring and Redirection* (monitoring, inspecting, and redirecting/converting the CBRN infrastructure).

**14.12.1.2 Derivation**

## 15.0 Strategic Theater Sustain

### 15.0.1 Introduction

At the strategic level of war, a nation, often as a member of a group of nations, determines national or multinational (alliance or coalition) security objectives and guidance, and develops and uses national resources to accomplish these objectives. Activities at this level establish national and multinational military objectives, sequence initiatives, define limits and assess risks for the use of military and other instruments of national power, develop global plans or theater war plans to achieve these objectives, and provide military forces and other capabilities in accordance with strategic plans. The Strategic Theater (ST) sublevel encompasses combatant command (COCOM) tasks. Fourteen ST Sustain (SUST) tasks were identified in the chemical, biological, radiological, and nuclear (CBRN) Functional Area Analysis (FAA) including a task for elimination operations. However, the detailed analysis of the elimination tasks has been deferred to the Joint Requirements Office for Chemical, Biological, Radiological, and Nuclear Defense (JRO-CBRND) sponsored FAA/Functional Needs Analysis (FNA) of the weapons of mass destruction (WMD) elimination and interdiction functional areas.

This chapter, detailing the STSUST area, restates relevant information from the CBRND FAA, including a description of each of the 14 STSUST tasks, derivation of the task, an indication of other linked tasks, and the pertinent conditions. The FNA section addresses the capability and deficiency analysis and a brief description of potential near term changes. Once all the capabilities are considered, the assessment concludes with a separate, overarching look at the entire capability spectrum to identify remaining gaps and/or synergies. The Functional Solutions Analysis (FSA) section addresses possible solutions for the deficiencies identified in the FNA section. These are categorized into materiel or non-materiel. The non-materiel solutions are addressed first and reflect one or more of the six areas of DOTLPF: doctrine, organization, training, leadership, personnel, and facilities. If there is no non-materiel solution to the deficiencies, then materiel solutions are considered. These encompass broad approaches that are not system-specific. These potential materiel approaches are addressed and in the Ideas for Materiel Approaches (IMA) section. The IMAs provide a possible near- or far-term resolution to identified deficiencies within the individual capabilities.

Most of the STSUST tasks involve required capabilities of major staffs or staff sections within the U.S. Department of Defense (DoD). In those areas where a DoD staff or agency needed to interact within the interagency, the task focused on DoD capabilities required to facilitate the interaction.

### 15.0.2 FNA Summary

Table 15.0-1 summarizes the overall current and projected capability to perform STSUST tasks identified in the CBRND FAA. The overall capability to conduct these tasks in the current time frame is assessed as “yellow.” The combatant commander coordinates policies, guidelines, and responsibilities with the theater commanders to govern theater restoration operations and establishes priorities. Nothing precludes the COCOM staff from accomplishing these tasks, but there is very little in the way of existing doctrine or tactics, techniques, and procedures (TTPs) to

help guide them. Procedures that specifically address moving sustainment cargo from uncontaminated to contaminated lift assets for movement into contaminated ports of debarkation (PODs) are currently manual, making the process slow, labor-intensive, and subject to human error. Without joint TTPs (JTTPs), training, or exercises to prepare them, the COCOM staff may not have adequate expertise or time to complete these tasks before they are required. While any COCOM could provide a Joint Task Force (JTF) HQ for command and control of restoration operations, it has never been accomplished. The joint exercise UNIFIED ENDEAVOR allows a COCOM to exercise in the establishment and training of a JTF, but the exercise has never been used to establish a JTF for the specific mission of conducting large-scale restoration operations. The COCOM staff would ultimately have the means to make a determination of the impact of ongoing or projected restoration operations on theater residual capability. Although the COCOM staff is skilled and experienced, they would have little skill or experience with CBRND issues concerning restoration operations. For restoration operation issues their current capability is manual, slowing down the process. The Global Command and Control System (GCCS) does not provide useful information on restoration operations for residual capability determinations and does not receive information from the Joint Warning and Reporting Network (JWARN). It is unlikely that assessments can be made manually within 2 hours. Although improvements are expected in many of the areas, the capability projection will remain “yellow”. This overall projected assessment remaining the same for STSUST tasks is based on anticipated extrapolated results of current and programmed doctrine, organization, training, materiel, leadership and education, personnel, and facilities (DOTMLPF) initiatives. There are no major technological barriers to be overcome. It is rather a matter of emphasis in future budgeting and programming of resources in order to initiate or enhance recommended DOTMLPF solutions. The estimated pace of change reflected in this assessment could be accelerated or slowed based on decisions to accelerate or slow the implementation of recommended solutions.

**Table 15.0-1. Strategic Theater Sustain Summary FNA Findings**

### 15.0.3 FSA Summary

The paragraphs below summarize the assessment of all potential DOTMLPF (non-materiel and materiel) solutions for the capability gaps identified in the FNA section. The ideas for materiel approaches primarily highlight the need for automated tools to replace processes that are currently manual and thereby slow, labor-intensive, and subject to human error.

#### 15.0.3.1 DOTLPF

The DOTLPF solutions identified in this chapter are associated primarily with decontamination and CBRND medical operations for joint forces. Non-materiel and materiel solutions have been identified. Non-materiel solutions include such things as development of TTPs for operational and thorough decontamination of sensitive equipment and fixed facilities (interior and exterior), along with applicable training programs. Remaining materiel requirements include the need for decontaminants that are nontoxic, noncorrosive, and environmentally friendly. These decontaminants must neutralize agents on a variety of surfaces such as aircraft skin and sensitive equipment, while using little or no water. In addition, they must be compatible with each other. Other remaining materiel requirements include application devices that allow for decontamination of porous surfaces, along with hard-to-reach and large areas while protecting the operator from spray-back or extensive IPE requirements.

**15.0.3.2 IMA**

This section summarizes possible materiel approaches that address the remaining materiel requirements of the DOTMLPF assessment. All assessments to facilitate developing theater restoration operation priorities must be done manually, increasing the time required to establish priorities when the CBRN situation changes. Automated systems and tools must be developed to facilitate this process. Procedures that specifically address moving sustainment cargo from uncontaminated to contaminated lift assets for movement into contaminated PODs are currently manual, making the process slow, labor-intensive, and subject to human error. It is important to develop automated tools and integrate procedures into automated systems that specifically address moving sustainment cargo from uncontaminated to contaminated lift assets for movement into contaminated PODs.

**15.1 Task STSUST 1: Establish theater restoration operation policy and guidelines****15.1.1 Functional Area Analysis****15.1.1.1 Definition**

To establish, prior to combat operations, policy and guidelines that will facilitate theater restoration operations. To facilitate joint and multinational intratheater execution of decontamination operations, the combatant commander provides these policy and guidelines, prior to combat operations, to the theater commanders to govern theater restoration operations. The wide variety of potential allies, as well as possible threat configurations and capabilities, requires both general and specific guidance. As threat capabilities change or improve, so too must the guidance. Includes guidance on support to special operations forces (SOF) and support required for foreign consequence management (CM).

**15.1.1.2 Derivation**

*UJTL (ST 9.4, ST 7.1.5, ST 4.2.3, ST 5.4.1), AJP 3-8.*

**15.1.1.2.1 Supported Task: SNSUST 3****15.1.1.2.2 Lateral Tasks: STSHA 6, STSUST 14****15.1.1.2.3 Supporting Tasks: OPSUST 1, OPSUST 12****15.1.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Partial preexisting arrangements. (C2.1.1.2)
2. Limited personnel expertise. (C2.2.4.5)
3. Poor joint staff integration. (C2.3.1.1)

**Civil.** N/A

**15.1.2 Functional Needs Analysis****15.1.2.1 Capability and Deficiency Assessment Summary**

Table 15.1-1 discusses the only capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The current assessment is “yellow.” The combatant commander coordinates policies and guidelines with the theater commanders to govern theater restoration operations. Nothing precludes the COCOM staff from establishing policies and guidelines for joint restoration operations, but there is very little in the way of existing doctrine or TTPs to help guide them. There are no definitive guidelines and policies for joint/multinational theater-/operational-level operations. Conflicting terminology has the potential to produce operational friction. A restoration exercise focused on theater restoration operations has not been conducted. A Restoration Operations (RESTOP) Advanced Concept Technology Demonstration (ACTD) has been conducted in U.S. Forces, Korea (USFK) with results to be published (TBP). Doctrine/TTPs have not been developed for operational level and above. Leader education does not address this issue. CBRND staffs and staffing at all levels is inadequate.

**Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. In the mid term, improvements will be made or initiated. Experiments and exercises focused on theater restoration operations will be conducted. Lessons learned from RESTOPS ACTD will be integrated into future exercises and experimentation that looks at issues other than fixed sites. Definitive guidelines and policies will be developed for joint/multinational theater-level operations. Conflicting terminology having the potential to produce operational friction will be standardized. The overall capability will improve to “green” in the near/mid term.

**Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. JTTPs, training and exercises, and education will all improve leading to a far-term assessment of “green.”

**Table 15.1-1. STSUST 1: Capability and Deficiency Assessment**

Capability: COCOM HQ	M1	M2	M3
Current Overall Capability <sup>1</sup>	Y <sup>2</sup>	G <sup>3</sup>	Y <sup>4</sup>
Near/Mid-Term Overall Capability <sup>5</sup>	Y	G	G <sup>6</sup>
Far-Term Overall Capability <sup>7</sup>	G <sup>8</sup>	G	G

	FAA Measure	Scale
M1	Policy and guidelines for theater restoration operations are established.	G – Yes, Y – Limited, R – No
M2	Existing policy and guidelines are updated regularly.	G – Yes, Y – Limited, R – No
M3	Theater exercises/experimentation provide feedback on efficacy of policy and guidelines.	G – Yes, Y – Limited, R – No

<sup>1</sup> No doctrine or TTPs have been developed that is useful for operational-level and above restoration operation consideration. Leader education does not address this issue. CBRND staffs and staffing at all levels is inadequate.

<sup>2</sup> Policies and guidelines for theater restoration operations are limited, but nothing precludes a COCOM staff from developing policies and guidelines. There are NATO, multi-Service, and individual Service tactical policies and guidelines, but no definitive guidelines and policies for joint/multinational theater-level operations. Conflicting terminology has the potential to produce operational friction.

<sup>3</sup> Policies and guidelines are updated regularly.

<sup>4</sup> Limited. A restoration exercise focused on theater restoration operations has not been conducted. A RESTOP ACTD (ongoing) has been conducted with results TBP.

<sup>5</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>6</sup> Experiments and exercises focused on theater restoration operations will be conducted. Lessons learned from RESTOPS ACTD will be integrated into future exercises and experimentation that looks at issues other than fixed sites.

<sup>7</sup> Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.

<sup>8</sup> Definitive guidelines and policies will be developed for joint/multinational theater-level operations. Conflicting terminology having the potential to produce operational friction will be standardized.

### 15.1.3 Functional Solution Analysis

#### 15.1.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Policies and guidelines for joint/multinational theater/operational-level restoration operations are limited.  
**Non-Materiel Solutions:** *Doctrine:* Establish policies and guidelines for joint/multinational theater/operational-level restoration operations. Include guidance on support to SOF and support required for foreign consequence management.
2. **Deficiency:** Conflicting terminology has the potential to produce operational friction.  
**Non-Materiel Solutions:** *Doctrine:* Deconflict terminology in joint, Service, and multinational doctrine and TTPs.
3. **Deficiency:** A restoration exercise focused on theater restoration operations has not been conducted.  
**Non-Materiel Solutions:** *Training:* Develop COCOM staff exercises to define and refine restoration operation policies and guidelines. Incorporate lessons learned from RESTOPS ACTD into future exercises. *Facilities:* Incorporate infrastructure required to conduct COCOM-level restoration exercises into the Joint National Training Center (JNTC).
4. **Deficiency:** A RESTOP ACTD (ongoing) has been conducted in USFK with results TBP.  
**Non-Materiel Solutions:** *Training:* Incorporate lessons learned from RESTOPS ACTD into future exercises and experimentation that looks at issues other than fixed sites.
5. **Deficiency:** Doctrine/TTPs have not been developed for operational level and above.  
**Non-Materiel Solutions:** *Doctrine:* Establish JPME leader education on this task.
6. **Deficiency:** CBRND staff functions and organization vary greatly between commands, which can be detrimental to planning, coordination, and operations.  
**Non-Materiel Solutions:** *Organization:* Analyze CBRND staffing in all organizations in light of the capabilities required of them in this task. Recommend staffing/organizational changes, enhancements, or alternative fixes as required.
7. **Deficiency:** Leader education does not address this issue.  
**Non-Materiel Solutions:** *Leadership:* Develop Joint Professional Military Education (JPME) training on restoration operations roles and responsibilities. CJCSI 1800.01a, JPME, must include leader-learning areas for restoration operations considerations at the ST level.

#### 15.1.3.2 IMA Assessment Summary

N/A

## **15.2 Task STSUST 2: Establish theater restoration operation priorities**

### **15.2.1 Functional Area Analysis**

#### **15.2.1.1 Definition**

To establish theater restoration operation priorities to ensure that strategically significant forces and facilities are available when required. The combatant commander establishes these priorities and provides them to theater commanders to govern the establishment of joint restoration operation priorities. Critical data elements include agent toxicity and persistency as well as the duration of a hazard on a variety of surfaces under differing weather conditions. As operational requirements change, priorities are adjusted as required.

#### **15.2.1.2 Derivation**

*UJTL (ST 9.4, ST 4.2.3, ST 5.4.1).*

##### **15.2.1.2.1 Supported Task: SNSUST 3**

##### **15.2.1.2.2 Lateral Tasks: STSHA 6, STSUST 14**

##### **15.2.1.2.3 Supporting Task: OPSUST 2**

#### **15.2.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

#### **Military**

1. Partial preexisting arrangements. (C2.1.1.2)
2. Limited personnel expertise. (C2.2.4.5)
3. Poor joint staff integration. (C2.3.1.1)

**Civil.** N/A

### **15.2.2 Functional Needs Analysis**

#### **15.2.2.1 Capability and Deficiency Assessment Summary**

Table 15.2-1 discusses the only capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The current assessment is “yellow.” The combatant commander coordinates theater restoration operation priorities and provides them to theater commanders to govern the establishment of joint restoration operation priorities. Nothing precludes the COCOM staff from establishing restoration priorities based on the current situation, but there is very little in the way of existing doctrine or TTPs to help guide them. All assessments must be done manually, increasing the time required to establish priorities when the CBRN situation changes. Changes must be made manually, and staff familiarity with CBRND issues is limited. A restoration exercise focused on theater restoration operations has not been conducted. A RESTOP ACTD has been conducted with results TBP.

**Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Little capability improvement is forecast for the near/mid term with the exception that DOTMLPF should improve in some areas as a result of initiatives that use data resulting from focused experimentation.

**Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. JTTPs, training and exercises, and education will all improve leading to a far-term assessment of “green.”

**Table 15.2-1. STSUST 2: Capability and Deficiency Assessment**

<b>Capability: COCOM HQ</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>
<b>Current Overall Capability<sup>1</sup></b>	Y <sup>2</sup>	Y <sup>3</sup>	Y <sup>4</sup>
<b>Near/Mid-Term Overall Capability<sup>5</sup></b>	Y	Y	Y
<b>Far-Term Overall Capability<sup>6</sup></b>	G <sup>7</sup>	G <sup>8</sup>	G <sup>9</sup>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Theater restoration operation priorities are established.	G – Yes, Y – Limited, R – No
M2	Priorities are modified after operational requirements change.	G – Yes, Y – Limited, R – No
M3	Theater exercises/experimentation provide feedback on the establishment of theater restoration operation priorities.	G – Yes, Y – Limited, R – No

<sup>1</sup> No doctrine/TTPs have been developed. Leader education does not address this issue.

<sup>2</sup> Nothing precludes the COCOM staff from establishing restoration priorities based on the current situation, but no pertinent joint publications provide guidance to assist planners who need to advise the combatant commander on the coordination of theater restoration operation priorities. All assessments must be done manually, increasing the time required to establish priorities when the CBRN situation changes.

<sup>3</sup> Nothing precludes changing priorities after operational requirements change, but the changes must be made manually, and staff familiarity with CBRND issues is limited.

<sup>4</sup> Limited, a restoration exercise focused on theater restoration operations has not been conducted. A RESTOP ACTD (ongoing) has been conducted with results TBP.

<sup>5</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>6</sup> Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.

<sup>7</sup> Joint publications will provide guidance to assist planners who need to advise the combatant commander on the coordination of theater restoration operation priorities. All assessments will no longer be done manually decreasing the time required to establish priorities when the CBRN situation changes.

<sup>8</sup> Changes will no longer be made manually, and staff familiarity with CBRND issues will increase due to education designed for JPME.

<sup>9</sup> Experiments and exercises focused on theater restoration operations will be conducted. Lessons learned from RESTOPS ACTD will be integrated into future exercises and experimentation that looks at issues other than fixed sites.

### 15.2.3 Functional Solution Analysis

#### 15.2.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** All assessments must be done manually, increasing the time required to establish priorities when the CBRN situation changes.  
**Non-Materiel Solutions:** *Training (partial):* Develop COCOM staff exercises to define and refine restoration priorities and guidelines.
2. **Deficiency:** A restoration exercise focused on theater restoration operations has not been conducted.  
**Non-Materiel Solutions:** *Training:* Develop COCOM staff exercises to define and refine restoration operation policies and guidelines. Incorporate lessons learned from RESTOPS ACTD into future exercises.
3. **Deficiency:** Doctrine/TTPs have not been developed for operational level and above.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs to provide assistance to staffs that must coordinate theater restoration operation priorities.
4. **Deficiency:** Leader education does not address this issue.  
**Non-Materiel Solutions:** *Leadership:* Establish JPME leader education on this task.

#### 15.2.3.2 IMA Assessment Summary

Table 15.2-2 shows possible material approaches that address the remaining materiel requirements of the DOTMLPF assessment.

**Table 15.2-2. STSUST 2: IMA Assessment**

Capability Gap	Idea for Materiel Approach	Description
All assessments must be done manually, increasing the time required to establish priorities when the CBRN situation changes.	Automated tools	Develop automated systems and tools to facilitate the establishment of theater restoration operation priorities.

### 15.3 Task STSUST 3: Establish theater restoration operation responsibilities

#### 15.3.1 Functional Area Analysis

##### 15.3.1.1 Definition

To establish theater restoration operation responsibilities to facilitate the smooth coordination of decontamination efforts. The combatant commander establishes and maintains these responsibilities and provides them to theater commanders to govern the control of joint restoration operations.

##### 15.3.1.2 Derivation

*UJTL (ST 9.4, ST 4.2.3, ST 5.4.1).*

##### 15.3.1.2.1 Supported Task: SNSUST 4

##### 15.3.1.2.2 Lateral Tasks: STSHA 6, STSUST 14

##### 15.3.1.2.3 Supporting Task: OPSUST 3

##### 15.3.1.3 Condition

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Partial preexisting arrangements. (C2.1.1.2)
2. Limited personnel expertise. (C2.2.4.5)
3. Poor joint staff integration. (C2.3.1.1)

**Civil.** N/A

#### 15.3.2 Functional Needs Analysis

##### 15.3.2.1 Capability and Deficiency Assessment Summary

Table 15.3-1 discusses the only capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

##### Current Capability and Deficiency

The current assessment is “yellow.” The combatant commander coordinates theater restoration operation responsibilities and provides them to theater commanders to govern the control of joint

restoration operations. Nothing precludes the COCOM staff from establishing restoration responsibilities based on the current situation, but there is very little in the way of existing doctrine or TTPs to help guide them. No pertinent joint publications provide guidance to assist the planners. Leader education does not address this issue.

### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Little capability improvement is forecast for the near/mid term with the exception that DOTMLPF should improve in some areas as a result of initiatives that use data resulting from focused experimentation.

### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. JTTPs, training and exercises, and education will all improve leading to a far-term assessment of “green.”

**Table 15.3-1. STSUST 3: Capability and Deficiency Assessment**

<b>Capability: COCOM HQ</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>Y<sup>2</sup></b>	<b>G<sup>3</sup></b>	<b>Y<sup>4</sup></b>
<b>Near/Mid-Term Overall Capability<sup>5</sup></b>	<b>Y</b>	<b>G</b>	<b>Y</b>
<b>Far-Term Overall Capability<sup>6</sup></b>	<b>G<sup>7</sup></b>	<b>G</b>	<b>G<sup>8</sup></b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Theater restoration operation responsibilities are established.	G – Yes, Y – Limited, R – No
M2	Responsibilities are modified after substantive changes are recommended and approved.	G – Yes, Y – Limited, R – No
M3	Theater exercises/experimentation provide feedback on the establishment of theater restoration operation responsibilities.	G – Yes, Y – Limited, R – No

<sup>1</sup> No doctrine/TTPs have been developed. Leader education does not address this issue.

<sup>2</sup> Nothing precludes the COCOM staff from coordinating theater restoration operation responsibilities and providing them to theater commanders to facilitate planning and govern the control of joint restoration operations, but no pertinent joint publications provide guidance to assist the planners.

<sup>3</sup> Nothing precludes changing priorities after substantive changes are recommended and approved.

<sup>4</sup> Limited. A restoration exercise focused on the establishment of theater restoration operation responsibilities has not been conducted. A RESTOP ACTD (ongoing) has been conducted with results TBP.

<sup>5</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>6</sup> Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.

<sup>7</sup> Joint publications will be enhanced to provide guidance to assist the planners.

<sup>8</sup> Experiments and exercises focused on theater restoration operations will be conducted. Lessons learned from RESTOPS ACTD will be integrated into future exercises and experimentation that looks at issues other than fixed sites.

### 15.3.3 Functional Solution Analysis

#### 15.3.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** No pertinent joint publications or TTPs provide guidance to assist the planners.  
**Non-Materiel Solutions:** *Doctrine:* Develop pertinent joint publications provide guidance to assist planners who need to advise the combatant commander on the coordination of theater restoration operation responsibilities.
2. **Deficiency:** A restoration exercise focused on the establishment of theater restoration operation responsibilities has not been conducted.  
**Non-Materiel Solutions:** *Training:* Develop COCOM staff exercises to define and refine restoration operation responsibilities. Incorporate lessons learned from RESTOPS ACTD into future exercises.
3. **Deficiency:** RESTOP ACTD results have not been published.  
**Non-Materiel Solutions:** *Training:* Incorporate lessons learned from RESTOPS ACTD into future doctrine and staff exercises.
4. **Deficiency:** Leader education does not address this issue.  
**Non-Materiel Solutions:** *Leadership:* Establish JPME leader education on this task.

#### 15.3.3.2 IMA Assessment Summary

N/A

**15.4 Task STSUST 4: Establish theater restoration operations guidance for strategic deployment, sustainment, and redeployment, including NEO and AE operations****15.4.1 Functional Area Analysis****15.4.1.1 Definition**

To ensure the integration of strategic deployment, sustainment, and redeployment with ongoing or planned restoration operations. Key considerations include contamination avoidance by lift assets, designation of alternate ports of embarkation/debarkation (POEs/PODs), identification of transload sites for transload of cargo and passengers from uncontaminated to contaminated lift platforms for movement into contaminated PODs, thorough decontamination of lift platforms, and redeploying forces to internationally recognized decontamination standards. Aeromedical evacuation (AE) planning should include TTPs to enable the movement of contagious/contaminated patients.

**15.4.1.2 Derivation**

*UJTL (ST 1.1.2, ST4, ST4.2.2.2, ST8.4.3, ST9.4), Air Mobility Operations in a Chemical and Biological Environment.*

**15.4.1.2.1 Supported Tasks:** SNSUST 1, SNSUST 2, SNSUST 5, SNSUST 7

**15.4.1.2.2 Lateral Tasks:** STSHA 6, STSUST 14

**15.4.1.2.3 Supporting Task:** OPSUST 11

**15.4.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Persistent CBRN effects. (C1.3.3.1-3)

**Military**

1. Stressful mission. (C2.1)
2. No mission preparation (C2.1.3)
3. Weak forces assigned. (C2.2.1)
4. Negligible personnel experience. (C2.2.4.5)
5. Limited lift assets available. (C2.5.2)
6. High rear-area security. (C2.7.1)
7. Limited host-nation support. (C2.8.5)
8. Conventional and terrorist threat form. (C2.9.2)
9. Fully developed state of conflict. (C2.10.1)

**Civil**

Limited foreign government support. (C3.1.2.3)

**15.4.2 Functional Needs Analysis****15.4.2.1 Capability and Deficiency Assessment Summary**

Table 15.4-1 discusses the only capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The current assessment is “red.” Any COCOM HQ has the basic ability to establish theater restoration operations guidance for strategic deployment, sustainment, and redeployment (including noncombatant evacuation operations [NEO] and AE) operations. There are some deficiencies that negatively impact on the speed and efficiency with which they will be able to do this, and some international standards that must be established to preclude intertheater movement problems.

**Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Improvements in JTTPs are forecast in the near/mid term, which should improve the overall capability to “yellow.”

**Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. JTTPs, training and exercises, and education will continue to improve leading to a far-term assessment of “green.” A problem anticipated to extend into the far term is that there is no universally accepted standard for movement of contaminated cargo and/or the evacuation of contagious or contaminated casualties/remains.

Table 15.4-1. STSUST 4: Capabilities and Deficiency Assessment

Capability: COCOM HQ	M1	M2	M3	M4	M5	M6	M7	M8
Current Overall Capability <sup>1</sup>	Y <sup>2</sup>	R <sup>3</sup>	G <sup>4</sup>	R <sup>5</sup>	G <sup>6</sup>	R <sup>7</sup>	R <sup>8</sup>	R <sup>9</sup>
Near/Mid-Term Overall Capability <sup>10</sup>	Y	Y	G	Y	G	Y	R	Y
Far-Term Overall Capability <sup>11</sup>	G <sup>12</sup>	Y <sup>13</sup>	G	Y <sup>14</sup>	G	Y <sup>15</sup>	R	G <sup>16</sup>

	FAA Measure	Scale
M1	Theater CBRN/toxic industrial material (TIM) status impacts on strategic deployment, sustainment, and/or redeployment are projected.	G – Yes, Y – Limited, R – No
M2	Alternate and/or diversion en route bases and PODs/POEs have been designated to avoid contaminated areas during deployment, sustainment, and redeployment operations.	G – Yes, Y – Limited, R – No
M3	Joint Logistics over The Shore (JLOTS) is planned to avoid contaminated Seaport of Embarkation/Debarcation (SPOE/SPOD).	G – Yes, Y – Limited, R – No
M4	Cargo/passenger transload site identified for transload of deploying forces and sustainment cargo from uncontaminated to contaminated lift assets for movement into contaminated PODs.	G – Yes, Y – Limited, R – No
M5	CBRN/TIM situation has been considered in theater reception, staging, onward movement, and integration plans.	G – Yes, Y – Limited, R – No
M6	All cargo is decontaminated to internationally accepted standards (when available) prior to redeployment.	G – Yes, Y – Limited, R – No
M7	Overflight and landing restrictions will permit the movement of contaminated cargo and/or the evacuation of contagious or contaminated casualties/remains.	G – Yes, Y – Limited, R – No
M8	NEO plans include actions in the event of CBRN/TIM attack.	G – Yes, Y – Limited, R – No

<sup>1</sup> No concepts or doctrine relating to this issue have been developed. Joint leader education does not address this issue.

<sup>2</sup> Limited. Any COCOM staff can determine how CBRN status in the theater impacts strategic deployment, sustainment, and/or redeployment, but there are no TTPs that specifically address issues affecting how to do this.

<sup>3</sup> Limited. Any COCOM staff can establish alternate PODs/POEs, but there are no TTPs that specifically address establishing PODs/POEs to avoid contaminated areas during deployment, sustainment, and redeployment operations.

<sup>4</sup> Nothing precludes JLOTS planning in response to any sort of contamination and it is anticipated as a requirement for any sort of SPOE/SPOD disruption.

<sup>5</sup> Limited. Any COCOM staff can develop, identify and monitor the operations of a transload site. However, no TTPs specifically address moving sustainment cargo from uncontaminated to contaminated lift assets for movement into contaminated PODs. Any such procedures are currently manual, making the process slow, labor-intensive, and subject to human error.

<sup>6</sup> Nothing precludes planning of this type. Contamination reports must be immediately available to execute plans.

<sup>7</sup> Any COCOM HQ can coordinate with the Department of Defense Explosive Safety Board to review and approve plans for the lease, transfer or disposal of DoD real property when contamination exists or is suspected to exist. There are no internationally accepted standards for decontamination completeness.

<sup>8</sup> There is no universally accepted standard for movement of contaminated cargo and/or the evacuation of contagious or contaminated casualties/remains.

<sup>9</sup> While some NEO plans do address CBRN issues to one degree or another, standards established by the joint staff do not exist.

<sup>10</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>11</sup> Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.

<sup>12</sup> JTTP will be developed to determine how CBRN status in the theater impacts strategic deployment, sustainment, and/or redeployment.

<sup>13</sup> JTTP will be developed that specifically addresses establishing PODs/POEs to avoid contaminated areas during deployment, sustainment, and redeployment operations.

<sup>14</sup> JTTP will be developed that specifically addresses moving sustainment cargo from uncontaminated to contaminated lift assets for movement into contaminated PODs.

<sup>15</sup> Internationally accepted standards for decontamination completeness will be established.

<sup>16</sup> Standards will be established by the joint staff to address NEO CBRND issues.

### 15.4.3 Functional Solution Analysis

#### 15.4.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** No TTPs exist to assist in projecting theater CBRN status impacts on strategic deployment, sustainment, and/or redeployment.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs to assist in projecting theater CBRN status impacts on strategic deployment, sustainment, and/or redeployment.
2. **Deficiency:** There are no TTPs that specifically address establishing PODs/POEs to avoid contaminated areas during deployment, sustainment, and redeployment operations.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs that specifically address establishing PODs/POEs to avoid contaminated areas during deployment, sustainment, and redeployment operations.
3. **Deficiency:** There are no TTPs that specifically address moving sustainment cargo from uncontaminated to contaminated lift assets for movement into contaminated PODs.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs that specifically address moving sustainment cargo from uncontaminated to contaminated lift assets for movement into contaminated PODs.
4. **Deficiency:** Procedures that specifically address moving sustainment cargo from uncontaminated to contaminated lift assets for movement into contaminated PODs are currently manual making the process slow, labor intensive, and subject to human error.  
**Non-Materiel Solutions:** None.
5. **Deficiency:** There are no internationally accepted standards for decontamination completeness.  
**Non-Materiel Solutions:** *Doctrine:* Develop internationally accepted standards for decontamination completeness.
6. **Deficiency:** There is no universally accepted standard for movement of contaminated cargo and/or the evacuation of contagious or contaminated casualties/remains  
**Non-Materiel Solutions:** *Doctrine:* Develop universally accepted standard for movement of contaminated cargo and/or the evacuation of contagious or contaminated casualties/remains.
7. **Deficiency:** Standards established by the joint staff that provide CBRN NEO guidance to all COCOMs do not exist.  
**Non-Materiel Solutions:** *Doctrine:* Develop standards established by the joint staff that provide CBRN NEO guidance to all COCOMs.
8. **Deficiency:** No concepts or doctrine relating to this issue have been developed.

**Non-Materiel Solutions:** *Doctrine:* Develop concepts and doctrine relating to this issue.

9. **Deficiency:** Joint leader education does not address this issue.

**Non-Materiel Solutions:** *Leadership:* Develop joint leader education relating to this issue.

**15.4.3.2 IMA Assessment Summary**

Table 15.4-2 shows possible material approaches that address the remaining materiel requirements of the DOTMLPF assessment.

**Table 15.4-2. STSUST 4: IMA Assessment**

<b>Capability Gap</b>	<b>Idea for Materiel Approach</b>	<b>Description</b>
Procedures that specifically address moving sustainment cargo from uncontaminated to contaminated lift assets for movement into contaminated PODs are currently manual, making the process slow, labor-intensive, and subject to human error.	Automation Tool	Develop automated tools and integrate procedures into automated systems that specifically address moving sustainment cargo from uncontaminated to contaminated lift assets for movement into contaminated PODs.

**15.5 Task STSUST 5: Incorporate units to support restoration operations in the TPFDL****15.5.1 Functional Area Analysis****15.5.1.1 Definition**

To incorporate units to support restoration operations in the Time-Phased Force and Deployment List (TPFDL) to ensure that the right restoration operation capabilities are available when required. The combatant commander is responsible for this incorporation and must be well-versed in both friendly restoration operation capabilities and limitations as well as changes in the CBRN/TIM threat.

**15.5.1.2 Derivation**

*UJTL (ST 9.4, ST 7.1.2, ST 7.1.3), QDR 2001.*

**15.5.1.2.1 Supported Tasks: SNSUST 9, SNSUST 10****15.5.1.2.2 Lateral Tasks: STSHA 6, STSUST 14****15.5.1.2.3 Supporting Task: N/A****15.5.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Multiple competing apportionments. (C2.2.2)
2. Limited personnel experience. (C2.2.4.5)
3. Limited host-nation support. (C2.8.5)

**Civil**

1. Limited foreign government support. (C3.1.2.3)

**15.5.2 Functional Needs Analysis****15.5.2.1 Capability and Deficiency Assessment Summary**

Table 15.5-1 discusses the only capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The current assessment is “green.” The Combatant Commander incorporates units to support restoration operations in the TPFDL. This task requires that the Combatant Commander be well-versed in friendly decontamination, medical, logistical, assessment, and engineering capabilities and limitations. Nothing precludes the COCOM staff from accomplishing this task, but there is very little in the way of existing doctrine or TTPs to help guide them.

**Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. JTTPs, training and exercises, and education will all improve retaining a mid-term assessment of “green.”

**Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. DOTMLPF should continue to improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. JTTPs, training and exercises, and education will all improve leading to a far-term assessment of “green.”

**Table 15.5-1. STSUST 5: Capability and Deficiency Assessment**

<b>Capability: COCOM HQ</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>
<b>Current Overall Capability<sup>1</sup></b>	G <sup>2</sup>	G <sup>3</sup>	Y <sup>4</sup>	G <sup>5</sup>
<b>Near/Mid-Term Overall Capability<sup>6</sup></b>	G	G	G <sup>7</sup>	G
<b>Far-Term Overall Capability<sup>8</sup></b>	G	G	G	G

	<b>FAA Measure</b>	<b>Scale</b>
M1	Units to support restoration operations are incorporated in the TPFDL.	G – Yes, Y – Limited, R – No
M2	TPFDL is modified after substantive changes are recommended and approved.	G – Yes, Y – Limited, R – No
M3	Theater exercises/experimentation provide feedback on the incorporation of units to support restoration operations in the TPFDL.	G – Yes, Y – Limited, R – No
M4	TPFDL changes are made as required by CBRN/TIM threat assessment.	G – Yes, Y – Limited, R – No

<sup>1</sup> JP 3-11 and other pertinent publications do not provide definitive guidance or methods by which units can be selected for deployment into theaters where contamination threats are possible. Joint leader education does not address this issue.

<sup>2</sup> QDR 2001 calls for sufficient mobility, including airlift, sealift, prepositioning, basing infrastructure, alternative points of debarkation, and new logistical concepts of operations, to conduct expeditionary operations in distant theaters against adversaries armed with CBRN and other means to deny access to U.S. forces. The capability to establish forward presence of decontamination units and facilities in theater and to incorporate units to support restoration operations in the TPFDL exists now.

<sup>3</sup> Yes. There are no organic constraints.

<sup>4</sup> Limited, a restoration exercise focused on the incorporation of units to support restoration operations in the TPFDL has not been conducted. A RESTOP ACTD (ongoing) has been conducted with results TBP.

<sup>5</sup> Yes. There are no organic constraints.

<sup>6</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>7</sup> Experiments and exercises focused on theater restoration operations will be conducted. Lessons learned from RESTOPS ACTD will be integrated into future exercises and experimentation that looks at issues other than fixed sites.

<sup>8</sup> Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.

### 15.5.3 Functional Solution Analysis

#### 15.5.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** A restoration exercise focused on the incorporation of units to support restoration operations in the TPFDL has not been conducted.  
**Non-Materiel Solutions:** *Training:* Develop COCOM staff exercises focusing on the incorporation of units to support restoration operations in the TPFDL.
2. **Deficiency:** RESTOP ACTD results have not been published.  
**Non-Materiel Solutions:** *Doctrine:* Incorporate lessons learned from RESTOPS ACTD into future doctrine and staff exercises.
3. **Deficiency:** JP 3-11 and other pertinent publications do not provide definitive guidance or methods by which units can be selected for deployment into theaters where contamination threats are possible.  
**Non-Materiel Solutions:** *Doctrine:* Develop doctrine/TTPs providing definitive guidance or methods by which units can be selected for deployment into theaters where contamination threats are possible.
4. **Deficiency:** Joint leader education does not address this issue.  
**Non-Materiel Solutions:** *Leadership:* Develop JPME training on this task.

#### 15.5.3.2 IMA Assessment Summary

N/A

**15.6 Task STSUST 6: Designate joint restoration operation site areas****15.6.1 Functional Area Analysis****15.6.1.1 Definition**

To designate joint restoration operation site areas to facilitate subordinate unit decontamination planning. The combatant commander, in conjunction with host-nation or coalition partners, is responsible for these designations. In addition to operational considerations, host-nation environmental impacts and hazards must be considered, as well as impacts on friendly civilian populations.

**15.6.1.2 Derivation**

*UJTL (ST 9.4, ST 4.2.3, ST 6.2.6.2).*

**15.6.1.2.1 Supported Task: SNSUST 10****15.6.1.2.2 Lateral Tasks: STSHA 6, STSUST 14****15.6.1.2.3 Supporting Task: OPSUST 13****15.6.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Partial preexisting arrangements. (C 2.1.1.2)
2. Limited personnel experience. (C2.2.4.5)
3. Limited lift assets available. (C2.5.2)
4. Poor joint staff integration. (C2.3.1.1)
5. Moderate host-nation support. (C2.8.5)

**Civil**

1. Mixed support for political policies. (C3.1)
2. Diplomatic foreign government support. (C3.1.2.3)

**15.6.2 Functional Needs Analysis.****15.6.2.1 Capability and Deficiency Assessment Summary**

Table 15.6-1 discusses the only capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The current assessment is “yellow.” In conjunction with host-nation or coalition partners, the combatant commander designates areas for fixed joint restoration operations. Nothing precludes the COCOM staff from accomplishing this task, but there is very little in the way of existing doctrine or TTPs to help guide them. A restoration exercise focused on determining efficacy of designated joint restoration operation site areas has not been conducted.

**Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. No capability improvement is forecast for the near/mid term.

**Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. JTTPs, training and exercises, and education will all improve leading to a far-term assessment of “green.”

**Table 15.6-1. STSUST 6: Capability and Deficiency Assessment**

Capability: COCOM HQ	M1	M2	M3
<b>Current Overall Capability<sup>1</sup></b>	Y <sup>2</sup>	G <sup>3</sup>	Y <sup>4</sup>
<b>Near/Mid-Term Overall Capability<sup>5</sup></b>	Y	G	Y
<b>Far-Term Overall Capability<sup>6</sup></b>	G <sup>7</sup>	G	G <sup>8</sup>

	FAA Measure	Scale
M1	Designated joint restoration operation site areas are established with nominated individual countries.	G – Yes, Y – Limited, R – No
M2	Designated joint restoration operation site areas are modified after substantive changes are recommended and approved.	G – Yes, Y – Limited, R – No
M3	International exercises/experimentation provide feedback on efficacy of designated joint restoration operation site areas.	G – Yes, Y – Limited, R – No

<sup>1</sup> No doctrine/TTPs have been developed. Leader education does not address this issue.

<sup>2</sup> Nothing precludes designating a joint RESTOPS area, but no guidance exists on selection criteria, so there is no way to know whether selection is appropriate or will meet operational requirements.

<sup>3</sup> Any staff can accomplish this task.

<sup>4</sup> Limited, a restoration exercise focused on efficacy of designated joint restoration operation site areas has not been conducted. A RESTOP ACTD (ongoing) has been conducted with results TBP.

<sup>5</sup> Doctrine/JTTPs will be developed. Leader education will be designed to address this issue.

<sup>6</sup> Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.

<sup>7</sup> Doctrine/JTTPs will be developed. Leader education will be designed to address this issue.

<sup>8</sup> Experiments and exercises focused on theater restoration operations will be conducted. Lessons learned from RESTOPS ACTD will be integrated into future exercises and experimentation that looks at issues other than fixed sites.

### 15.6.3 Functional Solution Analysis

#### 15.6.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** No guidance exists on selection criteria, so there is no way to know whether selection is appropriate or will meet operational requirements.  
**Non-Materiel Solutions:** *Doctrine:* Develop doctrine/TTPs providing definitive guidance or methods by which the efficacy of designated joint restoration operation site areas can be determined and the process improved. An Army Maneuver Support Center or Department of Navy action will be appropriate to address the doctrinal development of these technical procedures. Country studies will need to be done for engineering, water conservation issues, etc. Bilateral agreements with listed restrictions and requirements for hosting countries will need to be reached.
2. **Deficiency:** A restoration exercise focused on determining the efficacy of designated joint restoration operation site areas has not been conducted.  
**Non-Materiel Solutions:** *Training:* Develop COCOM staff exercises focusing on designating joint restoration operation site areas.
3. **Deficiency:** RESTOP ACTD results have not been published.  
**Non-Materiel Solutions:** *Doctrine:* Incorporate lessons learned from RESTOPS ACTD into future doctrine and staff exercises.
4. **Deficiency:** No leader education for restoration operations.  
**Non-Materiel Solutions:** *Leadership:* Develop JPME leader training on designating joint restoration operation areas.

#### 15.6.3.2 IMA Assessment Summary

N/A

**15.7 Task STSUST 7: Coordinate multinational restoration operations****15.7.1 Functional Area Analysis****15.7.1.1 Definition**

To plan for the mutual restoration operation interoperability and cooperation between U.S. and multinational units and facilities. The combatant commander provides for the coordination of multinational restoration operations using U.S. capabilities to restore multinational units/facilities, multinational capabilities to restore U.S. units/facilities, or a combination of both.

**15.7.1.2 Derivation**

*UJTL (ST 9.4, ST 8.2.10, ST 8.3.2), AJP 3-8.*

**15.7.1.2.1 Supported Task: SNSUST 1****15.7.1.2.2 Lateral Tasks: STSHA 8, STSUST 14****15.7.1.2.3 Supporting Tasks: OPSUST 5, OPSUST 6, OPSUST 7****15.7.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Partial preexisting arrangements. (C2.1.1.2)
2. Limited personnel experience. (C2.2.4.5)
3. Poor joint staff integration. (C2.3.1.1)
4. Moderate host-nation support. (C2.8.5)

**Civil**

1. Moderate host-nation support. (C2.8.5)
2. Mixed support for political policies. (C3.1)
3. Diplomatic foreign government support. (C3.1.2.3)

**15.7.2 Functional Needs Analysis****15.7.2.1 Capability and Deficiency Assessment Summary**

Table 15.7-1 discusses the only capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The current assessment is “yellow.” The combatant commander provides for the coordination of multinational restoration operations using U.S. capabilities to restore multinational units/facilities, using multinational capabilities to restore U.S. units/facilities, or a combination of both. Nothing precludes the COCOM staff from accomplishing this task, but there is very little in the way of existing doctrine or TTPs to help guide them. Plans for mutual restoration operation interoperability and cooperation between U.S. and multinational units are virtually nonexistent at the ST level. A restoration exercise focused on efficacy of plans for mutual restoration operation interoperability and cooperation between U.S. and multinational units and facilities has not been conducted. Little or no training is conducted to expose weaknesses in coordination of multinational restoration operations. Most of the considerations in AJP 3-8 are focused at the tactical level. JP 3-11 also presents information primarily at the tactical level with some operational considerations included. No document focuses on issues of concern for the combatant commander. Joint leader education does not address this issue.

**Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. No capability improvement is forecast for the near/mid term.

**Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. Experiments and exercises focused on theater restoration operations will be conducted. Lessons learned from RESTOPS ACTD will be integrated into future exercises and experimentation that looks at issues other than fixed sites. JTTPs, training and exercises, and education will all improve leading to a far-term assessment of “green.”

**Table 15.7-1. STSUST 7: Capability and Deficiency Assessment**

<b>Capability: COCOM HQ</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>
<b>Current Overall Capability<sup>1</sup></b>	Y <sup>2</sup>	G <sup>3</sup>	Y <sup>4</sup>
<b>Near/Mid-Term Overall Capability<sup>5</sup></b>	Y	G	Y
<b>Far-Term Overall Capability<sup>6</sup></b>	G <sup>7</sup>	G	G <sup>8</sup>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Plans for mutual restoration operation interoperability and cooperation between U.S. and multinational units and facilities are established with nominated individual countries.	G – Yes, Y – Limited, R – No
M2	Plans for mutual restoration operation interoperability and cooperation between U.S. and multinational units and facilities are modified after substantive changes are recommended and approved.	G – Yes, Y – Limited, R – No
M3	International exercises/experimentation provide feedback on efficacy of plans for mutual restoration operation interoperability and cooperation between U.S. and multinational units and facilities.	G – Yes, Y – Limited, R – No

<sup>1</sup> Most of the considerations in *AJP 3-8* are focused at the tactical level. *JP 3-11* also presents information primarily at the tactical level with some operational considerations included. No document focuses on issues of concern for the combatant commander. Joint leader education does not address this issue.

<sup>2</sup> The capability to coordinate multinational restoration operations exists now. Actual plans for mutual restoration operation interoperability and cooperation between U.S. and multinational units and facilities are limited. Plans for mutual restoration operation interoperability and cooperation between U.S. and multinational units and facilities are mature at the tactical level but virtually nonexistent at the ST level.

<sup>3</sup> Yes. There are no organic constraints once the initial plans exist.

<sup>4</sup> Limited, a restoration exercise focused on efficacy of plans for mutual restoration operation interoperability and cooperation between U.S. and multinational units and facilities has not been conducted. Little or no training is conducted to expose weaknesses in coordination of multinational restoration operations.

A RESTOP ACTD (ongoing) has been conducted with results TBP.

<sup>5</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>6</sup> Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.

<sup>7</sup> Plans for mutual restoration operation interoperability and cooperation between U.S. and multinational units and facilities will be refined or developed as a result of focused international experiments and exercises.

<sup>8</sup> Experiments and exercises focused on theater restoration operations will be conducted. Lessons learned from RESTOPS ACTD will be integrated into future exercises and experimentation that looks at issues other than fixed sites.

### 15.7.3 Functional Solution Analysis

#### 15.7.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** Plans for mutual restoration operation interoperability and cooperation between U.S. and multinational units are virtually nonexistent at the ST level.  
**Non-Materiel Solutions:** *Doctrine:* Develop plans for mutual restoration operation interoperability and cooperation between U.S. and multinational units at the ST level.
- 2. Deficiency:** A restoration exercise focused on efficacy of plans for mutual restoration operation interoperability and cooperation between U.S. and multinational units and facilities has not been conducted.  
**Non-Materiel Solutions:** *Training:* Develop COCOM staff exercises focusing on mutual restoration operation interoperability and cooperation between U.S. and multinational units at the ST level. National-level, COCOM, and JTF exercises must include the coordination of multinational restoration operations in order to test, find, and document potential weaknesses. CBRN incidents and events need to be included at all levels of command to integrate CBRN defense into multinational training. Multinational formations, North Atlantic Treaty Organization integrated military command structure components, and potential coalition partners need to be included. The appropriate training and exercise will be essential to integrate non-U.S. forces into the CBRN defense capability of the joint force.
- 3. Deficiency:** RESTOP ACTD results have not been published.  
**Non-Materiel Solutions:** *Doctrine:* Incorporate lessons learned from RESTOPS ACTD into future doctrine and staff exercises.
- 4. Deficiency:** Joint leader education does not address this issue.  
**Non-Materiel Solutions:** *Leadership:* JPME must include leader-learning areas for restoration operations considerations at the ST level.
- 5. Deficiency:** Doctrine does not exist above the tactical level.  
**Non-Materiel Solutions:** *Doctrine:* AJP 3-8 and JP 3-11 both need to be updated to include multinational restoration operation coordination guidance for the ST level.

#### 15.7.3.2 IMA Assessment Summary

N/A

**15.8 Task STSUST 8: Develop TEPs for restoration operation considerations and activities for assigned theater or designated countries****15.8.1 Functional Area Analysis****15.8.1.1 Definition**

To develop Theater Engagement Plans (TEPs) that will allow cooperation and the building of trust through a combination of restoration operation exercises, training, equipment exchange, and other cooperative efforts. Many nations that would normally support U.S. initiatives may feel threatened by hostile neighbors or nations that possess CBRN/TIM weapons. To ensure cooperation and interoperability, the combatant commander develops TEPs for restoration operation considerations and activities for assigned theater or designated countries. TEPs that include restoration operation considerations and activities for assigned theater or designated countries can help to mitigate reluctance to support the United States. If countries are provided with the means to restore themselves after CBRN/TIM attacks or if they are assured of U.S. assistance, they will feel less threatened. In conjunction with interagency partners, CJCS coordinates “Global Family of Engagement Plan” policy and guidelines to combatant commanders for restoration operation considerations.

**15.8.1.2 Derivation**

*UJTL (ST 9.4, ST 8.2.1, ST 8.1.2), CJCSM 3113.01a.*

**15.8.1.2.1 Supported Task: SNSUST 11****15.8.1.2.2 Lateral Task: STSHA 9****15.8.1.2.3 Supporting Task: OPSUST 7****15.8.1.3 Condition**

Perform this task under conditions of:

**Physical. N/A****Military**

1. No preexisting arrangements. (C2.1.1.2)
2. Limited personnel expertise. (C2.2.4.5)

**Civil**

1. Moderate host-nation support. (C2.8.5)
2. Mixed support for political policies. (C3.1)
3. Limited foreign government support. (C3.1.2.3.)

**15.8.2 Functional Needs Analysis****15.8.2.1 Capability and Deficiency Assessment Summary**

Table 15.8-1 discusses the only capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The current assessment is “yellow.” The Combatant Command develops TEPs for restoration operation considerations and activities for assigned theater or designated countries. Nothing precludes the COCOM staff from establishing these TEPs now, but there is very little in the way of existing doctrine or TTPs to help guide them. A TEP is primarily a strategic planning document intended to link COCOM-planned regional engagement activities with national strategic objectives. The TEP is based on defense planning guidance. COCOM planned and supported operations and activities produce multiple benefits in readiness, modernization, and engagement. However, peacetime military engagement activities must be prioritized to ensure efforts are focused on those that are of greatest importance, without sacrificing warfighting capability. Because WMDs represent the most significant threat to global security, they are ideal candidates for TEPs. TEPs identify the synchronization of these activities on a regional basis and illustrate the efficiencies gained from regional COCOM engagement activities that support national strategic objectives.

**Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. No capability improvement is forecast for the near/mid term.

**Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. JTTPs, training and exercises, and education will all improve leading to a far-term assessment of “green.”

**Table 15.8-1. STSUST 8: Capability and Deficiency Assessment**

<b>Capability: COCOM HQ</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>R<sup>2</sup></b>	<b>G<sup>3</sup></b>	<b>G<sup>4</sup></b>	<b>R<sup>5</sup></b>
<b>Near/Mid-Term Overall Capability</b>	<b>Y</b>	<b>G</b>	<b>G</b>	<b>R</b>
<b>Far-Term Overall Capability<sup>6</sup></b>	<b>Y<sup>7</sup></b>	<b>G</b>	<b>G</b>	<b>G<sup>8</sup></b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Restoration operation TEPs are established for designated countries.	G – Yes, Y – Limited, R – No
M2	TEPs are modified after substantive changes are recommended and approved.	G – Yes, Y – Limited, R – No
M3	TEPs meet guidelines of <i>CJCSM 3113.01A</i> .	G – Yes, Y – Limited, R – No
M4	Joint exercises/experimentation provide feedback on efficacy of TEPs for specific countries.	G – Yes, Y – Limited, R – No

<sup>1</sup> No doctrine has been developed. Leader education does not address this issue.

<sup>2</sup> Nothing precludes a COCOM staff from initiating TEP for restoration operations, but no guidance has been provided, and no doctrine exists specifically addressing restoration operation integration into TEPs.

<sup>3</sup> Nothing precludes meeting this standard once restoration operation TEPs are established.

<sup>4</sup> Nothing precludes restoration operation TEPs from meeting the guidelines of *CJCSM 3113.01a*. CBRND issues are perfect for TEPs.

<sup>5</sup> No Restoration Operation exercises/experimentation have been conducted to provide feedback on efficacy of TEPs for specific countries.

<sup>6</sup> Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.

<sup>7</sup> Guidance will be provided and doctrine will be developed specifically addressing restoration operation integration into TEPs.

<sup>7</sup> Restoration Operation exercises/experimentation will be conducted to provide feedback on efficacy of TEPs for specific countries.

### 15.8.3 Functional Solution Analysis

#### 15.8.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** No guidance has been provided and no doctrine/TTPs exist specifically addressing restoration operation integration into TEPs.  
**Non-Materiel Solutions:** *Doctrine:* Establish policies, TTPs, and guidelines that include practical ways to enhance theater restoration operations integration into TEPs.
2. **Deficiency:** No Restoration Operation exercises/experimentation have been conducted to provide feedback on efficacy of TEPs for specific countries.  
**Non-Materiel Solutions:** *Training:* Develop exercises to include restoration operations with TEP countries to determine efficacy of policy once established.
3. **Deficiency:** Leader education does not address this issue.  
**Non-Materiel Solutions:** *Leadership:* At the urging of the Joint Forces Staff College (JFSC), and as part of a JRO-CBRND joint education initiative, a team began to investigate ways to develop CBRN defense initiatives as part of theater engagement planning. The subject matter experts at the JFSC felt that in the current global environment, CBRND was an ideal platform for military engagement, enhancing a common global defense capability against weapons of mass destruction. The team plans to present these Joint Capabilities Integration and Development System (JCIDS) tasks to the JFSC as a foundation for the development of TEP education materials when they are finalized.

#### 15.8.3.2 IMA Assessment Summary

N/A

**15.9 Task STSUST 9: Coordinate SOF restoration operations requirements****15.9.1 Functional Area Analysis****15.9.1.1 Definition**

To provide specialized planning and coordination of key decontamination and support assets required to support SOF operational requirements. Because of the level of coordination required, the combatant commander coordinates SOF restoration operation requirements. SOF operations are often done clandestinely or in austere areas. Restoration operations for SOF will be complex and require extraordinary planning and support.

**15.9.1.2 Derivation**

*UJTL (ST 9.4, ST 1.3.4, ST 1.3.7).*

**15.9.1.2.1 Supported Tasks: SNSUST 9, SNSUST 10, SNSUST 12****15.9.1.2.2 Lateral Task: N/A****15.9.1.2.3 Supporting Task: OPSUST 8****15.9.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Persistent CBRN/TIM effects. (C1.3.3.1-3)

**Military**

1. Stressful mission. (C2.1)
2. Partially completed mission preparation. (C2.1.3)
3. Weak forces assigned. (C2.2.1)
4. Negligible personnel experience. (C2.2.4.5)
5. Poor joint staff integration. (C2.3.1.1)
6. Limited lift assets. (C2.5.2)
7. High rear-area security. (C2.7.1)
8. No host-nation support. (C2.8.5)
9. Conventional and terrorist threat form. (C2.9.2)
10. Fully developed state of conflict. (C2.10.1)

**Civil**

1. Limited foreign government support. (C3.1.2.3)

## **15.9.2 Functional Needs Analysis**

### **15.9.2.1 Capability and Deficiency Assessment Summary**

Table 15.9-1 discusses the capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The current assessment is “red.” Any COCOM staff has a team of operational planners and command and control specialists, and most have CBRN subject matter experts. This team of experts has the skill to support SOF restoration operation requirements, but there are some deficiencies that negatively impact on the efficiency with which they will be able to operate.

#### **Projected Near/Mid-Term Capability and Deficiency**

Some improvements in JTTP capability is currently projected for the near/mid term. The overall near/mid term capability is forecast to be “yellow.”

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. JTTPs, training and exercises, and education will continue to improve leading to a far-term assessment of “yellow.”

**Table 15.9-1. STSUST 9: Capability and Deficiency Assessment**

<b>Capability: COCOM HQ</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>	<b>M6</b>
<b>Current Overall Capability<sup>1</sup></b>	R <sup>2</sup>	R <sup>3</sup>	R <sup>4</sup>	R <sup>5</sup>	R <sup>6</sup>	R <sup>7</sup>
<b>Near/Mid-Term Overall Capability<sup>8</sup></b>	Y	Y	Y	Y	Y	R
<b>Far-Term Overall Capability<sup>9</sup></b>	Y <sup>10</sup>	Y <sup>11</sup>	Y <sup>12</sup>	Y <sup>13</sup>	Y <sup>14</sup>	Y <sup>15</sup>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Procedures are in place to facilitate response to SOF requests for assistance.	G – Yes, Y – Limited, R – No
M2	Procedures and checklists exist to help complete planning.	G – Yes, Y – Limited, R – No
M3	Decontamination support provided is adequate to meet mission requirements.	G – Yes, Y – Limited, R – No
M4	Decontamination and support forces have SOF restoration operation experience.	G – Yes, Y – Limited, R – No
M5	Decontamination lift requirements are met adequately to support mission requirements.	G – Yes, Y – Limited, R – No
M6	Joint exercises provide lessons learned on SOF restoration operation support.	G – Yes, Y – Limited, R – No

<sup>1</sup> No doctrine has been developed. Leader education does not address this issue.

<sup>2</sup> Limited. Any COCOM-level unit staff can respond to SOF request for assistance, but there are no specific procedures, TTPs, or formalized familiarization training that addresses the unique aspects of joint forces supporting SOF restoration operation requirements.

<sup>3</sup> Limited. Any ST-level HQ staff can develop procedures and checklists for operational plans and orders, but there are no TTPs that address development of the unique requirements of SOF restoration operational plans and orders.

<sup>4</sup> Limited. Any ST-level HQ staff can provide support, but there is no real way of knowing how effective this support will be without comprehensive training events.

<sup>5</sup> Limited. No staff will have an experience base without comprehensive training with SOF.

<sup>6</sup> Limited. Lift requirements cannot be determined without comprehensive training with SOF.

<sup>7</sup> No joint exercises/experimentation have provided lessons learned on SOF restoration operation support.

<sup>8</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>9</sup> Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.

<sup>10</sup> JTTPs and formalized familiarization training that addresses the unique aspects of joint forces supporting SOF restoration operation requirements will be developed.

<sup>11</sup> JTTPs will be formulated that address development of the unique requirements of SOF restoration operational plans and orders.

<sup>12</sup> Comprehensive training events will provide an assessment mechanism.

<sup>13</sup> Comprehensive training with SOF will allow staffs to develop an SOF support experience base.

<sup>14</sup> Comprehensive training with SOF will be conducted to determine lift requirements and special needs.

<sup>15</sup> Joint exercises/experimentation will provide lessons learned on SOF restoration operation support.

### 15.9.3 Functional Solution Analysis

#### 15.9.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** There are no specific procedures, doctrine, or TTPs that address the unique aspects of joint forces supporting SOF restoration operation requirements.  
**Non-Materiel Solutions:** *Doctrine:* Develop procedures, doctrine, or TTPs that address the unique aspects of joint forces supporting SOF restoration operation requirements.
2. **Deficiency:** There is no specific formalized familiarization training that addresses the unique aspects of joint forces supporting SOF restoration operation requirements.  
**Non-Materiel Solutions:** *Training:* Develop planning staff familiarization training that addresses the unique aspects of joint forces supporting SOF restoration operation requirements.
3. **Deficiency:** No joint exercises or experimentation have provided lessons learned on SOF restoration operation support.  
**Non-Materiel Solutions:** *Training:* Conduct specific ST-level exercises/experiments to determine SOF restoration operation support lessons learned under a wide variety of conditions.
4. **Deficiency:** Leader education does not address this issue.  
**Non-Materiel Solutions:** *Leadership:* JPME must include leader-learning areas for SOF restoration operations considerations at the ST level.

#### 15.9.3.2 IMA Assessment Summary

N/A

**15.10 Task STSUST 10: Provide JTF HQ for command and control of restoration operations****15.10.1 Functional Area Analysis****15.10.1.1 Definition**

To establish and deploy a JTF for the specific purpose of maintaining command, control, and execution of extensive restoration operations. The combatant commander may determine that the extent or complexity of required restoration operations is such that he needs to establish a JTF to control and coordinate the restoration operations.

**15.10.1.2 Derivation**

*UJTL (ST 9.4, ST 5.1, ST 5.4.3).*

**15.10.1.2.1 Supported Tasks: SNSUST 6, SNSUST 10****15.10.1.2.2 Lateral Task: N/A****15.10.1.2.3 Supporting Task: OPSUST 9****15.10.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Persistent CBR/TIM effects. (Chemical or biological or radiological contamination affecting forces strategically deployed or affecting terrain, facilities, equipment, or manpower required to facilitate their mission.) (C1.3.3.1-3)

**Military**

1. Stressful mission. (C2.1)
2. Partially completed mission preparation. (C2.1.3)
3. Weak forces assigned. (C2.2.1)
4. Negligible personnel experience. (C2.2.4.5)
5. Poor joint staff integration. (C2.3.1.1)
6. High rear-area security. (C2.7.1)
7. Moderate host-nation support. (C2.8.5)
8. Conventional and terrorist threat form. (C2.9.2)
9. Fully developed state of conflict. (C2.10.1)

**Civil**

1. Limited foreign government support. (C3.1.2.3)

**15.10.2 Functional Needs Analysis****15.10.2.1 Capability and Deficiency Assessment Summary**

Table 15.10-1 discusses the only capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The current assessment is “yellow.” This task has never been attempted by a theater COCOM, and no training or experience base exists. Any combatant command has the ability to stand up a JTF using a corps/division-equivalent HQ to form a JTF HQ. There are many deficiencies that negatively impact on the speed and efficiency with which they will be able to stand up a JTF HQ with the express purpose of providing command and control of restoration operations.

**Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. No capability improvement is forecast for the near/mid term.

**Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. In particular, a UNIFIED ENDEAVOR exercise is projected to enable this task in FY2011. JTTPs, training and exercises, and education will all improve leading to a far-term assessment of “green.”

Table 15.10-1. STSUST 10: Capabilities and Deficiency Assessment

Capability: COCOM HQ	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10	M11	M12	M13	M14	M15	M16
Current Overall Capability <sup>1</sup>	R <sup>2</sup>	R <sup>3</sup>	Y	R <sup>4</sup>	Y <sup>5</sup>	Y <sup>6</sup>	G <sup>7</sup>	R <sup>8</sup>	Y <sup>9</sup>	G <sup>10</sup>	G <sup>11</sup>	G <sup>12</sup>	R <sup>13</sup>	G <sup>14</sup>	Y	R <sup>15</sup>
Near/Mid-Term Overall Capability <sup>16</sup>	R	R	Y	R	Y	Y	G	R	Y	G	G	G	R	G	Y	R
Far-Term Overall Capability <sup>17</sup>	G <sup>18</sup>	G <sup>19</sup>	G	G <sup>20</sup>	G <sup>21</sup>	G <sup>22</sup>	G	G <sup>23</sup>	G <sup>24</sup>	G	G	G	G <sup>25</sup>	G	G	G <sup>26</sup>

	FAA Measure	Elaboration	Scale
M1	Plans have been developed that establish a JTF for the specific purpose of maintaining command and control of extensive restoration operations.		G – Yes, Y – Limited, R – No
M2	Procedures and checklists exist to help modify plans during crisis action planning (CAP).		G – Yes, Y – Limited, R – No
M3	Adequate planning time, during CAP, is made available by combatant commander to components for planning.	Restoration operations require significant planning efforts.	G – Yes, Y – Limited, R – No
M4	Appointed joint force commander has requisite training and experience.		G – Yes, Y – Limited, R – No
M5	Joint restoration operations area is defined.		G – Yes, Y – Limited, R – No
M6	Joint force headquarters element is deployed and established in theater.		G – Yes, Y – Limited, R – No
M7	Initial communication is established with host-nation and U.S. Department of State representatives (after combatant commander establishes joint force HQ).		G – Yes, Y – Limited, R – No
M8	Joint force staff has requisite training and experience.		G – Yes, Y – Limited, R – No
M9	Taskings to initial augmentees for newly formed JTF are determined and prepared in advance.		G – Yes, Y – Limited, R – No
M10	Friendly forces orders/taskings are not significantly delayed because of unclear command relationships with HQ.		G – Yes, Y – Limited, R – No
M11	All designated staff positions are filled.		G – Yes, Y – Limited, R – No
M12	All DoD components and involved foreign governments are adequately represented on designated joint force staff.		G – Yes, Y – Limited, R – No
M13	Joint force staff augmentees have previously trained as members of a restoration operation JTF.		G – Yes, Y – Limited, R – No
M14	Nations with allocated or apportioned forces are represented on JTF staff.		G – Yes, Y – Limited, R – No
M15	Necessary augmentees are identified in joint force SOPs by rank and duty position.	Personnel with proper skill sets are critical to validate completion of restoration operations and make critical recommendations for reopening of facilities.	G – Yes, Y – Limited, R – No

M16	Joint exercises/experimentation provide feedback on efficacy of providing a JTF for restoration operations.		G – Yes, Y – Limited, R – No
-----	---	--	------------------------------

<sup>1</sup> No doctrine has been developed.

<sup>2</sup> No plans have been developed.

<sup>3</sup> No procedures or checklists currently exist to aid plan modification.

<sup>4</sup> No leader training/education for JTF RESTOPS exists, nor is there any experience base.

<sup>5</sup> Nothing precludes designating a joint RESTOPS area, but no guidance exists.

<sup>6</sup> Nothing precludes this action, and COCOMs do exercise establishing a JTF HQ. However, it has never been done for RESTOPS, and no guidance exists.

<sup>7</sup> Yes. There are no organic common constraints.

<sup>8</sup> No staff training/education for JTF RESTOPS exists, nor is there any experience base.

<sup>9</sup> Nothing precludes this action, and COCOMs do exercise establishing taskings. However, it has never been done for RESTOPS, and no guidance exists.

<sup>10</sup> Yes. There are no organic command relationship constraints.

<sup>11</sup> Yes. There are no organic staffing constraints.

<sup>12</sup> Yes. There are no organic representation constraints.

<sup>13</sup> No. There is no experience base.

<sup>14</sup> Yes. There are no organic representation constraints.

<sup>15</sup> No. A RESTOPS JTF exercise/experiment has never been conducted.

<sup>16</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>17</sup> Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.

<sup>18</sup> Plans will be developed that establish a JTF for the specific purpose of maintaining command and control of extensive restoration operations. Current planning by the U.S. Northern Command for homeland security purposes can be used as a guide for joint combat operations.

<sup>19</sup> Procedures and checklists will be developed to aid plan modification.

<sup>20</sup> Leader training/education for will be specifically developed for JTF RESTOPS. Educated leaders will train resulting in an experience base.

<sup>21</sup> Guidance will be developed for designating a joint RESTOPS area.

<sup>22</sup> A UNIFIED ENDEAVOR exercise will specifically be used to exercise this task.

<sup>23</sup> Staff training/education for JTF RESTOPS will be developed and employed, resulting in enhanced staff expertise and experience.

<sup>24</sup> A UNIFIED ENDEAVOR exercise will specifically be used to exercise this task.

<sup>25</sup> As more training is done in this area, an experience base will be established.

<sup>26</sup> A UNIFIED ENDEAVOR exercise will specifically be used to exercise this task.

### 15.10.3 Functional Solution Analysis

#### 15.10.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** No plans have been developed that establish a JTF for the specific purpose of maintaining command and control of extensive restoration operations.  
**Non-Materiel Solutions:** *Doctrine:* Develop plans to establish a JTF for the specific purpose of maintaining command and control of extensive restoration operations.
- 2. Deficiency:** No procedures and checklists exist to help modify plans during CAP.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs to aid CAP.
- 3. Deficiency:** No leader training/education for JTF RESTOPS exists, nor is there any experience base.  
**Non-Materiel Solutions:** *Training:* Develop leader training (command post exercise) to exercise potential commanders and staffs in RESTOPS JTF operations. *Leadership:* Develop designated leaders (leader education/exercises) who are nominated to potentially command a RESTOPS JTF.
- 4. Deficiency:** No guidance exists for establishing a joint RESTOPS area.  
**Non-Materiel Solutions:** *Doctrine:* Develop doctrine for deploying a RESTOPS JTF to a theater.
- 5. Deficiency:** A RESTOPS JTF has never been deployed and established in theater, and no guidance exists.  
**Non-Materiel Solutions:** *Doctrine:* Develop doctrine for RESTOPS JTF deployment.  
*Training:* Develop training for RESTOPS JTF deployment.
- 6. Deficiency:** No staff training/education for JTF RESTOPS exists, nor is there any experience base.  
**Non-Materiel Solutions:** *Training:* Develop training for RESTOPS JTF staffs. *Leadership:* Develop leader education for RESTOPS JTF staffs.
- 7. Deficiency:** No guidance exists for determining and preparing taskings to initial augmentees.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs for determining and preparing taskings to initial RESTOPS JTF augmentees.
- 8. Deficiency:** No joint force staff augmentees have previously trained as members of a restoration operation JTF.  
**Non-Materiel Solutions:** *Training:* Develop training for joint force RESTOPS JTF staff augmentees. *Personnel:* Designate personnel to be assigned as joint force RESTOPS JTF staff augmentees.

**9. Deficiency:** No SOPs exists for a RESTOPS JTF.

**Non-Materiel Solutions:** *Doctrine:* Develop RESTOPS JTF SOPs.

**10. Deficiency:** Joint exercises/experimentation do not provide feedback on efficacy of providing a JTF for restoration operations.

**Non-Materiel Solutions:** *Training:* Develop exercises to develop lessons learned about RESTOPS JTF. Nominate establishing RESTOPS JTF to be part of JRO-CBRND experimentation campaign (UNIFIED ENDEAVOR FY2010). Conduct experiments on emerging RESTOPS JTF concepts.

**11. Deficiency:** No doctrine has been developed.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine for conduct of RESTOPS JTF operations.

#### **15.10.3.2 IMA Assessment Summary**

N/A

**15.11 Task STSUST 11: Coordinate the decontamination of strategically significant areas/terrain****15.11.1 Functional Area Analysis****15.11.1.1 Definition**

To develop plans and coordinate mission execution of the decontamination of areas or terrain that are considered of such strategic significance that they must undergo decontamination. Although weathering is the preferred decontamination technique for areas/terrain, if a determination is made that there is no alternative because of the strategic significance of the area/terrain, the complexity of the decontamination and the large amount of resources required will require COCOM coordination. An area of strategic significance would probably constitute a large area or very important transportation nodes and would necessarily involve host nations in the process.

**15.11.1.2 Derivation**

*UJTL (ST 9.4, ST 6.2.2).*

**15.11.1.2.1 Supported Task: SNSUST 10****15.11.1.2.2 Lateral Tasks: STSHA 8, STSUST 14****15.11.1.2.3 Supporting Task: OPSUST 10****15.11.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Persistent CBRN/TIM effects. (C1.3.3.1-3)

**Military**

1. Stressful mission. (C2.1)
2. Partially completed mission preparation. (C2.1.3)
3. Weak forces assigned. (C2.2.1)
4. Negligible personnel experience. (C2.2.4.5)
5. Poor joint staff integration. (C2.3.1.1)
6. High rear-area security. (C2.7.1)
7. Moderate host-nation support. (C2.8.5)
8. Conventional and terrorist threat form. (C2.9.2)
9. Fully developed state of conflict. (C2.10.1)

**Civil**

1. Limited foreign government support. (C3.1.2.3)

**15.11.2 Functional Needs Analysis****15.11.2.1 Capability and Deficiency Assessment Summary**

Table 15.11-1 discusses the capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The current assessment is “yellow.” Any COCOM staff has a team of operational planners and command and control specialists and most have CBRN subject matter experts. This team of experts has the skill to coordinate the decontamination of significant areas/terrain, but there are some deficiencies that negatively impact on the efficiency with which they will be able to operate.

**Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. No capability improvement is forecast for the near/mid term.

**Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. JTTPs, training and exercises, and education will all improve leading to a far-term assessment of “green.”

**Table 15.11-1. STSUST 11: Capability and Deficiency Assessment**

<b>Capability: COCOM HQ</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>
<b>Current Overall Capability<sup>1</sup></b>	Y <sup>2</sup>	Y <sup>3</sup>	G <sup>4</sup>	Y <sup>5</sup>	Y <sup>6</sup>
<b>Near/Mid-Term Overall Capability<sup>7</sup></b>	Y	Y	G	Y	Y

M1	Plans have been developed for the decontamination of strategically significant areas/terrain.	G – Yes, Y – Limited, R – No
M2	Procedures and checklists exist to help modify plans during CAP.	G – Yes, Y – Limited, R – No
M3	Adequate planning time, during CAP, is made available by combatant commander to components for planning.	G – Yes, Y – Limited, R – No
M4	Decontamination capabilities meet mission requirements.	G – Yes, Y – Limited, R – No
M5	Joint exercises/experimentation provide feedback on efficacy of providing a JTF for restoration operations.	G – Yes, Y – Limited, R – No

<sup>1</sup> No doctrine has been developed. Leader education does not address this issue.

<sup>2</sup> Limited. Any COCOM-level unit staff can develop plans to coordinate the decontamination of significant areas/terrain, to include standing up a joint task force HQ to provide command and control if required, but there are no specific procedures, TTPs, or formalized familiarization training that addresses the unique aspects of large-scale decontamination of significant areas/terrain at the ST level.

<sup>3</sup> Limited. Any ST-level HQ staff can develop procedures and checklists for modifying operational plans and orders during CAP, but there are no TTPs that are designed to help address CAP for decontamination of significant areas/terrain.

<sup>4</sup> Yes. There are no organic time constraints.

<sup>5</sup> Limited. Any ST-level HQ staff can provide support, but there is no real way of knowing how effective this support will be without comprehensive training events.

<sup>6</sup> Limited, a restoration exercise focused on efficacy of providing a JTF for decontamination of significant areas/terrain has not been conducted. A RESTOP ACTD (ongoing) has been conducted with results TBP.

<sup>7</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>8</sup> Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.

<sup>9</sup> Procedures, TTPs, and formalized familiarization training that address the unique aspects of large-scale decontamination of significant areas/terrain at the ST level will be developed.

<sup>10</sup> JTTPs that are designed to help address CAP for decontamination of significant areas/terrain will be developed.

<sup>11</sup> A UNIFIED ENDEAVOR exercise will specifically be used to exercise this task.

<sup>12</sup> Experiments and exercises focused on theater restoration operations will be conducted. Lessons learned from RESTOPS ACTD will be integrated into future exercises and experimentation that looks at issues other than fixed sites.

### 15.11.3 Functional Solution Analysis

#### 15.11.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** There are no specific procedures, TTPs or formalized familiarization training that addresses the unique aspects of large-scale decontamination of significant areas/terrain at the ST level.  
**Non-Materiel Solutions:** *Doctrine:* Establish specific procedures or TTPs that addresses the unique aspects of large-scale decontamination of significant areas/terrain at the ST level.  
*Training:* Develop formalized staff familiarization training that addresses the unique aspects of large-scale decontamination of significant areas/terrain at the ST level.
- 2. Deficiency:** There are no TTPs that are designed to help address CAP for decontamination of strategically significant areas/terrain.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs that are designed to help address CAP for decontamination of strategically significant areas/terrain.
- 3. Deficiency:** A restoration exercise/experimentation focused on efficacy of providing a JTF for decontamination of strategically significant areas/terrain has not been conducted.  
**Non-Materiel Solutions:** *Training:* A special UNIFIED ENDEAVOR JTF exercise should be scheduled to test a combatant command's ability to establish a JTF to provide command and control of extensive or complex restoration operations. It should include scenarios involving strategically significant areas/terrain or facilities. Lessons learned can be captured and used to develop doctrine and TTPs. Incorporate lessons learned from RESTOPS ACTD into future exercises.
- 4. Deficiency:** No doctrine has been developed.  
**Non-Materiel Solutions:** *Doctrine:* Develop doctrine for ST-level decontamination of significant areas/terrain.
- 5. Deficiency:** Leader education does not address this issue.  
**Non-Materiel Solutions:** *Leadership:* Develop leader education for ST-level decontamination of significant areas/terrain.

#### 15.11.3.2 IMA Assessment Summary

N/A

**15.12 Task STSUST 12: Coordinate the decontamination of strategically significant facilities or fixed sites****15.12.1 Functional Area Analysis****15.12.1.1 Definition**

To develop plans and coordinate mission execution of the decontamination of strategically significant facilities. Although weathering is the preferred decontamination technique for facilities, if a determination is made to actively decontaminate the facility, the complexity of the decontamination and the large amount of resources involved will require combatant command coordination.

**15.12.1.2 Derivation**

<sup>3</sup> Limited. Any ST-level HQ staff can develop procedures and checklists for modifying operational plans and orders during CAP, but there are no TTPs that are designed to help address CAP for decontamination of strategically significant facilities or fixed sites.

<sup>4</sup> Yes. There are no organic time constraints.

<sup>5</sup> Limited. Any ST-level HQ staff can provide support, but there is no real way of knowing how effective this support will be without comprehensive training events.

<sup>6</sup> Limited, a restoration exercise focused on efficacy of providing a JTF for decontamination of significant facilities or fixed sites has not been conducted. A RESTOP ACTD (ongoing) has been conducted with results TBP.

<sup>7</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>8</sup> Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.

<sup>9</sup> JTTPs and formalized familiarization training that addresses the unique aspects of large-scale decontamination of significant facilities or fixed sites at the ST level will be developed.

<sup>10</sup> JTTPs that are designed to help address CAP for decontamination of strategically significant facilities or fixed sites will be developed.

<sup>11</sup> A UNIFIED ENDEAVOR exercise will specifically be used to exercise this task.

<sup>12</sup> Experiments and exercises focused on theater restoration operations will be conducted. Lessons learned from RESTOPS ACTD will be integrated into future exercises and experimentation that looks at issues other than fixed sites.

### 15.12.3 Functional Solution Analysis

#### 15.12.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** There are no specific procedures, TTPs, or formalized familiarization training that addresses the unique aspects of large-scale decontamination of significant facilities or fixed sites at the ST level.  
**Non-Materiel Solutions:** *Doctrine:* Establish specific procedures or TTPs that addresses the unique aspects of large-scale decontamination of significant facilities or fixed sites at the ST level. *Training:* Develop formalized staff familiarization training that addresses the unique aspects of large-scale decontamination of significant facilities or fixed sites at the ST level.
- 2. Deficiency:** There are no TTPs that are designed to help address CAP for decontamination of strategically significant facilities or fixed sites.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs that are designed to help address CAP for decontamination of significant facilities or fixed sites.
- 3. Deficiency:** There is no way of knowing how effective decontamination of significant facilities or fixed sites will be without comprehensive training events.  
**Non-Materiel Solutions:** *Training:* Develop comprehensive training events to determine how effective decontamination of strategically significant facilities or fixed sites will be with current command and control techniques and equipment. *Personnel:* Personnel evaluating and mentoring CBRN elements of national-level, COCOM, and JTF exercises must possess adequate joint and CBRN credentials.
- 4. Deficiency:** No doctrine has been developed.  
**Non-Materiel Solutions:** *Doctrine:* Develop doctrine for ST-level decontamination of significant facilities or fixed sites.
- 5. Deficiency:** Leader education does not address this issue.  
**Non-Materiel Solutions:** *Leadership:* Develop leader education for ST-level decontamination of significant facilities or fixed sites.

#### 15.12.3.2 IMA Assessment Summary

N/A

**15.13 Task STSUST 13: Determine the impact of restoration operations on theater residual capability****15.13.1 Functional Area Analysis****15.13.1.1 Definition**

To initiate and direct the process of gathering required information about the impact of ongoing or anticipated restoration operations on theater residual capability and providing an assessment. The combatant commander must determine to what extent theater residual capability will be affected by ongoing or projected restoration operations. The length of time that key units or weapons systems or key facilities will be unavailable or capabilities will be degraded prior to or during decontamination operations will be of vital importance in a CBRN/TIM environment.

**15.13.1.2 Derivation**

*UJTL (ST 9.4, ST 4.2.3, ST 4.2.6).*

**15.13.1.2.1 Supported Task: SNSUST 8****15.13.1.2.2 Lateral Task: N/A****15.13.1.2.3 Supporting Task: OPSUST 4****15.13.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Persistent CBRN/TIM effects. (C1.3.3.1-3)

**Military**

1. Stressful mission. (C2.1)
2. No mission preparation. (C2.1.3)
3. Negligible personnel experience. (C2.2.4.5)
4. High rear-area security. (C2.7.1)
5. Fully developed state of conflict. (C2.10.1)

**Civil**

1. Limited foreign government support. (C3.1.2.3)

## **15.13.2 Functional Needs Analysis**

### **15.13.2.1 Capability and Deficiency Assessment Summary**

Table 15.13-1 discusses the only capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The current assessment is “yellow.” Any COCOM HQ has the basic ability to determine the impact of restoration operations on theater residual capability, but there are several obstacles that will prevent meeting the required timeline and hinder the process. Although the COCOM staff is skilled and experienced, they would have little skill or experience with CBRND issues concerning restoration operations. For restoration operation issues their current capability is manual, slowing down the process.

The COCOM Headquarters was assessed in light of current limited staff use of JWARN and the anticipated fielding initial operational capability (IOC) of the Joint Effects Model (JEM) Block I in FY2006 and the IOC of the Joint Operational Effects Federation (JOEF) Block I, Increment I in FY2008. JOEF will provide a significant CBRN adaptive planning capability for restoration operations. JEM will provide a single, validated capability to predict and track CBRN and TIM events and effects. JOEF will provide an operational requirements modeling and simulation system which accurately predicts CBRN effects on personnel, equipment, and operations and permit restoration operation planning. Since JEM/JOEF IOC will not be met until FY2006 and FY 2008, respectively, the time standard for Measure 1 was assessed as “red.” There are no TTPs that have been developed based on lessons learned from exercises or experimentation. Concepts, doctrine, and TTPs focusing restoration operation impact on theater residual capability are limited. CBRND staffs and staffing at all levels are not robustly manned making it difficult to apply CBRND subject matter expertise when required. CBRND staffs are not adequately trained/experienced on strategic theater CBRND issues. JPME does not currently address this issue.

#### **Projected Near/Mid-Term Capability and Deficiency**

The COCOM will benefit from JEM and JOEF Block I, which will be IOC for the near/mid term. The time standard for near-/mid-term Measure 1 will be assessed as “green” if the IOC is met. DOTLPP changes will also improve, but the overall situation will remain “yellow” in the near/mid term.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. DOTMLPP should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. JTTPs, training and exercises, and education will all improve leading to a far-term assessment of “green.”

**Table 15.13-1. STSUST 13: Capability and Deficiency Assessment**

<b>Capability: COCOM HQ</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>R<sup>2</sup></b>	<b>Y<sup>3</sup></b>	<b>Y<sup>4</sup></b>
<b>Near/Mid-Term Overall Capability<sup>5</sup></b>	<b>Y<sup>6</sup></b>	<b>Y</b>	<b>Y</b>
<b>Far-Term Overall Capability<sup>7</sup></b>	<b>G</b>	<b>G<sup>8</sup></b>	<b>G<sup>9</sup></b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Determination of restoration operation impact on theater residual capability can be made within 2 hours.	G – Yes, Y – Limited, R – No
M2	Procedures and checklists are developed to facilitate determination.	G – Yes, Y – Limited, R – No
M3	National/joint exercises provide lessons learned on procedures for determining restoration operation impact on theater residual capability.	G – Yes, Y – Limited, R – No

<sup>1</sup> Concepts, doctrine, and TTPs focusing restoration operation impact on theater residual capability are limited. CBRND staffs and staffing at all levels are not robustly manned, making it difficult to apply CBRND subject matter expertise when required. CBRND staffs are not adequately trained/experienced on strategic theater CBRND issues. JPME does not currently address this issue.

<sup>2</sup> The COCOM staff would ultimately have the means to make a determination of the impact of ongoing or projected restoration operations on theater residual capability. Although the COCOM staff is skilled and experienced, they would have little skill or experience with CBRND issues concerning restoration operations. For restoration operation issues their current capability is manual, slowing down the process.

<sup>3</sup> Any ST-level HQ staff can develop procedures and checklists to facilitate determination of restoration operation impact on theater residual capability, but there are no TTPs that have been developed based on lessons learned from exercises or experimentation.

<sup>4</sup> No exercise focused on restoration operation impact on theater residual capability has been conducted. A RESTOP ACTD (ongoing) has been conducted with results TBP, but it is unlikely to provide data on theater residual capability determinations.

<sup>5</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>6</sup> Through improved leader education and exercises, the COCOM staff will gain skill and experience with CBRND issues concerning restoration operations. The COCOM will benefit from JEM and JOEF Block I, which will be IOC for the near/mid term and allow automation of restoration operation planning and assessments. The two-hour time frame will be assessed as “green” if the IOC is met.

<sup>7</sup> DOTMLPF improvements will continue as a result of new lessons learned from experiments and exercises.

<sup>8</sup> JTTP will be developed based on lessons learned from exercises or experimentation.

<sup>9</sup> Experiments and exercises focused on theater restoration operations will be conducted. Lessons learned from RESTOPS ACTD will be integrated into future exercises and experimentation that looks at issues other than fixed sites.

### 15.13.3 Functional Solution Analysis

#### 15.13.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** The COCOM staff has little skill or experience with CBRND issues concerning restoration operations.  
**Non-Materiel Solutions:** *Doctrine:* Establish TTPs to assist the COCOM staff determine the restoration operation impact on theater residual capability. *Organization:* Analyze CBRND staffing in all organizations in light of the capabilities required of them in this task. Recommend staffing/organizational changes, enhancements, or alternative fixes as required. *Training:* Establish training to assist the COCOM staff determine the restoration operation impact on theater residual capability. *Personnel:* Provide at least one operator per watch with extensive experience in CBRND issues including restoration operation impacts. Preferably, this operator will be a CBRND subject matter expert if the size and organization of the CBRND staff allows.
- 2. Deficiency:** No TTPs have been developed based on lessons learned from exercises or experimentation.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs based on lessons learned from exercises or experimentation. Integrate COCOM staff into JRO experimentation campaign plan for FY2009/10 UNIFIED ENDEAVOR and all work-ups. Include this task for concept experimentation.
- 3. Deficiency:** A restoration exercise focused on procedures for determining restoration operation impact on theater residual capability has not been conducted.  
**Non-Materiel Solutions:** *Training:* Develop exercises that include this task.
- 4. Deficiency:** A RESTOP ACTD (ongoing) has been conducted with results TBP, but it is unlikely to provide data on theater residual capability determinations.  
**Non-Materiel Solutions:** *Training:* Incorporate lessons learned from RESTOPS ACTD into future doctrine and staff exercises.
- 5. Deficiency:** Concepts and doctrine focusing restoration operation impact on theater residual capability are limited.  
**Non-Materiel Solutions:** *Doctrine:* Develop concepts and doctrine focusing on restoration operation impact on theater residual capability.
- 6. Deficiency:** CBRND staffs and staffing at all levels are not robustly manned, making it difficult to apply CBRND subject matter expertise when required.  
**Non-Materiel Solutions:** *Organization:* Analyze CBRND staffing in all organizations in light of the capabilities required of them in this task. Recommend staffing/organizational changes, enhancements, or alternative fixes as required.

7. **Deficiency:** CBRND staffs are not adequately trained/experienced on ST CBRND issues.  
**Non-Materiel Solutions:** *Leadership:* Develop leader training requirements and curriculum on restoration operations designed specifically for CBRND subject matter experts.
8. **Deficiency:** JPME does not currently address this issue.  
**Non-Materiel Solutions:** *Leadership:* Develop JPME leader training requirements and curriculum on restoration operations.

#### **15.13.3.2 IMA Assessment Summary**

N/A

**15.14 Task STSUST 14: Plan CBRN elimination operations****15.14.1 Functional Area Analysis****15.14.1.1 Definition**

To plan and execute theater CBRN elimination operations. A combatant commander may conduct military operations for the explicit purpose of eliminating the CBRN weapons or capabilities held by an adversary. Specifically, U.S. military operations across the range of military operations also may entail a requirement to eliminate, or support the elimination of, CBRN weapons or capabilities. CBRN elimination is the systematic removal of a capability within a nation or organization to develop, deploy, or employ CBRN weapons. The degree or extent of elimination is a strategic objective, defined by a strategic end state, and ranges from complete removal of all capability (including research, production, and training for any form of CBRN weapon) to the focused removal of specific capabilities. This task encompasses three primary subtasks: *Planning Exploitation* (locating, characterizing, and securing CBRN materiel, weapons, equipment, personnel, and infrastructure, and developing appropriate forensic evidence); *Planning Disposition* (destroying, dismantling, rendering safe, removing, transferring, or otherwise verifiably disposing of CBRN materiel, weapons, equipment, and infrastructure); and *Planning Monitoring and Redirection* (monitoring, inspecting, and redirecting/converting the CBRN infrastructure).

**15.14.1.2 Derivation**

*Combatant Commander's Planning Guide for WMD Elimination Operations (Draft).*

**15.14.1.2.1 Supported Task: SNSUST 10****15.14.1.2.2 Lateral Tasks: STSHA 6, STSHA 8, STSUST 1, STSUST 2, STSUST 3, STSUST 4, STSUST 5, STSUST 6, STSUST 7, STSUST 11, STSUST 12****15.14.1.2.3 Supporting Task: OPSUST 14****15.14.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Chemical, biological, radiological or nuclear threat form. (C1.3.3.1-3)

**Military**

1. Cooperative nation.
  - a. Partial preexisting arrangements. (C2.1.1.2)
  - b. Limited military commitments from other nations. (C2.1.1.7)
  - c. Limited host-nation support. (C2.8.5)

2. Uncooperative nation
  - a. No preexisting arrangements. (C2.1.1.2)
  - b. Negligible military commitments from other nations. (C2.1.1.7)
  - c. No host nation support. (C2.8.5)

**Common Military Conditions**

1. Limited personnel expertise. (C2.2.4.5)

**Civil**

1. Cooperative nation.
  - a. Limited foreign government support. (C3.1.2.3)
2. Uncooperative nation
  - a. Negative foreign government support. (C3.1.2.3)

**Common Civil Conditions**

1. Moderate restraints on action. (C3.1.3.4)

**This task is analyzed in the WMD Interdiction and Elimination JCIDS Analysis.**

## 16.0 Operational Sustain

### 16.0.1 Introduction

The operational (OP) level of war is where campaigns and major operations are planned, conducted, and sustained to accomplish strategic objectives within theaters or areas of operations. Activities at this level link tactics and strategy by establishing operational objectives needed to accomplish the strategic objectives, sequencing events to achieve the operational objectives, initiating actions, and applying resources to bring about and sustain these events. These activities imply a broader dimension of time or space than do tactics; they ensure the logistic and administrative support of tactical forces and provide the means by which tactical successes are exploited to achieve strategic objectives. Fourteen OP Sustain (SUST) tasks were identified in the chemical, biological, radiological, and nuclear (CBRN) Functional Area Analysis (FAA), including a task for elimination operations. However, the detailed analysis of the elimination tasks has been deferred to the Joint Requirements Office for Chemical, Biological, Radiological, and Nuclear Defense (JRO-CBRND)–sponsored FAA/Functional Needs Analysis (FNA) of the weapons of mass destruction (WMD) elimination and interdiction functional areas.

This chapter, detailing the OPSUST area, restates relevant information from the CBRN Defense (CBRND) FAA, including a description of each of the 14 OPSUST tasks, derivation of the task, an indication of other linked tasks, and the pertinent conditions. The FNA section addresses the capability and deficiency analysis and a brief description of potential near-term changes. Once all the capabilities are considered, the assessment concludes with a separate, overarching look at the entire capability spectrum to identify remaining gaps and/or synergies. The Functional Solutions Analysis (FSA) section addresses possible solutions for the deficiencies identified in the FNA section. These are categorized into materiel or non-materiel. The non-materiel solutions are addressed first and reflect one or more of the six areas of DOTLPF: doctrine, organization, training, leadership, personnel, and facilities. If there is no non-materiel solution to the deficiencies, then materiel solutions are considered. These encompass broad approaches that are not system-specific. These potential materiel approaches are addressed and in the Ideas for Materiel Approaches (IMA) section. The IMAs provide a possible near- or far-term resolution to identified deficiencies within the individual capabilities.

### 16.0.2 FNA Summary

Table 16.0-1 summarizes the overall current and projected capability to perform the OPSUST tasks identified in the CBRND FAA. The overall capability to conduct these tasks in the current time frame is assessed as “yellow.” Any operational-level HQ has a team of operational planners and information command and control specialists, and most have CBRN subject matter experts. This team of experts has the skill to establish component commander reporting procedures for restoration requirements, but there are some deficiencies that negatively impact on standardization and experience levels. A CBRN mobile assessment team could be used to assess units that are contaminated and assembled on an ad hoc basis at any time from in-house Joint Task Force (JTF) resources. Prototype Standing JTF (SJTF) staffs must be assessed to determine their ability to provide mobile assessment teams. This capability has never been attempted or

tested. There is no doctrine that covers this capability. This capability could also be developed in any new CBRND units that are currently being stood up. Until teams are designated, staffed, trained and equipped they will be unable to respond to the incident site within 1 hour. While the staff has the ability to provide JTF command and control of restoration operations, they have nothing to guide their efforts without the development of specific doctrine and tactics, techniques, and procedures (TTPs). This doctrine and TTPs cannot be developed without lessons learned from exercises (none of which have ever been conducted) or experimentation. Until international standards for decontamination (How clean is “clean”?) are established, intertheater movement of decontaminated equipment will be problematic. Although significant improvements are anticipated in the mid term, the projected capability will remain “yellow.”

**Table 16.0-1. Operational Sustain Summary FNA Findings**

Task Number	CBRN Operational Sustain Task Title	Capability		
		Current	Near/Mid	Far
OPSUST 1	Establish component commander reporting procedures for restoration requirements.	●	●	●
OPSUST 2	Assess component command contamination reports for operational degradation implications and restoration operation requirements.	●	●	●
OPSUST 3	Conduct operational risk assessment of units, equipment, facilities, activities, or terrain that are contaminated for restoration prioritization and timing.	●	●	●
OPSUST 4	Assess the operational impact of required restoration activities.	●	●	●
OPSUST 5	Provide operational guidance to forces with contaminated units.	●	●	●
OPSUST 6	Provide mobile assessment teams to assess and determine disposition of contaminated units, equipment, facilities, or activities.	●	●	●
OPSUST 7	Provide restoration operation country assistance teams to support TEPs.	●	●	●

OVERALL		●	●	●

### 16.0.3 FSA Summary

The paragraphs below summarize the assessment of all potential doctrine, organization, training, materiel, leadership and education, personnel, and facilities (DOTMLPF) (non-materiel and materiel) solutions for the capability gaps identified in the FNA section.

#### 16.0.3.1 DOTLPF

The DOTLPF solutions identified in this chapter are associated primarily with a lack of established procedures and TTPs to guide performance of the tasks. TTPs must be developed, based on lessons learned in exercises and experiments, for the staff to use and to standardize processes, formats and data elements. Other solutions include the development of leader education programs, training, and doctrine. There are numerous deficiencies associated with the JTF staff's ability to provide mobile assessment teams to assess and determine disposition of contaminated units, equipment, facilities, or activities. Concepts must be developed that will guide use of mobile assessment teams to assess and determine disposition of contaminated units, equipment, facilities, or activities and experimentation conducted to refine the concepts. Refined concepts must be tested in full-scale exercises and lessons learned applied to the writing of and revisions of both doctrine and TTPs. Other solutions include the development of leader education programs.

#### 16.0.3.2 IMA

An automated system must be developed to provide these capabilities, as well as location (global positioning system) and unit/activity restoration operation status through component command unit communication systems into the Nuclear, Biological, and Chemical (NBC) Battlespace awareness system. The system must be automatic and provide component command restoration requirements in accordance with established formats. An automated system to ensure that reports are received even if the reporting unit is having severe degradation or communication problems must be developed. The current capability to conduct operational risk assessment of units, equipment, facilities, activities, or terrain that are contaminated for restoration prioritization and timing is not automated. The process must be linked to automated systems so that routine data can be used by automated tools (that must be developed). This will improve speed of assessment.

Human out of the loop will improve accuracy if data are reliable. The current capability to assess the operational impact of required restoration activities is manual. An automated tool will determine the impact of contaminated units or facilities that must undergo restoration operations on JTF operations. The system must have integrated analysis tools to predict and reprioritize restoration requirements based on interaction with JTF J3 operational priorities. This will improve speed of assessment. The current capability of providing operational guidance to forces with contaminated units is manual and not automated, slowing down the process. Automated tools and automatic processes must be developed for assisting commanders and staffs in providing operational guidance to forces with contaminated units. The system should be automatic and provide component command degradation information in accordance with established formats. The system should have integrated analysis tools to predict degradation impact to critical JTF operations based on interaction with JTF J3 operational priorities. Information on degradation must be automatically provided to J3 systems so that decisions can be made on operational priorities or required changes. This could be used in conjunction with a sensor system on individual vehicles and systems, integrated with an automated system that immediately provides a real-time assessment of operational degradation. A required materiel solution for the provision of mobile assessment teams will be a command and control platform to quickly transport the team to the incident site. It will provide them with all the tools required to make the assessment, provide them with total protection from any CBRN hazard and allow for quick and complete decontamination of the command and control platform after the assessment is complete. The tools onboard can be linked to sensors on the contaminated units, equipment, facilities providing automatic data feeds en route.

## **16.1 Task OPSUST 1: Establish component commander reporting procedures for restoration requirements**

### **16.1.1 Functional Area Analysis**

#### **16.1.1.1 Definition**

To establish and maintain procedures to be followed by component commanders that will be used to report their joint restoration operation requirements. The JTF commander establishes component commander reporting procedures for restoration requirements in order to provide for standardization and improved efficiency.

#### **16.1.1.2 Derivation**

*UJTL (OP 7.3, OP 5.3.2, ST 7.2.1).*

##### **16.1.1.2.1 Supported Task: STSUST 1**

##### **16.1.1.2.2 Lateral Task: OPSHA 10**

##### **16.1.1.2.3 Supporting Task: TASUST 24**

#### **16.1.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Partial preexisting arrangements. (C2.1.1.2)
2. Limited personnel expertise. (C2.2.4.5)
3. Poor joint staff integration. (C2.3.1.1)

**Civil.** N/A

### **16.1.2 Functional Needs Analysis**

#### **16.1.2.1 Capability and Deficiency Assessment Summary**

Table 16.1-1 discusses the only capability that currently exists to perform the task to the designated standards. No other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The current assessment is “yellow.” Any JTF HQ has a team of operational planners and information command and control specialists, and most have CBRN subject matter experts. This

team of experts has the skill to establish component commander reporting procedures for restoration requirements, but there are some deficiencies that negatively impact on standardization and experience levels.

**Projected Near/Mid-Term Capability and Deficiency**

DOTLPF should improve in the near/mid term. No other capabilities are currently projected for the near/mid term. No capability improvements are forecast for the near/mid term.

**Projected Far-Term Capability and Deficiency**

DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. JTTPs, training and exercises, and education will all improve leading to a far-term assessment of “green.”

**Table 16.1-1. OPSUST 1: Capability and Deficiency Assessment**

<b>Capability: Joint Task Force Headquarters (JTF-HQ)</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>
<b>Current Overall Capability<sup>1</sup></b>	Y <sup>2</sup>	Y <sup>3</sup>	Y <sup>4</sup>	Y <sup>5</sup>
<b>Near/Mid-Term Overall Capability<sup>6</sup></b>	Y	Y	Y	Y
<b>Far-Term Overall Capability<sup>7</sup></b>	G <sup>8</sup>	G <sup>9</sup>	G <sup>10</sup>	G <sup>11</sup>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Theater policy and guidelines for theater restoration operations are established.	G – Yes, Y – Limited, R – No
M2	Component commander reporting procedures for restoration requirements are established.	G – Yes, Y – Limited, R – No
M3	Component commander reporting procedures for restoration requirements are modified after substantive changes are recommended and approved.	G – Yes, Y – Limited, R – No
M4	Joint exercises/experimentation provide feedback of component commander reporting procedures for restoration requirements.	G – Yes, Y – Limited, R – No

<sup>1</sup> There is no leader training/education for JTF restoration operations.

<sup>2</sup> Limited. The existence of theater policy and guidelines for restoration operations varies by theater.

<sup>3</sup> Limited. Any JTF-HQ can develop reporting procedures, but there are no TTPs that specifically address reporting procedures for restoration requirements. Any procedures would be manual.

<sup>4</sup> Limited. A JTF-HQ does not have TTPs that specifically addresses reporting procedures for restoration operations to guide them in modifying procedures after substantive changes are recommended and approved.

<sup>5</sup> Limited. Any joint exercise/experiment can provide feedback, but few if any have been conducted that include reporting procedures for restoration requirements.

<sup>6</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>7</sup> Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.

<sup>8</sup> As the results of Restoration Operations (RESTOPS) Advanced Concept Technology Demonstration (ACTD) are understood and incorporated at all theaters, the appropriate policy and guidelines will be developed.

<sup>9</sup> Joint TTPs (JTTPs) that specifically address reporting procedures for restoration requirements will be developed.

<sup>10</sup> JTTPs that specifically address reporting procedures for restoration operations to guide them in modifying procedures after substantive changes are recommended and approved will be developed.

<sup>11</sup> A UNIFIED ENDEAVOR exercise will specifically be used to exercise this task.

### 16.1.3 Functional Solution Analysis

#### 16.1.3.1 DOTLPP Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** Limited reporting procedures exist. Any procedures would be manual.  
**Non-Materiel Solutions:** *Doctrine:* Refine TTPs on reporting procedures for restoration requirements. Begin to develop formats for restoration operation requirements and include them in pertinent joint publications. Developed joint format parameters will be included in pertinent Service publications. *Organization:* Prototype SJTF CBRN centers must be provided with adequate CBRN center staffing to ensure that manual collection of component command restoration requirements can be performed. Service component CBRN centers must be assessed to see if they can adequately perform the function of providing manual restoration requirement reports to the JTF CBRN center. CBRN staffing/training is not standard across the Services. Refine exercises to develop lessons learned about reporting procedures for restoration requirements of a JTF. Incorporate lessons learned from Restoration Operations (RESTOPS) Advanced Concept Technology Demonstration (ACTD) into future exercises. *Personnel:* Provide adequately trained personnel (either specially trained subject matter experts [SMEs] or unit personnel who receive extra training) for all units that must report/receive restoration requirements. Staffing of proposed joint “opposing force” must include personnel who possess adequate joint and CBRN credentials. Personnel evaluating and mentoring CBRN elements of JTF exercises must possess adequate joint and CBRN credentials.
- 2. Deficiency:** Limited restoration exercises.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs for developing exercises for restoration requirements. *Training:* Develop training for staffs on reporting procedures for restoration requirements.
- 3. Deficiency:** No TTPs have been developed.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs for reporting procedures for restoration requirements.
- 4. Deficiency:** There is no leader training/education for JTF restoration operations.  
**Non-Materiel Solutions:** *Training:* Develop training for staffs on reporting procedures for restoration requirements. *Leadership:* Develop leader training for staffs on reporting procedures for restoration requirements. Joint Professional Military Education (JPME) must include leader-learning areas for restoration operations considerations at the OP level.

#### 16.1.3.2 IMA Assessment Summary

Table 16.1-2 shows possible materiel approaches that address the remaining materiel requirements of the DOTMLPP assessment.

**Table 16.1-2. OPSUST 1: IMA Assessment**

<b>Capability Gap</b>	<b>Idea for Materiel Approach</b>	<b>Description</b>
Limited reporting procedures. Any procedures would be manual.	Automated system	An automated system that provides location (global positioning system) and unit restoration requirements through component command unit communication systems into the NBC Battle Management System and from there into Joint Warning and Reporting Network (JWARN) and Global Command and Control System (GCCS). System is automatic and provides component command restoration requirements in accordance with established formats.

## **16.2 Task OPSUST 2: Assess component command contamination reports for operational degradation implications and restoration operation requirements**

### **16.2.1 Functional Area Analysis**

#### **16.2.1.1 Definition**

To receive and assess component command contamination reports for operational degradation implications and restoration operation requirements. The JTF commander identifies the specific degradation of critical units and whether or not operations need to be modified.

#### **16.2.1.2 Derivation**

*UJTL (OP 7.3, OP 5.2, OP 5.1.4).*

##### **16.2.1.2.1 Supported Task: STSUST 2**

##### **16.2.1.2.2 Lateral Task: OPSHA 10**

##### **16.2.1.2.3 Supporting Task: TASUST 25**

#### **16.2.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Persistent CBRN/TIM effects. (C1.3.3.1-3)

##### **Military**

1. Stressful mission. (C2.1)
2. Partial preexisting arrangements. (C2.1.1.2)
3. Negligible personnel experience. (C2.2.4.5)
4. Moderate rear-area security. (C2.7.1)
5. Fully developed state of conflict. (C2.10.1)

##### **Civil. N/A**

### **16.2.2 Functional Needs Analysis**

#### **16.2.2.1 Capability and Deficiency Assessment Summary**

Table 16.2-1 discusses the only capability that currently exists to perform the task to the designated standards. No other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The current assessment is “yellow.” Any JTF HQ has a team of operational planners and information command and control specialists. This team of experts forms the backbone of the JTF command structure. This team can accomplish the task, but there are several factors that complicate their ability to do so.

**Projected Near/Mid-Term Capability and Deficiency**

No other capabilities are currently projected for the near/mid term. Limited capability improvements are forecast for the near/mid term except for DOTMLPF, which should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

**Projected Far-Term Capability and Deficiency**

DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. JTTPs, training and exercises, and education will all improve leading to a far-term assessment of “green.”

Table 16.2-1. OPSUST 2: Capability and Deficiency Assessment

Capability: Standing Joint Force Headquarters	M1	M2	M3	M4	M5	M6	M7	M8	M9
Current Overall Capability <sup>1</sup>	G <sup>2</sup>	Y <sup>3</sup>	Y <sup>4</sup>	Y <sup>5</sup>	G <sup>6</sup>	Y <sup>7</sup>	Y <sup>8</sup>	Y <sup>9</sup>	Y <sup>10</sup>
Near/Mid-Term Overall Capability <sup>11</sup>	G	Y	Y	Y	G	Y	Y	Y	Y
Far-Term Overall Capability <sup>12</sup>	G	G <sup>13</sup>	G <sup>14</sup>	G <sup>15</sup>	G	G <sup>16</sup>	G <sup>17</sup>	G <sup>18</sup>	G <sup>19</sup>

	FAA Measure	Scale
M1	Contamination reports are received within 1 hour.	G – Yes, Y – Limited, R – No
M2	Unit operational degradation is assessed within 1 hour after contamination reports are received.	G – Yes, Y – Limited, R – No
M3	Restoration operation requirements are estimated within 1 hour after unit operational degradation is assessed.	G – Yes, Y – Limited, R – No
M4	Data transmitted/disseminated follow standard format.	G – Yes, Y – Limited, R – No
M5	Information is passed within established time criteria.	G – Yes, Y – Limited, R – No
M6	Unit operational degradation assessment is accurate.	G – Yes, Y – Limited, R – No
M7	Restoration operation requirements estimate is accurate.	G – Yes, Y – Limited, R – No
M8	Procedures and checklists are developed to facilitate the ability to assess component command contamination reports for operation degradation implications and restoration operation requirements.	G – Yes, Y – Limited, R – No
M9	Joint exercises/experimentation provide feedback on the efficacy of assessment of component command contamination reports for operational degradation implications and restoration operation requirements.	G – Yes, Y – Limited, R – No

<sup>1</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>2</sup> Any SJFHQ staff can receive contamination reports manually within an hour, but an automated system would ensure that reports are received even if the reporting unit is having severe degradation or communication problems.

<sup>3</sup> Limited. Any SJFHQ staff can conduct an operational degradation assessment, but there are no TTPs or available familiarization training that specifically address making operational degradation assessments and no automated tools to assist the process.

<sup>4</sup> Limited. Any SJFHQ staff can estimate restoration requirements, but there are no TTPs or available familiarization training that specifically addresses considerations and how to estimate requirements.

<sup>5</sup> Limited. Any SJFHQ staff can transmit/disseminate information according to a standard format that they develop, but there are no specific formats for operational degradation assessment requirements.

<sup>6</sup> Any SJFHQ staff can pass information in a timely manner, but an automated system would ensure that reports are received even if the reporting unit is having severe degradation or communication problems.

<sup>7</sup> Limited. Any SJFHQ staff can conduct an accurate unit degradation assessment, but TTPs to ensure that assessments are accurate are limited to basic, nonspecific data that must be researched. More detailed specific information and checklists useful for time-sensitive situations are not available. Without automation, accuracy may not be as dependable and might be subject to human errors.

<sup>8</sup> Limited. Any SJFHQ staff can estimate restoration operation requirements, but TTPs to ensure that estimates are accurate are limited to basic, nonspecific data that must be researched. More detailed specific information and checklists useful for time-sensitive situations are not available. Without automation, accuracy may not be as dependable and might be subject to human errors.

<sup>9</sup> Limited. Any SJFHQ staff can develop procedures and checklists, but there are no TTPs that specifically address operational degradation implications.

<sup>10</sup> Limited. Any joint exercise/ experiment can provide feedback, but few if any have been conducted that specifically address restoration operational degradation implications. Therefore, lessons learned that would facilitate development of TTP are not available.

<sup>11</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>12</sup> Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.

<sup>13</sup> JTTPs and familiarization training that specifically address making operational degradation assessments will be developed.

<sup>14</sup> JTTPs and familiarization training that specifically address considerations and how to estimate requirements will be developed.

<sup>15</sup> Specific formats for operational degradation assessment requirements will be developed.

<sup>16</sup> JTTPs to ensure that assessments are accurate will be collected and developed. More detailed specific information and checklists useful for time-sensitive situations will be developed. When automated tools have been developed, accuracy will be dependable and not be subject to human errors.

<sup>17</sup> JTTPs to ensure that estimates are accurate will be collected or developed. More detailed specific information and checklists useful for time-sensitive situations will be developed. When automated tools have been developed, accuracy will be dependable and not be subject to human errors.

<sup>18</sup> JTTPs that specifically address operational degradation implications will be developed.

<sup>19</sup> Experiments and exercises focused on theater restoration operations will be conducted. Lessons learned from RESTOPS ACTD will be integrated into future exercises and experimentation that looks at issues other than fixed sites.

### 16.2.3 Functional Solution Analysis

#### 16.2.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Restoration exercises have been limited.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs on how to develop exercises/experiments for a JTF on assessing component command contamination reports for operational degradation implications and restoration requirements. *Training:* Develop exercises/experiments for a JTF on assessing component command contamination reports for operational degradation implications and restoration requirements. Incorporate lessons learned from RESTOPS ACTD into future exercises.
2. **Deficiency:** No TTPs have been developed.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs on how to assess component command contamination reports for operational degradation implications and restoration requirements.
3. **Deficiency:** There is no leader training/education for JTF restoration of operations.  
**Non-Materiel Solutions:** *Training:* Develop training for staffs on assessing component command contamination reports for operational degradation implications and restoration requirements. *Leadership:* Develop leader training for staffs on assessing component command contamination reports for operational degradation implications and restoration requirements.
4. **Deficiency:** There are no automated tools to assist the process.  
**Non-Materiel Solutions:** *Organization:* Prototype SJTF CBRN centers must be provided with adequate CBRN center staffing to ensure that manual coordination of operational implications of restoration operations with J3 can be performed. Service component CBRN centers must be assessed to see if they can adequately perform the function of providing manual restoration requirement reports to the JTF CBRN center. CBRN staffing/training is not standard across the Services.
5. **Deficiency:** No familiarization training has been developed.  
**Non-Materiel Solutions:** *Training:* Develop familiarization training to assist staffs in this process.

#### 16.2.3.2 IMA Assessment Summary

Table 16.2-2 shows possible materiel approaches that address the remaining materiel requirements of the DOTMLPF assessment.

Table 16.2-2. OPSUST 2: IMA Assessment

Capability Gap	Idea for Materiel Approach	Description
No automated tools to assist the process of assessing component command contamination reports for operational degradation implications and restoration operation requirements.	Automated system	An automated system that provides location (global positioning system) and unit restoration requirements through component command unit communication systems into the NBC Battle Management System and from there into JWARN and GCCS. The system is automatic and provides component command restoration requirements in accordance with established formats. An automated system to ensure that reports are received even if the reporting unit is having severe degradation or communication problems.

**16.3 Task OPSUST 3: Conduct operational risk assessment of units, equipment, facilities, activities, or terrain that are contaminated for restoration prioritization and timing****16.3.1 Functional Area Analysis****16.3.1.1 Definition**

To assess units, equipment, facilities, activities, or terrain that are contaminated to determine restoration prioritization and whether or not the timing of such operations must be modified to fit the operational situation. The JTF commander makes this assessment in the context of his operational priorities. Decisions are designed to preserve operations tempo (OPTEMPO).

**16.3.1.2 Derivation**

*UJTL (OP 7.3, OP 5.1.5, OP 5.2, OP 6.5.3).*

**16.3.1.2.1 Supported Task: STSUST 3****16.3.1.2.2 Lateral Task: OPSHA 12****16.3.1.2.3 Supporting Task: TASUST 25****16.3.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Persistent CBRN/TIM effects. (C1.3.3.1-3)

**Military**

1. Stressful mission. (C2.1)
2. No mission preparation. (C2.1.3)
3. Negligible personnel experience. (C2.2.4.5)
4. Moderate rear-area security. (C2.7.1)
5. Fully developed state of conflict. (C2.10.1)

**Civil**

1. Limited foreign government support. (C3.1.2.3)

## **16.3.2 Functional Needs Analysis**

### **16.3.2.1 Capability and Deficiency Assessment Summary**

Table 16.3-1 discusses the only capability that currently exists to perform the task to the designated standards. No other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The current assessment is “yellow.” Any JTF HQ has a team of operational planners and information command and control specialists. This team of experts forms the backbone of the JTF command structure. The standing joint force headquarters (SJFHQ) is not designed as a SJTF, but rather as a standing element that focuses on a combatant commander’s operational trouble spots. There are several limitations that cause problems for this task.

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capabilities are currently projected for the near/mid term. Limited capability improvements are forecast for the near/mid term except for DOTMLPF, which should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

#### **Projected Far-Term Capability and Deficiency**

DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. JTTPs, training and exercises, and education will all improve leading to a far-term assessment of “green.”

Table 16.3-1. OPSUST 3: Capability and Deficiency Assessment

Capability: SJFHQ	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10
Current Overall Capability <sup>1</sup>	Y <sup>2</sup>	Y <sup>3</sup>	Y <sup>4</sup>	Y <sup>5</sup>	G <sup>6</sup>	Y <sup>7</sup>	Y <sup>8</sup>	G <sup>9</sup>	Y <sup>10</sup>	Y <sup>11</sup>
Near/Mid-Term Overall Capability <sup>12</sup>	Y	Y	Y	Y	G	Y	Y	G	Y	Y
Far-Term Overall Capability	G <sup>13</sup>	G	G	G	G	G	G	G	G	G

	FAA Measure	Scale
M1	Contamination reports are received within 30 minutes of contamination.	G – Yes, Y – Limited, R – No
M2	Unit operational risk assessment is completed within 30 minutes after contamination reports are received.	G – Yes, Y – Limited, R – No
M3	Restoration operation priorities are determined within 30 minutes after operational risk assessments are completed.	G – Yes, Y – Limited, R – No
M4	Data transmitted/disseminated follow standard format.	G – Yes, Y – Limited, R – No
M5	Information is passed within established time criteria.	G – Yes, Y – Limited, R – No
M6	Unit operational risk assessment is accurate.	G – Yes, Y – Limited, R – No
M7	Restoration operation priority determination is accurate.	G – Yes, Y – Limited, R – No
M8	Restoration operation priority determination is modified after substantive operational changes are assessed.	G – Yes, Y – Limited, R – No
M9	Procedures and checklists are developed to facilitate the ability to conduct operational risk assessment of units, equipment, facilities, activities, or terrain that are contaminated for restoration prioritization and timing.	G – Yes, Y – Limited, R – No
M10	Joint exercises/experimentation provide feedback on the efficacy of operational risk assessment of critical units, equipment, facilities, activities, or terrain that are contaminated for restoration prioritization and timing.	G – Yes, Y – Limited, R – No

<sup>1</sup> No doctrine has been developed. The linkage of restoration operations and operational risk assessment is not integrated into leader education. This task is not a standard part of training.

<sup>2</sup> Any SJFHQ staff can receive contamination reports, but the current capability is manual, slowing down the process. It is unlikely that assessments can be received manually within 30 minutes.

<sup>3</sup> Limited. Any SJFHQ staff can conduct an operational risk assessment, but there are no TTPs or formal familiarization training that specifically addresses operational risk assessment for restoration prioritization and timing. With a manual system it is unlikely that the assessment can be made in 30 minutes.

<sup>4</sup> Limited. Any SJFHQ staff can determine operation priorities, but there are no TTPs or formal familiarization training that specifically addresses restoration prioritization of units, equipment, facilities, activities, or terrain that are contaminated. With a manual system it is unlikely that the priorities can be determined within 30 minutes, particularly if there are a large number of units.

<sup>5</sup> Limited. Any SJFHQ staff can develop and transmit/disseminate information according to a standard format, but there is no current format that specifically addresses operational risk assessment of units, equipment, facilities, activities, or terrain that are contaminated.

<sup>6</sup> Any SJFHQ staff can pass information in a timely manner once it is developed.

<sup>7</sup> Limited. Any OP-level staff can perform an accurate operational risk assessment, but TTPs to ensure that assessments are accurate are limited to basic, nonspecific data that must be researched. More detailed specific information and checklists useful for time-sensitive situations are not available. With manual processes, accuracy may not be as dependable and might be subject to human errors.

<sup>8</sup> Limited. Any OP-level staff can perform an accurate assessment, but TTPs to ensure that priority determinations are accurate are limited to basic, nonspecific data that must be researched. More detailed specific information and checklists useful for time-sensitive situations are not available. With manual processes, accuracy may not be as dependable and might be subject to human errors.

<sup>9</sup> Any SJFHQ can make modifications. Manual procedures will slow down the process.

<sup>10</sup> Limited. Any SJFHQ staff can develop procedures and checklists, but there are no TTPs and familiarization training that specifically address operational risk assessment of units, equipment, facilities, activities, or terrain that are contaminated for restoration prioritization and timing.

<sup>11</sup> Limited. Any joint exercise/experiment can provide feedback, but few if any have been conducted that specifically address operational risk assessment of units, equipment, facilities, activities, or terrain that are contaminated for restoration prioritization and timing.

<sup>12</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>13</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation and other JRO initiatives. All standards previously assessed as limited should improve to “green” in the far term with all deficiencies eradicated.

### 16.3.3 Functional Solution Analysis

#### 16.3.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Restoration exercises/experiments have been limited.  
**Non-Materiel Solutions:** *Doctrine:* Develop an exercise/experiment for a JTF on how to conduct operational risk assessment of units, equipment, facilities, activities, or terrain that are contaminated for restoration prioritization and timing. Incorporate lessons learned from RESTOPS ACTD into future exercises.
2. **Deficiency:** No TTPs have been developed.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs on how to conduct operational risk assessment of units, equipment, facilities, activities, or terrain that are contaminated for restoration prioritization and timing of JTF operations.
3. **Deficiency:** There is no leader training/education for JTF restoration of operations.  
**Non-Materiel Solutions:** *Training:* Develop training for JTF staffs on how to conduct operational risk assessment of units, equipment, facilities, activities, or terrain that are contaminated for restoration prioritization and timing. *Leadership:* Develop leader training for JTF staffs on how to conduct operational risk assessment of units, equipment, facilities, activities, or terrain that are contaminated for restoration prioritization and timing.
4. **Deficiency:** No doctrine has been developed.  
**Non-Materiel Solutions:** *Doctrine:* Develop more specific doctrine on the linkage of restoration operations and operational risk assessment.
5. **Deficiency:** System is manual.  
**Non-Materiel Solutions:** *Doctrine:* Manual methods for determining the consolidated impact of degradation of separate unit/activity on JTF critical operations are developed for inclusion in pertinent joint publications. Methods for determining prioritization of restoration operations to facilitate JTF OPTEMPO are developed for inclusion in pertinent joint publications.
6. **Deficiency:** The linkage of restoration operations and operational risk assessment is not integrated into leader education.  
**Non-Materiel Solutions:** *Leadership:* Link into Officer Professional Military Education (OPME)/JPME.
7. **Deficiency:** Current capability is not automated.  
**Non-Materiel Solutions:** None.
8. **Deficiency:** This task is not a standard part of training.  
**Non-Materiel Solutions:** *Training:* Integrate into appropriate exercises.

**16.3.3.2 IMA Assessment Summary**

Table 16.3-2 shows possible materiel approaches that address the remaining materiel requirements of the DOTMLPF assessment.

**Table 16.3-2. OPSUST 3: IMA Assessment**

<b>Capability Gap</b>	<b>Idea for Materiel Approach</b>	<b>Description</b>
System to conduct operational risk assessment of units, equipment, facilities, activities, or terrain that are contaminated for restoration prioritization and timing is manual.	Automated system	Current system is manual. An automated system that determines the consolidated impact of degradation of separate unit/activity on JTF critical operations should be developed.
Current capability to conduct operational risk assessment of units, equipment, facilities, activities, or terrain that are contaminated for restoration prioritization and timing is not automated.	Automated system	Link the process to automated systems so that routine data can be used by automated tools (that must be developed). This will improve speed of assessment. Human out of the loop will improve accuracy if data are reliable.

**16.4 Task OPSUST 4: Assess the operational impact of required restoration activities****16.4.1 Functional Area Analysis****16.4.1.1 Definition**

To make an assessment that determines how the required restoration activities of key units, facilities, or equipment will impact current or projected operational objectives. Some contaminated units or facilities must undergo restoration operations within a short time period or risk becoming completely combat ineffective.

**16.4.1.2 Derivation**

*UJTL (OP 7.3, OP 5.2, OP 1.3.1).*

**16.4.1.2.1 Supported Task: STSUST 13****16.4.1.2.2 Lateral Task: OPSHA 12****16.4.1.2.3 Supporting Task: TASUST 25****16.4.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Persistent CBRN/TIM effects. (C1.3.3.1-3)

**Military**

1. Stressful mission. (C2.1)
2. No mission preparation. (C2.1.3)
3. Negligible personnel experience. (C2.2.4.5)
4. Moderate rear-area security. (C2.7.1)
5. Fully developed state of conflict. (C2.10.1)

**Civil**

1. Limited foreign government support. (C3.1.2.3)

**16.4.2 Functional Needs Analysis****16.4.2.1 Capability and Deficiency Assessment Summary**

Table 16.4-1 discusses the only capability that currently exists to perform the task to the designated standards. No other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The current assessment is “yellow.” Any OP-level staff has a team of operational planners and command and control specialists, and most have CBRN subject matter experts. This team of experts has the skill to assess the impact of restoration activities on operational objectives, but there are some deficiencies that negatively impact on their accuracy and the speed they will be able to operate.

**Projected Near/Mid-Term Capability and Deficiency**

No other capabilities are currently projected for the near/mid term. Limited capability improvements are forecast for the near/mid term except for DOTMLPF, which should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

**Projected Far-Term Capability and Deficiency**

DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. JTTPs, training and exercises, and education will all improve leading to a far-term assessment of “green.”

**Table 16.4-1. OPSUST 4: Capability and Deficiency Assessment**

<b>Capability: Operational-Level Unit Staff</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>R<sup>2</sup></b>	<b>Y<sup>3</sup></b>	<b>Y<sup>4</sup></b>	<b>Y<sup>5</sup></b>	<b>Y<sup>6</sup></b>
<b>Near/Mid-Term Overall Capability<sup>7</sup></b>	<b>R</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>
<b>Far-Term Overall Capability<sup>8</sup></b>	<b>G<sup>9</sup></b>	<b>G<sup>10</sup></b>	<b>G<sup>11</sup></b>	<b>G<sup>12</sup></b>	<b>G<sup>13</sup></b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Determination of restoration operation impact on operational objectives can be made within 1 hour.	G – Yes, Y – Limited, R – No
M2	Assessments of impact of restoration operations are accurate.	G – Yes, Y – Limited, R – No
M3	Procedures and checklists are developed to facilitate the ability to assess the impact of required restoration activities on operational objectives.	G – Yes, Y – Limited, R – No
M4	Joint exercises/experimentation provide lessons learned on procedures for determining restoration operation impact on operational objectives.	G – Yes, Y – Limited, R – No
M5	Decontamination procedures are logistically supportable.	G – Yes, Y – Limited, R – No

<sup>1</sup> No doctrine has been developed. The linkage of restoration operations and operational risk assessment is not integrated into leader education. This task is not a standard part of training.

<sup>2</sup> For restoration operation issues the current capability is manual, slowing down the process. It is unlikely that assessments can be made manually within 1 hour.

<sup>3</sup> Limited. Any OP-level staff can perform an accurate assessment, but TTPs to ensure that assessments are accurate are limited to basic, nonspecific data that must be researched. More detailed specific information and checklists useful for time-sensitive situations are not available. With manual processes, accuracy may not be as dependable and might be subject to human errors.

<sup>4</sup> Limited. Any OP-level staff can develop procedures and checklists, but there are no TTPs that specifically address the impact of restoration activities on operational objectives.

<sup>5</sup> Limited. Few if any restoration exercises or experiments focused on operational impacts on units, equipment, facilities, activities, or terrain that are contaminated and require restoration operations have been conducted. A RESTOP ACTD (ongoing) has been conducted with results to be published (TBP) that may or may not provide insight into CBRND operational impact assessment.

<sup>6</sup> Limited. Depending on the extent of contamination and the decontamination means selected, the procedures may or may not be logistically supportable.

<sup>7</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>8</sup> Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.

<sup>9</sup> The process will be linked to automated systems so that routine data can be used by automated tools. An automated tool will determine the impact of contaminated units or facilities that must undergo restoration operations on JTF operations. System will have integrated analysis tools to predict and reprioritize restoration requirements based on interaction with JTF J3 operational priorities. This will improve speed of assessment. Human out of the loop will improve accuracy if data is reliable.

<sup>10</sup> JTTPs to ensure that estimates are accurate will be collected or developed. More detailed specific information and checklists useful for time-sensitive situations will be developed. When automated tools have been developed, accuracy will be dependable and not be subject to human errors.

<sup>11</sup> JTTPs that specifically address the impact of restoration activities on operational objectives will be developed.

<sup>12</sup> Experiments and exercises focused on theater restoration operations will be conducted. Lessons learned from RESTOPS ACTD will be integrated into future exercises and experimentation that looks at issues other than fixed sites.

<sup>13</sup> Development and acquisition of more efficient and less materiel-intensive decontamination systems will improve the logistical supportability in the far term.

### 16.4.3 Functional Solution Analysis

#### 16.4.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Current capability is not automated.  
**Non-Materiel Solutions:** None.
2. **Deficiency:** No doctrine or TTPs have been developed.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs on how to assess the operational impact of restoration activities on operational-level operations.
3. **Deficiency:** Restoration exercises and experiments have been limited.  
**Non-Materiel Solutions:** *Doctrine:* Develop exercises/ experiments for OP-level staffs on how to assess the operational impact of restoration activities. Incorporate lessons learned from RESTOPS ACTD into future exercises.
4. **Deficiency:** There is no leader training/education for JTF restoration of operations.  
**Non-Materiel Solutions:** *Training:* Develop training for OP-level staffs on how to assess the operational impact of restoration activities. *Leadership:* Develop leader training on how to assess the operational impact of restoration activities.
5. **Deficiency:** Few exercises/experiments have been conducted at the OP level of war to determine whether decontamination operations are logistically supportable under a wide variety of conditions.  
**Non-Materiel Solutions:** *Training:* Conduct specific OP-level exercises/experiments to determine whether decontamination operations are logistically supportable under a wide variety of conditions.

#### 16.4.3.2 IMA Assessment Summary

Table 16.4-2 shows possible materiel approaches that address the remaining materiel requirements of the DOTMLPF assessment.

Table 16.4-2. OPSUST 4: IMA Assessment

Capability Gap	Idea for Materiel Approach	Description
Lack of automated means to assess the operational impact of required restoration activities.	Automated system	Link the process to automated systems so that routine data can be used by automated tools. An automated tool will determine the impact of contaminated units or facilities that must undergo restoration operations on JTF operations. System has integrated analysis tools to predict and reprioritize restoration requirements based on interaction with JTF J3 operational priorities. This will improve speed of assessment. Human out of the loop will improve accuracy if data is reliable.

**16.5 Task OPSUST 5: Provide operational guidance to forces with contaminated units****16.5.1 Functional Area Analysis****16.5.1.1 Definition**

To provide specific, tailored operational guidance to forces that have some or all of their units contaminated. The JTF commander may determine that some critical units or facilities must continue essential operations for a specified period of time despite contamination, prior to conducting restoration operations. To provide adequate guidance, a complete picture of the projected degradation to the unit/facility over time must be available to the JTF commander.

**16.5.1.2 Derivation**

*UJTL (OP 7.3, OP 5.3.2).*

**16.5.1.2.1 Supported Task: STSUST 7****16.5.1.2.2 Lateral Task: OPSHA 6****16.5.1.2.3 Supporting Task: TASUST 26****16.5.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Persistent CBRN/TIM effects. (C1.3.3.1-3)

**Military**

1. Stressful mission. (C2.1)
2. No mission preparation. (C2.1.3)
3. Negligible personnel experience. (C2.2.4.5)
4. Moderate rear-area security. (C2.7.1)
5. Fully developed state of conflict. (C2.10.1)

**Civil. N/A****16.5.2 Functional Needs Analysis****16.5.2.1 Capability and Deficiency Assessment Summary**

Table 16.5-1 discusses the only capability that currently exists to perform the task to the designated standards. No other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The current assessment is “yellow.” Any JTF HQ has a team of operational planners and information command and control specialists. This team of experts forms the backbone of the JTF command structure. They can perform the task, but several factors will degrade their performance.

**Projected Near/Mid-Term Capability and Deficiency**

No other capabilities are currently projected for the near/mid term. Limited capability improvements are forecast for the near/mid term except for DOTMLPF, which should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

**Projected Far-Term Capability and Deficiency**

DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. JTTPs, training and exercises, and education will all improve leading to a far-term assessment of “green.”

**Table 16.5-1. OPSUST 5: Capability and Deficiency Assessment**

<b>Capability: Operational-Level Unit Staff</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>	<b>M6</b>	<b>M7</b>	<b>M8</b>	<b>M9</b>	<b>M10</b>	<b>M11</b>
<b>Current Overall Capability<sup>1</sup></b>	G <sup>2</sup>	Y <sup>3</sup>	Y <sup>4</sup>	Y <sup>5</sup>	G <sup>6</sup>	Y <sup>7</sup>	Y <sup>8</sup>	Y <sup>9</sup>	Y <sup>10</sup>	Y <sup>11</sup>	Y <sup>12</sup>
<b>Near/Mid-Term Overall Capability<sup>13</sup></b>	G	Y	Y	Y	G	Y	Y	Y	Y	Y	Y
<b>Far-Term Overall Capability<sup>14</sup></b>	G	G <sup>15</sup>	G	G	G	G	G	G	G <sup>16</sup>	G <sup>17</sup>	G

	<b>FAA Measure</b>	<b>Scale</b>
M1	Updated joint force situation is used.	G – Yes, Y – Limited, R – No
M2	Procedures and checklists exist to help access current situation and formulate revised plans of action.	G – Yes, Y – Limited, R – No
M3	Procedures and checklists exist to help the commander to formulate crisis assessment.	G – Yes, Y – Limited, R – No
M4	Procedures and checklists exist to help adjust original plan for alternate operations (after recognizing planning assumptions invalid).	G – Yes, Y – Limited, R – No
M5	Commander's situation reports (SITREPs) follow standard format.	G – Yes, Y – Limited, R – No
M6	Courses of action (COAs) are evaluated to find which are suitable, feasible, acceptable, and complete after assessing capabilities of contaminated units.	G – Yes, Y – Limited, R – No
M7	Milestone criteria for plan development are available and followed.	G – Yes, Y – Limited, R – No
M8	New executable operational plans and orders adequately address contamination of units.	G – Yes, Y – Limited, R – No
M9	Joint exercises/experimentation provide lessons learned on procedures for providing operational guidance to forces with contaminated units.	G – Yes, Y – Limited, R – No
M10	Decontamination procedures are logistically supportable.	G – Yes, Y – Limited, R – No
M11	Report/advise contaminated units of commander's guidance within 1 hour.	G – Yes, Y – Limited, R – No

<sup>1</sup> No doctrine has been developed. The linkage of restoration operations and providing operational guidance is not integrated into leader education. This task is not a standard part of training.

<sup>2</sup> Yes. Once restoration operations are required, nothing prevents a staff from updating the joint force situation.

<sup>3</sup> Limited. Any staff can develop procedures and checklists, but there are no TTPs that specifically address providing operational guidance to forces with contaminated units.

<sup>4</sup> Limited. Any staff can develop procedures and checklists, but there are no TTPs that help the commander to formulate a crisis assessment.

<sup>5</sup> Limited. Any staff can develop procedures and checklists, but there are no TTPs that specifically address how to adjust original plans for alternate operations (after recognizing planning assumptions are invalid) for forces with contaminated units.

<sup>6</sup> Yes. Once restoration operations are required, nothing prevents a staff from using existing standard formats.

<sup>7</sup> Limited. Any staff can evaluate COAs, but there are no TTPs that specifically address evaluating the COAs after assessing capabilities of contaminated units.

<sup>8</sup> Limited. Any staff can develop milestone criteria for plan development, but there are no TTPs that specifically address milestone criteria for plan development for forces with contaminated units.

<sup>9</sup> Limited. Any staff can develop generic operational plans, but there are no TTPs that specifically address developing operational plans and orders addressing issues facing contaminated units.

<sup>10</sup> Limited. Any joint exercise/ experiment can provide feedback, but few if any have been conducted that specifically address assessing the operational impact of restoration activities.

<sup>11</sup> Limited. Under specific certain circumstances, any decontamination procedure may or may not be logistically supportable at the operational level. Few exercises/experiments have been conducted at the OP level of war to determine whether decontamination operations are logistically supportable under a wide variety of conditions.

<sup>12</sup> Any staff can report/advise contaminated units of the commander's guidance, but the current capability is manual, slowing down the process. It is unlikely that assessments can be made manually within 1 hour.

<sup>13</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>14</sup> Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.

<sup>15</sup> TTP will be developed for all pertinent standards by the far term.

<sup>16</sup> Experiments and exercises focused on theater restoration operations will be conducted. Lessons learned from RESTOPS ACTD will be integrated into future exercises and experimentation that looks at issues other than fixed sites.

<sup>17</sup> Experiments and exercises focused on theater restoration operations will be conducted. Lessons learned from RESTOPS ACTD will be integrated into future exercises and experimentation that looks at issues other than fixed sites.

### 16.5.3 Functional Solution Analysis

#### 16.5.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** The current capability is manual and not automated, slowing down the process.  
**Non-Materiel Solutions:** None.
2. **Deficiency:** Restoration exercises/experimentation have been limited.  
**Non-Materiel Solutions:** *Doctrine:* Develop an exercise/experiment for a JTF on how to provide operational guidance to forces with contaminated units. Incorporate lessons learned from RESTOPS ACTD into future exercises.
3. **Deficiency:** No TTPs/doctrine have been developed.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs and doctrine on all aspects of developing and providing operational guidance to forces with contaminated units of JTF operations.
4. **Deficiency:** Few exercises/experiments have been conducted at the OP level of war to determine whether decontamination operations are logistically supportable under a wide variety of conditions.  
**Non-Materiel Solutions:** *Training:* Develop exercises/experiments to be conducted at the OP level of war to determine whether decontamination operations are logistically supportable under a wide variety of conditions. Review and assess RESTOPS ACTD for pertinent data when published.
5. **Deficiency:** There is no leader training/education for JTF restoration of operations.  
**Non-Materiel Solutions:** *Training:* Develop training for OP-level staffs on operational guidance to forces with contaminated units. *Leadership:* Develop leader training for OP-level staffs and commanders on all aspects of developing and providing operational guidance to forces with contaminated units.

#### 16.5.3.2 IMA Assessment Summary

Table 16.5-2 shows possible materiel approaches that address the remaining materiel requirements of the DOTMLPF assessment.

**Table 16.5-2. OPSUST 5: IMA Assessment**

<b>Capability Gap</b>	<b>Idea for Materiel Approach</b>	<b>Description</b>
The current capability is manual and not automated, slowing down the process of providing operational guidance to forces with contaminated units.	Automated systems	Develop automation tools and automatic processes for assisting commanders and staffs in providing operational guidance to forces with contaminated units. System should be automatic and provide component command degradation information in accordance with established formats. System should have integrated analysis tools to predict degradation impact to critical JTF operations based on interaction with JTF J3 operational priorities. Information on degradation must be automatically provided to J3 systems so that decisions can be made on operational priorities or required changes. This could be used in conjunction with a sensor system on individual vehicles and systems, integrated with an automated system that immediately provides a real-time assessment of operational degradation.

**16.6 Task OPSUST 6: Provide mobile assessment teams to assess and determine disposition of contaminated units, equipment, facilities, or activities****16.6.1 Functional Area Analysis****16.6.1.1 Definition**

To establish and deploy mobile assessment teams, staffed with experts in both CBRND and operational considerations, who can make a complete assessment of contaminated units, equipment, facilities, or activities and determine their disposition. When critical units or facilities become contaminated, there will be much confusion and likely an inability of the unit to provide an objective assessment of its status or requirements. The JTF commander may provide mobile assessment teams to assess and determine residual capability of and recommend disposition of contaminated units, equipment, facilities, or activities. The team will provide its assessments and recommendations to the JTF commander.

**16.6.1.2 Derivation**

*UJTL (OP 7.3, OP 4.4.4, OP 5.2, OP 5.3.2, OP 4.7.8).*

**16.6.1.2.1 Supported Task: STSUST 7****16.6.1.2.2 Lateral Task: N/A****16.6.1.2.3 Supporting Task: TASUST 24****16.6.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Persistent CBRN/TIM effects. (C1.3.3.1-3)

**Military**

1. Stressful mission. (C2.1)
2. No mission preparation. (C2.1.3)
3. Negligible personnel experience. (C2.2.4.5)
4. Moderate rear-area security. (C2.7.1)
5. Limited host-nation support. (C2.8.5)
6. Fully developed state of conflict. (C2.10.1)

**Civil**

1. Limited foreign government support. (C3.1.2.3)

**16.6.2 Functional Needs Analysis****16.6.2.1 Capability and Deficiency Assessment Summary**

Table 16.6-1 discusses the only capability that currently exists to perform the task to the designated standards. No other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The current assessment is “yellow.” Any JTF HQ has a team of operational planners and information command and control specialists. This team of experts forms the backbone of the JTF command structure. A CBRN mobile assessment team could be assembled on an ad hoc basis at any time from in-house JTF resources. Prototype SJTF staffs must be assessed to determine their ability to provide mobile assessment teams. This capability has never been attempted or tested. There is no doctrine that covers this capability. This capability could also be developed in any new CBRND units that are currently being stood up.

**Projected Near/Mid-Term Capability and Deficiency**

No other capabilities are currently projected for the near/mid term. No capability improvements are forecast for the near/mid term.

**Projected Far-Term Capability and Deficiency**

No other capabilities are currently projected for the far-term. Limited capability improvements are forecast for the near/mid term. DOTMLPF could be developed (including checklists) to improve many deficient areas as a result of initiatives that use data resulting from focused experimentation if a decision is made to resource teams.

**Table 16.6-1. OPSUST 6: Capability and Deficiency Assessment**

Capability: SJFHQ	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10	M11	M12	M13	M14	M15	M16	M17	M18	M19	M20	M21	M22	M23	M24	M25

	FAA Measure	Scale
M1	Mobile assessment team arrives within 1 hour after incident.	G – Yes, Y – Limited, R – No
M2	Coordination process is activated with host nation.	G – Yes, Y – Limited, R – No
M3	Mobile assessment team properly trained, staffed, and equipped.	G – Yes, Y – Limited, R – No
M4	Liaison is established with country team and other U.S. government agencies, nongovernmental organizations (NGOs), international organizations and coalition forces.	G – Yes, Y – Limited, R – No
M5	Affected joint force commander is provided with technical expertise relating to CBRN/TIM hazards.	G – Yes, Y – Limited, R – No
M6	Appropriate U.S. resources and capabilities are factored into operational plans and actions.	G – Yes, Y – Limited, R – No
M7	Appropriate coalition resources and capabilities are factored into plans and actions.	G – Yes, Y – Limited, R – No
M8	Affected joint force/facility is provided with guidance on how and when to commence decontamination operations.	G – Yes, Y – Limited, R – No
M9	Coordination is made for additional support assets to go to the incident area if required.	G – Yes, Y – Limited, R – No
M10	A plan is in place for mobile assessment team operations.	G – Yes, Y – Limited, R – No
M11	If required, the Defense Threat Reduction Agency (DTRA) Consequence Management Advisory Team is requested.	G – Yes, Y – Limited, R – No
M12	Determination is made of the population at risk and a CBRN/TIM casualty estimate is provided for the commander's intelligence estimate.	G – Yes, Y – Limited, R – No
M13	CBRN/TIM casualty management is adequate.	G – Yes, Y – Limited, R – No
M14	CBRN/TIM casualties are assessed.	G – Yes, Y – Limited, R – No
M15	CBRN/TIM casualties are treated.	G – Yes, Y – Limited, R – No
M16	CBRN/TIM casualties are decontaminated.	G – Yes, Y – Limited, R – No
M17	Procedures are in place for movement/quarantine of CBRN/TIM casualties.	G – Yes, Y – Limited, R – No
M18	Procedures are set up for tracking and follow-up procedures of contaminated personnel.	G – Yes, Y – Limited, R – No
M19	Coordination is made with mortuary affairs on handling, decontaminating, and transporting human remains.	G – Yes, Y – Limited, R – No
M20	Operational forces are trained to operate in a CBRN/TIM environment.	G – Yes, Y – Limited, R – No
M21	Operational forces are equipped to operate in a CBRN/TIM environment.	G – Yes, Y – Limited, R – No
M22	Facilities unavailable due to CBRN/TIM attack are reported.	G – Yes, Y – Limited, R – No

M23	Theater medical threats are identified and countermeasures developed.	G – Yes, Y – Limited, R – No
M24	Mobile assessment team recommends establishment of JTF for restoration operations if required.	G – Yes, Y – Limited, R – No
M25	Procedures and checklists are developed to facilitate the ability to provide mobile assessment teams to assess and determine disposition of contaminated units, equipment, facilities, or activities.	G – Yes, Y – Limited, R – No

<sup>1</sup> No DOTMLPF is in place at this time.

<sup>2</sup> Assessment teams are not designated, staffed, trained or equipped at this time. Until that happens, there is no way they will be able to respond to the incident site within 1 hour.

<sup>3</sup> Nothing precludes activating a coordination process of this type, but first, the process must be developed and refined through exercises.

<sup>4</sup> There are no mobile assessment teams at this time.

<sup>5</sup> Nothing precludes activating a liaison process of this type, but it has never been done in the context of assessing a CBRN incident.

<sup>6</sup> Nothing precludes this action. A call-back mechanism is available now from DTRA for technical expertise relating to CBRN/TIM, but in an emergency of this type, the expertise needs to be available to the affected joint force commander at the incident site.

<sup>7</sup> Yes. Nothing precludes factoring U.S. resources and capabilities into operational plans and actions.

<sup>8</sup> Yes. Nothing precludes factoring coalition resources and capabilities into operational plans and actions.

<sup>9</sup> Nothing precludes providing this guidance, but no TTPs exist at this time. See OPSUST 5.

<sup>10</sup> Yes. Nothing precludes making coordination for additional support assets to go to the incident area if required.

<sup>11</sup> No. There are no mobile assessment teams at this time.

<sup>12</sup> Yes. Nothing precludes requesting the DTRA Consequence Management Advisory Team.

<sup>13</sup> Yes. Nothing precludes making this determination or providing casualty estimates.

<sup>14</sup> If casualty treatment units can be brought to the site quickly, and there is enough capability available to meet the demand it will be deemed adequate. This task needs to be exercised at both the operational and tactical levels because response time and adequacy has not been determined for all possible scenarios. See tactical casualty management tasks.

<sup>15</sup> Nothing precludes triaging of CBRN casualties once adequate CBRND capable medical forces are on hand. This task needs to be exercised at both the operational and tactical levels because response time and adequacy has not been determined for all possible scenarios.

<sup>16</sup> Nothing precludes treatment of CBRN casualties once adequate CBRND capable medical forces are on hand. This task needs to be exercised at both the operational and tactical levels because response time and adequacy has not been determined for all possible scenarios.

<sup>17</sup> Nothing precludes decontamination of CBRN casualties once adequate CBRND capable medical forces are on hand. This task needs to be exercised at both the operational and tactical levels because response time and adequacy has not been determined for all possible scenarios.

<sup>18</sup> Procedures for movement/quarantine of CBRN casualties are available, but this task needs to be exercised at both the operational and tactical levels because response time and adequacy of procedures has not been determined for all possible scenarios.

<sup>19</sup> Procedures are available for tracking and follow-up procedures of contaminated personnel, but they need to be exercised in a stressful situation to determine their efficacy and to identify capability gaps.

<sup>20</sup> Nothing precludes making coordination with mortuary affairs on handling, decontaminating, and transporting human remains.

<sup>21</sup> Operational forces are trained to “survive” in a CBRN environment. There are so few exercises with realistic CBRN scenarios that it is impossible to determine whether forces could “operate” in a CBRN environment. It is also important to know whether they would be able to accomplish assigned missions in a CBRN environment.

<sup>22</sup> Operational forces are equipped to “survive” in a CBRN environment. There are so few exercises with realistic CBRN scenarios that it is impossible to determine whether forces are truly equipped to “operate” in a CBRN environment. It is also important to know whether they are adequately equipped to accomplish assigned missions in a CBRN environment.

<sup>23</sup> Nothing precludes reporting facilities unavailable due to CBRN attack.

<sup>24</sup> The mobile assessment team should be equipped with the means to detect, sample, and identify CBRN/TIM related medical threats. Development of medical threat countermeasures is beyond the scope of this task and must be referred appropriately.

<sup>25</sup> The mobile assessment team should be equipped with the means to detect, sample, and identify CBRN/TIM related medical threats. Development of medical threat countermeasures is beyond the scope of this task and must be referred appropriately.

<sup>26</sup> No. There are no mobile assessment teams at this time.

<sup>27</sup> Experimentation results may cause the creation of DOTMLPF that can be used if a decision is made to resource teams.

<sup>28</sup> Experimentation results may cause the creation of checklists that can be used if a decision is made to resource teams.

### 16.6.3 Functional Solution Analysis

#### 16.6.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** Assessment teams are not designated, staffed, trained, or equipped at this time.  
**Non-Materiel Solutions:** *Doctrine:* Development must begin on concepts and doctrine to guide mobile assessment teams to help component commanders assess and determine residual capability of and recommend disposition of contaminated units, equipment, facilities, or activities. *Organization:* Prototype SJFHQ staffs must be assessed to determine their ability to provide mobile assessment teams. Prototype SJFHQ CBRN centers must be provided with adequate CBRN center staffing to ensure that support can be provided for mobile assessment teams. *Training:* As concepts and doctrine are developed, they must be tested and refined through experimentation and ultimately in full-scale exercises. *Leadership:* JPME must include leader-learning areas for restoration operation considerations at the OP level. *Personnel:* Personnel evaluating and mentoring CBRN elements of JTF exercises must possess adequate joint and CBRN credentials. *Facilities:* As plans are made for the establishment of the JNTC, TTPs for testing a JTF HQ's ability to field and deploy mobile assessment teams to help component commanders assess and determine residual capability of and recommend disposition of contaminated units, equipment, facilities, or activities must be integrated into training center infrastructure plans.
- 2. Deficiency:** Until teams are designated, staffed, trained, and equipped they will be unable to respond to the incident site within 1 hour.  
**Non-Materiel Solutions:** None.
- 3. Deficiency:** The coordination process with host nations must be developed and refined through exercises.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs and doctrine on all aspects of coordinating with host nations during large-scale CBRN incidents. *Training:* Develop exercises/experiments to be conducted on all aspects of coordinating with host nations during large-scale CBRN incidents.
- 4. Deficiency:** Establishing liaison with country team and other U.S. government agencies, NGOs, international organizations, and coalition forces has never been done by a mobile assessment team.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs and doctrine on all aspects of establishing liaison with country team and other U.S. government agencies, NGOs, international organizations, and coalition forces.
- 5. Deficiency:** CBRN technical expertise must be part of the team and available to the affected joint force commander.

**Non-Materiel Solutions: Personnel:** Analyze CBRND staffing in all organizations in light of the capabilities required of them in this task. Recommend staffing/organizational changes, enhancements, or alternative fixes as required.

- 6. Deficiency:** Operational- and tactical-level exercises have not provided adequate information.

**Non-Materiel Solutions: Leadership:** This task needs to exercise at both the operational and tactical levels because response time and adequacy of casualty management, triage, treatment, decontamination, movement/quarantine, tracking and follow-up has not been adequately determined for all possible scenarios. Operational forces must be assessed to see not only whether they are trained and equipped not only to “survive” in a CBRN environment, but also whether they can accomplish typical assigned missions.

- 7. Deficiency:** No DOTMLPF is in place at this time.

**Non-Materiel Solutions: Doctrine:** All pertinent DOTMLPF needs to be developed in accordance with the process outlined in Footnote 1. JPME must include leader-learning areas for restoration operations considerations at the OP level.

### 16.3.2 IMA Assessment Summary

Table 16.6-2 shows possible materiel approaches that address the remaining materiel requirements of the DOTMLPF assessment.

**Table 16.6-2. OPSUST 6: IMA Assessment**

Capability Gap	Idea for Materiel Approach	Description
Until teams are designated, staffed, trained and equipped, they will be unable to respond to the incident site within 1 hour.	Mobile command and control platform	A required materiel solution will be a command and control platform to quickly transport the team to the incident site. It will provide them with all the tools required to make the assessment, provide them with total protection from any CBRN hazard, and allow for quick and complete decontamination of the command and control platform after the assessment is complete. The tools onboard can be linked to sensors on the contaminated units, equipment, facilities providing automatic data feeds en route.

**16.7 Task OPSUST 7: Provide restoration operation country assistance teams to support TEPs****16.7.1 Functional Area Analysis****16.7.1.1 Definition**

To provide restoration operation country assistance teams to support the Theater Engagement Plan (TEP) that has been provided by the combatant commander. Many nations that would normally support U.S. initiatives may feel threatened by hostile neighbors or nations that possess CBRN/TIM weapons. TEPs for restoration operation considerations are executed by special teams and units that demonstrate restoration operation capability or provide restoration operation training to selected countries.

**16.7.1.2 Derivation**

*UJTL (OP 7.3, OP 4.7.1, ST 8.1.2), CJCSM 3113.01a.*

**16.7.1.2.1 Supported Tasks: STSUST 7, STSUST 8****16.7.1.2.2 Lateral Task: OPSHA 9****16.7.1.2.3 Supporting Task: TASUST 25****16.7.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. No preexisting arrangements. (C 2.1.1.2)
2. Limited personnel expertise. (C2.2.4.5)

**Civil**

1. Mixed support for political policies. (C3.1)
2. Limited foreign government support. (C3.1.2.3.)

**16.7.2 Functional Needs Analysis****16.7.2.1 Capability and Deficiency Assessment Summary**

Table 16.7-1 discusses the only capability that currently exists to perform the task to the designated standards. No other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The current assessment is “red.” Any JTF HQ has a team of operational planners and information command and control specialists. This team of experts has the skill to provide restoration operation country assistance teams to support the TEP, but there are some deficiencies that negatively impact on their ability to do so.

**Projected Near/Mid-Term Capability and Deficiency**

No other capabilities are currently projected for the near/mid term. Limited capability improvements are forecast for the near/mid term except for DOTMLPF, which should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. The overall projected capability will remain “red” in the near/mid term.

**Projected Far-Term Capability and Deficiency**

No other capabilities are currently projected for the far-term. DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. Steps can be taken to establish and equip country assistance teams. JTTPs, training and exercises, and education will all improve leading to a far-term assessment of “green.”

**Table 16.7-1. OPSUST 7: Capability and Deficiency Assessment**

<b>Capability: SJFHQ</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>
<b>Current Overall Capability<sup>1</sup></b>	R <sup>2</sup>	G <sup>3</sup>	R <sup>4</sup>	Y <sup>5</sup>
<b>Near/Mid-Term Overall Capability<sup>6</sup></b>	R	G	R	Y
<b>Far-Term Overall Capability<sup>7</sup></b>	G <sup>8</sup>	G	G <sup>9</sup>	G <sup>10</sup>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Restoration operation country assistance teams are properly trained and equipped.	G – Yes, Y – Limited, R – No
M2	Valid requests for restoration operation assistance are met.	G – Yes, Y – Limited, R – No
M3	Procedures and checklists are developed to facilitate the ability to provide restoration operation country assistance teams to support the TEP.	G – Yes, Y – Limited, R – No
M4	Joint exercises provide feedback on restoration operation country assistance teams.	G – Yes, Y – Limited, R – No

<sup>1</sup> No specific doctrine has been developed. The linkage of restoration operations restoration operation country assistance teams is not integrated into leader education. This task is not a standard part of training.

<sup>2</sup> No. While any SJFHQ staff can train and equip a country assistance team, none have ever been established. There has been no training or equipment developed that specifically addresses the training and equipment requirements for a restoration operation country assistance team.

<sup>3</sup> Yes. Any SJFHQ staff can process and honor requests for a country assistance team. There is currently no experience base, however.

<sup>4</sup> No. Any SJFHQ staff can develop procedures and checklist for a country assistance team, but there are no TTPs that addresses a restoration operation country assistance team support to theater engagement planning.

<sup>5</sup> Limited. Few if any restoration exercises or experiments focused on restoration operation country assistance teams have been conducted.

<sup>6</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>7</sup> Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.

<sup>8</sup> Steps will be taken to establish and equip country assistance teams.

<sup>9</sup> JTTPs that addresses a restoration operation country assistance team support to TEP will be developed.

<sup>10</sup> Experiments and exercises focused on theater restoration operations will be conducted. Lessons learned from RESTOPS ACTD will be integrated into future exercises and experimentation that looks at issues other than fixed sites.

### 16.7.3 Functional Solution Analysis

#### 16.7.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Restoration operation country assistance teams requirements are not defined.  
**Non-Materiel Solutions:** *Doctrine:* CJCS has not developed an operational concept for restoration operations country assistance teams and specific guidance (technical or procedural) on how to approach this task has not been provided. Develop TTPs, organizational structure, training, leadership education, and equipment for restoration operation country assistance teams to support TEPs.
2. **Deficiency:** Prototype country assistance teams are not organized.  
**Non-Materiel Solutions:** *Organization:* Develop organizational tables of distribution and allowances (TDAs) for restoration operation country assistance teams to support TEPs.
3. **Deficiency:** Training is inadequate for country assistance teams.  
**Non-Materiel Solutions:** *Training:* Develop training for restoration operation country assistance teams to support TEPs.
4. **Deficiency:** Leader education inadequate.  
**Non-Materiel Solutions:** *Leadership:* Develop JPME classes for restoration operation country assistance teams to support TEPs.
5. **Deficiency:** Restoration exercises have been limited.  
**Non-Materiel Solutions:** *Doctrine:* Develop and refine restoration of operations exercises for a JTF. Incorporate lessons learned from RESTOPS ACTD into future exercises.

#### 16.7.3.2 IMA Assessment Summary

N/A

**16.8 Task OPSUST 8: Support SOF restoration operation requirements****16.8.1 Functional Area Analysis****16.8.1.1 Definition**

To support special operations force (SOF) restoration operation requirements following the planning guidance provided by the combatant commander and utilizing JTF resources. The contamination of SOF may require extraordinary resources over long distances and to austere locations.

**16.8.1.2 Derivation**

*UJTL (OP 7.3, OP 3.2.5.3, OP 5.4.5).*

**16.8.1.2.1 Supported Task: STSUST 9****16.8.1.2.2 Lateral Task: OPSHA 3****16.8.1.2.3 Supporting Tasks: TASUST 1, TASUST 2, TASUST 3, TASUST 4, TASUST 5, TASUST 6, TASUST 7, TASUST 8, TASUST 9, TASUST 10, TASUST 11, TASUST 12, TASUST 13, TASUST 16, TASUST 17, TASUST 20, TASUST 21, TASUST 23, TASUST 24, TASUST 25, TASUST 26, TASUST 27, TASUST 28, TASUST 29, TASUST 30****16.8.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Persistent CBRN/TIM effects. (C1.3.3.1-3)

**Military**

1. Stressful mission. (C2.1)
2. Partially completed mission preparation. (C2.1.3)
3. Weak forces assigned. (C2.2.1)
4. Negligible personnel experience. (C2.2.4.5)
5. Poor joint staff integration. (C2.3.1.1)
6. Limited lift assets. (C2.5.2)
7. Moderate rear-area security. (C2.7.1)
8. No host-nation support. (C2.8.5)
9. Conventional and terrorist threat form. (C2.9.2)
10. Fully developed state of conflict. (C2.10.1)

**Civil**

1. Limited foreign government support. (C3.1.2.3)

**16.8.2 Functional Needs Analysis****16.8.2.1 Capability and Deficiency Assessment Summary**

Table 16.8-1 discusses the only capability that currently exists to perform the task to the designated standards. No other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The current assessment is “yellow.” Any OP-level staff has a team of operational planners and command and control specialists, and most have CBRN subject matter experts. This team of experts has the skill to support SOF restoration operation requirements, but there are some deficiencies that negatively impact on the efficiency with which they will be able to operate.

**Projected Near/Mid-Term Capability and Deficiency**

No other capabilities are currently projected for the near/mid term. Limited capability improvements are forecast for the near/mid term except for DOTMLPF, which should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

**Projected Far-Term Capability and Deficiency**

DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. Experiments and exercises focused on theater restoration operations will be conducted that specifically address SOF restoration operation support provided by JTF. Although JTTPs, training and exercises, and education will all improve the far-term assessment will remain “yellow.”

**Table 16.8-1. OPSUST 8: Capability and Deficiency Assessment**

<b>Capability: Operational-Level Unit Staff</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>	<b>M6</b>	<b>M7</b>	<b>M8</b>	<b>M9</b>
<b>Current Overall Capability<sup>1</sup></b>	Y <sup>2</sup>	Y <sup>3</sup>	Y <sup>4</sup>	Y <sup>5</sup>	Y <sup>6</sup>	G <sup>7</sup>	Y <sup>8</sup>	Y <sup>9</sup>	Y <sup>10</sup>
<b>Near/Mid-Term Overall Capability<sup>11</sup></b>	Y	Y	Y	Y	Y	G	Y	Y	Y
<b>Far-Term Overall Capability<sup>12</sup></b>	Y	Y	Y	Y	Y	G	Y	G <sup>13</sup>	G <sup>14</sup>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Procedures are in place to facilitate response to SOF requests for assistance.	G – Yes, Y – Limited, R – No
M2	Procedures and checklists exist to help develop executable operational plans and orders.	G – Yes, Y – Limited, R – No.
M3	Support provided is adequate.	G – Yes, Y – Limited, R – No
M4	Decontamination and support forces have SOF restoration operation experience.	G – Yes, Y – Limited, R – No
M5	COAs are available and selected in advance of execution.	G – Yes, Y – Limited, R – No
M6	COAs are coordinated between JTF and SOF prior to execution.	G – Yes, Y – Limited, R – No
M7	Procedures and checklists exist to help issue commander's estimate.	G – Yes, Y – Limited, R – No
M8	Joint exercises/experimentation provide lessons learned on SOF restoration operation support provided by JTF.	G – Yes, Y – Limited, R – No
M9	Decontamination procedures are logistically supportable.	G – Yes, Y – Limited, R – No

<sup>1</sup> This task is not a standard part of training.

<sup>2</sup> Limited. Any OP-level unit staff can respond to SOF request for assistance, but there are no TTPs or formalized familiarization training that addresses the unique aspects of joint forces supporting SOF restoration operation requirements.

<sup>3</sup> Limited. Any OP-level unit staff can develop procedures and checklists for operational plans and orders, but there are no TTPs that address development of the unique requirements of SOF restoration operational plans and orders.

<sup>4</sup> Limited. Any OP-level unit staff can provide support, but there is no real way of knowing how effective this support will be without comprehensive training events.

<sup>5</sup> Limited. No staff will have an experience base without comprehensive training with SOF.

<sup>6</sup> Limited. Any OP-level unit staff can develop/select COAs in advance of execution of the mission. There are no TTPs that address development and selection of COAs while supporting a SOF restoration operation.

<sup>7</sup> Any OP-level unit staff can coordinate COAs between HQs.

<sup>8</sup> Limited. Any OP-level staff can develop an accurate estimate, but TTPs to ensure that estimates are accurate are limited to basic, nonspecific data that must be researched. More detailed specific information and checklists useful for time-sensitive situations are not available. With manual processes, accuracy may not be as dependable and might be subject to human errors.

<sup>9</sup> Limited. Any joint exercise/ experiment can provide feedback, but few if any have been conducted that specifically address SOF restoration operation support provided by JTF.

<sup>10</sup> Limited. Depending on the extent of contamination and the decontamination means selected, the procedures may or may not be logistically supportable.

<sup>11</sup> DOTMLPF should improve in all deficient areas, including inclusion in training, as a result of initiatives that use data resulting from focused experimentation.

<sup>12</sup> Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.

<sup>13</sup> Experiments and exercises focused on theater restoration operations will be conducted that specifically address SOF restoration operation support provided by JTF.

<sup>14</sup> Development and acquisition of more efficient and less materiel-intensive decontamination systems will improve the logistical supportability in the far term.

### 16.8.3 Functional Solution Analysis

#### 16.8.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** There are no TTPs for SOF restoration operation requirements.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs for SOF restoration of operations requirements.
2. **Deficiency:** Planning exercises for restoration with SOF have been limited.  
**Non-Materiel Solutions:** *Doctrine:* Develop and refine restoration of operations exercises for SOF. Incorporate lessons learned from RESTOPS ACTD into future exercises.
3. **Deficiency:** There is no leader training/education for JTF restoration of operations.  
**Non-Materiel Solutions:** *Training:* Develop training for staffs on SOF restoration of operations requirements. *Leadership:* Develop leader training for staffs on SOF restoration of operations requirements.
4. **Deficiency:** Automated means to support SOF restoration operation requirements is lacking.  
**Non-Materiel Solutions:** None.

#### 16.8.3.2 IMA Assessment Summary

Table 16.8-2 shows possible materiel approaches that address the remaining materiel requirements of the DOTMLPF assessment.

**Table 16.8-2. OPSUST 8: IMA Assessment**

Capability Gap	Idea for Materiel Approach	Description
Lack of an automated means to support SOF restoration operation requirements.	Automated systems	Link the process to automated systems so that routine data can be used by automated tools (that must be developed). This will improve speed and accuracy of planning. Human out of the loop will improve accuracy if data are reliable.

**16.9 Task OPSUST 9: Provide JTF command and control of restoration operations****16.9.1 Functional Area Analysis****16.9.1.1 Definition**

To provide the command, control, communications, and planning capabilities required for restoration operations that only a JTF HQ can provide. After a JTF HQ is established at the direction of the combatant commander, it will provide command and control of extensive or complex restoration operations. This could be a standing JTF HQ that can move from theater to theater or a JTF HQ established by a specific combatant command. The JTF HQ will provide all elements of command and control of restoration operations.

**16.9.1.2 Derivation**

*UJTL (OP 7.3, OP 4.4, OP 5.4, OP 5.5.6).*

**16.9.1.2.1 Supported Task: STSUST 10****16.9.1.2.2 Lateral Task: OPSHA 8****16.9.1.2.3 Supporting Tasks: TASUST 24, TASUST 25****16.9.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Persistent CBRN/TIM effects. (C1.3.3.1-3)

**Military**

1. Stressful mission. (C2.1)
2. Partially completed mission preparation. (C2.1.3)
3. Weak forces assigned. (C2.2.1)
4. Negligible personnel experience. (C2.2.4.5)
5. Poor joint staff integration. (C2.3.1.1)
6. Moderate rear-area security. (C2.7.1)
7. Moderate host-nation support. (C2.8.5)
8. Conventional and terrorist threat form. (C2.9.2)
9. Fully developed state of conflict. (C2.10.1)

**Civil**

1. Limited foreign government support. (C3.1.2.3)

**16.9.2 Functional Needs Analysis****16.9.2.1 Capability and Deficiency Assessment Summary**

Table 16.9-1 discusses the only capability that currently exists to perform the task to the designated standards. No other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The current assessment is “yellow.” Any JTF HQ staff has a team of operational planners and command and control specialists, and most have CBRN subject matter experts. This team of experts has the skill to provide JTF command and control of restoration operations, but there are some deficiencies that negatively impact on their ability to do so.

**Projected Near/Mid-Term Capability and Deficiency**

No other capabilities are currently projected for the near/mid term. Limited capability improvements are forecast for the near/mid term except for DOTMLPF, which should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

**Projected Far-Term Capability and Deficiency**

DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. JTTPs that specifically address the change in manning allocation as required by a restoration operation mission will be developed. Joint exercises and experiments will be conducted that will provide feedback on how a JTF commands and controls a restoration operation. JTTPs, training and exercises, and education will all improve leading to a far-term assessment of “green.”

Table 16.9-1. OPSUST 9: Capability and Deficiency Assessment

Capability: SJFHQ	M1	M2	M3	M4	M5	M6	M7	M8
Current Overall Capability <sup>1</sup>	Y <sup>2</sup>	Y <sup>3</sup>	Y <sup>4</sup>	G <sup>5</sup>	G <sup>6</sup>	Y <sup>7</sup>	Y <sup>8</sup>	Y <sup>9</sup>
Near/Mid-Term Overall Capability <sup>10</sup>	Y	Y	Y	G	G	Y	Y	Y
Far-Term Overall Capability <sup>11</sup>	G <sup>12</sup>	G <sup>13</sup>	G <sup>14</sup>	G	G	G <sup>15</sup>	G <sup>16</sup>	G <sup>17</sup>

	FAA Measure	Scale
M1	Procedures and checklists exist to help facilitate the stand-up of a JTF for restoration operations.	G – Yes, Y – Limited, R – No
M2	Procedures exist for dissolving of the JTF (following achievement of end state).	G – Yes, Y – Limited, R – No
M3	Joint restoration operation site areas or select fixed sites are defined.	G – Yes, Y – Limited, R – No
M4	Directive or mission is provided.	G – Yes, Y – Limited, R – No
M5	Directive contains desired effect and scope of action required.	G – Yes, Y – Limited, R – No
M6	Procedures and checklists exist to help facilitate the change in manning allocation of initial HQ required by restoration operation mission.	G – Yes, Y – Limited, R – No
M7	Joint exercises/experimentation provide lessons learned on restoration operation execution provided by JTF.	G – Yes, Y – Limited, R – No
M8	Decontamination procedures are logistically supportable.	G – Yes, Y – Limited, R – No

<sup>1</sup> There is no concept/doctrine on how to stand up a JTF for the conduct of restoration operations. Command and control of large-scale restoration operations is not integrated into leader education.

<sup>2</sup> Limited. Any SJFHQ staff can develop these kinds of procedures and checklists, but there are currently no TTPs that specifically address standing up a JTF for restoration operations.

<sup>3</sup> Limited. Any SJFHQ staff can develop these kinds of procedures, but there are currently no TTPs that specifically address dissolving a JTF for restoration operations following achievement of end state.

<sup>4</sup> Limited. Any SJFHQ staff can select and define operation site areas or fixed sites, but there are no TTPs that specifically address selecting and defining joint restoration sites.

<sup>5</sup> Nothing precludes a higher HQ from providing a directive or mission.

<sup>6</sup> Nothing precludes a higher HQ from providing a directive or mission that contains desired effect and scope of action required.

<sup>7</sup> Limited. Any SJFHQ staff can develop procedures and checklists, but there are currently no TTPs that specifically address the change in manning allocation as required by a restoration operation mission.

<sup>8</sup> No joint exercise or experiment has ever been conducted that would provide feedback on how a JTF commands and controls a restoration operation.

<sup>9</sup> Limited. Depending on the extent of contamination and the decontamination means selected, the procedures may or may not be logistically supportable.

<sup>10</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>11</sup> Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.

<sup>12</sup> JTTPs that specifically address standing up a JTF for restoration operations will be developed.

<sup>13</sup> JTTPs that specifically address dissolving a JTF for restoration operations following achievement of end state will be developed.

<sup>14</sup> JTTPs that specifically address selecting and defining joint restoration sites will be developed.

<sup>15</sup> JTTPs that specifically address the change in manning allocation as required by a restoration operation mission will be developed.

<sup>16</sup> Joint exercises and experiments will be conducted that will provide feedback on how a JTF commands and controls a restoration operation.

<sup>17</sup> Development and acquisition of more efficient and less materiel-intensive decontamination systems will improve the logistical supportability in the far term.

### 16.9.3 Functional Solution Analysis

#### 16.9.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** No concept/doctrine/TTPs exist for JTF conduct of restoration operations.  
**Non-Materiel Solutions:** *Doctrine:* Develop concepts/doctrine/TTPs for JTF command and control of restoration operations to include standing up/dissolving a JTF for restoration operations, selecting and defining joint restoration operation sites, and establishing the manning allocation of initial HQ required by restoration operation mission.
2. **Deficiency:** No JTF restoration exercises/experimentation.  
**Non-Materiel Solutions:** *Training:* Develop a JTF command and control of restoration operations exercise/experiment. Include in CBRND experimentation campaign plan schedule.
3. **Deficiency:** There is no leader training/education for JTF restoration of operations.  
**Non-Materiel Solutions:** *Training:* Develop training for staffs that are likely to be part of JTF's providing command and control of restoration operations. Nominate as candidate for FY 2009/2010 UNIFIED ENDEAVOR within CBRND experimentation campaign plan.  
*Leadership:* Develop leader education for staffs on command and control of restoration operations.

#### 16.9.3.2 IMA Assessment Summary

N/A

**16.10 Task OPSUST 10: Provide JTF command and control of decontamination of strategically significant areas/terrain or facilities****16.10.1 Functional Area Analysis****16.10.1.1 Definition**

To provide the command, control, communications, and planning capabilities required for decontamination of strategically significant areas/terrain or facilities that only a JTF HQ can provide. A JTF HQ may be established by a combatant commander to provide command and control of extensive or complex decontamination operations involving strategically significant areas/terrain or facilities. The decontamination of an area or facility will require a resource-intensive restoration operation.

**16.10.1.2 Derivation**

*UJTL (OP 7.3, OP 1.3.1, OP 5.4, OP 5.5).*

**16.10.1.2.1 Supported Tasks:** STSUST 11, STSUST 12**16.10.1.2.2 Lateral Task:** OPSHA 5**16.10.1.2.3 Supporting Tasks:** TASUST 24, TASUST 25**16.10.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Persistent CBRN/TIM effects. (C1.3.3.1-3)

**Military**

1. Stressful mission. (C2.1)
2. Partially completed mission preparation. (C2.1.3)
3. Weak forces assigned. (C2.2.1)
4. Negligible personnel experience. (C2.2.4.5)

8. Conventional and terrorist threat form. (C2.9.2)
9. Fully developed state of conflict. (C2.10.1)

**Civil**

1. Limited foreign government support. (C3.1.2.3)

**16.10.2 Functional Needs Analysis****16.10.2.1 Capability and Deficiency Assessment Summary**

Table 16.10-1 discusses the only capability that currently exists to perform the task to the designated standards. No other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The current assessment is “yellow.” Any JTF HQ staff has a team of operational planners and command and control specialists, and most have CBRN subject matter experts. This team of experts has the skill to provide JTF command of restoration of strategically significant areas/terrain or facilities, but there are some deficiencies that negatively impact on their ability to do so.

**Projected Near/Mid-Term Capability and Deficiency**

No other capabilities are currently projected for the near/mid term. Limited capability improvements are forecast for the near/mid term except for DOTMLPF, which should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

**Projected Far-Term Capability and Deficiency**

DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. Joint exercises and experiments will be conducted to provide feedback on how a JTF commands extensive or complex decontamination of significant areas/terrain or facilities. JTTPs, training and exercises, and education will all improve leading to a far-term assessment of “green.”

**Table 16.10-1. OPSUST 10: Capability and Deficiency Assessment**

<b>Capability: SJFHQ</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>	<b>M6</b>	<b>M7</b>	<b>M8</b>
<b>Current Overall Capability<sup>1</sup></b>	Y <sup>2</sup>	Y <sup>3</sup>	G <sup>4</sup>	G <sup>5</sup>	G <sup>6</sup>	Y <sup>7</sup>	R <sup>8</sup>	Y <sup>9</sup>
<b>Near/Mid-Term Overall Capability<sup>10</sup></b>	Y	Y	G	G	G	Y	R	Y
<b>Far-Term Overall Capability<sup>11</sup></b>	G <sup>12</sup>	G	G	G	G	G	G <sup>13</sup>	G <sup>14</sup>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Procedures and checklists exist to help facilitate the stand up of a JTF for terrain/facilities decontamination mission.	G – Yes, Y – Limited, R – No
M2	Procedures exist for dissolving of the JTF (following achievement of end state).	G – Yes, Y – Limited, R – No
M3	Areas/terrain/facilities to be decontaminated are defined.	G – Yes, Y – Limited, R – No
M4	Directive or mission is provided.	G – Yes, Y – Limited, R – No
M5	Directive contains desired effect and scope of action required.	G – Yes, Y – Limited, R – No
M6	Procedures and checklists exist to help facilitate the change in manning allocation of initial HQ required by terrain/facilities decontamination mission.	G – Yes, Y – Limited, R – No
M7	Joint exercises provide lessons learned on terrain/facilities decontamination mission provided by JTF.	G – Yes, Y – Limited, R – No
M8	Decontamination procedures are logistically supportable.	G – Yes, Y – Limited, R – No.

<sup>1</sup> There is no concept/doctrine on how to stand up a JTF for the conduct of extensive or complex decontamination of significant areas/terrain or facilities. Command and control of large-scale decontamination operations is not integrated into leader education.

<sup>2</sup> Limited. While there are generic procedures to stand up a JTF, there are no TTPs that specifically address standing up of a JTF for an extensive or complex terrain/facilities decontamination mission.

<sup>3</sup> Limited. Any SJFHQ staff can dissolve a JTF following achievement of end state, but a JTF specifically for extensive or complex decontamination operations involving significant areas/terrain or facilities has never been stood up and thus never been dissolved.

<sup>4</sup> Nothing precludes a higher HQ from defining areas/terrain/facilities to undergo decontamination.

<sup>5</sup> Nothing precludes a higher HQ from providing a directive or mission.

<sup>6</sup> Nothing precludes a higher HQ from providing a directive or mission that contains desired effect and scope of action required.

<sup>7</sup> Limited. Any SJFHQ staff can develop procedures and checklists, but there are no TTPs and limited training that specifically addresses the change in manning allocation as required by extensive or complex decontamination of significant areas/terrain or facilities.

<sup>8</sup> No joint exercise or experiment has ever been conducted that would provide feedback on how a JTF commands extensive or complex decontamination of significant areas/terrain or facilities.

<sup>9</sup> Limited. Depending on the extent of contamination and the decontamination means selected, the procedures may or may not be logistically supportable.

<sup>10</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>11</sup> Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.

<sup>12</sup> In the far term, JTTPs will improve for all areas.

<sup>13</sup> Joint exercises and experiments will be conducted to provide feedback on how a JTF commands extensive or complex decontamination of significant areas/terrain or facilities.

<sup>14</sup> Development and acquisition of more efficient and less materiel-intensive decontamination systems will improve the logistical supportability in the far term.

### 16.10.3 Functional Solution Analysis

#### 16.10.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Concepts/doctrine/TTPs do not exist for extensive or complex terrain/facilities decontamination missions.  
**Non-Materiel Solutions:** *Doctrine:* Develop concepts/doctrine/TTPs for JTF command and control of decontamination operations for extensive or complex terrain/facilities decontamination missions, to include standing up/dissolving the JTF, selecting and defining joint decontamination operation sites, and establishing the manning allocation of initial HQ required by decontamination operation mission.
2. **Deficiency:** There have been no JTF complex terrain/facilities decontamination missions exercises/experimentation.  
**Non-Materiel Solutions:** *Training:* Develop a JTF command and control of decontamination operations exercise/experiment. Include in CBRND experimentation campaign plan schedule.
3. **Deficiency:** There is no leader training/education for standing up of a JTF for an extensive or complex terrain/facilities decontamination mission.  
**Non-Materiel Solutions:** *Training:* Develop training for staffs that are likely to be part of JTF's providing command and control of extensive or complex terrain/facilities decontamination mission. Nominate as candidate for FY 2009/2010 UNIFIED ENDEAVOR within CBRND experimentation campaign plan. *Leadership:* Develop leader education for staffs.

#### 16.10.3.2 IMA Assessment Summary

N/A

**16.11 Task OPSUST 11: Integrate restoration operations with strategic deployment, sustainment, and redeployment, including NEO and AE operations****16.11.1 Functional Area Analysis****16.11.1.1 Definition**

To integrate and deconflict restoration operations with strategic mobility activities required to deploy/redeploy forces and sustain the warfighter. Due to the dubiety of current decontamination capabilities and the absence of internationally accepted decontamination standards, contaminated lift assets may be removed from the strategic lift flow. Therefore, to the maximum extent possible, uncontaminated lift assets will not be used at contaminated ports of embarkation/ports of debarkation (POEs/PODs). Contamination avoidance by lift assets requires the designation of alternate POEs/PODs, identification of transload sites for transload of cargo and passengers from uncontaminated to contaminated lift platforms for movement into contaminated PODs, thorough decontamination of lift platforms, and redeploying forces to internationally recognized decontamination standards (once obtained). Aeromedical evacuation (AE) planning should include TTPs to enable the movement of contagious/contaminated patients.

**16.11.1.2 Derivation**

*UJTL (OP1.1, OP1.1.3, OP1.6, OP4, OP4.6.3, OP7.3, OP7.4, Air Mobility Operations In a Chemical and Biological Environment).*

Perform this task under conditions of:

**Physical**

1. Persistent CBRN/TIM effects. (C1.3.3.1-3)

**Military**

1. Stressful mission. (C2.1)
2. No mission preparation (C2.1.3)

3. Weak forces assigned. (C2.2.1)
4. Negligible personnel experience. (C2.2.4.5)
5. Limited lift assets. (C2.5.2)
6. High rear-area security. (C2.7.1)
7. Limited host-nation support. (C2.8.5)
8. Conventional and terrorist threat form. (C2.9.2)
9. Fully developed state of conflict. (C2.10.1)

**Civil**

1. Cooperative nation
  - a. Limited foreign government support. (C3.1.2.3.)
2. Uncooperative nation
  - a. Negative foreign government support. (C3.1.2.3.)

**Common Civil Conditions**

1. Moderate restraints on action. (C3.1.3.4)

**16.11.2 Functional Needs Analysis****16.11.2.1 Capability and Deficiency Assessment Summary**

Table 16.11-1 discusses the only capability that currently exists to perform the task to the designated standards. No other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The current assessment is “yellow.” Any JTF HQ staff has a team of operational planners and command and control specialists, and most have CBRN subject matter experts. This team of experts has the skill to integrate restoration operations with strategic deployment, sustainment, and redeployment (including noncombatant evacuation operations [NEO] and AE) operations, but there are some deficiencies that negatively impact on their ability to do so.

**Projected Near/Mid-Term Capability and Deficiency**

No other capabilities are currently projected for the near/mid term. Limited capability improvements are forecast for the near/mid term except for DOTMLPF, which should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

**Projected Far-Term Capability and Deficiency**

DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. Joint exercises/ experiments will be conducted that can provide

feedback on procedures to integrate restoration operations with strategic deployment, sustainment, and redeployment (including NEO and AE) operations. Lessons learned from RESTOPS ACTD will be integrated into future exercises and experimentation that look at issues other than fixed sites. JTTPs, training and exercises, and education will all improve leading to a far-term assessment of “green.”

**Table 16.11-1. OPSUST 11: Capability and Deficiency Assessment**

<b>Capability: SJFHQ</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>	<b>M6</b>	<b>M7</b>	<b>M8</b>	<b>M9</b>
<b>Current Overall Capability<sup>1</sup></b>	Y <sup>2</sup>	Y <sup>3</sup>	G <sup>4</sup>	Y <sup>5</sup>	G <sup>6</sup>	Y <sup>7</sup>	R <sup>8</sup>	Y <sup>9</sup>	Y <sup>10</sup>
<b>Near/Mid-Term Overall Capability<sup>11</sup></b>	Y	Y	G	Y	G	Y	R	Y	Y
<b>Far-Term Overall Capability<sup>12</sup></b>	G <sup>13</sup>	G	G	G	G	G	Y	G	G <sup>14</sup>

	<b>FAA Measure</b>	<b>Scale</b>
M1	CBRN/TIM status in the Joint Operations Area (JOA) impacts strategic deployment, sustainment, and/or redeployment.	G – Yes, Y – Limited, R – No
M2	Alternate and/or diversion POEs/PODs (possibly including unimproved/improvised landing strips) are established to avoid contaminated areas during deployment, sustainment, and redeployment operations.	G – Yes, Y – Limited, R – No
M3	Joint Logistics over the Shore (JLOTS) is planned to avoid contaminated seaports of embarkation/debarkation (SPOEs/SPODs).	G – Yes, Y – Limited, R – No
M4	Uncontaminated lift platforms are limited to operations in uncontaminated ports and cargo/passenger transload site have been identified for transload of deploying forces and sustainment cargo from uncontaminated to contaminated lift assets for movement into contaminated PODs.	G – Yes, Y – Limited, R – No
M5	JOA Reception, Staging, Onward Movement, and Integration (RSOI) is planned to avoid CBRN/TIM contaminated areas.	G – Yes, Y – Limited, R – No
M6	All cargo is decontaminated to internationally accepted standards (when available) prior to redeployment.	G – Yes, Y – Limited, R – No
M7	Direction is provided to conduct patient evacuation including procedures for the movement of contagious/contaminated casualties.	G – Yes, Y – Limited, R – No
M8	Direction for the protection and/or decontamination of evacuees is provided in NEO plans.	G – Yes, Y – Limited, R – No
M9	Joint exercises/experimentation are conducted to integrate restoration operations with strategic deployment, sustainment, and redeployment (including NEO and AE) operations.	G – Yes, Y – Limited, R – No

<sup>1</sup> No concepts or doctrine relating to this issue have been developed. Leader education does not address this issue.

<sup>2</sup> Limited. Any SJFHQ staff can determine how CBRN status in the JOA impacts strategic deployment, sustainment, and/or redeployment, but there are no TTPs that specifically address issues affecting how to do this.

<sup>3</sup> Limited. Any SJFHQ staff can establish alternate PODs/POEs, but there are no TTPs that specifically address establishing PODs/POEs to avoid contaminated areas during deployment, sustainment, and redeployment operations.

<sup>4</sup> Nothing precludes JLOTS planning in response to any sort of contamination and it is anticipated as a requirement for any sort of SPOE/SPOD disruption.

<sup>5</sup> Limited. Any SJFHQ staff can develop, identify, and monitor the operations of a transload site. However, there are no TTPs that specifically address moving sustainment cargo from uncontaminated to contaminated lift assets for movement into contaminated PODs. Any such procedures are currently manual making the process slow, labor-intensive, and subject to human error.

<sup>6</sup> Nothing precludes planning of this type. Contamination reports must be immediately available to execute plans.

<sup>7</sup> Any SJFHQ can coordinate with the Department of Defense Explosive Safety Board (DDESB) to review and approve plans for the lease, transfer or disposal of DoD real property when contamination exists or is suspected to exist. There are no internationally accepted standards for decontamination completeness.

<sup>8</sup> Limited. Any SJFHQ staff can coordinate patient evacuation, but there is little in the way of TTP that specifically address the movement of contagious/contaminated casualties.

<sup>9</sup> Limited. Any SJFHQ staff can develop NEO plans, but there is little in the way of TTPs that specifically address the protection and/or decontamination of evacuees for incorporation into NEO plans.

<sup>10</sup> Few joint exercises/ experiments have been conducted that can provide feedback on procedures to integrate restoration operations with strategic deployment, sustainment, and redeployment (including NEO and AE) operations. RESTOPS ACTD must be examined when published to determine whether any information is relevant.

<sup>11</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>12</sup> Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.

<sup>13</sup> In the far term, DOTMLPF improvements across the spectrum will provide a capability of “green”.

<sup>14</sup> Joint exercises/ experiments will be conducted that can provide feedback on procedures to integrate restoration operations with strategic deployment, sustainment, and redeployment (including NEO and AE) operations. Lessons learned from RESTOPS ACTD will be integrated into future exercises and experimentation that looks at issues other than fixed sites.

### 16.11.3 Functional Solution Analysis

#### 16.11.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** There are no internationally accepted standards for decontamination completeness.  
**Non-Materiel Solutions:** *Doctrine:* Develop and negotiate universally accepted standards for decontamination completeness. These standards must be in place prior to need.
2. **Deficiency:** No TTPs that specifically address the movement of contagious/contaminated casualties.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs that specifically address the movement of contagious/contaminated casualties.
3. **Deficiency:** No TTPs that specifically address the protection and/or decontamination of evacuees for incorporation into NEO plans.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs that specifically address the protection and/or decontamination of evacuees for incorporation into NEO plans.
4. **Deficiency:** Few joint exercises/ experiments have been conducted that can provide feedback on procedures to integrate restoration operations with strategic deployment, sustainment, and redeployment (including NEO and AE) operations.  
**Non-Materiel Solutions:** *Training:* Develop exercises/ experiments that can provide feedback on procedures to integrate restoration operations with strategic deployment, sustainment, and redeployment (including NEO and AE) operations.
5. **Deficiency:** RESTOPS ACTD results are not yet published.  
**Non-Materiel Solutions:** *Training:* RESTOPS ACTD must be examined when published to determine whether any information is relevant.
6. **Deficiency:** No concepts or doctrine exist.  
**Non-Materiel Solutions:** *Doctrine:* Develop concepts and doctrine that provide information on how to approach this issue.
7. **Deficiency:** No leader education exists.  
**Non-Materiel Solutions:** *Leadership:* Develop leader education to assist commanders and staffs who must deal with these issues.

#### 16.11.3.2 IMA Assessment Summary

N/A

## **16.12 Task OPSUST 12: Coordinate decontamination procedures for processing contaminated remains in the JOA**

### **16.12.1 Functional Area Analysis**

#### **16.12.1.1 Definition**

To plan, execute, and control decontamination procedures for processing contaminated remains in the Joint Operations Area (JOA). In the event that large numbers of casualties need decontamination before they can be processed or transported, operational coordination of administrative, facility, terrain, personnel, and equipment requirements will be necessary. Separate procedures may need to be established commensurate with type of contamination (chemical, biological, or radiological).

#### **16.12.1.2 Derivation**

*UJTL (OP 7.3, OP 4.4.1.2, OP 5.4.5).*

##### **16.12.1.2.1 Supported Task: STSUST 1**

##### **16.12.1.2.2 Lateral Task: OPSHA 8**

##### **16.12.1.2.3 Supporting Task: TASUST 4**

#### **16.12.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Persistent CBRN/TIM effects. (C1.3.3.1-3)

##### **Military**

1. Stressful mission. (C2.1)
2. Partially completed mission preparation. (C2.1.3)
3. Weak forces assigned. (C2.2.1)
4. Negligible personnel experience. (C2.2.4.5)
5. Poor joint staff integration. (C2.3.1.1)
6. Moderate rear-area security. (C2.7.1)
7. Moderate host-nation support. (C2.8.5)
8. Conventional and terrorist threat form. (C2.9.2)
9. Fully developed state of conflict. (C2.10.1)

##### **Civil**

1. Limited foreign government support. (C3.1.2.3)

**16.12.2 Functional Needs Analysis****16.12.2.1 Capability and Deficiency Assessment Summary**

Table 16.12-1 discusses the only capability that currently exists to perform the task to the designated standards. No other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The current assessment is “yellow.” The Joint Mortuary Affairs Office (JMAO) is responsible for integrating Mortuary Affairs (MA) support throughout the JOA including operations in a CBRN environment. This team of experts has the skill to coordinate decontamination procedures for processing contaminated remains in the JOA, but there are some deficiencies that negatively impact on their ability to do so.

**Projected Near/Mid-Term Capability and Deficiency**

No other capabilities are currently projected for the near/mid term. No capability improvements are forecast for the near/mid term.

**Projected Far-Term Capability and Deficiency**

DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. JTTPs, training and exercises, and education will all improve leading to a far-term assessment of “green.”

Table 16.12-1. OPSUST 12: Capability and Deficiency Assessment

Capability: JTF HQ	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10	M11	M12	M13	M14	M15	M16	M17

	FAA Measure	Scale
M1	Records of contaminated deceased/missing personnel in JOA are accurately maintained.	G – Yes, Y – Limited, R – No
M2	Records of contaminated personal effects in JOA are accurately maintained.	G – Yes, Y – Limited, R – No
M3	Personal effects of contaminated deceased/missing in JOA are accurately processed.	G – Yes, Y – Limited, R – No
M4	Decision on mortuary affairs policy for contaminated remains is made in a timely fashion resulting in no delay in the disposition of remains.	G – Yes, Y – Limited, R – No
M5	Operations include establishment of mortuary affairs decontamination collection points in theater.	G – Yes, Y – Limited, R – No
M6	Contaminated remains are correctly identified.	G – Yes, Y – Limited, R – No
M7	Contaminated remains are re-identified after disposition.	G – Yes, Y – Limited, R – No
M8	Temporary interment facilities for contaminated remains are established.	G – Yes, Y – Limited, R – No
M9	Mortuary Affairs Decontamination Collection Point (MADCP) tasks are included in planning.	G – Yes, Y – Limited, R – No
M10	Contaminated remains are recovered at the end of CBRN/TIM attacks.	G – Yes, Y – Limited, R – No
M11	Remains are recovered from temporary interment sites in the JOA and disposition determined (after end of operations in theater).	G – Yes, Y – Limited, R – No
M12	Procedures and checklists exist to facilitate the ability to coordinate decontamination procedures for processing contaminated remains in the joint operational area.	G – Yes, Y – Limited, R – No
M13	Procedures exist to facilitate personnel to search for, recover, identify, care for, and evacuate or inter deceased personnel (without MADCP units).	G – Yes, Y – Limited, R – No
M14	Decontamination procedures are logistically supportable.	G – Yes, Y – Limited, R – No
M15	Procedures and checklists exist to facilitate the ability to process contaminated remains in the JOA for air shipment.	G – Yes, Y – Limited, R – No
M16	Disposition policies are in effect for handling of remains in a timely fashion.	G – Yes, Y – Limited, R – No
M17	Joint exercises and experimentation provide lessons learned on coordinating decontamination procedures for processing contaminated remains in the JOA.	G – Yes, Y – Limited, R – No

<sup>1</sup> Limited. MA doctrine, training, personnel, organizations, and facilities exist. However, they are limited in their ability to process mass fatalities following a CBRN attack.

<sup>2</sup> Nothing precludes a JMAO/unit staff from accurately maintaining records of contaminated deceased/missing personnel in JOA.

<sup>3</sup> Nothing precludes a JMAO/unit staff from accurately maintaining records of contaminated personal effects in JOA.

<sup>4</sup> Limited. Any JMAO/unit staff can coordinate the accurate processing of personal effects of contaminated deceased/missing in JOA, but no TTPs exist to aid the process.

<sup>5</sup> Limited. Any JMAO/unit staff can coordinate making decisions in a timely fashion on the disposition of contaminated remains resulting in no delay in the disposition of remains, but no TTPs exist to help the decision-making process.

<sup>6</sup> Limited. Nothing prevents the JMAO from coordinating the establishment of MADCP operations in theater whenever the threat of CBRN warfare exists, but leader education and joint exercises do not adequately incorporate MADCP operations.

<sup>7</sup> Limited. Nothing prevents JMAO/unit staff from coordinating with a MADCP to ensure correctly identifying contaminated remains, but no TTPs exist to aid the process.

<sup>8</sup> Limited. Nothing prevents a prevents JMAO/unit staff from coordinating with a MADCP to ensure reidentifying contaminated remains after disposition but no TTPs exist to aid the process.

<sup>9</sup> Limited. Any JMAO/unit staff can coordinate to establish temporary interment facilities, but no TTPs exist to facilitate the process and to help operational staffs integrate this process into their planning.

<sup>10</sup> Limited. Any JMAO/unit staff can include MADCP tasks in planning, but leader education and joint exercises do not adequately incorporate MADCP operations.

<sup>11</sup> Limited. Nothing prevents JMAO/unit staff from coordinating with a MADCP to ensure contaminated remains are being recovered at the end of CBRN attacks, but leader education and joint exercises do not adequately incorporate MADCP operations. Also, no TTPs exist to facilitate the process and to help operational staffs integrate this process into their planning.

<sup>12</sup> Limited. Any JMAO staff can coordinate to plan, execute, and control recovering of remains from temporary internment sites in the JOA, but few TTPs exist to guide the process.

<sup>13</sup> Limited. Any JMAO staff can develop procedures and checklists, but few TTPs exist to guide the process.

<sup>14</sup> No TTPs exist to facilitate this process by non-MADCP units.

<sup>15</sup> Limited. Depending on the extent of contamination and the decontamination means selected, the procedures may or may not be logistically supportable.

<sup>16</sup> No TTP exists to facilitate this process.

<sup>17</sup> Limited. MA policies exist. However, they are limited in their applicability to contaminated remains.

<sup>18</sup> Limited. Any joint exercise/experiment that includes MA tasks can provide lessons learned, but few if any joint exercises have been conducted that specifically address MADCP/coordinating decontamination procedures for processing contaminated remains in the JOA.

<sup>19</sup> In the far term, DOTMLPF enhancements across the board, made possible by focused experimentation and lessons learned from exercises will improve all measures to a “green” rating.

<sup>20</sup> Development and acquisition of more efficient and less materiel-intensive decontamination systems will improve the logistical supportability in the far term.

### 16.12.3 Functional Solution Analysis

#### 16.12.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** A joint MA Staff Officers Course does not exist.  
**Non-Materiel Solutions:** *Doctrine:* Develop a joint MA Staff Officers Course and include CBRN considerations.
2. **Deficiency:** JMAO/MADCP-specific training/education is not incorporated throughout the JPME system.  
**Non-Materiel Solutions:** *Leadership:* Incorporate JMAO/MADCP-specific training throughout the JPME system.
3. **Deficiency:** Joint exercises/experiments do not specifically address the JMAO coordinating decontamination procedures for processing contaminated remains in the JOA.  
**Non-Materiel Solutions:** *Training:* Develop joint training exercises and experiments specifically addressing JMAO/MADCP and coordinating decontamination procedures for processing contaminated remains in the JOA.
4. **Deficiency:** Few or no TTPs exist to facilitate the coordination of decontamination procedures for processing contaminated remains in the JOA.  
**Non-Materiel Solutions:** *Doctrine:* Develop broad TTPs to facilitate the coordination of decontamination procedures for processing contaminated remains in the JOA.

<b>Current Overall Capability<sup>1</sup></b>	<b>Y<sup>2</sup></b>	<b>Y<sup>3</sup></b>	<b>Y<sup>4</sup></b>	<b>Y<sup>5</sup></b>	<b>Y<sup>6</sup></b>	<b>Y<sup>7</sup></b>	<b>Y<sup>8</sup></b>	<b>Y<sup>9</sup></b>
<b>Near/Mid-Term Overall Capability</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>
<b>Far-Term Overall Capability</b>	<b>G<sup>10</sup></b>	<b>G</b>	<b>G</b>	<b>G</b>	<b>G</b>	<b>G</b>	<b>G</b>	<b>G</b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Procedures and checklists exist to facilitate the ability to recover and decontaminate critical items.	G – Yes, Y – Limited, R – No
M2	Procedures exist for hazardous material that cannot be processed in accordance with appropriate regulations.	G – Yes, Y – Limited, R – No
M3	Procedures and checklists exist to facilitate the ability to dispose of hazardous material appropriately.	G – Yes, Y – Limited, R – No
M4	Procedures and checklists exist to facilitate the ability to transport contaminated materials to rear areas or designated sites.	G – Yes, Y – Limited, R – No
M5	Procedures and checklists exist to facilitate the ability to coordinate salvage of materials that require decontamination.	G – Yes, Y – Limited, R – No
M6	Procedures exist to properly dispose of contaminated material.	G – Yes, Y – Limited, R – No
M7	Decontamination procedures are logistically supportable.	G – Yes, Y – Limited, R – No
M8	Joint exercises/experimentation provide feedback on how a JTF would coordinate salvage of materials that require decontamination	G – Yes, Y – Limited, R – No

<sup>1</sup> Limited. There is DOTMLPF in place that addresses salvage, but there are no TTPs and limited training that specifically addresses coordinating the salvage of materials that require decontamination.

<sup>2</sup> Limited. Any SJFHQ staff can develop procedures and checklists, but there are no TTPs that addresses the recovery and decontamination of critical items.

<sup>3</sup> Limited. Although there are regulations that address the processing of hazardous materials and any staff can develop TTPs to facilitate complying with regulation, there are no TTPs that link formerly CBRN contaminated materials and address the process by which they become hazardous material defined in accordance with appropriate regulations.

<sup>4</sup> Limited. Any SJFHQ staff can develop procedures and checklists, but there are no TTPs that address the ability to dispose of hazardous material appropriately.

<sup>5</sup> Limited. Any SJFHQ staff can develop procedures and checklist, but there are no TTPs that address the ability to transport contaminated materials to rear areas or designated sites.

<sup>6</sup> Limited. Any SJFHQ staff can develop procedures and checklists, but there are no TTPs that addresses the ability to coordinate salvage of materials that require decontamination.

<sup>7</sup> Limited. Any SJFHQ staff can develop procedures and checklists, but there are no TTPs that specifically address facilitating the ability to properly dispose of contaminated material.

<sup>8</sup> Limited. Current through the mid term, decontamination procedures will remain logistically difficult to support. Improvements will be seen in the far term with the fielding of more logistically supportable decontamination alternatives.

<sup>9</sup> Limited. Few if any exercises/experiments have been conducted that specifically addresses coordinating the salvage of materials that require decontamination.

<sup>10</sup> In the far term, DOTMLPF enhancements across the board, made possible by focused experimentation and lessons learned from exercises will improve all measures to a “green” rating.

### 16.13.3 Functional Solution Analysis

#### 16.13.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** No TTPs addresses the coordination of salvage materials that require decontamination.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs on the coordination of salvage materials that require decontamination.
2. **Deficiency:** Salvage exercises and experiments that include decontamination issues have been limited.  
**Non-Materiel Solutions:** *Training:* Develop exercises/experiments on the coordination of salvage materials that require decontamination. Incorporate lessons learned from RESTOPS ACTD into future exercises.
3. **Deficiency:** There is no leader training/education for salvage operations in a CBRN environment.  
**Non-Materiel Solutions:** *Training:* Develop training for staffs on the coordination of salvage materials that require decontamination. *Leadership:* Develop leader education for staffs on the coordination of salvage materials that require decontamination.

#### 16.13.3.2 IMA Assessment Summary

N/A

**16.14 Task OPSUST 14: Conduct CBRN elimination operations****16.14.1 Functional Area Analysis****16.14.1.1 Definition**

To execute theater CBRN elimination operations. A joint force commander may be directed by the combatant commander to conduct military operations for the explicit purpose of eliminating the CBRN weapons or capabilities held by an adversary. Specifically, U.S. military operations across the range of military operations also may entail a requirement to eliminate, or support the elimination of, CBRN weapons or capabilities. CBRN elimination is the systematic removal of a capability within a nation or organization to develop, deploy, or employ CBRN weapons. The degree or extent of elimination is a strategic objective, defined by a strategic end state, and ranges from complete removal of all capability (including research, production, and training regarding any form of CBRN weapon) to the focused removal of specific capabilities. This task encompasses three primary subtasks: *Executing Exploitation* (locating, characterizing, and securing CBRN materiel, weapons, equipment, personnel, and infrastructure, and developing appropriate forensic evidence); *Executing Disposition* (destroying, dismantling, rendering safe, removing, transferring, or otherwise verifiably disposing of CBRN materiel, weapons, equipment, and infrastructure); and *Executing Monitoring and Redirection* (monitoring, inspecting, and redirecting/converting the CBRN infrastructure).

**16.14.1.2 Derivation**

*Combatant Commander's Planning Guide for WMD Elimination Operations (Draft), TM 60A-1-111 (S) – CBRNE EOD Operations.*

**16.14.1.2.1 Supported Task: STSUST 14****16.14.1.2.2 Lateral Task: OPSHA 1****16.14.1.2.3 Supporting Tasks: TASUST 28, TASUST 29, TASUST 30****16.14.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Chemical, biological, radiological or nuclear threat form. (C1.3.3.1-3)

**Military**

1. Cooperative nation
  - a. Partial preexisting arrangements. (C2.1.1.2)
  - b. Limited military commitments from other nations. (C2.1.1.7)
  - c. Limited host-nation support. (C2.8.5)

2. Uncooperative nation
  - a. No preexisting arrangements. (C2.1.1.2)
  - b. Negligible military commitments from other nations. (C2.1.1.7)
  - c. No host-nation support. (C2.8.5)

**Common Military Conditions**

1. Limited personnel expertise. (C2.2.4.5)

**Civil**

1. Cooperative nation
  - a. Limited foreign government support. (C3.1.2.3.)
2. Uncooperative nation
  - a. Negative foreign government support. (C3.1.2.3.)

**Common Civil Conditions**

1. Moderate restraints on action. (C3.1.3.4)

**This task is analyzed in the WMD Interdiction and Elimination JCIDS Analysis.**

17.30	Task TASUST 30: Conduct monitoring and redirection operations .....	240

## 17.0 Tactical Sustain

### 17.0.1 Introduction

At the Tactical (TA) level of war, battles and engagements are planned and executed to accomplish military objectives assigned to tactical units or task forces. Activities at this level focus on the ordered arrangement and maneuver of combat elements in relation to each other and to the enemy to achieve combat objectives. Thirty Tactical Sustain (SUST) tasks were identified in the chemical, biological, radiological, and nuclear (CBRN) Functional Area Analysis (FAA). An additional task was added associated with isolation operations, which is a recently added component of elimination operations. However, the detailed analysis of the elimination tasks has been deferred to the Joint Requirements Office for Chemical, Biological, Radiological, and Nuclear Defense (JRO-CBRND)–sponsored FAA/Functional Needs Analysis (FNA) of the weapons of mass destruction (WMD) elimination and interdiction functional areas.

This chapter, detailing the Tactical Sustain (TASUST) area, restates relevant information from the CBRND Defense (CBRND) FAA, including a description of each of the 30 TASUST tasks, derivation of the task, an indication of other linked tasks, and the pertinent conditions. The FNA section addresses the capability and deficiency analysis and a brief description of potential near-term changes. Once all the capabilities are considered, the assessment concludes with a separate, overarching look at the entire capability spectrum to identify remaining gaps and/or synergies. The Functional Solutions Analysis (FSA) section addresses possible solutions for the deficiencies identified in the FNA section. These are categorized into materiel or non-materiel. The non-materiel solutions are addressed first and reflect one or more of the six areas of DOTLPPF: doctrine, organization, training, leadership, personnel, and facilities. If there is no non-materiel solution to the deficiencies, then materiel solutions are considered. These encompass broad approaches that are not system-specific. These potential materiel approaches are addressed and evaluated in the Ideas for Materiel Solutions (IMA) section. The IMAs provide a possible near- or far-term resolution to identified deficiencies within the individual capabilities.

Most of the TASUST tasks involve the process of decontamination of such things as equipment, vehicles, weapons, facilities, open areas, and personnel. According to current doctrine, the possible spectrum of decontaminants is quite broad, including standard, nonstandard, and natural materials. This effort limits consideration of decontaminants within the capability assessment to those items that are readily available to units and personnel. Typically, these encompass primarily standard and natural decontaminants.

Tasks associated with personnel, such as decontaminating casualties or diagnosing and treating CBRN effects, also include military working animals (MWAs), specifically military working dogs (MWDs). Several animal species are used as MWAs; however, MWDs are the predominant species and are most likely to be deployed with military personnel.

The remaining tasks address CBRND medical diagnostics and medical therapeutics, as well as relevant CBRND joint tactical and Service component tactical tasks.

## 17.0.2 FNA Summary

Table 17.0-1 below summarizes the overall current and projected capability to perform the TASUST tasks identified in the CBRND FAA. The overall capability to conduct these tasks in the current time frame is assessed as “yellow.” There are key deficiencies in the U.S. Department of Defense’s (DoD’s) ability to decontaminate sensitive equipment, aircraft, fixed facilities and open areas, along with deficiencies in producing potable water in a contaminated environment (on an individual basis). It is projected that the overall status will remain “yellow” in the near/mid term in spite of the fielding of item-specific, initial decontamination capabilities resulting from targeted developmental programs and technology demonstrations. This status is primarily due to ongoing logistical challenges in the decontamination of open areas and remains, as well as shortfalls in the low-level verification of decontamination efficacy for chemical and biological agents.

More specific decontamination capability gaps revealed by the analysis include efficacy, the ability to decontaminate a wider range of agents/hazards, thorough decontamination processing rates, materiel compatibility, and logistics challenges presented when conducting decontamination operations. Future decontamination processes should achieve efficacy levels that will allow unprotected post-decontamination exposures for long periods with minimal hazards, preferably meeting both civilian and military standards, although specific policy guidance is lacking on acceptable levels for residual contamination levels. Capabilities are needed to decontaminate all potential residual hazards in the battlespace that may require multiple processes, systems, and/or decontaminants to achieve. Future processes and systems should lessen the time required to carry out decontamination to provide warfighters more rapid relief from Mission-Oriented Protective Posture (MOPP). Decontamination processes, systems, and decontaminants must be compatible with a wide range of materiel and facilities to avoid degrading readiness and capabilities due to damage from decontamination processes. Technology thrusts are needed to lessen logistical burdens and cut manpower requirements associated with decontamination for both current and existing developmental programs.

To determine current decontamination capabilities, the following standard decontaminants, systems and other capabilities to perform decontamination at the immediate, operational and thorough levels were evaluated (identified as “I” for immediate, “O” for operational, and “T” for thorough below each measure in the capability/deficiency assessment tables that follow):

M291 Skin Decontamination Kit (SDK). The M291 has six packets of applicator pads filled with decontamination powder. The powder absorbs and neutralizes liquid chemical agents on skin and personal nonsensitive equipment.

M100 Sorbent Decontamination System (SDS). The M100 consists of two 0.7-pound bags of powdered reactive sorbent and two mitts. It is used on small areas that must be touched and crew-served weapons.

M295 Individual Equipment Decontamination Kit. One M295 pouch contains four wipe-down mitts used on masks/hoods, gloves, helmet, and weapons using the same powder as the M100 SDS.

M17-series Lightweight Decontamination System (LDS). A relatively small engine-powered pump and water-heating unit with two wand assemblies and 1580–3000 gallon collapsible water tanks. Lightweight Decontamination Systems are primarily used for operational and thorough decontamination of vehicles and equipment. They may also be used for personnel showers.

M12A1 Power-Driven Decontamination Apparatus (PDDA). The M12A1 is a large engine-powered pump and water-heating unit with two spray wand assemblies and a metal 500-gallon tank capable of mixing decontaminants and water in the tank. It is an aging system used for larger-scale decontamination missions to include terrain decontamination. Only the Army currently utilizes the M12A1.

Super Tropical Bleach (STB). A standard military decontaminant utilized in powder form or diluted with water as slurry.

High-Test Hypochlorite (HTH). A standard military decontaminant utilized in water-diluted solution mixtures.

Various other existing capabilities that are used to support decontamination processes were also evaluated. Many standard soaps and detergents are readily available and commonly used to remove but not neutralize contamination. Soaps and detergents are the primary decontaminants used to remove radioactive fallout or other particles. Many common disinfectants are effective against non-spore-forming biological agents. Decontamination sites utilize most of the existing decontamination systems in accordance with doctrine and tactics, techniques, and procedures (TTPs) to methodically carry out various decontamination processes. Naval ships possess countermeasures washdown systems (CMWDs) used to prewet exterior shipboard surfaces when it is suspected the ship may become contaminated and to assist with post-event decontamination efforts. Firemain and steam sources available on ships can also assist with decontamination. Physical removal of contamination may also be specified, particularly for ships undergoing maintenance and in some terrain decontamination scenarios.

To determine near-/mid-/far-term decontamination capabilities, current ongoing developmental decontamination programs were assessed assuming that these programs would meet all specified key performance parameters. The following developmental programs to perform decontamination at the immediate, operational and thorough levels were evaluated (identified as “I,” “O,” and “T” below each measure in the capability/deficiency assessment tables):

- Joint Service Personnel/Skin Decontamination System (JSPDS). JSPDS will replace the M291 Skin Decontaminating Kit. All four Services are participating in this program. Increment I will provide operational capabilities equal to, and efficacy capabilities greater than, the M291 Skin Decontaminating Kit. Increment II capabilities will address percutaneous hazards for which existing systems (i.e., M291 Skin Decontaminating Kit) are not effective and add system capabilities to include decontamination of personnel with open wounds, thorough whole-body decontamination, radiological decontamination, and handling of contaminated personnel remains.

- Joint Service Transportable Decontamination Systems (JSTDS). JSTDS will develop two decontamination systems, small-scale and large scale. The small-scale system (JSTDS-SS) will replace all existing M17-series Lightweight Decontamination Systems in Service inventories. All four Services are participating in this program. The large-scale system (JSTDS-LS) will replace the M12A1 system used by the Army and will also be employed by the Air Force. Both small- and large-scale decontamination systems will be developed using an incremental approach. Increment I will provide improved capabilities over current systems to decontaminate tactical and nontactical vehicles, ship exterior surfaces, crew-served weapons, aircraft, and aircraft support equipment, building/facility exteriors, and terrain. Increment II will focus on improving overarching decontamination processes, efficacy, and system capabilities for operational and thorough decontamination of equipment, aircraft, and nonsensitive building/facility interior spaces.
- Joint Portable Decontamination System (JPDS). JPDS will replace capabilities formerly provided by the M11 and M13 Decontamination Apparatuses using Decontamination Solution #2 (DS-2). All Services stopped using DS-2 during FY2004 due to storage and health hazards. All Services except the Marine Corps are participating in this program. Increment I will provide initial or improved capabilities to decontaminate a broad range of equipment (e.g., ships, tactical vehicles, and crew-served weapons). In addition, JPDS may be used for immediate decontamination of individual equipment. JPDS will be used with existing approved soaps to perform decontamination operations on aircraft and aircraft support equipment. Increment II will focus on improving decontamination processes, efficacy, and system capabilities to include thorough decontamination of select aircraft and nonsensitive building/facility interior spaces.
- Joint Service Sensitive Equipment Decontamination (JSSSED). JSSSED will provide a new capability. All four Services are participating in this program. Increment I will provide initial or improved capabilities to decontaminate sensitive equipment. Increment I improvements will standardize sensitive equipment decontamination processes, lessen potential to damage or degrade sensitive equipment, and provide greater assurance that decontaminated items can be safely handled and employed after being decontaminated. Increment II will focus on further improving decontamination efficacy and range of agents that can be decontaminated, lessen time required for decontamination cycles, eliminate equipment degradation, and provide initial capabilities for JSSSED to decontaminate large sensitive equipment items.
- Joint Platform Interior Decontamination (JPID). JPID will provide a new capability. All Services except the Marine Corps are participating in this program. Increment I will provide initial or improved capabilities to decontaminate vehicles, ships, fixed-site facilities, aircraft, and mobile maintenance facility interiors. Increment I improvements will lessen the potential to damage or degrade sensitive equipment and provide greater assurance that decontaminated interior spaces can be safely occupied after being decontaminated. Increment II will focus on further improving decontamination efficacy and the range of agents that can be decontaminated, lessen time required for decontamination processes, allow for the decontamination of aircraft cargo spaces and cargo while in flight, and eliminate equipment degradation.

There are also key deficiencies in CBRN diagnosis and treatment of personnel and MWDs. First, in regards to chemical exposure diagnostics, there are no definite clinical tests to confirm mustard agent or phosgene exposure. This lack is important since signs and symptoms of mustard and phosgene exposure can be delayed and may not be immediately recognizable to medical and veterinary staff. Signs and symptoms of early stages of biological agent infection are frequently nonspecific; consequently, there is a lack of capability to identify illnesses during prodromal stages. In some cases, clinical diagnosis can presumptively identify infected personnel and MWDs during presymptomatic and prodromal stages; however, this task usually requires reliable sampling capabilities, which currently do not exist. Signs and symptoms of radiation exposure can easily be confused for those caused by other conditions. For example, many acute radiation syndrome prodromal symptoms can also be caused by psychological stress. For this reason, clinical diagnosis is critical to diagnosing exposed personnel and MWDs. However, there is no clinical test that can rapidly identify personnel and MWDs that either were exposed to radiation or have internalized radioactive contamination.

In terms of treatment capabilities, there is a lack of Food and Drug Administration (FDA)–approved chemical exposure countermeasures that can be self- or buddy-administered (Self/Buddy Aid is basically limited to autoinjectors for nerve agent exposure). Furthermore, many, if not most, of these countermeasures have major contraindications. In addition, there is a lack of effective antivirals and antitoxins for personnel and MWDs infected by viruses and toxins of interest, respectively. For example, there are no effective antivirals for Ebola/Marburg viruses, the equine encephalitis viruses, and smallpox; and there are no effective antitoxins for ricin, SEB, and T-2 mycotoxins. Radiological exposure countermeasures are primarily limited to therapeutics and symptomatic care. Though there are chelating, blocking, diluting, and mobilizing agents, many of these must be administered promptly after internalization or they lose their effectiveness. Also, many can have toxic effects on the body.

The capability assessment provided by this FNA is provided as a tool to show where capability gaps exist. All capability gaps will continue to be prioritized by the Joint Priority List (JPL) in accordance with Paragraph 3.2.1.5 of the Implementation Plan for the Management of the Chemical and Biological Defense Program. The FNA/FSA is not used to specifically support the planning, programming and budgeting for the Chemical and Biological Defense Program but is used to support the Joint Capabilities Integration and Development System (JCIDS) process.

**Table 17.0-1. Tactical Sustain Summary FNA Findings**

Task Number	CBRN Tactical Sustain Task Title	Capabilities		
		Current	Near/Mid-Term	Far-Term
TASUST 1	Decontaminate personnel.	●	●	●
TASUST 2	Decontaminate casualties.	●	●	●
TASUST 3	Decontaminate wounds.	●	●	●
TASUST 4	Decontaminate remains.	●	●	●

### 17.0.3 FSA Summary

The paragraphs below summarize the assessment of all potential doctrine, organization, training, materiel, leadership and education, personnel, and facilities (DOTMLPF) (non-materiel and materiel) solutions for the capability gaps identified in the FNA section. The materiel approaches address current, developmental, and emerging technologies for possible materiel solutions.

#### 17.0.3.1 DOTMLPF

The DOTMLPF solutions identified in this chapter are associated primarily with decontamination and CBRND medical operations for joint forces. Non-materiel and materiel solutions have been identified. Non-materiel solutions include such things as development of TTPs for operational and thorough decontamination of sensitive equipment and fixed facilities (interior and exterior), along with applicable training programs. Non-materiel solutions for the treatment of personnel and MWAs involve the updating of doctrine and training to include most up-to-date treatment guidelines. Remaining materiel requirements include the need for decontaminants that are nontoxic, noncorrosive, and environmentally friendly. These decontaminants must neutralize agents on a variety of surfaces, such as aircraft skin and sensitive equipment, while using little or no water. In addition, they must be compatible with each other. Other remaining decontamination materiel requirements include application devices that allow

for decontamination of porous surfaces, along with hard-to-reach and large areas while protecting the operator from spray-back or extensive individual protective equipment (IPE) requirements. Remaining materiel requirements for the treatment and diagnosis of personnel and MWAs includes the development of therapeutics and diagnostic systems.

### 17.0.3.2 IMA

The following are the Key Attributes for Sustain. The near- to mid-term procedures and equipment used to support operational and thorough decontamination of personnel and their associated equipment must be improved to significantly increase throughput while reducing personnel and logistics support. Decontamination of individual equipment and weapons (not sensitive) should eliminate the need for manual scrubbing and provide for throughput rates sufficient to support operational decontamination of personnel. Standard equipment coatings should be developed to prevent agent penetration and/or neutralize the agent. The far-term operational decontamination capabilities should eliminate the requirement for thorough decontamination. This may be accomplished through a combination of IPE design, new technology, and TTPs to allow individuals to remove contaminated IPE without logistical support or assistance from other personnel. All CBRN IPE should be capable of being decontaminated and reissued. Future decontamination capabilities should be capable of removing contamination from equipment down to a level that allows its return to the continental United States (CONUS).

Table 17.0-2 summarizes possible materiel approaches that address the remaining materiel requirements of the DOTMLPF assessment for decontamination tasks. These approaches are in various stages of development. Therefore, some are more readily applicable than others. There are seven IMAs that relate to decontaminants that remove chemical and biological agents through a chemical process and an additional six that remove chemical and biological agents through physical processes. Additionally, there are 10 IMAs that could resolve identified deficiencies in current applicators used for decontamination operations throughout the joint forces.

Table 17.0-3 summarizes possible materiel approaches that address the remaining materiel requirements of the DOTMLPF assessment for the treatment and diagnosis tasks.

Table 17.0-2. Decontamination IMAs

Materiel Approach	Description
<i>Chemical Processes</i>	
1. Enzymes <ul style="list-style-type: none"> <li>• Stored physical state: powder, liquid</li> <li>• Delivered physical state: liquid, foams, gels, aerosols</li> <li>• Related system(s): containment</li> </ul>	Based on highly specialized catalysts of biological derivation that speed up the rate of reactions at physiological temperatures. Though enzymes can be stored in powder form, enzymatic-based decontaminants are typically delivered in buffered water solutions. A particular advantage of enzyme systems is that they are generally nontoxic, noncorrosive, nonflammable, and environmentally safe. Enzymes of interest include organophosphorous acid anhydrolase (OPAA), squid diisopropylfluorophosphotase (DFPase), and organophosphorous hydrolase (OPH).
2. Aqueous oxidants/nucleophiles <ul style="list-style-type: none"> <li>• Stored physical state: liquid, powder</li> <li>• Delivered physical state: liquid, foams, gels, wipes, aerosols,</li> <li>• Related system(s): containment</li> </ul>	Aqueous solutions containing oxidants and nucleophiles that neutralize chemical and biological agents. Some examples include calcium hypochlorite, chloramines-B, DF200 (Sandia foam), fichtlor, oxime, and chlorine dioxide solutions.
3. Mixed (water/nonaqueous solvent) oxidants/nucleophiles <ul style="list-style-type: none"> <li>• Stored physical state: liquid</li> <li>• Delivered physical state: liquid, foams, gels, wipes, aerosols</li> <li>• Related system(s): containment, recycle</li> </ul>	Oxidants and nucleophiles contained within mixed aqueous/nonaqueous solutions. This idea for materiel approach includes microemulsions, i.e., thermodynamically stable mixtures of water, oil, surfactants, and cosurfactants that appear macroscopically as a homogenous phase. Water-insoluble agents are dissolved into the organic phase of the microemulsion and react with the water-soluble decontaminant at the water/nonaqueous solvent interface. Some examples include mixed sodium hydroxide and sodium sulfide solution.
4. Reactive nonaqueous liquids <ul style="list-style-type: none"> <li>• Stored physical state: liquid</li> <li>• Delivered physical state: liquid, foams, gels, aerosols</li> <li>• Related system(s): containment, recycle</li> </ul>	Nonaqueous solutions containing nucleophiles that neutralize chemical and biological agents. Some examples include monoethanolamine, and CD-1.

5. Reactive gases and vapors <ul style="list-style-type: none"> <li>• Stored physical state: compressed gas</li> <li>• Delivered physical state: gas, vapor</li> <li>• Related system(s): containment, recycle</li> </ul>	Volatile chemicals that can neutralize chemical agents and inactivate biological agents. Reactive gases and vapors are useful for the decontamination of interior surfaces. Some examples include ozone, chlorine, chlorine dioxide, and vaporized hydrogen peroxide.
6. Active (self-decontaminating) coatings <ul style="list-style-type: none"> <li>• Stored physical state: N/A</li> <li>• Delivered physical state: N/A</li> <li>• Related system(s): N/A</li> </ul>	Coatings that contain catalytically reactive sites, such as fluorine substituents, that decontaminate chemical and biological agents on contact. Self-decontaminating coatings would most likely be applied to vehicle exterior surfaces, filters, and shelter materials. Examples include reactive ion exchange resins and polyoxometalate catalysts for chemical agents and Triosyn quaternary ammonium triiodide coatings and Veridian aerogel coatings for biological agents. Some biocidal coatings are already available.
7. Plasmas <ul style="list-style-type: none"> <li>• Stored physical state: feed gas (possibly)</li> <li>• Delivered physical states: gas</li> <li>• Related system(s): containment, recycle</li> </ul>	A gas capable of conducting an electric current is ionized through energetic electron impact. As a result, reactive ions and radicals are formed, which can decompose chemical agents and denature biological agents. Cold (not thermal) plasmas, which are most likely to be used for decontamination, are most effective if used within a closed container. Small personal gear and sensitive equipment are the most likely targets for decontamination. Plasmas should be able to penetrate porous surfaces and little or no waste will be produced, as the plasma will decompose the agent to benign, typically gaseous, by-products. Technology is in the research and development (R&D) phase, and Markland Technologies, AGT, and MicroEnergy Technologies are developing platforms.
<b><i>Physical Processes</i></b>	
8. Low-temperature thermal (accelerated weathering) <ul style="list-style-type: none"> <li>• Stored physical state: N/A</li> <li>• Delivered physical state: gas</li> <li>• Related system(s): containment, recycle</li> </ul>	Physical removal of chemical agents and possibly neutralize biological agents through the application of hot air. The effectiveness of hot air decontamination varies with respect to the physical properties of the agent and the surface being decontaminated. For example, additional heat and time are required to fully remove neat chemical agent deposited on a porous or adsorbent surface than on a nonporous, nonadsorbent surface.
9. Sorption <ul style="list-style-type: none"> <li>• Stored physical state: wipe</li> <li>• Delivered physical state: wipe</li> <li>• Related system(s): N/A</li> </ul>	Materials that physically remove agent from surfaces (e.g., skin) via adsorption or absorption. The agent either remains intact within the sorbent material and makes the sorbent toxic or is detoxified in situ by reactive species placed into the sorbent material. Fuller's earth is an inert sorbent, whereas the M100 SDS sorbent is reactive.

10. Water/steam wash <ul style="list-style-type: none"> <li>• Stored physical state: liquid</li> <li>• Delivered physical states: liquid, gas (steam)</li> <li>• Related system(s): containment, recycle</li> </ul>	Physically removed agents through the application of water or steam to surfaces at low to high pressures. Removal of agents from surfaces is highly dependent upon the nature of the surfaces (i.e., surfaces which are flat and smooth can be more readily decontaminated than curved porous surfaces). Low-pressure water can be used to decontaminate skin. The addition of soap can enhance dissolution of water-insoluble contamination.
11. (Nonaqueous) solvent wash <ul style="list-style-type: none"> <li>• Stored physical state: liquid</li> <li>• Delivered physical states: liquid</li> <li>• Related system(s): containment, recycle</li> </ul>	Physical removal of agents from a surface by washing the molecules away using alcohol, nonozone-depleting fluorocarbon compounds, diesel fuel, etc. The agent is diluted, though not likely detoxified (particularly for chemical agents). In open environments, solvents are often applied using pressurized sprayers such as a power washer or aerosol sprayer. Solvents can also be used in an enclosed environment to effectively decontaminate sensitive equipment. In closed environments, their decontamination effectiveness can be enhanced by heating them or using them in conjunction with ultrasonics or supersonic sprays. After a decontamination cycle, the solvents can often be recycled for further use before being discarded and detoxified. Examples include alcohols, ethers, ketones, aromatics, and hexane.
12. Ionizing/nonionizing radiation <ul style="list-style-type: none"> <li>• Stored physical state: N/A</li> <li>• Delivered physical states: N/A</li> <li>• Related system(s): containment</li> </ul>	Radiation of sufficient energy to cause denaturing/inactivation of biological agents and degradation of chemical agents. Ionizing radiation (e.g., gamma, x-ray, and electron beam) causes ionization of exposed molecules. Gamma irradiation has been widely used for the sterilization of medical and pharmaceutical supplies and foods. Nonionizing radiation (e.g., ultraviolet [UV] radiation) can promote activation of exposed molecules, which may lead to chemical reactions such as rearrangement and dissociation. Both chemical and biological agents could be degraded through nonionizing radiation. Radiation-based decontamination systems could prove effective for biological decontamination of personal gear and small equipment and possibly human remains. There may also be potential applications associated with biological decontamination of vehicles, aircraft and facility interiors. The Surebeam Ebeam System is an example of an electron beam system that is used to irradiate mail.
13. Electrostatic decontamination system (EDS)	A system that operates on a simple interaction of UV light rays and a photooxidative solution (patent pending). The system works by spraying a thin layer (25 µm) of liquid photosensitizer onto a contaminated surface, then illuminating the surface with high-fluence UV light.
<b><i>Application Systems</i></b>	
14. Multiheaded nozzle accessories	Based on the inability to decontaminate hard-to-reach places with current applicators, may require modification/new development, including multiheaded nozzle accessories to increase the spray pattern. May also require ability disseminate various physical states of decontaminants.

15. Extended range	Based on the inability to decontaminate hard-to-reach places with current applicators, there is a requirement to modify or develop a sprayer that is able to reach high and low areas by extending its length as necessary. Also it may require the ability to disseminate various physical states of decontaminants.
16. CMWD (ship) modification	Based on the inability to neutralize agents on ship's surfaces because of the utilization of saltwater through the CMWD. The current system could be modified to allow the injection of a decontaminant into the CMWD saltwater flow.
17. Large coverage (operator-encapsulated) sprayer system	Based on the inability to decontaminate large open areas or large facility exteriors with current applicators, a large-scale applicator must be developed that will provide a large coverage of decontaminant but at the same time provide total protection for the operator from backsplash, possibly some type of encapsulation.
18. Aerial platform application systems	Various aerial platforms, both fixed and rotary wing, have proven capabilities to deliver water and retardants in support of fighting wildfires. These same capabilities could potentially have utility supporting wide area decontamination.
19. Enhanced thorough personnel decontamination processing systems	A system of systems approach to enhance thorough personnel decontamination capabilities. A system of systems approach can more rapidly and effectively decontaminate personnel and their associated individual protective equipment and other individual equipment to include weapons and sensitive equipment.
20. Robotic or semiautonomous systems	Robotic or semiautonomous systems that reduce equipment and manpower requirements. System must be versatile and able to utilize all decontaminants in various physical forms and also be effective in reducing time requirements.
<b>Miscellaneous</b>	
21. Containment	The ability to control and contain decontamination waste (e.g., runoff) to minimize cross-contamination hazards and enable safe waste disposition. Containment is not an independent system, can be a property of decontamination system. All chemical and physical process IMAs are amenable to containment. (Note: Containment is an intrinsic property of active coatings and sorbents.)
22. Recycling	The ability to recover, reprocesses, and reuse the decontaminant. Recycling is not an independent system, can be a property of decontamination system. Enzymatic, mixed (water/nonaqueous solvent) oxidants/nucleophiles, reactive nonaqueous liquids, reactive gases and vapors, plasmas, low-temperature thermal, water/steam wash, and (nonaqueous) solvent wash systems may be amenable to recycling.

23. Decontaminating bandage	Neutralizes agent and does not damage underlying tissue or inhibit wound healing. Could be a cloth bandage impregnated with decontamination product or be applied as a liquid bandage.
-----------------------------	--

**Table 17.0-3. Diagnostics/Treatment Ideas for Materiel Approaches**

<b>Materiel Approach</b>	<b>Description</b>
<b><i>Chemical Effects Diagnostics</i></b>	
1. Portable chemical agent identification tests and diagnostic methods	Field-hardened, compact, and portable kits capable of presumptive detection, identification, and quantification of chemical agents in clinical samples.
2. Advanced laboratory tests and diagnostic methods	Laboratory-based tests and diagnostic methods capable of confirmatory detection, identification, and quantification of chemical agents (and high-priority toxic industrial chemical [TICs]) in clinical samples.
3. Large-volume laboratory diagnostic testing	Laboratory-based automated testing capable of presumptive detection, identification, and quantification of chemical agents (and high-priority TICs) in clinical samples. Has the capability to process large numbers of samples in a short amount of time. Gives a quick “go/no-go” indication as to the need for and type of treatment required.
<b><i>Biological Effects Diagnostics</i></b>	
1. Portable biological agent identification tests and diagnostic methods	Field-hardened, compact, and portable kits capable of rapid presumptive detection, identification, and quantification of biological agents in clinical samples.
2. Advanced laboratory tests and diagnostic methods	Laboratory-based tests and diagnostic methods capable of rapid confirmatory detection, identification, and quantification of biological agents in clinical samples from patients in early stages of infection. May use antigen/antibody testing methodologies to eliminate the need for culturing live agents to perform diagnosis.
3. Large-volume laboratory diagnostic testing	Laboratory-based automated testing capable of presumptive detection, identification, and quantification of biological agents in clinical samples from patients in early stages of infection. Has the capability to process large numbers of samples in a short amount of time.
<b><i>Radiological Effects Diagnostics</i></b>	
1. Individual dosimeters	Lightweight and provides accurate indication of whole and partial body exposure. Can also differentiate different types and amounts of exposure. Advanced technologies/dosimeters that identify dose rate of exposure over time. Can be worn by individual or MWAs.

2. Laboratory dosimeters	Lightweight and provides accurate indication of whole- and partial-body exposure. Can also differentiate different types and amounts of exposure. Advanced technologies/dosimeters that identify dose rate of exposure over time.
3. Rapid diagnostics	Rapid identification tests and diagnostic methods that are field-hardened, compact, and portable. Should be easy to use and require minimal amount of sample preparation. Simple and sensitive field-portable diagnostic assays for radiation exposure. Gives accurate indication of radiation exposure. Eliminates the need for shipping specimens for confirmatory testing.
4. Individual detector	Detector that can be worn by individual or MWAs. Provides rapid identification of type and amount of radiation. Is simple to use, field-hardened, compact, and easy to use and maintain.
<b><i>Chemical Effects Treatment</i></b>	
<b><i>Nerve Agent Exposure</i></b>	
1. Next-generation oximes	AKA, "Next-Generation Oxime Candidate for Nerve Agent Treatment." Development of new oxime(s) more effective than 2-pralidoxime (2-PAM) against classic and nontraditional nerve agents.
2. Nontraditional nerve agent medical countermeasures	Compounds or medical strategies that demonstrate the ability to prevent, interrupt, or terminate the action of nontraditional nerve agents.
3. Injectable nanoparticles for in vivo removal of overdose toxins from blood	Several potential drugs being investigated.
<b><i>Cyanide Exposure Treatment</i></b>	
4. Next-generation cyanide antidotes	Cyanide antidotes that do not have significant adverse and contraindications and that can be administered by buddy-aid, MWD handler, or other non-VS personnel. Compounds/biomolecules of interest include Stroma-free methemoglobin, 8-aminoquinoline analogs of primaquine (e.g., WR242511), and alpha-ketoglutaric acid.
<b><i>Blister Agent Exposure Treatment</i></b>	
5. Intracellular scavengers	Biomolecules that prevent DNA alkylation through intracellular scavengers. N-acetyl cysteine is an example.
6. Biochemical inhibitors/modulators	Biomolecules that affect the cellular processes related to vesicant exposure. Examples include mimosine (cell cycle inhibitors that prevent deoxyribose nucleic acid [DNA] strand breaks), niacinamide (PARP inhibitors that prevents PARP [poly(ADP)-ribose polymerase] activation), BAPTA, Dimercaprol (calcium modulators that prevents disruption of calcium), and sulfonyl fluorides (protease inhibitors that prevent proteolytic activation).

<b><i>Pulmonary Agent Exposure Treatment</i></b>	
7. Vesicant agent antidote	Licensed therapeutic for vesicant exposure (FY2010–19) is expected to reduce, if not eliminate, deficiency.
8. Antiinflammatories	Nonsteroidal, antiinflammatory drugs (NSAIDs) that can be administered by buddy-aid or MWD handler.
9. Pulmonary edema–reducing treatments	Post-exposure pulmonary agent antidote that reduces pulmonary edema and consequently decreases the requirement for supplemental oxygen therapy and chance of developing pneumonia.
10. Next-generation bronchodilators	Nonaminophylline bronchodilator that can be administered by buddy-aid or MWD handler and has minimal side effects.
<b><i>Biological Effects Treatment</i></b>	
1. Immunostimulants	Induce a short-term, nonantigen-specific enhancement of the immune system. Could benefit humans and MWDs with potential exposure to many different pathogens.
2. Monoclonal antibodies	Provide immediate protection from specific bacterial or viral agents. If used as post-exposure treatment, need rapid diagnostic to correctly identify pathogen involved, since this dictates the appropriate antibodies to be used.
3. Next-generation/new antibiotics	Improvement/development of medications produced by or derived from certain fungi, bacteria, and other organisms that can destroy or inhibit the growth of other microorganisms. Used to treat bacterial infections. Antibiotics may also be synthetically produced in a laboratory.
4. Next-generation/new antitoxins	Improvement/development of substances (sometimes the product of a specific microorganism and sometimes naturally present in the blood or tissues of an animal), capable of producing immunity from certain diseases, or of counteracting the poisonous effects of pathogenic bacteria.
5. Next-generation/new antivirals	Improvement/development of herbs, drugs, or agents capable of destroying viruses or inhibiting their growth or multiplication until the body is capable of destroying the virus itself.
6. Immunomodulators	Disease-modifying chemicals that alter, suppress, or stimulate the body's immune system.
7. Next-generation/new vaccines	Vaccines are typically indicated as prophylaxis either pre- or post-exposure; however, use of vaccines as treatment.
8. New therapeutics	Potential development of new therapeutics using following technologies: systemic corticosteroids, platelet activating factor antagonists, transition state inhibitors, bioadhesion, and anticoagulant proteins.

<i><b>Radiological Effects Treatment</b></i>	
1. Radioprotectants	Exposure to ionizing radiation causes defects in hemopoiesis that result in low numbers of circulating blood cells and platelets as well as in an increased susceptibility to infection and hemorrhage. Need to conduct research on drugs that enhance recovery from the hemopoietic syndrome. Drugs designed to ameliorate or prevent damage caused by radiation. Develop radioprotective drugs that have low toxicity when used over long periods of time. Develop next generation of radioprotective drugs with longer duration of activity. Could be delivered through slow-release system (i.e., dermal patch) to reduce need for daily dosing.
2. Immunomodulators	Drugs that increase the immune system's capability to respond to a foreign substance.
3. Countermeasures	Cytokines can help stimulate production of white blood cells. Cell line stimulants capable of restoring the immune competence of bone marrow that would allow survival from a previously lethal dose of radiation.
4. Next-generation/new blocking agents	Drugs that block the effects of radiation within the body. Example is potassium iodide, which blocks the absorption of radioactive iodide by the thyroid.
5. Next-generation/new chelating agents	Chelating drugs reduce the amount of time the isotope stays in the body. Develop next-generation chelating agents that have reduced toxicity for the removal of internally deposited radioisotopes.
6. Cell line stimulants	Cell line stimulants capable of restoring the immune competence of bone marrow that would allow survival from a previously lethal dose of radiation.
7. New antibiotics	Development of new antibiotics and testing of current antibiotics to determine which are most effective at controlling the infections that occur after high-dose-radiation injury. Probiotics are one class that should be considered.
8. Nitroxides	Over the past decade, stable nitroxide compounds have been identified as a unique class of antioxidants with demonstrated radioprotective properties. Studies have shown that nitroxides protect against radiation-induced DNA damage, chromosome aberrations, mutation induction, cell killing, and lethality in mice that receive whole-body irradiation. Whether these agents provide radioprotection for low-level radiation doses remains to be determined. They are currently in clinical trials to evaluate their anticarcinogenic potential.
9. Cytoprotectants	The ability to prevent radiotherapy-induced toxicity without affecting antitumor efficacy has the potential to enhance the therapeutic benefit for cancer patients without increasing their risk of serious adverse effects. In vitro studies with the active metabolite of amifostine (WR-1065) have shown it to prevent both radiation-induced cell death and radiation-induced mutagenesis.

**17.1 Task TASUST 1: Decontaminate personnel****17.1.1 Functional Area Analysis****17.1.1.1 Definition**

To decontaminate all personnel: military and eligible civilians. This task assumes that individuals are in protective MOPP gear. Levels of personnel decontamination include immediate, operational, and thorough. Objectives of each of these levels are identified as follows:

- Immediate: Minimize casualties, save lives, and minimize spread of contamination.
- Operational: Via MOPP gear exchange, reduce level of contamination to regenerate combat power.
- Thorough: Reduce CBRN/ toxic industrial material (TIM) contamination to the lowest possible levels to permit partial or total removal of IPE and maintain operations with minimum degradation.

**17.1.1.2 Derivation**

*UJTL (TA 7, TA 7.1), Protection Joint Functional Concept.*

**17.1.1.2.1 Supported Tasks:** OPSUST 8, OPSUST 11**17.1.1.2.2 Lateral Task:** TASHA 24**17.1.1.2.3 Supporting Task:** N/A**17.1.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Extremely rough sea state. (C1.2.1.3)
2. Tropical, arctic, and arid climate. (C1.3.1)
3. All seasons. (C1.3.1.1)
4. Precipitating and stormy weather. (C1.3.1.3)
5. Hot and very cold air temperature. (C1.3.1.3.1)
6. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6.1)
7. Negligible light. (C1.3.2.1)
8. Nuclear effects. (C1.3.3.1)
9. Chemical effects. (C1.3.3.2)
10. Biological effects. (C1.3.3.3)

**Military**

1. Stressful mission. (C2.1)
2. Location—ashore/afloat. (C2.1.4.1)
3. Minimal time available. (C2.1.5)
4. Marginal forces allocated. (C2.2.3)
5. Some or no interoperability. (C2.2.6)
6. Low personnel capability. (C2.2.4)
7. Negligible personnel experience. (C2.2.4.5)
8. Severe personnel fatigue. (C2.2.4.6)
9. Limited, little, or no lift assets. (C2.5.2)
10. Limited or no host-nation support. (C2.8.5)
11. Ambiguous threat existence. (C2.9.3)

**Civil**

1. Limited or negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)
3. High mission priority. (C3.1.3.2)
4. Few or negligible translators. (C3.2.1.2)
5. Significant customs adjustment. (C3.2.2)
6. Significant refugee-care responsibility. (C3.3.2.3)

**17.1.1 Functional Needs Analysis****17.1.2.1 Capabilities and Deficiencies Assessment Summary**

Table 17.1-1 presents overall current, near-/mid-term, and far-term capabilities to perform the task. There are seven current capabilities and two projected capabilities to be added in the future (JSPDS Increment I in the near/mid term and JSPDS Increment II in the far term).

**Current Capabilities and Deficiencies**

Current capabilities to decontaminate personnel require the use of M291 kits, bleach solutions, soap and water, STB and HTH mixtures, and seawater. Capability gaps associated with personnel decontamination include the excessive amount of time it takes to manually process large numbers of personnel and their associated individual equipment and weapons through thorough decontamination processes; STB and HTH decontaminants can be toxic and corrosive, requiring large amounts of water for dilution; runoff from personnel decontamination processes may be contaminated; and current decontaminants are effective against only a limited range of chemical and biological agents. In addition, current thorough personnel decontamination processes may not be feasible in many operational situations due to time and space requirements.

### **Projected Near/Mid-Term Capabilities and Deficiencies**

The projected near/mid-term capabilities and deficiencies evaluated were associated with JSPDS, Increment I.

### **Projected Far-Term Capabilities and Deficiencies**

The projected far-term capabilities and deficiencies evaluated were associated with JSPDS Increment II.

	FAA Measure	Elaboration	Scale
M1	(Yes/No) Cross-contamination is controlled?	Cross-contamination is controlled. Scale represents range from no control to complete control of contamination. Where cross-contamination is less than 100% controlled, measures must be in place to prevent cross-contamination from becoming an unacceptable hazard.	10: Yes, Complete (100%) 7: Yes, Substantial (~75%) 5: Yes, Partial (~50%) 3: Yes, Minimal (~25%) 0: No, Cross-contamination cannot be controlled and presents an unacceptable hazard.

M2	(Quantity) Personnel per hour to complete thorough decontamination process.	Sufficient number of personnel per hour can be processed through a thorough decontamination system or process to maximize restoration of full individual combat capabilities. Thorough decontamination of personnel includes the decontamination of individually carried equipment.	10: >150 9: 125–150 8: 100–124 7: 80–99 6: 60–79 5: 50–59 4: 40–49 3: 30–39 2: 20–29 1: 10–19 0: <10
M3	(Time) To initiate immediate decontamination procedures.	Initiate and complete immediate decontamination of the hands, face, and neck within a measured amount of time to prevent a casualty-producing exposure.	10: Immediately 9: <10 seconds 8: <30 seconds 7: <45 seconds 6: <1 minute 5: <1 minute, 15 seconds 4: <1 minute, 30 seconds 3: <1 minute, 45 seconds 2: <2 minutes 1: <3 minutes 0: >3 minutes
M4	(Quantity) Personnel per hour to complete operational decontamination process.	Sufficient number of personnel per hour can be processed through an operational decontamination system or process (MOPP gear exchange or equivalent process). Operational decontamination of personnel includes the decontamination of individually carried equipment.	10: >300 9: 250–300 8: 200–249 7: 160–199 6: 120–159 5: 100–119 4: 80–99 3: 60–79 2: 40–59 1: 20–39 0: <20
M5	(Yes/No) Contaminated by-products are controlled?	Contaminated by-products are controlled. Scale represents range of no control to complete control of by-products. Where contaminated by-products are less than 100% controlled, measures must be in place to prevent cross-contamination from becoming an unacceptable hazard.	10: Yes, Complete (100%) 7: Yes, Substantial (~75%) 5: Yes, Limited (~50%) 3: Yes, Minimal (~25%) 0: No, Contaminated by-products cannot be controlled and present an unacceptable hazard.

M6	(Level) Of chemical contamination after decontamination procedures.	The level of chemical contamination is acceptable after decontamination procedures. Agents defined as: current generation chemical warfare agents (CWAs), nontraditional agents (NTAs) and toxic industrial materials and chemicals (TIMs).	<p>10: Decontaminate all CWAs, NTAs, TIMs to general population exposure limits; must also be FDA approved.</p> <p>7: Decontaminate all CWAs, all NTAs, some TIMs to a level that will allow unprotected exposure; must also be FDA approved.</p> <p>5: Decontaminate all CWAs, some NTAs to a level that will allow unprotected exposure; must also be FDA approved.</p> <p>3: Decontaminate most CWAs to a level that will allow unprotected exposure.</p> <p>0: No effective decontaminant or process.</p>
M7	(Level) Of biological contamination after decontamination procedures.	The level of biological contamination is acceptable after decontamination procedures. Vegetative and nonvegetative bacteria are measured in colony-forming units/square meter (CFU/m <sup>2</sup> ), and viruses are measured in plaque-forming units/square meter (PFU/m <sup>2</sup> ).	<p>10: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against all 25 threat agents and also must be FDA approved.</p> <p>9: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against 20 or more key threat agents and also must be FDA approved.</p> <p>8: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against 15 or more key threat agents and also must be FDA approved.</p> <p>7: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against 10 or more key threat agents and also must be FDA approved.</p> <p>6: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against eight or more key threat agents and also must be FDA approved.</p> <p>5: Less than infective dose levels/casualty-producing toxin exposure levels against six or more key threat agents and also must be FDA approved.</p> <p>4: Less than infective dose levels/casualty-producing toxin exposure levels against four key threat agents and also must be FDA approved.</p> <p>3: Less than infective dose levels/casualty-producing toxin exposure levels against three key threat agents.</p> <p>2: Less than infective dose levels/casualty-producing toxin exposure levels against two or more key threat agents.</p> <p>1: Less than infective dose levels/casualty-producing toxin exposure levels against one key threat agent.</p> <p>0: More than infective dose levels/casualty-producing toxin exposure levels.</p>

M8	(Level) Of radiological contamination after decontamination procedures.	The level of radiological contamination is acceptable after decontamination procedures. 0.33 centigray per hour (cGy/hour) equates to an exposure that can cause mild incapacitation in 2.5% or less of unprotected, not previously exposed personnel.	10: Total removal to natural background level. 8: ≤0.11 cGy/hour residual dose rate. 6: ≤0.22 cGy/hour residual dose rate. 4: <0.33 cGy/hour residual dose rate. 2: 0.33 cGy residual dose rate. 0: Removal capabilities limited or ineffective, allowing excessive residual dose rates >0.33 cGy/hour.
M9	(Yes/No) Decontamination procedures are logistically supportable?	Decontamination procedures must be logistically supportable.	10: No negative impacts on operations. 7: Limited negative impact on operational capability. 5: Moderate negative impact on operational capability 3: Major negative impact on operational capability 0: Not logistically supportable.
M10	There is effective DOTLPF in place to conduct task?	Refers to non-materiel elements associated with the execution of a task with the system.	10: DOTLPF is adequate for all tasks to be performed with this system without limitations that cause significant impact upon operations. 7: DOTLPF is adequate for most of the tasks to be performed with this system without limitations that cause significant impact upon operations. 5: Many critical aspects of DOTLPF for the task to be performed with this system are addressed. 3: Some critical aspects of DOTLPF for the task to be performed with this system are addressed. 0: DOTLPF is completely inadequate or does not exist for the tasks to be performed with this system.

<sup>1</sup> M1 – (Yes/No) Cross-contamination is controlled? 7: Yes, Substantial (~75%).

<sup>2</sup> M2 – (Quantity) Personnel per hour to complete thorough decontamination process. 2: 20–29.

<sup>3</sup> M5 – (Yes/No) Contaminated by-products are controlled? 7: Yes, Substantial (~75%).

<sup>4</sup> M6 – (Level) Of chemical contamination after decontamination procedures. 3: Decontaminate most chemical warfare agents (CWAs) to a level that will allow unprotected exposure.

<sup>5</sup> M7 – (Level) Of biological contamination after decontamination procedures. 1: Less than infective dose levels/casualty-producing toxin-exposure levels against one key threat agent.

<sup>6</sup> M9 – (Yes/No) Decontamination procedures are logistically supportable? 7: Limited negative impact on operational capability.

<sup>7</sup> M10 – There is effective DOTLPF in place to conduct task? 10: DOTLPF is adequate for all tasks to be performed with this system without limitations that cause significant impact upon operations.

<sup>8</sup> M1 – (Yes/No) Cross-contamination is controlled? 5: Yes, Partial (~50%).

<sup>9</sup> M5 – (Yes/No) Contaminated by-products are controlled? 5: Yes, Limited (~50%).

<sup>10</sup> M7 – (Level) Of biological contamination after decontamination procedures. 5: Less than infective dose levels/casualty-producing toxin-exposure levels against six or more key threat agents and also must be FDA approved.

<sup>11</sup> M9 – (Yes/No) Decontamination procedures are logistically supportable? 5: Moderate negative impact on operational capability.

<sup>12</sup> M10 – There is effective DOTLPF in place to conduct task? 7: DOTLPF is adequate for most of the tasks to be performed with this system without limitations that cause significant impact upon operations.

<sup>13</sup> M1 – (Yes/No) Cross-contamination is controlled? 3: Yes, Minimal (~25%).

<sup>14</sup> M5 – (Yes/No) Contaminated by-products are controlled? 3: Yes, Minimal (~25%).

<sup>15</sup> M6 – (Level) Of chemical contamination after decontamination procedures. 0: No effective decontaminant or process.

<sup>16</sup> M7 – (Level) Of biological contamination after decontamination procedures. 3: Less than infective dose levels/casualty-producing toxin-exposure levels against three key threat agents.

<sup>17</sup> M8 – (Level) Of radiological contamination after decontamination procedures. 6:  $\leq 0.22$  cGy/hour residual dose rate.

<sup>18</sup> M8 – (Level) Of radiological contamination after decontamination procedures. 2: 0.33 cGy residual dose rate.

<sup>19</sup> M8 – (Level) Of radiological contamination after decontamination procedures. 4:  $< 0.33$  cGy/hour residual dose rate.

<sup>20</sup> M10 – There is effective DOTLPF in place to conduct task? 5: Many critical aspects of DOTLPF for the task to be performed with this system are addressed.

<sup>21</sup> M2 – (Quantity) Personnel per hour to complete thorough decontamination process. 2: 20–29.

<sup>22</sup> M4 – (Quantity) Personnel per hour to complete operational decontamination process. 5: 100–119.

<sup>23</sup> M7 – (Level) Of biological contamination after decontamination procedures. 4: Less than infective dose levels/casualty-producing toxin-exposure levels against four key threat agents and also must be FDA approved.

<sup>24</sup> M8 – (Level) Of radiological contamination after decontamination procedures. 8:  $\leq 0.11$  cGy/hour residual dose rate.

<sup>25</sup> M9 – (Yes/No) Decontamination procedures are logistically supportable? 3: Major negative impact on operational capability.

<sup>26</sup> M6 – (Level) Of chemical contamination after decontamination procedures. 5: Decontaminate all CWA, some nontraditional agents (NTAs) to a level that will allow unprotected exposure; must also be FDA approved.

## 17.1.2 Functional Solution Analysis

### 17.1.3.1 DOTLPP Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, the deficiency is then reassessed in the IMA section.

1. **Deficiency:** Current array of decontaminants may not neutralize all chemical and biological hazards.  
**Non-Materiel Solutions:** None.
2. **Deficiency:** High concentrations of HTH or STB are may be harmful to personnel.  
**Non-Materiel Solutions:** *Doctrine (partial):* Expand presentation of basic decontamination concepts using HTH and STB into other doctrinal products beyond only CBRND. *Training (partial):* Enhance training on basic decontamination procedures using HTH and STB to mitigate the personnel hazards these products can produce.
3. **Deficiency:** Current procedures may not be feasible due to time and space requirements.  
**Non-Materiel Solutions:** None.
4. **Deficiency:** Lack of doctrine and training for aircrew radiological decontamination procedures.  
**Non-Materiel Solutions:** *Doctrine:* Incorporate aircrew decontamination procedures for radiological environments into current doctrine.
5. **Deficiency:** Operational and thorough procedures require large amounts of water.  
**Non-Materiel Solutions:** *Training (partial):* Develop resource management training to minimize water usage level to lowest possible level.
6. **Deficiency:** Runoff may be contaminated.  
**Non-Materiel Solutions:** *Doctrine (partial):* Modify doctrine to consider contaminated runoff as an operational consideration. Doctrine should address how to dispose of or neutralize runoff. *Training (partial):* Modify training to consider contaminated runoff as an operational consideration. Training should address how to dispose of or neutralize runoff.

### 17.1.3.2 IMA Assessment Summary

Table 17.1-2 identifies which of the materiel approaches might address specific materiel gaps identified in the DOTMLPP assessment.

Table 17.1-2. TASUST 1: IMA Assessment

Identified Gaps	Ideas for Materiel Approaches (IMA)												
	Enzymes	Aqueous Oxidants/ Nucleophiles	Mixed (Water/Nonaqueous Solvent) Oxidants/Nucleophiles	Reactive Nonaqueous Liquids	Nonaqueous Solvent Wash*	Reactive Gases and Vapors*	Low-Temperature Thermal (Accelerated Weathering)*	Sorption	(Nonaqueous) Solutions*	Containment System	Recycling Decontaminant System	Enhanced Thorough Personnel Decontamination System	Electrostatic Decontamination System*

**17.2 Task TASUST 2: Decontaminate casualties and potentially exposed personnel****17.2.1 Functional Area Analysis****17.2.1.1 Definition**

To decontaminate all casualties and potentially exposed personnel, ambulatory and nonambulatory, as well as MWAs, specifically MWDs that have been exposed to CBRN/TIM hazards. Several animal species are used as MWAs; however, MWDs are the predominant species and are most likely to be deployed with military personnel. Levels of decontamination are immediate and thorough. There is no operational level of decontamination for casualties. Objectives of each of these levels are identified as follows:

- Immediate: Immediate removal of gross contamination to minimize casualties, save lives, and minimize spread of contamination.
- Operational: N/A
- Thorough: Reduce CBRN/TIM contamination to the lowest possible levels to permit partial or total removal of IPE and maintain operations with minimum degradation.

**17.2.1.2 Derivation**

*UJTL (TA 7, TA 7.1), Protection Joint Functional Concept.*

**17.2.1.2.1 Supported Tasks:** OPSUST 8, OPSUST 11**17.2.1.2.2 Lateral Task:** TASHA 24**17.2.1.2.3 Supporting Task:** N/A**17.2.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Extremely rough sea state. (C1.2.1.3)
2. Tropical, arctic, and arid climate. (C1.3.1)
3. All seasons. (C1.3.1.1)
4. Precipitating and stormy weather. (C1.3.1.3)
5. Hot and very cold air temperature. (C1.3.1.3.1)
6. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6.1)
7. Negligible light. (C1.3.2.1)
8. Nuclear effects. (C1.3.3.1)
9. Chemical effects. (C1.3.3.2)
10. Biological effects. (C1.3.3.3)

**Military**

1. Stressful mission. (C2.1)
2. Location—ashore/afloat. (C2.1.4.1)
3. Minimal time available. (C2.1.5)
4. Marginal forces allocated. (C2.2.3)
5. Low personnel capability. (C2.2.4)
6. Negligible personnel experience (C2.2.4.5)
7. Severe personnel fatigue. (C2.2.4.6)
8. Some or no interoperability. (C2.2.6)
9. Limited, little, or no lift assets. (C2.5.2)
10. Limited or no host-nation support. (C2.8.5)
11. Ambiguous threat existence. (C2.9.3)

**Civil**

1. Limited or negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)
3. High mission priority. (C3.1.3.2)
4. Few or negligible translators. (C3.2.1.2)
5. Significant customs adjustment. (C3.2.2)
6. Significant refugee-care responsibility. (C3.3.2.3)

**17.2.2 Functional Needs Analysis****17.2.2.1 Capabilities and Deficiencies Assessment Summary**

Table 17.2-1 presents individual and overall current capabilities to perform the task to the designated standards. There are five current capabilities used to accomplish this task and two projected capabilities to be added in the future (JSPDS Increment I in the near/mid term, JSPDS Increment II in the far).

**Current Capabilities and Deficiencies**

Current capabilities to conduct casualty decontamination include the use of M291 kits, bleach solutions, soap and water, brushes/removal and patient decontamination stations. The possibility of cross-contamination and contaminated by-products during patient decontamination operations will always be a challenge, especially if a mass casualty event occurs where a large number of patients must be decontaminated. The decontamination procedures for animals use the same tactics, techniques, and procedures as patient decontamination. Effectively decontaminating MWDs is a challenge due to their hair coat. In addition, MWDs are naturally resistant to most biological agents likely to be used as a WMD.

There are some deficiencies associated with casualty decontamination that exist at the immediate and thorough levels. There is no single capability that can perform the task to all of the designated standards. In general, thorough decontamination is a time and resource intensive

process, especially in a mass casualty environment, large amounts of water may be needed for the prescribed capabilities, and run-off might be contaminated. An additional deficiency is that the M291 kit cannot be used on wounds. Veterinary Services personnel and MWD handlers will generally be responsible for conducting MWA decontamination. MWD handlers normally carry one additional M291 kit for use on the dog.

**Projected Near/Mid-Term Capabilities and Deficiencies**

The projected near/mid-term capabilities and deficiencies evaluated were associated with JSPDS, Increment I.

**Projected Far-Term Capabilities and Deficiencies**

The projected far-term capabilities and deficiencies evaluated were associated with JSPDS, Increment II.

	FAA Measure	Elaboration	Scale
M1	(Yes/No) Cross-contamination is controlled?	Cross-contamination is controlled. Where cross-contamination is less than 100% controlled, measures must be in place to prevent cross-contamination from becoming an unacceptable hazard.	10: Yes, Complete (100%) 7: Yes, Substantial (~75%) 5: Yes, Limited (~50%) 3: Yes, Minimal (~25%) 0: No, cross-contamination cannot be controlled and presents an unacceptable hazard

M2	(Quantity) Casualties/ personnel per hour to complete thorough decontamination process.	An adequate number of casualties can be thoroughly decontaminated per hour to minimize delays before receiving full medical treatment.	10: >60 9: 50-60 8: 40-49 7: 35-39 6: 30-34 5: 25-29 4: 20-24 3: 15-19 2: 10-14 1: 5-9 0: <5
M3	(Time) To initiate immediate decontamination procedures.	Initiate and complete immediate decontamination procedures within an adequate amount of time to preclude additional injury to casualties from chemical exposure. Time factors equate to the time required to decontaminate 1300 cm <sup>2</sup> of skin surface area.	10: Immediately 9: <10 seconds 8: <30 seconds 7: <45 seconds 6: <1 minute 5: <1 minute, 15 seconds 4: <1 minute, 30 seconds 3: <1 minute, 45 seconds 2: <2 minutes 1: <3 minutes 0: >3 minutes
M4	(Level) Of chemical contamination after decontamination procedures.	Chemical decontamination can be performed to a level that no longer poses an imminent health threat to casualties or health care providers. The level of chemical contamination is acceptable after decontamination procedures. Agents defined as current-generation CWAs, NTAs, TIMs, and TICs.	10: Decontaminate all CWAs, NTAs, TIMs to general population exposure limits, must also be FDA approved. 7: Decontaminate all CWAs, all NTAs, some TIMs to a level that will allow unprotected exposure; must also be FDA approved. 5: Decontaminate all CWAs, some NTAs to a level that will allow unprotected exposure; must also be FDA approved. 3: Decontaminate most CWAs to a level that will allow unprotected exposure. 0: No effective decontaminant or process.

M5	(Level) Of biological contamination after decontamination procedures.	The level of biological contamination is acceptable after decontamination procedures. Vegetative and nonvegetative bacteria are measured in CFU/m <sup>2</sup> , and viruses are measured in PFU/m <sup>2</sup> .	<p>10: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against all 25 threat agents, and also must be FDA approved.</p> <p>9: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against 20 or more key threat agents, and also must be FDA approved.</p> <p>8: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against 15 or more key threat agents, and also must be FDA approved.</p> <p>7: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against 10 or more key threat agents, and also must be FDA approved.</p> <p>6: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against six or more key threat agents, and also must be FDA approved.</p> <p>5: Less than infective dose levels/casualty-producing toxin exposure levels against five or more key threat agents, and also must be FDA approved.</p> <p>4: Less than infective dose levels/casualty-producing toxin exposure levels against four key threat agents, and also must be FDA approved.</p> <p>3: Less than infective dose levels/casualty-producing toxin exposure levels against three key threat agents.</p> <p>2: Less than infective dose levels/casualty-producing toxin exposure levels against two or more key threat agents.</p> <p>1: Less than infective dose levels/casualty-producing toxin exposure levels against one key threat agent.</p> <p>0: More than infective dose levels/casualty-producing toxin exposure levels.</p>
M6	(Level) Of radiological contamination after decontamination procedures.	Radiological decontamination can be performed to a level that no longer poses an imminent health threat to casualties or health care providers. 0.33 cGy/hour equates to an exposure that can cause mild incapacitation in 2.5% or less of unprotected, not previously exposed personnel.	<p>10: Total removal to natural background level.</p> <p>8: ≤0.11 cGy/hour residual dose rate.</p> <p>6: ≤0.22 cGy/hour residual dose rate.</p> <p>4: &lt;0.33 cGy/hour residual dose rate.</p> <p>2: 0.33 cGy/hour residual dose rate.</p> <p>0: Removal capabilities limited or ineffective, allowing excessive residual dose rates &gt;0.33 cGy/hour.</p>
M7	(Yes/No) Contaminated by-products are controlled?	Contaminated by-products are controlled. Where contaminated by-products are less than 100% controlled, measures must be in place to prevent cross-contamination from becoming an unacceptable hazard.	<p>10: Yes, Complete (100%).</p> <p>7: Yes, Substantial (~75%).</p> <p>5: Yes, Partial (~50%).</p> <p>3: Yes, Minimal (~25%).</p> <p>0: No, Contaminated by-products cannot be controlled and present an unacceptable hazard.</p>

M8	(Yes/No) Decontamination procedures are logistically supportable?	Decontamination procedures must be logistically supportable.	10: No negative impacts on operations. 7: Limited negative impact on operational capability. 5: Moderate negative impact on operational capability. 3: Major negative impact on operational capability. 0: Not logistically supportable.
M9	There is effective DOTLPF in place to conduct task?	Refers to non-materiel elements associated with the execution of a task with the system.	10: DOTLPF is adequate for all tasks to be performed with this system without limitations that cause significant impact upon operations. 7: DOTLPF is adequate for most of the tasks to be performed with this system without limitations that cause significant impact upon operations. 5: Many critical aspects of DOTLPF for the task to be performed with this system are addressed. 3: Some critical aspects of DOTLPF for the task to be performed with this system are addressed. 0: DOTLPF is completely inadequate or does not exist for the tasks to be performed with this system.

<sup>1</sup> M1 – (Yes/No) Cross-contamination is controlled? 7: Yes, Substantial (~75%).

<sup>2</sup> M3 – (Time) To initiate immediate decontamination procedures. 8: <30 Seconds.

<sup>3</sup> M4 – (Level) Of chemical contamination after decontamination procedures. 3: Less than infective dose levels/casualty-producing toxin-exposure levels against three key threat agents.

<sup>4</sup> M5 – (Level) Of biological contamination after decontamination procedures. 1: Less than infective dose levels/casualty-producing toxin-exposure levels against one key threat agent.

<sup>5</sup> M7 – (Yes/No) Contaminated by-products are controlled? 7: Yes, Substantial (~75%).

<sup>6</sup> M8 – (Yes/No) Decontamination procedures are logistically supportable? 7: Limited negative impact on operational capability.

<sup>7</sup> M9 – There is effective DOTLPF in place to conduct task? 10: DOTLPF is adequate for all tasks to be performed with this system without limitations that cause significant impact upon operations.

<sup>8</sup> M1 – (Yes/No) Cross-contamination is controlled? 3: Yes, Minimal (~25%).

<sup>9</sup> M4 – (Level) Of chemical contamination after decontamination procedures. 0: No effective decontaminant or process.

<sup>10</sup> M5 – (Level) Of biological contamination after decontamination procedures. 3: Less than infective dose levels/casualty-producing toxin-exposure levels against three key threat agents.

<sup>11</sup> M6 – (Level) Of radiological contamination after decontamination procedures. 8: ≤0.11 cGy/hour residual dose rate.

<sup>12</sup> M7 – (Yes/No) Contaminated by-products are controlled? 3: Yes, Minimal (~25%).

<sup>13</sup> M8 – (Yes/No) Decontamination procedures are logistically supportable? 5: Moderate negative impact on operational capability.

<sup>14</sup> M9 – There is effective DOTLPF in place to conduct task? 7: DOTLPF is adequate for most of the tasks to be performed with this system without limitations that cause significant impact upon operations.

<sup>15</sup> M1 – (Yes/No) Cross-contamination is controlled? 5: Yes, Limited (~50%).

<sup>16</sup> M5 – (Level) Of biological contamination after decontamination procedures. 5: Less than infective dose levels/casualty-producing toxin-exposure levels against five or more key threat agents, and also must be FDA approved.

<sup>17</sup> M7 – (Yes/No) Contaminated by-products are controlled? 5: Yes, Partial (~50%).

<sup>18</sup> M6 – (Level) Of radiological contamination after decontamination procedures. 4: <0.33 cGy/hour residual dose rate.

<sup>19</sup> M2 – (Quantity) Casualties/personnel per hour to complete thorough decontamination process. 1: 5–9.

<sup>20</sup> M8 – (Yes/No) Decontamination procedures are logistically supportable? 3: Major negative impact on operational capability

<sup>21</sup> M2 – (Quantity) Casualties/personnel per hour to complete thorough decontamination process. 2: 10–14.

<sup>22</sup> M4 – (Level) Of chemical contamination after decontamination procedures. 5: Decontaminate all CWAs, some NTAs to a level that will allow unprotected exposure; must also be FDA approved.

<sup>23</sup> M5 – (Level) Of biological contamination after decontamination procedures. 4: Less than infective dose levels/casualty-producing toxin-exposure levels against four key threat agents, and also must be FDA approved.

### 17.2.3 Functional Solution Analysis

#### 17.2.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, the deficiency is then reassessed in the IMA section.

1. **Deficiency:** Decontamination process causes delay in treatment.  
**Non-Materiel Solutions:** *Doctrine:* Doctrine should clearly define those medical treatments that should be performed in a contaminated environment and during the decontamination process. *Training:* Prepare and practice decontamination procedures to gain proficiency and to determine the approximate number of people that can be processed per hour for each decontamination method.
2. **Deficiency:** Current decontaminants may not neutralize all hazards.  
**Non-Materiel Solutions:** None.
3. **Deficiency:** Large amount of water may be needed.  
**Non-Materiel Solutions:** None.
4. **Deficiency:** Cross-contamination may be difficult to control due to insufficient or uncontrolled drainage and water flow.  
**Non-Materiel Solutions:** *Training (partial):* Cross-contamination can be minimized through adequate training of personnel performing decontamination tasks.
5. **Deficiency:** Time- and resource-intensive.  
**Non-Materiel Solutions:** None.
6. **Deficiency:** Runoff may be contaminated.  
**Non-Materiel Solutions:** *Doctrine (partial):* Modify doctrine to consider contaminated runoff as an operational consideration. Doctrine should address how to dispose of or neutralize runoff. *Training (partial):* Modify training to consider contaminated runoff as an operational consideration. Training should address how to dispose of or neutralize runoff. *Facilities (partial):* Supporting infrastructure to neutralize or dispose of captured contaminated runoff.
7. **Deficiency:** M291 kit cannot be used on wounds.  
**Non-Materiel Solutions:** None.
8. **Deficiency:** Internal decontamination of inhaled biological organisms is not possible.  
**Non-Materiel Solutions:** Since it is not possible to decontaminate internal biological contamination, patients exposed to potential contamination must be referred for medical treatment (prophylaxis and/or treatment). *Doctrine:* Doctrine can reinforce the importance of early identification and referral. *Training:* Training can provide the skills necessary for early identification and referral.

- 9. Deficiency:** The dog handler carries only one additional skin decontaminating kit for the dog.  
**Non-Materiel Solutions:** *Doctrine:* Modify doctrine to allow veterinary service personnel and MWD handlers to carry more than one additional skin decontaminating kit.
- 10. Deficiency:** Doctrine does not address decontamination procedures for individuals not in MOPP gear.  
**Non-Materiel Solutions:** *Doctrine:* Modify doctrine to include procedures for casualties not in MOPP gear.
- 11. Deficiency:** Doctrine does not address all methods of decontamination available for MWDs.  
**Non-Materiel Solutions:** *Doctrine:* Modify doctrine to include all methods of decontamination.
- 12. Deficiency:** Some decontaminants produce contaminated by-products.  
**Non-Materiel Solutions:** *Doctrine (partial):* Modify doctrine to address proper disposal of contaminated by-products.

#### **17.2.3.2 IMA Assessment Summary**

Although early physical removal of any agent is the most important aspect of decontamination, there are potential future technologies that may improve capabilities to conduct casualty decontamination. Table 17.2-2 links materiel alternatives to the identified gaps. Rapid adaptation of some materiel solutions to dogs is no doubt possible and desirable, while other solutions deserve a directed research effort to determine their applicability for decontamination of working dogs.

Table 17.2-2. TASUST 2: IMA Assessment

Identified Gaps	Ideas for Materiel Approaches (IMA)							
	Enzymes	Aqueous Oxidants/ Nucleophiles	Mixed (Water/Nonaqueous Solvent) Oxidants/Nucleophiles	Reactive Nonaqueous Liquids	Sorption	Cold Plasma	Recycled Decontaminant System	Containment System
Current decontaminants may not neutralize all hazards.	X	X	X	X	X	X		
M291 kit cannot be used on wounds.				X	X			
Time- and resource-intensive.	X	X	X	X	X	X

Some decontaminants produce contaminated by-products.	X						X	X

**17.3 Task TASUST 3: Decontaminate wounds****17.3.1 Functional Area Analysis****17.3.1.1 Definition**

To decontaminate external wounds. External wounds damage skin, penetrate skin, or open skin. Internal wounds resulting from inhalation, ingestion, or absorption are not decontaminated but rather medically treated and are discussed in another task. This task includes MWAs, specifically MWDs that have been exposed to CBRN/TIM hazards. Several animal species are used as MWAs; however, MWDs are the predominant species and are most likely to be deployed with military personnel. Levels of decontamination include immediate, operational, and thorough. There is no operational decontamination of wounds. Objectives of each of these levels are identified as follows:

- Immediate: Immediate removal of gross contamination to minimize casualties, save lives, and minimize spread of contamination.
- Operational: N/A
- Thorough: Reduce CBRN/TIM contamination to the lowest possible levels to permit partial or total removal of IPE and maintain operations with minimum degradation.

**17.3.1.2 Derivation**

*UJTL (TA 7, TA 7.1), Protection Joint Functional Concept.*

**17.3.1.2.1 Supported Tasks:** OPSUST 8, OPSUST 11**17.3.1.2.2 Lateral Task:** TASHA 24**17.3.1.2.3 Supporting Task:** N/A**17.3.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Negligible light. (C1.3.2.1)
2. Nuclear effects. (C1.3.3.1)
3. Chemical effects. (C1.3.3.2)
4. Biological effects. (C1.3.3.3)

**Military**

1. Stressful mission. (C2.1)
2. Location—ashore/afloat. (C2.1.4.1)
3. Minimal time available. (C2.1.5)

4. Marginal forces allocated. (C2.2.3)
5. Low personnel capability. (C2.2.4)
6. Negligible personnel experience. (C2.2.4.5)
7. Severe personnel fatigue. (C2.2.4.6)
8. Some or no interoperability. (C2.2.6)

### **Civil**

1. High mission priority. (C3.1.3.2)
2. Few or negligible translators. (C3.2.1.2)
3. Significant customs adjustment. (C3.2.2)
4. Significant refugee-care responsibility. (C3.3.2.3)

## **17.3.2 Functional Needs Analysis**

### **17.3.2.1 Capabilities and Deficiencies Assessment Summary**

Table 17.3-1 presents individual and overall current capabilities to perform the task to the designated standards. There are three current capabilities used to accomplish this task and one projected capability to be added in the future, JSPDS Increment II in the far term).

#### **Current/Near/Mid-Term Capabilities and Deficiencies**

The current capabilities and deficiencies for wound decontamination procedures involve the use of soap and water, diluted bleach, and surgical debridement. Although skin areas adjacent to wounds can be decontaminated using current existing materiel and procedures, current deficiencies include the difficulty in decontaminating hard-to-reach areas, contaminated by-products, and the potential to retard natural healing of the wound or cause additional injury as a result of the decontamination process or decontaminant exposure.

#### **Projected Far-Term Capabilities and Deficiencies**

The projected far-term capabilities and deficiencies evaluated were associated with JSPDS Increment II. JSPDS Increment II will introduce radiological decontamination capabilities and systematic capabilities to process casualties and human remains. It will also provide a capability to decontaminate casualties with open wounds without making the wound worse or retard healing.

Table 17.3-1. TASUST 3: Capabilities and Deficiencies Assessment

Capabilities	M1		M2		M3		M4		M5		M6		M7		M8	
	I	T	I	T	I	T	I	T	I	T	I	T	I	T	I	T

<b>Far-Term Overall Capabilities</b>	7	7	5	5	5	5	4	8	8	N/A	7	7	7	7	10	10

	FAA Measure	Elaboration	Scale
M1	(Yes/No) Cross-contamination is controlled?	Cross-contamination and contaminated by-products are controlled. Where cross-contamination is less than 100% controlled, measures must be in place to prevent cross-contamination from becoming an unacceptable hazard.	10: Yes, Complete (100%). 7: Yes, Substantial (~75%). 5: Yes, Partial (~50%). 3: Yes, Minimal (~25%). 0: No, cross-contamination cannot be controlled and presents an unacceptable hazard.
M2	(Level) Of chemical contamination after decontamination procedures.	Chemical decontamination can be performed on or around a wound to a level that no longer poses an imminent health threat to casualties or health care providers. Compatibility with wounds assumes decontaminant will not otherwise hinder healing of a wound that it comes in contact with. The level of chemical contamination is acceptable after decontamination procedures. Agents defined as current-generation CWAs, NTAs, TIMs, and TICs.	10: Decontaminate all CWAs, NTAs, TIMs to general population exposure limits, must also be FDA approved. 7: Decontaminate all CWAs, all NTAs, some TIMs to a level that will allow unprotected exposure; must also be FDA approved. 5: Decontaminate all CWAs, some NTAs to a level that will allow unprotected exposure; must also be FDA approved. 3: Decontaminate most CWAs to a level that will allow unprotected exposure. 0: No effective decontaminant or process.

M3	(Level) Of biological contamination after decontamination procedures.	Biological decontamination (to include toxins) can be performed on or around a wound to a level that no longer poses an imminent health threat to casualties or health care providers. Compatibility with wounds assumes decontaminant will not otherwise hinder healing of a wound that it comes in contact with. Vegetative and nonvegetative bacteria are measured in CFU/m <sup>2</sup> , and viruses are measured in PFU/m <sup>2</sup> .	<p>10: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against all 25 threat agents, and also must be FDA approved.</p> <p>9: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against 20 or more key threat agents, and also must be FDA approved.</p> <p>8: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against 15 or more key threat agents, and also must be FDA approved.</p> <p>7: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against 10 or more key threat agents, and also must be FDA approved.</p> <p>6: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against six or more key threat agents, and also must be FDA approved.</p> <p>5: Less than infective dose levels/casualty-producing toxin exposure levels against five or more key threat agents, and also must be FDA approved.</p> <p>4: Less than infective dose levels/casualty-producing toxin exposure levels against four key threat agents, and also must be FDA approved.</p> <p>3: Less than infective dose levels/casualty-producing toxin exposure levels against three key threat agents, and also must be FDA approved.</p> <p>2: Less than infective dose levels/casualty-producing toxin exposure levels against two or more key threat agents.</p> <p>1: Less than infective dose levels/casualty-producing toxin exposure levels against one key threat agent.</p> <p>0: More than infective dose levels/casualty-producing toxin exposure levels.</p>
M4	(Level) Of radiological contamination after decontamination procedures.	Radiological decontamination can be performed on or around a wound to a level that no longer poses an imminent health threat to casualties or health care providers. Compatibility with wounds assumes decontaminant will not otherwise hinder healing of a wound that it comes in contact with. 0.33 cGy/hour equates to an exposure that can cause mild incapacitation in 2.5% or less of unprotected, not previously exposed personnel.	<p>10: Total removal to natural background level, will decontaminate wounds if required.</p> <p>8: ≤0.11 cGy/hour residual dose rate, will decontaminate wounds if required.</p> <p>6: ≤0.22 cGy/hour residual dose rate, compatible with wounds.</p> <p>4: &lt;0.33 cGy/hour residual dose rate, compatible with wounds.</p> <p>2: 0.33 cGy residual dose rate, wounds should not be exposed to decontaminant.</p> <p>0: Removal capabilities limited or ineffective, allowing excessive residual dose rates.</p> <p>&gt;0.33 cGy/hour, wounds should not be exposed to decontaminant.</p>

M5	(Time) To initiate immediate decontamination procedures.	Initiate and complete immediate decontamination procedures on or within (if compatible) or around a wound within an adequate amount of time to preclude additional injury to casualty from chemical exposure. Time factors equate to the time required to decontaminate 1300 cm <sup>2</sup> of skin surface area.	10: Immediately 9: <10 seconds 8: <30 seconds 7: <45 seconds 6: <1 minute 5: <1 minute, 15 seconds 4: <1 minute, 30 seconds 3: <1 minute, 45 seconds 2: <2 minutes 1: <3 minutes 0: >3 minutes
M6	(Yes/No) Contaminated by-products are controlled?	Contaminated by-products are controlled. Where contaminated by-products are less than 100% controlled, measures must be in place to prevent cross-contamination from becoming an unacceptable hazard.	10: Yes, Complete (100%). 7: Yes, Substantial (~75%). 5: Yes, Partial (~50%). 3: Yes, Minimal (~25%). 0: No, Contaminated by-products cannot be controlled and present an unacceptable hazard.
M7	(Yes/No) Decontamination procedures are logistically supportable?	Decontamination procedures must be logistically supportable.	10: No negative impacts on operations. 7: Limited negative impact on operational capability. 5: Moderate negative impact on operational capability. 3: Major negative impact on operational capability. 0: Not logistically supportable.
M8	There is effective DOTLPF in place to conduct task?	Refers to non-materiel elements associated with the execution of a task with the system.	10: DOTLPF is adequate for all tasks to be performed with this system without limitations that cause significant impact upon operations. 7: DOTLPF is adequate for most of the tasks to be performed with this system without limitations that cause significant impact upon operations. 5: Many critical aspects of DOTLPF for the task to be performed with this system are addressed. 3: Some critical aspects of DOTLPF for the task to be performed with this system are addressed. 0: DOTLPF is completely inadequate or does not exist for the tasks to be performed with this system.

<sup>1</sup> M1 – (Yes/No) Cross-contamination is controlled? 3: Yes, Minimal (~25%).

<sup>2</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 0: No effective decontaminant or process.

<sup>3</sup> M3 – (Level) Of biological contamination after decontamination procedures. 3: Less than infective dose levels/casualty-producing toxin-exposure levels against three key threat agents and also must be FDA approved.

<sup>4</sup> M4 – (Level) Of radiological contamination after decontamination procedures. 8: ≤0.11 cGy/hour residual dose rate, will decontaminate wounds if required.

---

<sup>5</sup> M6 – (Yes/No) Contaminated by-products are controlled? 3: Yes, Minimal (~25%).

<sup>6</sup> M7 – (Yes/No) Decontamination procedures are logistically supportable? 5: Moderate negative impact on operational capability.

<sup>7</sup> M8 – There is effective DOTLPF in place to conduct task? 10: DOTLPF is adequate for all tasks to be performed with this system without limitations that cause significant impact upon operations.

<sup>8</sup> M1 – (Yes/No) Cross-contamination is controlled? 5: Yes, Partial (~50%).

<sup>9</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 3: Decontaminate most CWAs to a level that will allow unprotected exposure.

<sup>10</sup> M3 – (Level) Of biological contamination after decontamination procedures. 5: Less than infective dose levels/casualty-producing toxin-exposure levels against five or more key threat agents, and also must be FDA approved.

<sup>11</sup> M6 – (Yes/No) Contaminated by-products are controlled? 5: Yes, Partial (~50%).

<sup>12</sup> M1 – (Yes/No) Cross-contamination is controlled? 7: Yes, Substantial (~75%).

<sup>13</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 5: Decontaminate all CWAs, some NTAs to a level that will allow unprotected exposure; must also be FDA approved.

<sup>14</sup> M3 – (Level) Of biological contamination after decontamination procedures. 5: Less than infective dose levels/casualty-producing toxin-exposure levels against five or more key threat agents, and also must be FDA approved.

<sup>15</sup> M6 – (Yes/No) Contaminated by-products are controlled? 10: Yes, Complete (100%).

<sup>16</sup> M4 – (Level) Of radiological contamination after decontamination procedures. 4: <0.33 cGy/hour residual dose rate, compatible with wounds.

<sup>17</sup> M5 – (Time) To initiate immediate decontamination procedures. 8: <30 Seconds.

<sup>18</sup> M6 – (Yes/No) Contaminated by-products are controlled? 7: Yes, Substantial (~75%).

<sup>19</sup> M7 – (Yes/No) Decontamination procedures are logistically supportable? 7: Limited negative impact on operational capability.

### 17.3.3 Functional Solution Analysis

#### 17.3.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, the deficiency is then reassessed in the IMA section.

1. **Deficiency:** Some capabilities produce contaminated by-products.  
**Non-Materiel Solutions:** *Doctrine (partial):* Modify doctrine to ensure that proper procedures are in place to handle and dispose of contaminated by-products.
2. **Deficiency:** Current decontaminants may not neutralize all agents.  
**Non-Materiel Solutions:** None.
3. **Deficiency:** Wounds may be further damaged by decontaminants.  
**Non-Materiel Solutions:** *Doctrine (partial):* Develop doctrine that clearly outlines how wounds should be cleaned to minimize damage in an immediate situation. *Training (partial):* At self/buddy-aid levels, train individuals to properly clean wounds in an effort to minimize any wound damage.
4. **Deficiency:** May be difficult to decontaminate all wound surfaces or deep wounds.  
**Non-Materiel Solutions:** None.
5. **Deficiency:** Process may be time- and resource-intensive.  
**Non-Materiel Solutions:** None.

#### 17.3.3.2 IMA Assessment Summary

There is a need to improve the wound decontamination process to make it more effective and less resource-intensive. Table 17.3-2 links materiel alternatives to the identified gaps.

Table 17.3-2. TASUST 3: IMA Assessment

<div> <div>Identified Gaps</div> <div>Ideas for Materiel Approaches (IMA)</div> </div>	Enzymes	Aqueous Oxidants/ Nucleophiles	Mixed (Water/ Nonaqueous Solvent) Oxidants/Nucleophiles	Reactive Nonaqueous Liquids	Sorption	Cold Plasma	Decontaminating Bandage

**17.4 Task TASUST 4: Decontaminate remains****17.4.1 Functional Area Analysis****17.4.1.1 Definition**

To decontaminate human remains. Remains of MWAs will not normally be decontaminated. Levels of decontamination include immediate, operational, and thorough. Objectives of each of these levels are identified as follows:

- Immediate: N/A
- Operational: Reduce CBRN contamination to negligible risk until remains can be checked for contamination and thoroughly decontaminated at the Mortuary Affairs Decontamination Collection Point (MADCP).
- Thorough: Reduce CBRN contamination to negligible risk.

**17.4.1.2 Derivation**

**17.4.1.2.1 Supported Tasks: OPSUST 8, OPSUST 11, OPSUST 12****17.4.1.2.2 Lateral Task: TASHA 24****17.4.1.2.3 Supporting Task: N/A****17.4.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Extremely rough sea state. (C1.2.1.3)
2. Tropical, arctic, and arid climate. (C1.3.1)
3. All seasons. (C1.3.1.1)
4. Precipitating and stormy weather. (C1.3.1.3)
5. Hot and very cold air temperature. (C1.3.1.3.1)
6. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6.1)
7. Negligible light. (C1.3.2.1)
8. Nuclear effects. (C1.3.3.1)
9. Chemical effects. (C1.3.3.2)
10. Biological effects. (C1.3.3.3)

**Military**

1. Stressful mission. (C2.1)
2. Location—ashore/afloat. (C2.1.4.1)

3. Marginal forces allocated. (C2.2.3)
4. Low personnel capability. (C2.2.4)
5. Poor personnel morale. (C2.2.4.4)
6. Negligible personnel experience. (C2.2.4.5)
7. Severe personnel fatigue. (C2.2.4.6)
8. Limited, little, or no lift assets. (C2.5.2)
9. Limited or no host-nation support. (C2.8.5)

### **Civil**

1. Adversarial media relations. (C3.1.1.5)
2. Limited or negative foreign government support. (C3.1.2.3)
3. Aggressively opposed foreign public opinion. (C3.1.2.4)
4. Low mission priority. (C3.1.3.2)
5. Few or negligible translators. (C3.2.1.2)
6. Significant customs adjustment. (C3.2.2)

## **17.4.2 Functional Needs Analysis**

### **17.4.2.1 Capabilities and Deficiencies Assessment Summary**

An analysis was conducted to determine the capabilities and deficiencies of DoD to decontaminate CBRN contaminated remains and personal effects (PE). Tables 17.4-1 and 17.4-2 depict external and internal decontamination overall current and near/mid-term capabilities.

Currently, there are five capabilities that will decontaminate remains and PE to varying degrees, depending on the threat and capability used. One additional known capability is projected to be added in the future (JSPDS Increment I in the near/mid term, JSPDS Increment II in the far term), and actions are in progress to add a second.

### **Current Capabilities and Deficiencies**

Normally, decontamination of remains and PE is conducted at a MADCP established as close to the incident site as safety permits. Depending on the situation, however, decontamination operations or temporary interment of contaminated remains may have to be conducted by in-theater forces prior to the arrival of MADCP personnel and equipment. And, depending on the threat, MADCP personnel may use soap and water, diluted chlorine solutions, or DF 200 (Sandia Foam), once approved, to decontaminate remains and PE. None of these capabilities have the ability to neutralize bacterial and viral pathogens that may remain viable inside the body following external remains decontamination. For this reason, in the event mass fatalities should result from a biological incident in a theater of operations outside the continental United States (OCONUS), in accordance with DoD policy, biologically contaminated remains will be temporarily interred in theater until an effective decontamination method has been identified or developed that is capable of neutralizing bacterial and viral pathogens that may remain viable inside the body or until the remains have been thoroughly decontaminated by the environment and can be safely disinterred and returned to CONUS for final processing. Should a biological

mass fatality incident occur in CONUS, biologically contaminated remains may also have to be temporarily interred.

Handling biologically contaminated remains is further complicated by the fact that DoD does not have a containment system to safely transport biologically contaminated remains and personal effects from the incident site to the MADCP or decontamination facility. The inability to safely transport and decontaminate biologically contaminated remains is a significant capability deficiency that DoD must resolve to counter current and anticipated threats.

### **Projected Near/Mid-Term Capabilities and Deficiencies**

Current, The Combined Arms Support Command (CASCOM) is working with JRO-CBRND to determine the feasibility of fielding an Interim Mortuary Affairs Remains Decontamination System based on the Small Shelter Decontamination System evaluated under the Contamination Avoidance at Sea Ports of Debarkation Advanced Capability Technology Demonstration conducted by the Defense Threat Reduction Agency (DTRA). Fielding a limited quantity of these systems will provide DoD the capability to decontaminate the majority of remains and PE resulting from a CBRN incident. Currently, DoD has limited Mortuary Affairs (MA) equipment and force structure to support total force requirements, and MA personnel are only marginally trained to accomplish this mission.

CASCOM is also working with DTRA to test military and commercial products to safely transport contaminated remains from an incident site to a decontamination site. In conjunction with Dugway Proving Ground, DTRA is planning to conduct a swatch test, using live agents, of the military unique and commercial Human Remains Pouches (HRP) currently used by DoD (Military Type II and IIA), as well as BioSeal<sup>®</sup> material, and commercial Contaminated Remains Pouches (CRP). Based on the swatch test results, the selected technologies will be tested as a unit in a live-agent test chamber. For example: an HRP, BioSeal<sup>®</sup> material, and a CRP. If the selected technologies configured as a unit pass the technical test, an operational demonstration will be recommended to assess the technologies. Military Utility Testing is scheduled to be conducted in September 2005.

### **Projected Far-Term Capabilities and Deficiencies**

To identify far-term requirements and identify potential solutions, CASCOM is conducting a JCIDS study to formally analyze the DoD MA program. Existing capabilities and capability gaps, potential solutions, and recommended courses of action will be proposed to eliminate identified capability deficiencies. One potential far-term solution may be realized through JSPDS Increment II developmental efforts, which will provide the capability to neutralize all H-series, V-series, and G-series chemical and biological warfare agents, as well as T-2 mycotoxins, TICs, and TIMs.

Additional far-term solutions to identify and neutralize both known and unknown warfare agents may be identified through the JCIDS process being conducted by CASCOM.

**Table 17.4-1. TASUST 4: External Decontamination—Capabilities and Deficiencies Assessment**

Capabilities	M1		M2		M3		M4		M5		M6		M7	
	O	T	O	T	O	T	O	T	O	T	O	T	O	T
<b>Current</b>

Temporary Interment	7 <sup>13</sup>	7	7 <sup>14</sup>	7	0 <sup>15</sup>	0	4 <sup>16</sup>	4	N/A	7 <sup>17</sup>	3 <sup>18</sup>	3	7	7
Embalming	N/A	7	N/A	7	N/A	8 <sup>19</sup>	N/A	N/A	N/A	7	N/A	3	N/A	5
<b>Near/Mid-Term</b>														
DF 200	7	7	3	3	8	8	N/A	N/A	7	7	5	5	0 <sup>20</sup>	7
<b>Far-Term</b>														
JSPDS Increment II	10 <sup>21</sup>	10	5 <sup>22</sup>	5	8	8	8	8	7	7	5	5	10 <sup>23</sup>	10
<b>Current Overall Capabilities*</b>	5	6	3	5	3	6	6	6	5	7	5	5	5	7
<b>Near/Mid-Term Overall Capabilities</b>	7	7	3	5	8	8	8	8	7	7	5	5	5	7
<b>Far-Term Overall Capabilities</b>	10	10	5	5	8	8	8	8	7	7	5	5	10	10

\*This table suggests that current overall capabilities should be labeled “yellow”; however, Mortuary Affairs units and personnel do not have a standard remains decontamination system to utilize the capabilities currently available, which were evaluated in the table. This deficiency suggests the need to develop a standardized remains decontamination system to effectively utilize existing and developmental capabilities. Development of an effective system for external remains decontamination is not technology constrained.

	FAA Measure	Elaboration	Scale
M1	(Yes/No) Contaminated by-products are controlled?	Contaminated by-products are controlled. Where contaminated by-products are controlled less than 100%, measures must be in place to prevent them from becoming an unacceptable hazard or safety risk. NOTE: The definition of “contaminated by-products” is the residual waste created during the decontamination process.	10: Complete (100%). 7: Substantial (~75%). 5: Partial (~50%). 3: Minimal (~25%). 0: No, cross-contamination cannot be controlled and presents an unacceptable hazard.

M2	(Level) Of chemical contamination after decontamination procedures.	Chemically contaminated remains can be decontaminated to reduce the level of contamination to a low enough level that remains no longer pose an imminent health threat to the living. Every effort is made to render remains safe for immediate return to families. "Agents" defined as current-generation CWAs, NTAs, TIMS, and TICs.	10: Decontaminate all CWAs, NTAs, and TIMs to general population exposure limits. 7: Decontaminate all CWAs and NTAs and some TIMs to a level that will allow unprotected exposure. 5: Decontaminate all CWAs, some NTAs to a level that will allow unprotected exposure. 3: Decontaminate most CWAs to a level that will allow unprotected exposure. 0: No effective decontaminant or process.
M3	(Level) Of biological contamination after decontamination procedures.	Biologically contaminated (to include toxins) remains can be decontaminated to reduce the level of contamination low enough that remains no longer pose an imminent health threat to the living. Every effort is made to make remains safe for immediate return to families. Vegetative and nonvegetative bacteria are measured in CFU/m <sup>2</sup> and viruses are measured in PFU/m <sup>2</sup> .	10: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins without causing any visual effects to remains. 8: Less than infective dose levels/casualty-producing toxin exposure levels; no visual effects on remains. 6: Less than infective dose levels/casualty-producing toxin exposure levels; minor visual effects on remains. 4: Less than infective dose levels/casualty-producing toxin exposure levels; significant visual effects on remains. 2: Less than infective dose levels/casualty-producing toxin exposure levels; remains may not be viewable due to disfigurement by decontamination process 0: More than infective dose levels/casualty-producing toxin exposure levels, and remains cannot be immediately transported and returned to families
M4	(Level) Of radiological contamination after decontamination procedures.	Radiologically contaminated remains can be decontaminated to reduce the level of contamination low enough that remains no longer pose an imminent health threat to the living. Every effort is made to make remains safe for immediate return to families.	10: Total removal to natural background level; no visual effects on remains. 8: <0.4 Bq/cm <sup>2</sup> beta/gamma activity and <0.04 Bq/cm <sup>2</sup> alpha activity; no visual effects on remains. 6: <0.4 Bq/cm <sup>2</sup> beta/gamma activity and <0.04 Bq/cm <sup>2</sup> alpha activity; minor visual effects on remains. 4: <0.4 Bq/cm <sup>2</sup> beta/gamma activity and <0.04 Bq/cm <sup>2</sup> alpha activity; significant visual effects on remains. 2: <0.4 Bq/cm <sup>2</sup> beta/gamma a activity and <0.04 Bq/cm <sup>2</sup> alpha activity; remains may not be viewable due to disfigurement by decontamination process. 0: Partial removal; remains cannot be immediately transported and returned to families due to excessive residual dose rate.

M5	(Yes/No) Cross-contamination is controlled?	Cross-contamination is controlled. Where cross-contamination is less than 100% controlled, measures must in place to prevent cross-contamination from becoming an unacceptable hazard or safety risk.	10: Complete (100%). 7: Substantial (~75%). 5: Partial (~50%). 3: Minimal (~25%). 0: No, Contaminated by-products cannot be controlled and present an unacceptable hazard
M6	(Yes/No) Decontamination procedures are logistically supportable?	Procedures required to implement the capabilities necessary to decontaminate remains against a given threat are logistically supportable.	10: No negative impacts on operations. 7: Limited negative impact on operational capability. 5: Moderate negative impact on operational capability. 3: Major negative impact on operational capability. 0: Not logistically supportable.
M7	There is effective DOTLPF in place to conduct task?	The non-materiel elements associated with executing the tasks required to implement a given capability have been established and are available.	10: DOTLPF is adequate for all tasks to be performed with this system without limitations that cause significant impact upon operations. 7: DOTLPF is adequate for most of the tasks to be performed with this system without limitations that cause significant impact upon operations. 5: Many critical aspects of DOTLPF for the task to be performed with this system are addressed. 3: Some critical aspects of DOTLPF for the task to be performed with this system are addressed. 0: DOTLPF is completely inadequate or does not exist for the tasks to be performed with this system.

<sup>1</sup> M1 – (Yes/No) Contaminated by-products are controlled? 3: Minimal (~25%).

<sup>2</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 0: No effective decontaminant or process.

<sup>3</sup> M3 – (Level) Of biological contamination after decontamination procedures. 4: Less than infective dose levels/casualty-producing toxin-exposure levels, significant visual effects on remains.

<sup>4</sup> M4 – (Level) Of radiological contamination after decontamination procedures. 8: <0.4 bequerel/square centimeter (Bq/cm<sup>2</sup>) beta/gamma activity and <0.04 Bq/cm<sup>2</sup> alpha activity; no visual effects on remains.

<sup>5</sup> M5 – (Yes/No) Cross-contamination is controlled? 3: Minimal (~25%).

<sup>6</sup> M6 – (Yes/No) Decontamination procedures are logistically supportable? 5: Moderate negative impact on operational capability.

<sup>7</sup> M7 – There is effective DOTLPF in place to conduct task? 5: Many critical aspects of DOTLPF for the task to be performed with this system are addressed.

<sup>8</sup> M7 – There is effective DOTLPF in place to conduct task? 7: DOTLPF is adequate for most of the tasks to be performed with this system without limitations that cause significant impact upon operations.

<sup>9</sup> M1 – (Yes/No) Contaminated by-products are controlled? 5: Partial (~50%).

<sup>10</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 3: Decontaminate most CWAs to a level that will allow unprotected exposure.

<sup>11</sup> M3 – (Level) Of biological contamination after decontamination procedures. 6: Less than infective dose levels/casualty-producing toxin-exposure levels; minor visual effects on remains.

<sup>12</sup> M5 – (Yes/No) Cross-contamination is controlled? 5: Partial (~50%).

<sup>13</sup> M1 – (Yes/No) Contaminated by-products are controlled? 7: Substantial (~75%).

- <sup>14</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 7: Decontaminate all CWAs, all NTAs, some TIMs to a level that will allow unprotected exposure.
- <sup>15</sup> M3 – (Level) Of biological contamination after decontamination procedures. 0: More than infective dose levels/casualty-producing toxin-exposure levels, and remains cannot be immediately transported and returned to families.
- <sup>16</sup> M4 – (Level) Of radiological contamination after decontamination procedures. 4: <0.4 Bq/cm<sup>2</sup> beta/gamma activity and <0.04 Bq/cm<sup>2</sup> alpha activity; significant visual effects on remains.
- <sup>17</sup> M5 – (Yes/No) Cross-contamination is controlled? 7: Substantial (~75%).
- <sup>18</sup> M6 – (Yes/No) Decontamination procedures are logistically supportable? 3: Major negative impact on operational capability.
- <sup>19</sup> M3 – (Level) Of biological contamination after decontamination procedures. 8: Less than infective dose levels/casualty-producing toxin-exposure levels; no visual effects on remains.
- <sup>20</sup> M7 – There is effective DOTLPF in place to conduct task? 0: DOTLPF is completely inadequate or does not exist for the tasks to be performed with this system.
- <sup>21</sup> M1 – (Yes/No) Contaminated by-products are controlled? 10: Complete (100%).
- <sup>22</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 5: Decontaminate all CWAs, some NTAs to a level that will allow unprotected exposure.
- <sup>23</sup> M7 – There is effective DOTLPF in place to conduct task? 10: DOTLPF is adequate for all tasks to be performed with this system without limitations that cause significant impact upon operations.

**Table 17.4-2. TASUST 4: Internal Decontamination—Capabilities and Deficiencies Assessment**

Capabilities	M1		M2		M3		M4		M5		M6		M7

\*Temporary interment, embalming, and cremation, while offering various capabilities, are either not allowed by current policies or are not desired solutions for the expeditious return of previously contaminated remains to families. These are stop-gap and extreme measures utilized only in the case of lacking other decontamination capabilities. There are no formal capability development programs currently under way to decontaminate remains with residual internal hazards.

<sup>1</sup> M1 – (Yes/No) Contaminated by-products are controlled? 7: Substantial (~75%).

<sup>2</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 7: Decontaminate all CWAs, all NTAs, some TIMs to a level that will allow unprotected exposure.

<sup>3</sup> M3 – (Level) Of biological contamination after decontamination procedures. 0: More than infective dose levels/casualty-producing toxin-exposure levels, and remains cannot be immediately transported and returned to families.

<sup>4</sup> M4 – (Level) Of radiological contamination after decontamination procedures. 4: <0.4 Bq/cm<sup>2</sup> beta/gamma activity and <0.04 Bq/cm<sup>2</sup> alpha activity; significant visual effects on remains

<sup>5</sup> M5 – (Yes/No) Cross-contamination is controlled? 7: Substantial (~75%).

<sup>6</sup> M6 – (Yes/No) Decontamination procedures are logistically supportable? 3: Major negative impact on operational capability.

<sup>7</sup> M7 – There is effective DOTLPF in place to conduct task? 7: DOTLPF is adequate for most of the tasks to be performed with this system without limitations that cause significant impact upon operations.

<sup>8</sup> M3 – (Level) Of biological contamination after decontamination procedures. 8: Less than infective dose levels/casualty-producing toxin-exposure levels; no visual effects on remains.

<sup>9</sup> M7 – There is effective DOTLPF in place to conduct task? 5: Many critical aspects of DOTLPF for the task to be performed with this system are addressed.

<sup>10</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 10: Decontaminate all CWAs, NTAs, and TIMs to general population exposure limits.

<sup>11</sup> M3 – (Level) Of biological contamination after decontamination procedures. 2: Less than infective dose levels/casualty-producing toxin-exposure levels; remains may not be viewable due to disfigurement by decontamination process.

<sup>12</sup> M6 – (Yes/No) Decontamination procedures are logistically supportable? 0: Not logistically supportable.

<sup>13</sup> M7 – There is effective DOTLPF in place to conduct task? 0: DOTLPF is completely inadequate or does not exist for the tasks to be performed with this system.

### 17.4.3 Functional Solution Analysis

#### 17.4.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, the deficiency is then reassessed in the IMA section.

1. **Deficiency:** Inadequate expeditionary capabilities to perform remains decontamination.  
**Non-Materiel Solutions:** *Doctrine (partial):* Doctrine establishes policy—i.e., what must be done, not how to do it—and history has demonstrated repeatedly that doctrine cannot always be implemented during combat as envisioned. This principle is especially true on the ambiguous, nonlinear battlefield of today where personnel from all Services are evacuating remains from the battlefield. Doctrine must be updated to take into account the force structure changes taking place in all the Services to enhance their capability to rapidly deploy and to efficiently and effectively fight in a joint, combined, and/or multinational environment. Above all, however, it is essential that doctrine be updated to emphasize the need for a capability to safely transport and decontaminate biologically contaminated remains and PE.
2. **Deficiency:** Inadequate force structure and equipment to perform expeditionary remains decontamination.  
**Non-Materiel Solutions:** *Organizations (partial):* CASCOT is currently drafting a Force Design Update to restructure U.S. Army MA companies to enable them to better support the full spectrum of MA operations. And other Service components are changing their force structure as well to increase their organic MA operational capability. Changing the current structure of military organizations or adding additional activities to the military force structure may provide personnel assets to support transporting and decontaminating biologically contaminated remains and PE, but without the right equipment to perform these functions, these serious capability gaps will not be eliminated. To ensure U.S. Army MA companies, as well as the other Service component organizations, are able to perform MA decontamination functions as required, CASCOT is currently working with JRO-CBRND to determine the feasibility of fielding an Interim Mortuary Affairs Remains Decontamination System to provide DoD the capability to decontaminate the exterior of CBRN contaminated remains and PE. If approved, this equipment will be added to the MA company tables of organization and equipment (TOEs). Other Service components will also be able to add it to their authorized equipment lists, as well. CASCOT is also working with DTRA to develop and test a containment system to safely transport contaminated remains from an incident site to a decontamination site. CASCOT anticipates this effort will be successful. If so, depending on the solution identified and approved through the JCIDS process to decontaminate biologically contaminated remains, the equipment may be added to the MA Company TOEs, and other Service Component equipment lists. *Personnel (partial):* An increase or decrease in personnel authorizations cannot resolve this urgent requirement, and until specific materiel solutions are identified and approved to support these requirements, the need for changes in personnel authorizations will not be known. Certain military occupational specialties for existing military positions, and/or job descriptions for existing

DoD civilian personnel may very well need to be modified to incorporate operation of this equipment as a primary duty.

- 3. Deficiency:** Training to perform remains decontamination is inadequate.

**Non-Materiel Solutions:** *Training (partial):* Changes to existing Service Component professional development and training plans will not address this deficiency by themselves. As previously mentioned, materiel solutions are required to provide DoD the capability to safely transport and decontaminate biologically contaminated remains. The addition of new equipment to support this requirement, will however, require the development of new training plans on how to operate and maintain the equipment; as well as the procedures to be followed to transport and decontaminate biologically contaminated remains and PE.

*Leadership Development (partial):* Like training, changes to existing leadership development programs will not correct these capability gaps. The addition of new technology equipment to the military inventory, and the subsequent processes developed for the implementation of this technology may/ require the addition of, or changes to leadership development programs.

- 4. Deficiency:** A lack of fixed facilities with capabilities to support remains decontamination.

**Non-Materiel Solutions:** None. Existing facilities do not have the capability or can be modified to provide this critical requirement, however, a materiel solution to decontaminate biologically contaminated remains may require equipment to be installed and maintained in fixed facilities. Until a specific solution is identified and approved, however, the answer to this question will not be known. If fixed facilities are required, they may need to be strategically located at multiple sites within CONUS to enable them to support both CONUS and OCONUS requirements. Facilities may also need to be identified in overseas theaters of operation that can be used to house the system in the event a bioterrorist attack is launched against United States interests overseas.

#### 17.4.3.2 IMA Assessment Summary

Table 17.4-3 identifies which of the materiel approaches might address specific materiel gaps identified in the DOTMLPF assessment.

Table 17.4-3. TASUST 4: IMA Assessment

Identified Gaps	Enzymes	Aqueous Oxidants/ Nucleophiles	Mixed (Water/Nonaqueous Solvent) Oxidants/Nucleophiles	Sorption	(Nonaqueous) Solutions	Ionizing/Nonionizing Radiation	Plasmas	Containment System	Reactive Gases and Vapors	Electrostatic Decontamination System	Mortuary Affairs Remains Decontamination System
Current array of decontaminants may not neutralize all chemical and biological hazards.	X	X	X	X	X	X	X		X	X	X
Lack of capability decontaminate biologically and chemically contaminated internal organs of contaminated human remains.						X			X		X
No containment system to safely transport internally biologically contaminated human remains.						X		X	X		X

**17.5 Task TASUST 5: Diagnose chemical effects on personnel and MWAs****17.5.1 Functional Area Analysis****17.5.1.1 Definition**

To use medical diagnostic tools and procedures to identify and confirm chemical hazard exposure in both personnel and MWAs, specifically MWDs. Also includes monitoring presymptomatic levels of exposure. Several animal species are used as MWAs; however, MWDs are the predominant species and are most likely to be deployed with military personnel.

**17.5.1.2 Derivation**

*UJTL (TA 7, TA 7.1), Protection Joint Functional Concept.*

**17.5.1.2.1 Supported Tasks:** OPSUST 8, OPSUST 11**17.5.1.2.2 Lateral Tasks:** TASHA 12, TASHA 13**17.5.1.2.3 Supporting Task:** N/A**17.5.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Negligible light. (C1.3.2.1)
2. Chemical effects. (C1.3.3.2)

**Military**

1. Severe health status. (NEW)
2. Stressful mission. (C2.1)
3. Minimal or short time available. (C2.1.5)
4. Marginal forces allocated. (C2.2.3)
5. Low personnel capability. (C2.2.4)
6. Limited or negligible personnel experience. (C2.2.4.5)
7. Severe personnel fatigue. (C2.2.4.6)
8. Some or no interoperability. (C2.2.6)
9. Restricted information exchange. (C2.3.1.8)

**Civil**

1. High mission priority. (C3.1.3.2)
2. Few or negligible translators. (C3.2.1.2)
3. Significant customs adjustment. (C3.2.2)

4. Significant refugee-care responsibility. (C3.3.2.3)

## **17.5.2 Functional Needs Analysis**

### **17.5.2.1 Capabilities and Deficiencies Assessment Summary**

Table 17.5-1 presents individual and overall current, near-/mid-term, and far-term capabilities to perform the task to the designated standards. There are eight current capabilities used to accomplish this task. The individual capabilities include signs/symptomatology and clinical diagnosis capabilities for nerve, blister, cyanide, and pulmonary agent exposure.

#### **Current Capabilities and Deficiencies**

The overall current capability is assessed as “yellow.” High-level chemical exposure typically causes a rapid onset of recognizable signs and symptoms; however, signs and symptoms of mustard and phosgene exposure as well as low-level exposure by all chemical agents may not be immediately recognizable to medical and veterinary services personnel. Diagnostic tools are available to presumptively identify and quantify chemical agent exposure by class (with the exception of phosgene intoxication). However, there are no clinical laboratory tests that confirm blister agent or phosgene exposure. Furthermore, laboratory diagnosis typically cannot be completed in sufficient time frame to reduce morbidity and mortality.

#### **Projected Near/Mid-Term Capabilities and Deficiencies**

No changes in capability are projected in the near/mid term for this task, so the overall projected near/mid-term capability will remain “yellow.”

#### **Projected Far-Term Capabilities and Deficiencies**

No changes in capability are projected in the far term for this task, so the overall projected far-term capability will remain “yellow.”

**Table 17.5-1. TASUST 5: Capabilities and Deficiencies Assessment**

System/Measure	M1	M2	M3	M4	M5	M6

<b>Current Overall Capabilities</b>	5	8	8	5	5	9
<b>Near/Mid-Term Overall Capabilities</b>	5	8	8	5	5	9
<b>Far-Term Overall Capabilities</b>	5	8	8	5	5	9

	FAA Measure	Elaboration	Scale
M1	Signs and symptoms of chemical exposure can be recognized?	Applies to sign and symptomatology capabilities only.	10: Complete capability. 5: Partial capability. 0: No capability.
M2	All chemical hazard effects can be identified during diagnostic evaluation?		10: Complete capability (e.g., specific agent identified). 5: Partial capability (e.g., agent type identified). 0: No capability.
M3	All chemical hazard effects can be quantified during diagnostic evaluation?	Applies to clinical diagnosis capabilities only.	10: Complete capability. 5: Partial capability. 0: No capability.
M4	Time to prepare sample?	Applies to clinical diagnosis capabilities only.	10: Sample collection/preparation can be completed in sufficient time frame to reduce morbidity and mortality. 5: Sample collection/preparation cannot be completed in sufficient time frame to reduce morbidity and mortality. 0: Samples cannot be collected and prepared for analysis.
M5	Time to confirm hazard presence in sample?	Applies to clinical diagnosis capabilities only.	10: Sample analysis can be completed in sufficient time frame to reduce morbidity and mortality. 5: Sample analysis cannot be completed in sufficient time frame to reduce morbidity and mortality. 0: Sample analysis capability does not exist.

M6	Capability (DOTLPF) exists to diagnose chemical exposure?		10: DOTLPF exists and is adequate for this task. Task can be effectively performed with minor limitations with little or no direct impact upon operations. 5: Most critical aspects of DOTLPF for this task are addressed. 0: DOTLPF is inadequate or does not exist for this task. Task cannot be effectively accomplished.

### 17.5.3 Functional Solution Analysis

#### 17.5.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, that deficiency is then reassessed in the IMA section.

1. **Deficiency:** Inability to immediately recognize low-level exposure to chemical agents or confusing it for other maladies.  
**Non-Materiel Solutions:** *Training:* Increase Medical and Veterinary Services personnel training on recognizing signs and symptom of chemical agent exposures in personnel and MWAs.
2. **Deficiency:** Lack of recognition of early signs and symptoms that indicate chemical exposure in MWAs.  
**Non-Materiel Solutions:** *Training:* Develop course for Veterinary Services personnel (based on existing course for human chemical agent casualties) and provide initial and refresher training on medical identification and management of chemical effects in MWAs.
3. **Deficiency:** Inability to definitively identify mustard and phosgene casualties during early post-exposure period.  
**Non-Materiel Solutions:** None.
4. **Deficiency:** General inability to identify, during diagnosis, actual agent that caused exposure.  
**Non-Materiel Solutions:** None.
5. **Deficiency:** Lack of clinical laboratory tests that confirm blister agent or phosgene exposure.  
**Non-Materiel Solutions:** None.
6. **Deficiency:** Inability to complete clinical diagnosis in sufficient time frame to reduce morbidity and mortality.  
**Non-Materiel Solutions:** None.
7. **Deficiency:** Lack of resources to prevent mass casualty diagnostic requirements from overwhelming the laboratory system.  
**Non-Materiel Solutions:** *Doctrine (partial):* Incorporate guidelines for an MOU/A with external laboratory resources. Revise doctrine to define those circumstances when assistance from alternative laboratories would be needed, to identify which staff and what equipment would be readily available to conduct diagnostics, to clarify DoD requirements for personnel (i.e., clearance, experience, etc.), to identify what protocol for diagnosing/analyzing samples are to be followed, and to ensure adequate training of personnel. *Training (partial):* Coordinate training and certify personnel from alternative laboratories. *Organization (partial):* Develop MOU/As with civilian and/or commercial laboratories to assist with diagnostic requirements.

- 8. Deficiency:** Inadequate chain-of-custody procedures and/or special packaging and handling.  
**Non-Materiel Solutions:** *Doctrine (partial):* Clearly define chain-of-custody process, handling, and packaging procedures. *Training (partial):* Train personnel on chain-of-custody, handling, and packaging procedures.

#### **17.5.3.2 IMA Assessment Summary**

Table 17.5-2 identifies which of the materiel approaches might address specific materiel gaps identified in the DOTMLPF assessment.

Table 17.5-2. TASUST 5: IMA Assessment

<div style="display: flex; justify-content: space-between; align-items: center;"> <div style="width: 60%;"><b>Identified Gap</b></div> <div style="width: 40%; text-align: center;"><b>Idea for Materiel Approach (IMA)</b></div> </div>	Portable Chemical Agent Identification Tests and Diagnostic Methods	Advanced Laboratory Tests and Diagnostic Methods	Large-Volume Laboratory Diagnostic Testing

**17.6 Task TASUST 6: Diagnose biological effects on personnel and MWAs****17.6.1 Functional Area Analysis****17.6.1.1 Definition**

To use medical diagnostic tools and procedures to identify and confirm biological hazard exposure in both personnel and MWAs, specifically MWDs. Also includes monitoring presymptomatic levels of exposure. Several animal species are used as MWAs; however, MWDs are the predominant species and are most likely to be deployed with military personnel.

**17.6.1.2 Derivation**

*UJTL (TA 7, TA 7.1), Protection Joint Functional Concept.*

**17.6.1.2.1 Supported Tasks:** OPSUST 8, OPSUST 11

**17.6.1.2.2 Lateral Tasks:** TASHA 12, TASHA 13

**17.6.1.2.3 Supporting Task:** N/A

**17.6.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Negligible light. (C1.3.2.1)
2. Biological effects. (C1.3.3.3)

**Military**

1. Severe health status. (NEW)
2. Stressful mission. (C2.1)
3. Minimal or short time available. (C2.1.5)
4. Marginal forces allocated. (C2.2.3)
5. Low personnel capability. (C2.2.4)
6. Limited or negligible personnel experience. (C2.2.4.5)
7. Severe personnel fatigue. (C2.2.4.6)
8. Some or no interoperability. (C2.2.6)
9. Restricted information exchange. (C2.3.1.8)

**Civil**

1. High mission priority. (C3.1.3.2)
2. Few or negligible translators. (C3.2.1.2)
3. Significant customs adjustment. (C3.2.2)

4. Moderate or high health risk. (C3.3.1.5)
5. Significant refugee-care responsibility. (C3.3.2.3)

## **17.6.2 Functional Needs Analysis**

### **17.6.2.1 Capabilities and Deficiencies Assessment Summary**

Table 17.6-1 presents individual and overall current, near-/mid-term, and far-term capabilities to perform the task to the designated standards. There are six current capabilities and three projected to be added in the future (actually two: Joint Biological Agent Identification and Diagnostic System [JBAIDS] Block I and II in the near/mid term). The individual capabilities include signs/symptomatology and clinical diagnosis capabilities for bacteria/rickettsia, viruses, and toxins.

#### **Current Capabilities and Deficiencies**

The overall current capability is assessed as “yellow.” Signs and symptomatology, in addition to currently available diagnostic tools, partially meet most standards for diagnosing biological effects on personnel and MWAs<sup>1</sup>. They partially meet confirmatory standards since, with the exception of toxins, cultivation and identification of pathogen is usually required and this process can take days.

#### **Projected Near/Mid-Term Capabilities and Deficiencies**

The overall projected near/mid-term capability is assessed as “yellow.” Near-future capability JBAIDS Block I will rapidly identify and quantify all bacterial/rickettsia agents of interest and most viral agents of interest in clinical samples. JBAIDS Block II will also detect all toxins or interest.

#### **Projected Far-Term Capabilities and Deficiencies**

No changes in capability are projected in the far term for this task, so the overall projected far-term capability will remain “yellow.”

---

<sup>1</sup> In general, diseases produced by the offensive use of biological warfare (BW) agents against U.S. forces could be lethal and/or disabling. These BW agents could also infect the animal population within the contaminated area; however, most of the diseases that are likely to be used in BW are unlikely to cause illness in MWDs, primarily due to varied species susceptibility between dogs and humans for most BW agents. (For definitive information on BW agents, see FM 8-284). Of the diseases considered to be likely BW agents, MWDs are likely to be susceptible to only plague (*Yersinia pestis*), tularemia, brucellosis, Q-fever, and anthrax. In all of these diseases, the MWD is believed to be less susceptible than man.

	FAA Measure	Elaboration	Scale
M1	Signs and symptoms of biological exposure can be recognized?	Applies to signs and symptomatology capabilities only.	10: Complete capability. 5: Partial capability. 0: No capability.
M2	All biological hazard effects can be identified during diagnostic evaluation?		10: Complete capability (e.g., specific agent identified). 5: Partial capability (e.g., agent type identified). 0: No capability.
M3	All biological hazard effects can be quantified during diagnostic evaluation?	Applies to clinical diagnosis capabilities only.	10: Complete capability. 5: Partial capability. 0: No capability.

M4	Time to prepare sample?	Applies to clinical diagnosis capabilities only.	10: Sample collection/preparation can be completed in sufficient time frame to reduce morbidity and mortality. 5: Sample collection/preparation cannot be completed in sufficient time frame to reduce morbidity and mortality. 0: Samples cannot be collected and prepared for analysis.
M5	Time to confirm hazard presence in sample?	Applies to clinical diagnosis capabilities only.	10: Sample analysis can be completed in sufficient time frame to reduce morbidity and mortality. 5: Sample analysis cannot be completed in sufficient time frame to reduce morbidity and mortality. 0: Sample analysis capability does not exist.
M6	Capability (DOTLPF) exists to diagnose biological exposure?		10: DOTLPF exists and is adequate for this task. Task can be effectively performed with minor limitations with little or no direct impact upon operations. 5: Most critical aspects of DOTLPF for this task are addressed. 0: DOTLPF is inadequate or does not exist for this task. Task cannot be effectively accomplished.

### 17.6.3 Functional Solution Analysis

#### 17.6.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, that deficiency is then reassessed in the IMA section.

1. **Deficiency:** Inability to perform presumptive identification during early stages of illness.  
**Non-Materiel Solutions:** None.
2. **Deficiency:** Unacceptable amount of time (i.e., order of days) required for confirmation of bacterial and viral etiologic agents.  
**Non-Materiel Solutions:** None.
3. **Deficiency:** Limited capability for forward-deployed medical personnel to rapidly analyze biological specimens.  
**Non-Materiel Solutions:** None.
4. **Deficiency:** Limited capability for forward-deployed medical personnel to collect and prepare samples.  
**Non-Materiel Solutions:** None.
5. **Deficiency:** Lack of resources to prevent mass casualty diagnostic requirements from overwhelming the laboratory system.  
**Non-Materiel Solutions:** *Doctrine (partial):* Revise doctrine to define those circumstances when assistance from alternative laboratories would be needed, to identify which staff and what equipment would be readily available to conduct diagnostics, to clarify DoD requirements for personnel (i.e., clearance, experience, etc.), to identify what protocol for diagnosing/analyzing samples are to be followed, and to ensure adequate training of personnel. *Organization (partial):* Develop MOU/As with civilian and/or commercial laboratories to assist with diagnostic requirements. *Training (partial):* Coordinate training and certify personnel from alternative laboratories.
6. **Deficiency:** Inability to presumptively differentiate between bacterial diseases during early illness through recognition of signs and symptoms.  
**Partial Non-Materiel Solutions:** *Training (Partial):* Develop course for Veterinary Services personnel (based on existing course for human biological agent casualties) and provide initial and refresher training on medical identification and management of biological warfare agents effects in MWAs.
7. **Deficiency:** Unacceptable risk of infecting laboratory personnel during clinical specimen analysis.  
**Non-Materiel Solutions:** *Training (partial):* Train laboratory personnel on safe handling and testing procedures and protocols.

**8. Deficiency:** Lack of specificity of most routine laboratory tests.

**Non-Materiel Solutions:** None.

**9. Deficiency:** Inadequate chain-of-custody procedures and/or special packaging and handling.

**Non-Materiel Solutions:** *Doctrine (partial):* Clearly define chain-of-custody process, handling, and packaging procedures. *Training (partial):* Train personnel on chain-of-custody, handling, and packaging procedures.

#### **17.6.3.2 IMA Assessment Summary**

Table 17.6-2 identifies which of the materiel approaches might address specific materiel gaps identified in the DOTMLPF assessment.

Table 17.6-2. TASUST 6: IMA Assessment

Identified Gap	Idea for Materiel Approach (IMA)		
	Portable Biological Agent Identification Tests and Diagnostic Methods	Advanced Laboratory Tests and Diagnostic Methods	Large-Volume Laboratory Diagnostic Testing
Inability to perform presumptive identification during early stages of illness.		X	X

**17.7 Task TASUST 7: Diagnose radiological effects on personnel and MWAs****17.7.1 Functional Area Analysis****17.7.1.1 Definition**

To use medical diagnostic tools and procedures to identify and confirm radiological hazard exposure in both personnel and MWAs, specifically MWDs. Also includes monitoring presymptomatic levels of exposure. Several animal species are used as MWAs; however, MWDs are the predominant species and are most likely to be deployed with military personnel.

**17.7.1.2 Derivation**

*UJTL (TA 7, TA 7.1), Protection Joint Functional Concept.*

**17.7.1.2.1 Supported Tasks:** OPSUST 8, OPSUST 11

**17.7.1.2.2 Lateral Tasks:** TASHA 12, TASHA 13

**17.7.1.2.3 Supporting Task:** N/A

**17.7.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Negligible light. (C1.3.2.1)
2. Nuclear effects. (C1.3.3.1)

**Military**

1. Severe health status. (NEW)
2. Stressful mission. (C2.1)
3. Minimal or short time available. (C2.1.5)
4. Marginal forces allocated. (C2.2.3)
5. Low personnel capability. (C2.2.4)
6. Limited or negligible personnel experience. (C2.2.4.5)
7. Severe personnel fatigue. (C2.2.4.6)
8. Some or no interoperability. (C2.2.6)
9. Restricted information exchange. (C2.3.1.8)

**Civil**

1. High mission priority. (C3.1.3.2)
2. Few or negligible translators. (C3.2.1.2)
3. Significant customs adjustment. (C3.2.2)

4. Significant refugee-care responsibility. (C3.3.2.3)

## **17.7.2 Functional Needs Analysis**

### **17.7.2.1 Capabilities and Deficiencies Assessment Summary**

Table 17.7-1 presents individual and overall current, near-/mid-term, and far-term capabilities to perform the task to the designated standards. There are two current capabilities used to accomplish this task. The individual capabilities include signs/symptomatology and clinical diagnosis capabilities for detecting, identifying, and quantifying radiation exposure.

#### **Current Capabilities and Deficiencies**

Since effects from radiation resemble other common illnesses, laboratory findings are essential. Current deficiencies include limited capability for forward-deployed medical personnel to rapidly identify radiological agents in clinical specimens, lack of diagnostic tools at all levels of care to identify or quantify exposure in the absence of recognizable signs and symptoms.

#### **Projected Near/Mid-Term Capabilities and Deficiencies**

No changes in capability are projected in the near/mid term for this task, so the overall projected near/mid-term capability will remain “yellow.”

#### **Projected Far-Term Capabilities and Deficiencies**

No changes in capability are projected in the far term for this task, so the overall projected far-term capability will remain “yellow.”

Table 17.5-1. TASUST 7: Capabilities and Deficiencies Assessment

System/Measure	M1	M2	M3	M4	M5	M6
<b>Current</b>						
Signs and Symptoms	5	5	N/A	N/A	N/A	10
Clinical Diagnosis	N/A	5	5	10	5	10
<b>Current and Overall Capabilities</b>	5	5	5	10	5	10
<b>Near/Mid-Term Overall Capabilities</b>	5	5	5	10	5	10
<b>Far-Term Overall Capabilities</b>	5	5	5	10	5	10

	FAA Measure	Elaboration	Scale
M1	Signs and symptoms of radiological exposure can be recognized?	Applies to signs and symptomatology capabilities only.	10: Complete capability. 5: Partial capability. 0: No capability.
M2	All radiological hazard effects can be identified during diagnostic evaluation?		10: Complete capability 5: Partial capability. 0: No capability.
M3	All radiological hazard effects can be quantified during diagnostic evaluation?	Applies to clinical diagnosis capabilities only.	10: Complete capability. 5: Partial capability. 0: No capability.
M4	Time to prepare sample?	Applies to clinical diagnosis capabilities only.	10: Sample collection/preparation can be completed in sufficient time frame to reduce morbidity and mortality. 5: Sample collection/preparation cannot be completed in sufficient time frame to reduce morbidity and mortality. 0: Samples cannot be collected and prepared for analysis.
M5	Time to confirm hazard presence in sample?	Applies to clinical diagnosis capabilities only.	10: Sample analysis can be completed in sufficient time frame to reduce morbidity and mortality. 5: Sample analysis cannot be completed in sufficient time frame to reduce morbidity and mortality. 0: Sample analysis capability does not exist.
M6	Capability (DOTLPF) exists to diagnose radiological exposure?		10: DOTLPF exists and is adequate for this task. Task can be effectively performed with minor limitations with little or no direct impact upon operations. 5: Most critical aspects of DOTLPF for this task are addressed. 0: DOTLPF is inadequate or does not exist for this task. Task cannot be effectively accomplished.

### 17.7.3 Functional Solution Analysis

#### 17.7.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, that deficiency is then reassessed in the IMA section.

1. **Deficiency:** Inability of physical dosimeter to differentiate between whole-body and partial-body exposure.  
**Non-Materiel Solutions:** None.
2. **Deficiency:** Inability to determine dose rate of exposure from most physical dosimeters.  
**Non-Materiel Solutions:** None.
3. **Deficiency:** Lack of resources to prevent mass casualty diagnostic requirements from overwhelming the laboratory system.  
**Non-Materiel Solutions:** *Doctrine:* Revise doctrine to define those circumstances when assistance from alternative laboratories would be needed, to identify which staff and what equipment would be readily available to conduct diagnostics, to clarify DoD requirements for personnel (i.e., clearance, experience, etc.), to identify what protocol for diagnosing/analyzing samples are to be followed, and to ensure adequate training of personnel.  
*Organization:* Develop MOU/As with civilian and/or commercial laboratories to assist with diagnostic requirements. *Training:* Coordinate training and certify personnel from alternative laboratories.
4. **Deficiency:** Lack of recognition of early signs and symptoms that indicate radiation exposure.  
**Non-Materiel Solutions:** *Training:* Continue to provide initial and refresher training on medical identification and management of radiation casualties. Adapt existing courses for human casualties to MWAs for Veterinary Services personnel. *Leadership:* Leadership may be required to divert nontraditional medical evacuation assets in order to evacuate casualties to higher levels of care required for life saving diagnosis and treatment.
5. **Deficiency:** Limited capability for forward-deployed medical personnel to rapidly identify radiological agents in clinical specimens.  
**Non-Materiel Solutions:** *Doctrine (Partial):* Clearly define under what conditions medical prophylaxis and treatment should be initiated (prior to confirmatory testing). If decision is made after results of confirmatory testing the morbidity and mortality rate significantly increases.
6. **Deficiency:** Inability to diagnose radiation effects in sufficient time frame to reduce morbidity and mortality.  
**Non-Materiel Solutions:** None.
7. **Deficiency:** Inadequate chain-of-custody procedures and/or special packaging and handling.

**Non-Materiel Solutions:** *Doctrine (partial)*: Clearly define chain-of-custody process, handling, and packaging procedures. *Training (partial)*: Train personnel on chain-of-custody, handling, and packaging procedures.

### 17.7.3.2 IMA Assessment Summary

Table 17.7-2 identifies which of the materiel approaches might address specific materiel gaps identified in the DOTMLPF assessment. Advances in individual dosimeters may be able to address all identified deficiencies.

Table 17.7-2. TASUST 7: IMA Assessment

Identified Gaps	Idea for Materiel Approach (IMA)			
	Individual Dosimeters	Laboratory Dosimeters	Rapid Diagnostics	Individual Detector
Inability of physical dosimeter cannot to differentiate between whole-body and partial-body exposure.	X	X		
Inability to determine dose rate of exposure from most physical dosimeters.	X	X		
Limited capability for forward-deployed medical personnel to rapidly identify radiological agents in clinical specimens.	X	X	X	X
Inability to diagnose radiation effects in sufficient time frame to reduce morbidity and mortality.	X	X	X	X
Inadequate chain-of-custody procedures and/or special packaging and handling.	X	X	X	X

**17.8 Task TASUST 8: Treat chemical effects on personnel and MWAs****17.8.1 Functional Area Analysis****17.8.1.1 Definition**

To provide rapid treatment and mitigation of health effects of chemical agents, including TICs, exposure to personnel and MWAs, specifically MWDs. Treatment includes the protocols and procedures for the administration of the treatment regime as well as the logistical requirements necessary to support surge operations required by the mass exposure of personnel.

**17.8.1.2 Derivation**

*UJTL (TA 7, TA 7.1), Protection Joint Functional Concept.*

**17.8.1.2.1 Supported Tasks:** OPSUST 8, OPSUST 11**17.8.1.2.2 Lateral Task:** TASHA 24**17.8.1.2.3 Supporting Task:** N/A**17.8.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Negligible light. (C1.3.2.1)
2. Chemical effects. (C1.3.3.2)

**Military**

1. Severe health status. (NEW)
2. Stressful mission. (C2.1)
3. Minimal or short time available. (C2.1.5)
4. Marginal forces allocated. (C2.2.3)
5. Low personnel capability. (C2.2.4)
6. Limited or negligible personnel experience. (C2.2.4.5)
7. Severe personnel fatigue. (C2.2.4.6)
8. Some or no interoperability. (C2.2.6)
9. Restricted information exchange. (C2.3.1.8)

**Civil**

1. High mission priority. (C3.1.3.2)
2. Few or negligible translators. (C3.2.1.2)
3. Significant customs adjustment. (C3.2.2)

#### 4. Significant refugee-care responsibility. (C3.3.2.3)

### 17.8.2 Functional Needs Analysis

#### 17.8.2.1 Capabilities and Deficiencies Assessment Summary

Table 17.8-1 presents individual and overall current, near-/mid-term, and far-term capabilities to perform the task to the designated standards. There are 13 current capabilities used to accomplish this task and one projected capability to be added in the future (one in the near/mid term). The capabilities include a range of MWD handler and Veterinary Services personnel-administered post-exposure therapeutics with differing capabilities to meet the identified standards.

##### **Current Capabilities and Deficiencies.**

The overall current capability is assessed as “yellow.” Multiple nerve agent therapeutics exist for personnel, and many of these can also be used “extra label” in MWAs. If administered immediately after exposure, they are usually effective. Nevertheless, there are severe contraindications associated with many of these therapeutics, and most of them are required to be given under the supervision of medical or veterinary personnel.

There are no FDA-approved therapeutics for personnel or MWA exposure to blister agents with the exception of symptomatic treatment and supportive care. Dimercaprol (a.k.a. British Anti-Lewisite) is not FDA approved for either personnel or MWAs, though it can be used “extra label” in MWAs.

Effective therapeutics for cyanide intoxication (both through respiration and ingestion) exist. However, many are given intravenously, and most require medical or veterinary personnel for administration. Though none of the cyanide therapeutics are FDA approved for MWAs, they can be used “extra label” for MWAs.

Like blister agent therapeutics, pulmonary agent therapeutics are based on symptomatic treatment and supportive care. Many of these therapeutics have major contraindications and are not readily available for MWA care, and most, if not all, must be administered under the supervision of medical or veterinary personnel.

Current deficiencies include the lack of vesicant and pulmonary agent antidotes and the lack of effective nerve, vesicant, and pulmonary agent exposure therapeutics that do not have significant adverse effects and that can be readily administered by MWD handlers.

##### **Projected Near/Mid-Term Capabilities and Deficiencies**

The overall projected near/mid-term capability is assessed as “yellow.” In the near/mid-term future, the Advanced Anticonvulsant System (AAS) is expected to replace the convulsive antidote for nerve agent. The protection against seizures caused by nontraditional chemical agents provided by the midazolam-containing AAS will be superior to that provided by the

diazepam-containing convulsive antidote for nerve agent, since midazolam has a broader window of time for effective administration than diazepam.

### **Projected Far-Term Capabilities and Deficiencies**

No changes in capability are projected in the far term for this task, so the overall projected far-term capability will remain “yellow.”

**Table 17.8-1. TASUST 8: Capabilities and Deficiencies Assessment**

System/Measure	M1	M2	M3
<b>Current</b>			
<i>Nerve Agents</i>

<b>Near/Mid-Term</b>			
<i>Nerve Agents</i>			
AAS	5	5	N/A
<b>Current and Overall Capabilities</b>	5	8	7
<b>Near/Mid-Term Overall Capabilities</b>	5	8	N/A
<b>Far-Term Overall Capabilities</b>	5	8	N/A

Measures			
	FAA Measure	Elaboration	Scale
M1	Therapeutics are FDA approved?		10: FDA approved for use in both personnel and MWAs. 5: Not FDA approved in personnel and/or MWAs; can be used “extra label” for personnel and/or MWAs. 0: Cannot be used in either personnel or MWAs.
M2	Therapeutics exist for all chemical hazards?	Effectiveness of a particular therapeutic for chemical hazards of a certain type (i.e., nerve agents, blister agents, cyanides, and pulmonary agents).	10: Complete capability (effective for all chemical hazards of a certain type). 5: Partial capability (limited effectiveness for one or more chemical hazards of a certain type). 0: No capability.
M3	Capability (DOTLPF) exists to treat chemical exposure?		10: DOTLPF exists and is adequate for this task. Task can be effectively performed with minor limitations with little or no direct impact upon operations. 5: Most critical aspects of DOTLPF for this task are addressed. 0: DOTLPF is inadequate or does not exist for this task. Task cannot be effectively accomplished.

### 17.8.3 Functional Solution Analysis

#### 17.8.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, that deficiency is then reassessed in the IMA section.

1. **Deficiency:** Lack of animal testing to support efficacy and administration of many therapeutics for nerve agent exposure.  
**Non-Materiel Solutions:** *Doctrine:* Develop doctrine based on results of future tests on animal models.
2. **Deficiency:** Limited efficacy of oximes on quickly “aging” agents such as soman.  
**Non-Materiel Solutions:** None.
3. **Deficiency:** Significant adverse effects or contraindications for some nerve agent therapeutics, including ATNAA and benzodiazepine receptor agonists.  
**Non-Materiel Solutions:** None.
4. **Deficiency:** Lack of therapeutics including MANAA, memantine, midazolam, and lorazepam that are packaged for self- or buddy-administration or administration by a MWD handler (These usually require administration by a physician or veterinarian).  
**Non-Materiel Solutions:** *Personnel (Partial):* Increase number of physicians and veterinarians that can administer and monitor treatment. *Training (Partial):* Train nonmedical personnel and MWD handlers to administer therapeutics under limited circumstances.
5. **Deficiency:** Lack of resources to prevent mass casualty diagnostic requirements from overwhelming the laboratory system.  
**Non-Materiel Solutions:** *Doctrine (Partial):* Revise doctrine to define those circumstances when assistance from alternative laboratories would be needed, to identify which staff and what equipment would be readily available to conduct diagnostics, to clarify DoD requirements for personnel (i.e., clearance, experience, etc.), to identify what protocol for diagnosing/analyzing samples are to be followed, and to ensure adequate training of personnel. *Organization (Partial):* Develop MOU/As with civilian and/or commercial laboratories to assist with diagnostic requirements. *Training (Partial):* Coordinate training and certify personnel from alternative laboratories.
6. **Deficiency:** Lack of effective and rapidly acting therapeutics for high-level cyanide exposure.  
**Non-Materiel Solutions:** None.
7. **Deficiency:** Significant adverse effects and contraindications of cyanide therapeutics such as Pasadena Cyanide Antidote Kit and Sodium Thiosulfate.  
**Non-Materiel Solutions:** None.

- 8. Deficiency:** Required physician or veterinarian administration and monitoring of cyanide therapeutics such as Pasadena Cyanide Antidote and Sodium Thiosulfate.  
**Non-Materiel Solutions:** *Personnel (Partial):* Increase number of physicians and veterinarians that can administer and monitor treatment.
- 9. Deficiency:** Inability of MWD handlers to give current pulmonary agent therapeutics (must be given at Level II, III or IV).  
**Non-Materiel Solutions:** None.
- 10. Deficiency:** Lack of pulmonary agent antidote.  
**Non-Materiel Solutions:** None.
- 11. Deficiency:** Significant adverse effects and contraindications of symptomatic treatment and supportive care for pulmonary agent exposure.  
**Non-Materiel Solutions:** None.
- 12. Deficiency:** Required physician or veterinarian supervision and monitoring of intravenously administered drugs such as corticosteroids and aminophylline.  
**Non-Materiel Solutions:** *Personnel (Partial):* Increase number of physicians and veterinarians that can administer and monitor treatment. *Training (Partial):* Train nonmedical personnel and MWD handlers to administer therapeutics under limited circumstances.
- 13. Deficiency:** Lack of animal testing to support efficacy and administration of many therapeutics for pulmonary agent exposure.  
**Non-Materiel Solutions:** *Doctrine (Partial):* Develop doctrine based on results of future tests on animal models.
- 14. Deficiency:** Lack of vesicant agent antidote.  
**Non-Materiel Solutions:** None.
- 15. Deficiency:** Lack of animal testing to support efficacy and administration of many therapeutics for vesicant agent exposure.  
**Non-Materiel Solutions:** *Doctrine:* Develop doctrine based on results of tests on animal models.

### 17.8.3.2 IMA Assessment Summary

Table 17.8-2 identifies which of the materiel approaches might address specific materiel gaps identified in the DOTMLPF assessment.

Table 17.8-2. TASUST 8: IMA Assessment

Identified Gap	Idea for Materiel Approach (IMA)									
	Next Generation Oximes	Nontraditional Nerve Agent Medical Countermeasures	Injectable Nanoparticles	Next-Generation Cyanide Antidotes	Vesicant Agent Antidote	Antiinflammatories	Pulmonary Edema–Reducing Treatments	Next-Generation Bronchodilators	Intracellular Scavengers	Biochemical Inhibitors/Modulators
<i>Nerve Agents</i>										
Limited efficacy of oximes on quickly “aging” agents such soman.	X									
Significant adverse effects or contraindications for some nerve agent therapeutics including ATNAA and benzodiazepine receptor agonists.		X	X							
Lack of therapeutics including MANAA, memantine, midazolam and lorazepam that packaged for self- or buddy-administration or administration by a MWD handler (these usually require administration by a physician or veterinarian).										
<i>Cyanides</i>										
Lack of effective and rapidly acting therapeutics for high-level cyanide exposure.				X						
Significant adverse effects and contraindications of cyanide therapeutics such as Pasadena Cyanide Antidote Kit and Sodium Thiosulfate.				X						
Required physician or veterinarian administration and monitoring of Pasadena Cyanide Antidote and Sodium Thiosulfate.				X						
<i>Pulmonary Agents</i>										
Inability of MWD handlers to give current pulmonary agent therapeutics (must be given at Level II, III or IV).					X	X		X		
Lack of pulmonary agent antidote.					X					

Significant adverse effects and contraindications of symptomatic treatment and supportive care for pulmonary agent exposure.					X	X	X			
Required physician or veterinarian supervision and monitoring of intravenously administered drugs such as corticosteroids and aminophylline.					X	X		X		
<i>Vesicants</i>										
Lack of vesicant agent antidote.									X	X

**17.9 Task TASUST 9: Treat biological effects on personnel and MWAs****17.9.1 Functional Area Analysis****17.9.1.1 Definition**

To provide rapid treatment and mitigation of health effects of biological agent exposure to personnel and MWAs, specifically MWDs. Treatment includes the protocols and procedures for the administration of the treatment regime as well as the logistical requirements necessary to support surge operations required by the mass exposure of personnel.

**17.9.1.2 Derivation**

*UJTL (TA 7, TA 7.1), Protection Joint Functional Concept.*

**17.9.1.2.1 Supported Tasks:** OPSUST 8, OPSUST 11**17.9.1.2.2 Lateral Task:** TASHA 24**17.9.1.2.3 Supporting Task:** N/A**17.9.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Negligible light. (C1.3.2.1)
2. Biological effects. (C1.3.3.3)

**Military**

1. Severe health status. (NEW)
2. Stressful mission. (C2.1)
3. Minimal or short time available. (C2.1.5)
4. Marginal forces allocated. (C2.2.3)
5. Low personnel capability. (C2.2.4)
6. Limited or negligible personnel experience. (C2.2.4.5)
7. Severe personnel fatigue. (C2.2.4.6)
8. Some or no interoperability. (C2.2.6)
9. Restricted information exchange. (C2.3.1.8)

**Civil**

1. High mission priority. (C3.1.3.2)
2. Few or negligible translators. (C3.2.1.2)
3. Significant customs adjustment. (C3.2.2)

4. Moderate or high health risk. (C3.3.1.5)
5. Significant refugee-care responsibility. (C3.3.2.3)

## 17.9.2 Functional Needs Analysis

### 17.9.2.1 Capabilities and Deficiencies Assessment Summary

Table 17.9-1 presents individual and overall current, near-/mid-term, and far-term capabilities to perform the task to the designated standards. There are three current capabilities used to accomplish this task and one projected capability to be added in the future (one in the near/mid term). The capabilities include a range of physician-administered post-exposure therapeutics with differing capabilities to meet the identified standards.

#### Current Capabilities and Deficiencies

The overall current capability is assessed as “yellow.” Many effective antibiotics exist to treat personnel and MWAs<sup>1</sup> infected with bacteria/rickettsia of interest. Many are FDA approved for use in both personnel and MWAs<sup>2</sup>; those that are not can usually be used “extra label.”

There are very few effective antivirals for viruses of interest. Ribavirin is an investigational new drug (IND) for Lassa fever. There are no effective antivirals for Ebola/Marburg, the equine encephalitis viruses, or smallpox.

There are no antitoxins for most toxins of interest. While an FDA-approved trivalent antitoxin exists for botulinum, there are no effective antitoxins (FDA-approved, IND, or otherwise) for ricin, SEB, or T-2 mycotoxins.

#### Projected Near/Mid-Term Capabilities and Deficiencies

According to the analysis methodology, the overall projected near/mid-term capability is assessed as “red.” The apparent decrement in capability from the current to near/mid-term future is actually an artifact of the analysis. In all assessed tasks, DOTLPF is evaluated for the current capability, but not for future capabilities. The projected near/mid-term capability will not likely be inferior to the current capability. Near/mid-term future capability ABthrax<sup>TM</sup> is currently under development in Phase I clinical trials.

#### Projected Far-Term Capabilities and Deficiencies

No changes in capability are projected in the far term for this task, so the overall projected far-term capability will remain “red.” Once again, the apparent decrement in capability from the

<sup>1</sup> Of the diseases considered to be likely BW agents, MWDs are likely to be susceptible to only plague (*Yersinia pestis*), tularemia, brucellosis, Q-fever, and anthrax. In all of these diseases the MWD is believed to be less susceptible than man.

<sup>2</sup> One of the key doctrinal elements is that the DoD MWD Veterinary Service currently recommends that all MWDs deployed to areas with high risk of natural tick-borne rickettsial disease be placed on prophylactic doxycycline at 6 mg/kg/day. Doxycycline is generally considered efficacious against each of the diseases of concern and this prophylactic dose may provide additional protection for MWDs against BW agents. Doxycycline is not currently approved by the FDA for use in animals.

current to far-term future is an artifact of the analysis. The projected far-term capability will not likely be inferior to the current capability.

**Table 17.9-1. TASUST 9: Capabilities and Deficiencies Assessment**

System/Measure	M1	M2	M3
<b>Current</b>			
Bacteria/Rickettsia			
Antibiotics	5	10	5
Viruses			
Antivirals	0	0	5
Toxins			
Antitoxins	0	0	5

Antibiotics	Unk	Unk	N/A
<b>Current and Overall Capabilities</b>	2	3	5
<b>Near/Mid-Term Overall Capabilities</b>	2	3	N/A
<b>Far-Term Overall Capabilities</b>	2	3	N/A

	FAA Measure	Elaboration	Scale
M1	Therapeutics are FDA approved?		10: FDA approved for use in both personnel and MWAs. 5: Not FDA approved in personnel and/or MWAs; can be used “extra label” for personnel and/or MWAs. 0: Not FDA approved in either personnel or MWAs; cannot be used “extra label” for personnel and/or MWAs.
M2	Therapeutics exist for all biological hazards?	Effectiveness of a particular therapeutic for biological hazards of a certain type (i.e., bacteria/ rickettsia, viruses, and toxins).	10: Complete capability (effective for all biological hazards of a certain type). 5: Partial capability (limited effectiveness for one or more biological hazards of a certain type). 0: No capability.
M3	Capability (DOTLPF) exists to treat biological exposure?		10: DOTLPF exists and is adequate for this task. Task can be effectively performed with minor limitations with little or no direct impact upon operations. 5: Most critical aspects of DOTLPF for this task are addressed. 0: DOTLPF is inadequate or does not exist for this task. Task cannot be effectively accomplished.

### 17.9.3 Functional Solution Analysis

#### 17.9.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, that deficiency is then reassessed in the IMA section.

1. **Deficiency:** Lack of FDA-approved therapeutic for Glanders/Melioidosis.  
**Non-Materiel Solutions:** *Leadership:* Obtain FDA-approval for off-label antibiotics effective for treating glanders/melioidosis.
2. **Deficiency:** Doctrine does not reflect the most up-to-date treatment recommendations.  
**Non-Materiel Solutions:** *Doctrine:* Update doctrine to reflect most up-to-date treatment guidelines, or identify source of most up-to-date guidelines (Centers for Disease Control, Military Surgeon General, etc).
3. **Deficiency:** Training does not include the most up-to-date treatment recommendations.  
**Non-Materiel Solutions:** *Training:* Update training to reflect most up-to-date treatment guidelines.
4. **Deficiency:** Lack of resources to prevent mass casualty diagnostic requirements from overwhelming the laboratory system.  
**Non-Materiel Solutions:** *Doctrine (Partial):* Revise doctrine to define those circumstances when assistance from alternative laboratories would be needed, to identify which staff and what equipment would be readily available to conduct diagnostics, to clarify DoD requirements for personnel (i.e., clearance, experience, etc.), to identify what protocol for diagnosing/analyzing samples are to be followed, and to ensure adequate training of personnel. *Organization (Partial):* Develop MOU/As with civilian and/or commercial laboratories to assist with diagnostic requirements. *Training (Partial):* Coordinate training and certify personnel from alternative laboratories.
5. **Deficiency:** Insufficient medical facilities, resources, and personnel to deal with casualties.  
**Non-Materiel Solutions:** *Doctrine (Partial):* Revise doctrine to define those circumstances when supplemental medical care would be needed; to identify which staff and what equipment could be readily transported for situations where medical resources need to be deployed (i.e., for cases when transporting large numbers of casualties to medical treatment facilities is not an option). *Organization (Partial):* Establish MOU/As with neighboring medical facilities (civilian hospitals, clinics, etc) to assist with surge capacity. *Training:* Coordinate exercises and training with personnel from alternate medical resources. *Personnel:* Obtain alternate sources of personnel or cross train individuals. *Facilities:* Obtain surge capacity through use of nonmilitary assets or use other military facilities for medical purposes (dual use).
6. **Deficiency:** Lack of therapeutics for any of the toxins of interest, except for botulinum toxin.  
**Non-Materiel Solutions:** None.

7. **Deficiency:** Lack of therapeutics for most viral infections of interest.  
**Non-Materiel Solutions:** None.
8. **Deficiency:** Lack of FDA-approval for Ciprofloxacin in MWAs.  
**Non-Materiel Solutions:** *Leadership:* Obtain FDA approval for ciprofloxacin use in MWAs.
9. **Deficiency:** Limited treatment window for effective administration of antibiotics.  
**Non-Materiel Solutions:** *Training (partial):* Provide training to medical/veterinary personnel and MWD handlers to recognize the early signs and symptoms of biological agent exposure.

#### 17.9.3.2 IMA Assessment Summary

Table 17.9-2 identifies which of the materiel approaches might address specific materiel gaps identified in the DOTMLPF assessment.

Table 17.9-2. TASUST 9: IMA Assessment

Identified Gap	Idea for Materiel Approach (IMA)							
	Immunostimulants	Monoclonal Antibodies	Next-Generation/ New Antibiotics	Next-Generation/ New Antitoxins	Next-Generation/ New Antivirals	Immunomodulators	Next-Generation/ New Vaccines	New Therapeutics
Lack of therapeutics for any of the toxins of interest, except for botulinum toxin.	X			X		X	X	X
Lack of therapeutics for most viral infections.	X	X			X	X	X	X

**17.10 Task TASUST 10: Treat radiological effects on personnel and MWAs****17.10.1 Functional Area Analysis****17.10.1.1 Definition**

To provide rapid treatment and mitigation of health effects of radiological agent exposure to personnel and MWAs, specifically MWDs. Treatment includes the protocols and procedures for the administration of the treatment regime as well as the logistical requirements necessary to support surge operations required by the mass exposure of personnel.

**17.10.1.2 Derivation**

*UJTL (TA 7, TA 7.1), Protection Joint Functional Concept.*

**17.10.1.2.1 Supported Tasks:** OPSUST 8, OPSUST 11

**17.10.1.2.2 Lateral Task:** TASHA 24

**17.10.1.2.3 Supporting Task:** N/A

**17.10.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Negligible light. (C1.3.2.1)
2. Nuclear effects. (C1.3.3.1)

**Military**

1. Severe health status. (NEW)
2. Stressful mission. (C2.1)
3. Minimal or short time available. (C2.1.5)
4. Marginal forces allocated. (C2.2.3)
5. Low personnel capability. (C2.2.4)
6. Limited or negligible personnel experience. (C2.2.4.5)
7. Severe personnel fatigue. (C2.2.4.6)
8. Some or no interoperability. (C2.2.6)
9. Restricted information exchange. (C2.3.1.8)

**Civil**

1. Few or negligible translators. (C3.2.1.2)
2. Significant customs adjustment. (C3.2.2)
3. Significant refugee-care responsibility. (C3.3.2.3)

## **17.10.2 Functional Needs Analysis**

### **17.10.2.1 Capabilities and Deficiencies Assessment Summary**

Table 17.10-1 presents individual and overall current, near-/mid-term, and far-term capabilities to perform the task to the designated standards. There is one family of current capabilities used to accomplish this task. It includes a range of MWD handler–, Veterinary Services–, and medical personnel–administered post-exposure therapeutics.

#### **Current Capabilities and Deficiencies**

The overall current capability is assessed as “yellow.” Therapeutics and symptomatic care are available for all radiological agents, though they typically have short-lived activity and can have toxic effects. Most therapeutics simply block absorption or expedite excretion of internalized radiological materials. Symptomatic care can include treatment to bolster the immune system as radiation exposure can cause immunosuppression. Current deficiencies include a need for FDA-approved therapeutics and countermeasures to treat radiological effects.

#### **Projected Near/Mid-Term Capabilities and Deficiencies**

No changes in capability are projected in the near/mid term for this task, so the overall projected near/mid-term capability will remain “yellow.”

#### **Projected Far-Term Capabilities and Deficiencies**

No changes in capability are projected in the far term for this task, so the overall projected far-term capability will remain “yellow.”

**Table 17.10-1. TASUST 10: Capabilities and Deficiencies Assessment**

System/Measure	M1	M2	M3
<b>Current</b>			
Radiological Exposure Therapeutics and Supportive Care	5	5	5
<b>Current and Overall Capabilities</b>	5	5	5
<b>Near/Mid-Term Overall Capabilities</b>	5	5	5
<b>Far-Term Overall Capabilities</b>	5	5	5

	FAA Measure	Elaboration	Scale
M1	Therapeutics are FDA approved?		10: FDA approved for use in both personnel and MWAs. 5: Not FDA approved in personnel and/or MWAs; can be used "extra label" for personnel and/or MWAs. 0: Not FDA approved in either personnel or MWAs; cannot be used "extra label" for personnel and/or MWAs.
M2	Therapeutics exist for all radiological hazards?	Effectiveness of a particular therapeutic for radiological hazards of a certain type (i.e., alpha emitters, beta emitters, gamma emitters, neutron emitters; alpha radiation, beta radiation, gamma radiation, neutron radiation).	10: Complete capability (effective for all radiological hazards). 5: Partial capability (limited effectiveness for one or more radioisotope internalizations or radiation type exposures). 0: No capability.
M3	Capability (DOTLPF) exists to treat radiological exposure?		10: DOTLPF exists and is adequate for this task. Task can be effectively performed with minor limitations with little or no direct impact upon operations. 5: Most critical aspects of DOTLPF for this task are addressed. 0: DOTLPF is inadequate or does not exist for this task. Task can not be effectively accomplished.

### 17.10.3 Functional Solution Analysis

#### 17.10.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, that deficiency is then reassessed in the IMA section.

1. **Deficiency:** Lack of FDA-approved therapeutics and alternative therapeutic delivery systems that are quick-acting, long-lasting, and easy to carry and use on the battlefield.  
**Non-Materiel Solutions:** *Leadership (partial):* Obtain FDA-approval for therapeutics and alternative therapeutic delivery systems
2. **Deficiency:** Lack of guidance of when INDs can be used to treat radiological effects.  
**Non-Materiel Solutions:** *Doctrine:* Define those circumstances when use of INDs can be considered to treat radiological effects.
3. **Deficiency:** Significant toxic effects of therapeutics such as chelating agents.  
**Non-Materiel Solutions:** None.
4. **Deficiency:** Lack of ability to evacuate casualties in a timely manner to level of care that can provide definitive care.  
**Non-Materiel Solutions:** *Doctrine:* Define theater evacuation policy to maximize evacuation of casualties within critical time frame that will ensure casualties receive definitive medical care.
5. **Deficiency:** Lack of animal model for current therapeutic initiatives.  
**Non-Materiel Solutions:** *Doctrine:* Perform necessary animal model testing to create doctrinal animal model for therapeutic initiatives.
6. **Deficiency:** Lack of drugs to prevent onset of radiation-induced performance decrements.  
**Non-Materiel Solutions:** None.

#### 17.10.3.2 IMA Assessment Summary

Table 17.10-2 identifies which of the materiel approaches might address specific materiel gaps identified in the DOTMLPF assessment.

Table 17.10-2. TASUST 10: IMA Assessment

**17.11 Task TASUST 11: Decontaminate individual and crew-served weapons****17.11.1 Functional Area Analysis****17.11.1.1 Definition**

To decontaminate individual and crew-served weapons such as the 9-mm hand gun; M-16 rifle; M60 machine gun; M203 grenade launcher; tube-launched, optically tracked, wire-guided (TOW) missile; 81-mm mortar; M198 howitzer; etc. Includes minimizing effects of contaminants and decontaminants on operations. Levels of decontamination include immediate, operational, and thorough. Objectives of each of these levels are identified as follows:

- Immediate: Reduce/limit the spread of CBRN contamination.
- Operational: Reduce CBRN contamination to regenerate combat effectiveness.
- Thorough: Reduce CBRN contamination to negligible risk.

**17.11.1.2 Derivation**

*UJTL (TA 7, TA 7.1), Protection Joint Functional Concept.*

**17.11.1.2.1 Supported Tasks: OPSUST 8, OPSUST 11****17.11.1.2.2 Lateral Task: TASHA 24****17.11.1.2.3 Supporting Task: N/A****17.11.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Extremely rough sea state. (C1.2.1.3)
2. Tropical, arctic, and arid climate. (C1.3.1)
3. All seasons. (C1.3.1.1)
4. Precipitating and stormy weather. (C1.3.1.3)
5. Hot and very cold air temperature. (C1.3.1.3.1)
6. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6.1)
7. Negligible light. (C1.3.2.1)
8. Nuclear effects. (C1.3.3.1)
9. Chemical effects. (C1.3.3.2)
10. Biological effects. (C1.3.3.3)

**Military**

1. Stressful mission. (C2.1)
2. Location—ashore/afloat. (C2.1.4.1)

3. Minimal to short time available. (C2.1.5)
4. Marginal forces allocated. (C2.2.3)
5. Low personnel capability. (C2.2.4)
6. Negligible personnel experience. (C2.2.4.5)
7. Severe personnel fatigue. (C2.2.4.6)
8. Limited, little, or no lift assets. (C2.5.2)
9. Some or no interoperability. (C2.2.6)
10. Limited or no host-nation support. (C2.8.5)
11. Ambiguous threat existence. (C2.9.3)

### **Civil**

1. Limited or negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)

## **17.11.2 Functional Needs Analysis**

### **17.11.2.1 Capabilities and Deficiencies Assessment Summary**

Table 17.11-1 presents individual and overall current, near-/mid-term, and far-term capabilities to perform the task to the designated standard. There are a total of four current capabilities used to accomplish this task and three projected capabilities to be added in the future. Capabilities exist at the immediate, operational, and thorough levels of decontamination.

#### **Current Capabilities and Deficiencies**

Current capabilities to decontaminate individual and crew-served weapons require the use of M291/M295 kits, M100 SDS, soap and water, solvents and STB/HTH bleach mixtures. Capability gaps associated with individual and crew-served weapons decontamination include the excessive amount of time it takes to manually process large quantities of weapons through thorough decontamination processes. STB and HTH decontaminants can be toxic and corrosive requiring large amounts of water for dilution. Runoff from decontamination sites may be contaminated and current decontaminants are only effective against a limited range of chemical and biological agents. In addition, current thorough decontamination processes may not be feasible in many operational situations due to time and space requirements.

#### **Projected Near/Mid-Term Capabilities and Deficiencies**

The projected near/mid-term capabilities and deficiencies evaluated were associated with JSPDS Increment I and JSTDS-SS Increment I.

#### **Projected Far-Term Capabilities and Deficiencies**

The projected far-term capabilities and deficiencies evaluated were associated with JSPDS Increment II, JSTDS-SS Increment II and JPDS Increments I/II.

	FAA Measure	Elaboration	Scale
M1	(Yes/No) Contaminated by-products are controlled?	The by-products from the decontamination process are controlled. Where the control of by-products is less than 100%, measures must be in place to prevent by-products from becoming an unacceptable hazard.	10: Yes, Complete (100%). 7: Yes, Substantial (~75%). 5: Yes, Partial (~50%). 3: Yes, Minimal (~25%). 0: No, Contaminated by-products cannot be controlled and present an unacceptable hazard.

M2	(Level) Of chemical contamination after decontamination procedures.	The level of chemical contamination is acceptable after decontamination operations from a starting liquid challenge of 10 g/m <sup>2</sup> . Agents defined as current-generation CWAs, NTAs, TIMs, and TICs.	<p>10: Decontaminate all CWAs, NTAs, TIMs to general population exposure limits.</p> <p>7: Decontaminate all CWAs, all NTAs, and some TIMs to a level that will allow unprotected exposure.</p> <p>5: Decontaminate all CWAs, some NTAs to a level that will allow unprotected exposure.</p> <p>3: Decontaminate most CWAs to a level that will allow unprotected exposure.</p> <p>0: No effective decontaminant or process.</p>
M3	(Level) Of biological contamination after decontamination procedures.	The level of biological contamination is acceptable after decontamination procedures. Vegetative and nonvegetative bacteria are measured in CFU/m <sup>2</sup> , and viruses are measured in PFU/m <sup>2</sup> .	<p>10: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against all 25 threat agents.</p> <p>9: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against 20 or more key threat agents.</p> <p>8: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against 15 or more key threat agents.</p> <p>7: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against 10 or more key threat agents.</p> <p>6: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against eight or more key threat agents.</p> <p>5: Less than infective dose levels/casualty-producing toxin exposure levels against six or more key threat agents.</p> <p>4: Less than infective dose levels/casualty-producing toxin exposure levels against four key threat agents.</p> <p>3: Less than infective dose levels/casualty-producing toxin exposure levels against three key threat agents.</p> <p>2: Less than infective dose levels/casualty-producing toxin exposure levels against two or more key threat agents.</p> <p>1: Less than infective dose levels/casualty-producing toxin levels against one key threat agent.</p> <p>0: More than infective dose levels/casualty-producing toxin exposure levels.</p>

M4	(Level) Of radiological contamination after decontamination procedures.	The level of radiological contamination is acceptable after decontamination operations from a starting challenge of 4 g/m <sup>2</sup> of insoluble radioactive contaminants, 37–200 µm in size and 185 GBq/m <sup>2</sup> gamma activity. 0.33 cGy/hour equates to an exposure that can cause mild incapacitation in 2.5% or less of unprotected, not previously exposed personnel.	10: Total removal to natural background level. 8: ≤0.11 cGy/hour residual dose rate. 6: ≤0.22 cGy/hour residual dose rate. 4: <0.33 cGy/hour residual dose rate. 2: 0.33 cGy/hour residual dose rate 0. 0: Removal capabilities limited or ineffective, allowing excessive residual dose rates >0.33 cGy/hour.	
M5	(Yes/No) Cross-contamination is controlled?	Cross-contamination is controlled. Where contaminated by-products are less than 100% controlled, measures must be in place to prevent cross-contamination from becoming an unacceptable hazard	10: Yes, Complete (100%). 7: Yes, Substantial (~75%). 5: Yes, Partial (~50%). 3: Yes, Minimal (~25%). 0: No, cross-contamination cannot be controlled and present an unacceptable hazard.	
M6	(Time) To initiate and conduct immediate and operational decontamination procedures.	Initiate and complete immediate weapon decontamination procedures in minimal amount of time.  Number of weapons that can be operationally decontaminated per hour.	<u>Immediate</u> 10: Immediately 9: <1 minute 8: <2 minutes 7: <3 minutes 6: <4 minutes 5: <5 minutes 4: <7 minutes 3: <9 minutes 2: <12 minutes 1: <15 minutes 0: >15 minutes	<u>Operational</u> 10: >300 9: 250–300 8: 200–249 7: 160–199 6: 120–159 5: 100–119 4: 80–99 3: 60–79 2: 40–59 1: 20–39 0: <20
M7	(Percent) Of systems unusable due to the effects of decontamination.	The quantity of systems that may be rendered unserviceable by decontamination process must be minimized.	10: 0% 9: <1% 8: <2% 7: <3% 6: <4% 5: <5% 4: <6% 3: <7% 2: <8% 1: <9% 0: ≥10%	

M8	(Percent) Of systems that require repair or replacement due to the effects of decontamination.	The quantity of repairs or parts replacements required due to decontamination process must be minimized.	10: 0% 9: <1% 8: <2% 7: <3% 6: <4% 5: <5% 4: <6% 3: <7% 2: <8% 1: <9% 0: ≥10%
M9	(Yes/No) Decontamination procedures are logistically supportable?	Decontamination procedures must be logistically supportable.	10: No negative impacts on operations. 7: Limited negative impact on operational capability. 5: Moderate negative impact on operational capability. 3: Major negative impact on operational capability. 0: Not logistically supportable.
M10	(Time) To conduct thorough decontamination procedures.	Number of weapons that can be thoroughly decontaminated per hour.	10: >150 9: 125–150 8: 100–124 7: 80–99 6: 60–79 5: 50–59 4: 40–49 3: 30–39 2: 20–29 1: 10–19 0: <10
M11	There is effective DOTLPF in place to conduct task?	Refers to non-materiel elements associated with the execution of a task with the system.	10: DOTLPF is adequate for all tasks to be performed with this system without limitations that cause significant impact upon operations. 7: DOTLPF is adequate for most of the tasks to be performed with this system without limitations that cause significant impact upon operations. 5: Many critical aspects of DOTLPF for the task to be performed with this system are addressed. 3: Some critical aspects of DOTLPF for the task to be performed with this system are addressed. 0: DOTLPF is completely inadequate or does not exist for the tasks to be performed with this system.

<sup>1</sup> M1 – (Yes/No) Contaminated by-products are controlled? 7: Yes, Substantial (~75%).

<sup>2</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 3: Decontaminate most CWAs to a level that will allow unprotected exposure.

- <sup>3</sup> M3 – (Level) Of biological contamination after decontamination procedures. 1: Less than infective dose levels/casualty-producing toxin levels against one key threat agent.
- <sup>4</sup> M5 – (Yes/No) Cross-contamination is controlled? 7: Yes, Substantial (~75%).
- <sup>5</sup> M6 – (Time) To initiate and conduct immediate decontamination procedures. 8: <2 minutes.
- <sup>6</sup> M6 – (Time) To initiate and conduct operational decontamination procedures. 1: 20–39 weapons can be operationally decontaminated per hour.
- <sup>7</sup> M7 – (Percent) Of systems unusable due to the effects of decontamination. 9: <1%.
- <sup>8</sup> M8 – (Percent) Of systems that require repair or replacement due to the effects of decontamination. 8: <2%.
- <sup>9</sup> M9 – (Yes/No) Decontamination procedures are logistically supportable? 7: Limited negative impact on operational capability.
- <sup>10</sup> M11 – There is effective DOTLPF in place to conduct task? 7: DOTLPF is adequate for most of the tasks to be performed with this system without limitations that cause significant impact upon operations.
- <sup>11</sup> M1 – (Yes/No) Contaminated by-products are controlled? 3: Yes, Minimal (~25%).
- <sup>12</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 0: No effective decontaminant or process.
- <sup>13</sup> M4 – (Level) Of radiological contamination after decontamination procedures. 4: <0.33 cGy/hour residual dose rate.
- <sup>14</sup> M5 – (Yes/No) Cross-contamination is controlled? 3: Yes, Minimal (~25%).
- <sup>15</sup> M5 – (Yes/No) Cross-contamination is controlled? 5: Yes, Partial (~50%).
- <sup>16</sup> M8 – (Percent) Of systems that require repair or replacement due to the effects of decontamination. 7: <3%.
- <sup>17</sup> M9 – (Yes/No) Decontamination procedures are logistically supportable? 5: Moderate negative impact on operational capability.
- <sup>18</sup> M10 – (Time) To conduct thorough decontamination procedures. 1: 10–19 weapons can be thoroughly decontaminated per hour.
- <sup>19</sup> M3 – (Level) Of biological contamination after decontamination procedures. 5: Less than infective dose levels/casualty-producing toxin-exposure levels against six or more key threat agents.
- <sup>20</sup> M6 – (Time) To initiate and conduct immediate decontamination procedures. 9: <1 minute.
- <sup>21</sup> M10 – (Time) To conduct thorough decontamination procedures. 2: 20–29 weapons can be thoroughly decontaminated per hour.
- <sup>22</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 5: Decontaminate all CWAs, some NTAs to a level that will allow unprotected exposure.
- <sup>23</sup> M11 – There is effective DOTLPF in place to conduct task? 10: DOTLPF is adequate for all tasks to be performed with this system without limitations that cause significant impact upon operations.
- <sup>24</sup> M1 – (Yes/No) Contaminated by-products are controlled? 10: Yes, Complete (100%).
- <sup>25</sup> M4 – (Level) Of radiological contamination after decontamination procedures. 8: ≤0.11 cGy/hour residual dose rate.
- <sup>26</sup> M5 – (Yes/No) Cross-contamination is controlled? 10: Yes, Complete (100%).
- <sup>27</sup> M1 – (Yes/No) Contaminated by-products are controlled? 5: Yes, Partial (~50%).
- <sup>28</sup> M3 – (Level) Of biological contamination after decontamination procedures. 4: Less than infective dose levels/casualty-producing toxin-exposure levels against four key threat agents.
- <sup>29</sup> M4 – (Level) Of radiological contamination after decontamination procedures. 6: ≤0.22 cGy/hour residual dose rate.

### 17.11.3 Functional Solution Analysis

#### 17.11.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, the deficiency is then reassessed in the IMA section.

Current capabilities to decontaminate individual and crew-served weapons require using M291/M295 kits, M100 SDS, soap and water, and STB/HTH bleach mixtures. Capability gaps associated with individual and crew-served weapons decontamination include the excessive amount of time it takes to manually process large quantities of weapons through thorough decontamination processes, STB and HTH decontaminants can be toxic and corrosive requiring water for dilution, runoff from decontamination sites may be contaminated, and runoff must be controlled.

1. **Deficiency:** Current decontaminants are effective against only a limited range of chemical and biological agents.  
**Non-Materiel Solutions:** None.
2. **Deficiency:** Risk of damage to sensitive parts.  
**Non-Materiel Solutions:** *Doctrine (partial):* Modify doctrine to ensure applicable decontaminants are used on sensitive equipment.
3. **Deficiency:** Runoff may be contaminated.  
**Partial Non-Materiel Solutions:** *Doctrine (partial):* Modify doctrine to consider contaminated runoff as an operational consideration. Doctrine should address how to dispose of or neutralize runoff. *Training (partial):* Modify training to consider contaminated runoff as an operational consideration. Training should address how to dispose of or neutralize runoff.
4. **Deficiency:** The inability to decontaminate porous materiel.  
**Non-Materiel Solutions:** None.
5. **Deficiency:** Large amounts of water are required to support current decontamination processes.  
**Non-Materiel Solutions:** None.
6. **Deficiency:** Current thorough decontamination processes may not be feasible in many operational situations due to time and space requirements.  
**Non-Materiel Solutions:** None.
7. **Deficiency:** Powder from sorbent-based (M291/M295/M100) decontamination kits can cause weapons malfunctions.  
**Non-Materiel Solutions:** *Training:* Proper training on weapons decontamination and associated post-decontamination maintenance.

### **17.11.3.2 IMA Assessment Summary**

Table 17.11-2 identifies which of the materiel approaches might address specific materiel gaps identified in the DOTMLPF assessment.

Table 17.11-18. TASUST 11: IMA Assessment

Identified Gaps	Ideas for Materiel Approaches (IMA)													
	Enzymes	Aqueous Oxidants/ Nucleophiles	Mixed (Water/Nonaqueous Solvent) Oxidants/Nucleophiles	Reactive Nonaqueous Liquids	Reactive Gases and Vapors	Low-Temperature Thermal (Accelerated Weathering)	Sorption	Water/Steam Wash	(Nonaqueous) Solvent Wash	Irradiation	Cold Plasma	Containment System	Enhanced Thorough Personnel Decontamination Processing System	Electrostatic Decontamination System

**17.12 Task TASUST 12: Decontaminate vehicles, weapons, and nonsensitive equipment****17.12.1 Functional Area Analysis****17.12.1.1 Definition**

To decontaminate ground vehicles and hardened equipment, such as tanks, high-mobility multipurpose wheeled vehicles, commercial utility cargo vehicles, 5-ton trucks, materiel-handling equipment, ground support equipment, etc. Includes minimizing effects of contaminants and decontaminants on operations. Levels of decontamination include immediate, operational, and thorough. Objectives of each of these levels are identified as follows:

- Immediate: Limit spread of contamination.
- Operational: Gross removal of exterior contamination.
- Thorough: Reduce contamination to negligible levels.

**17.12.1.2 Derivation**

*UJTL (TA 7, TA 7.1), Protection Joint Functional Concept.*

**17.12.1.2.1 Supported Tasks: OPSUST 8, OPSUST 11****17.12.1.2.2 Lateral Task: TASHA 24****17.12.1.2.3 Supporting Task: N/A****17.12.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Extremely rough sea state. (C1.2.1.3)
2. Tropical, arctic, and arid climate. (C1.3.1)
3. All seasons. (C1.3.1.1)
4. Precipitating and stormy weather. (C1.3.1.3)
5. Hot and very cold air temperature. (C1.3.1.3.1)
6. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6.1)
7. Negligible light. (C1.3.2.1)
8. Nuclear effects. (C1.3.3.1)
9. Chemical effects. (C1.3.3.2)
10. Biological effects. (C1.3.3.3)

**Military**

1. Stressful mission. (C2.1)
2. Location—ashore/afloat. (C2.1.4.1)

3. Minimal to short time available. (C2.1.5)
4. Marginal forces allocated. (C2.2.3)
5. Some or no interoperability. (C2.2.6)
6. Low personnel capability. (C2.2.4)
7. Negligible personnel experience. (C2.2.4.5)
8. Severe personnel fatigue. (C2.2.4.6)
9. Limited, little, or no lift assets. (C2.5.2)
10. Limited or no host-nation support. (C2.8.5)
11. Ambiguous threat existence. (C2.9.3)

### **Civil**

1. Limited or negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)
3. High mission priority. (C3.1.3.2)

## **17.12.2 Functional Needs Analysis**

### **17.12.2.1 Capabilities and Deficiencies Assessment Summary**

Table 17.12-1 present individual and overall current, near-/mid-term, and far-term capabilities to perform the task to the designated standard. There are a total of four current capabilities used to accomplish this task and four projected capabilities to be added in the future. Capabilities exist at the immediate, operational, and thorough levels of decontamination.

### **Current Capabilities and Deficiencies**

The most current capabilities associated with vehicles, along with vehicle-mounted weapons and nonsensitive equipment include a variety of decontaminants such as soap and water, STB, and HTH, along with appropriate applicators. However, there are minimal capabilities to decontaminate vehicle interiors, particularly if porous material is involved. Primary deficiencies include the potential damage to vehicles, weapons, and nonsensitive equipment surfaces with the use of corrosive decontaminants, as well as dangerous chemical reactions occurring with the combination of certain decontaminants. Other deficiencies include the requirement for large amounts of water, time, and personnel; controlling contaminated runoff; and the inability to decontaminate porous materials.

### **Projected Near/Mid-Term Capabilities and Deficiencies**

The projected near/mid-term capabilities and deficiencies evaluated were associated with JSPDS Increment I, JSTDS-SS Increment I and JPID Increment I.

### **Projected Far-Term Capabilities and Deficiencies**

The projected far-term capabilities and deficiencies evaluated were associated with JSTDS-SS Increment II, JSTDS-LS Increments I and II, JPID Increment II, and JPDS Increments I and II.

	<b>FAA Measure</b>	<b>Elaboration</b>	<b>Scale</b>
M1	(Yes/No) Contaminated by-products are controlled?	Contaminated by-products are controlled. Where by-products are less than 100% controlled, measures must be in place to prevent cross-contamination from becoming an unacceptable hazard.	10: Yes, Complete (100%). 7: Yes, Substantial (~75%). 5: Yes, Partial (~50%). 3: Yes, Minimal (~25%). 0: No, Contaminated by-products cannot be controlled and present an unacceptable hazard.
M2	(Level) Of chemical contamination after decontamination procedures.	The level of chemical contamination is acceptable after decontamination operations from a starting liquid challenge of 10 g/m <sup>2</sup> . Agents defined as current-generation CWAs, NTAs, TIMs, and TICs.	10: Decontaminate all CWAs, NTAs, TIMs to general population exposure limits. 7: Decontaminate all CWAs, all NTAs, and some TIMs to a level that will allow unprotected exposure. 5: Decontaminate all CWAs, some NTAs to a level that will allow unprotected exposure. 3: Decontaminate most CWAs to a level that will allow unprotected exposure. 0: No effective decontaminant or process.
M3	(Level) Of biological contamination after decontamination procedures.	The level of biological contamination is acceptable after decontamination procedures. Vegetative and nonvegetative bacteria are measured in CFU/m <sup>2</sup> and viruses are measured in PFU/m <sup>2</sup> .	10: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against all 25 threat agents. 9: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against 20 or more key threat agents. 8: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against 15 or more key threat agents. 7: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against 10 or more key threat agents. 6: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against eight or more key threat agents. 5: Less than infective dose levels/casualty-producing toxin exposure levels against six or more threat agents. 4: Less than infective dose levels/casualty-producing toxin exposure levels against four key threat agents. 3: Less than infective dose levels/casualty-producing toxin exposure levels against three key threat agents. 2: Less than infective dose levels/casualty-producing toxin exposure levels against two or more key threat agents. 1: Less than infective dose levels/casualty-producing toxin levels against one key threat agent. 0: More than infective dose levels/casualty-producing toxin exposure levels.

M4	(Level) Of radiological contamination after decontamination procedures.	The level of radiological contamination is acceptable after decontamination operations from a starting challenge of 4 g/m <sup>2</sup> of insoluble radioactive contaminants, 37–200 µm in size and 185 GBq/m <sup>2</sup> gamma activity. 0.33 cGy/hour equates to an exposure that can cause mild incapacitation in 2.5% or less of unprotected, not previously exposed personnel.	10: Total removal to natural background level. 8: ≤0.11 cGy/hour residual dose rate. 6: ≤0.22 cGy/hour residual dose rate. 4: <0.33 cGy/hour residual dose rate. 2: 0.33 cGy/hour residual dose rate. 0: Removal capabilities limited or ineffective, allowing excessive residual dose rates >0.33 cGy/hour.	
M5	(Yes/No) Cross-contamination is controlled?	Cross-contamination is controlled. Where cross-contamination is less than 100% controlled, measures must be in place to prevent cross-contamination from becoming an unacceptable hazard.	10: Complete (100%). 7: Substantial (~75%). 5: Partial (~50%). 3: Minimal (~25%). 0: No, cross-contamination cannot be controlled and present an unacceptable hazard.	
M6	(Time) To initiate immediate and operational decontamination procedures.	Initiate immediate decontamination procedures within a minimal amount of time.  Initiate operational decontamination procedures within a minimal amount of time.	<u>Immediate</u> 10: Immediately 9: <10 seconds 8: <30 seconds 7: <45 seconds 6: <1 minute 5: <1 minute, 15 seconds 4: <1 minute, 30 seconds 3: <1 minute, 45 seconds 2: <2 minutes 1: <3 minutes 0: >3 minutes	<u>Operational</u> 10: Immediately 9: <1 hour 8: <2 hours 7: <3 hours 6: <4 hours 5: <5 hours 4: <6 hours 3: <7 hours 2: <8 hours 1: <9 hours 0: >9 hours
M7	(Time) To conduct immediate and operational decontamination procedures.	Complete immediate decontamination procedures within a minimal amount of time.  Number of vehicles/other large equipment items operationally decontaminated in one hour.	<u>Immediate</u> 10: Immediately 9: <1 minute 8: <2 minutes 7: <3 minutes 6: <4 minutes 5: <5 minutes 4: <7 minutes 3: <9 minutes 2: <12 minutes 1: <15 minutes 0: >15 minutes	<u>Operational</u> 10: >100 9: 90–100 8: 80–89 7: 70–79 6: 60–69 5: 50–59 4: 40–49 3: 30–39 2: 20–29 1: 10–19 0: <10

M8	(Percent) Of systems unusable due to the effects of decontamination.	The quantity of systems that may be rendered unserviceable by decontamination process must be minimized.	10: 0% 9: <1% 8: <2% 7: <3% 6: <4% 5: <5% 4: <6% 3: <7% 2: <8% 1: <9% 0: ≥10%
M9	(Percent) Of systems that require repair or replacement due to the effects of decontamination.	The quantity of repairs or parts replacements required due to decontamination process must be minimized.	10: 0% 9: <1% 8: <2% 7: <3% 6: <4% 5: <5% 4: <6% 3: <7% 2: <8% 1: <9% 0: ≥10%
M10	(Yes/No) Decontamination procedures are logistically supportable?	Decontamination procedures must be logistically supportable.	10: No negative impacts on operations. 7: Limited negative impact on operational capability. 5: Moderate negative impact on operational capability. 3: Major negative impact on operational capability. 0: Not logistically supportable.
M11	(Quantity) Vehicles, weapons, and nonsensitive equipment decontaminated per hour.	Number of vehicles/other large equipment items thoroughly decontaminated in one hour	10: >50 9: 45–49 8: 40–44 7: 35–39 6: 30–34 5: 25–29 4: 20–24 3: 15–19 2: 10–14 1: 5–9 0: <5

M12	There is effective DOTLPF in place to conduct task?	Refers to non-materiel elements associated with the execution of a task with the system.	10: DOTLPF is adequate for all tasks to be performed with this system without limitations that cause significant impact upon operations. 7: DOTLPF is adequate for most of the tasks to be performed with this system without limitations that cause significant impact upon operations. 5: Many critical aspects of DOTLPF for the task to be performed with this system are addressed. 3: Some critical aspects of DOTLPF for the task to be performed with this system are addressed. 0: DOTLPF is completely inadequate or does not exist for the tasks to be performed with this system.
-----	---	--	---

<sup>1</sup> M1 – (Yes/No) Contaminated by-products are controlled? 5: Yes, Partial (~50%).

<sup>2</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 3: Decontaminate most CWAs to a level that will allow unprotected exposure.

<sup>3</sup> M3 – (Level) Of biological contamination after decontamination procedures. 5: Less than infective dose levels/casualty-producing toxin-exposure levels against six or more threat agents.

<sup>4</sup> M5 – (Yes/No) Cross-contamination is controlled? 3: Minimal (~25%).

<sup>5</sup> M5 – (Yes/No) Cross-contamination is controlled? 5: Partial (~50%).

<sup>6</sup> M6 – (Time) To initiate operational decontamination procedures. 8: <2 hours.

<sup>7</sup> M8 – (Percent) Of systems unusable due to the effects of decontamination. 9: <1%.

<sup>8</sup> M9 – (Percent) Of systems that require repair or replacement due to the effects of decontamination. 7: <3%.

<sup>9</sup> M10 – (Yes/No) Decontamination procedures are logistically supportable? 5: Moderate negative impact on operational capability.

<sup>10</sup> M11 – (Quantity) Vehicles, weapons, and nonsensitive equipment decontaminated per hour. 0: <5.

<sup>11</sup> M12 – There is effective DOTLPF in place to conduct task? 7: DOTLPF is adequate for most of the tasks to be performed with this system without limitations that cause significant impact upon operations.

<sup>12</sup> M1 – (Yes/No) Contaminated by-products are controlled? 7: Yes, Substantial (~75%).

<sup>13</sup> M3 – (Level) Of biological contamination after decontamination procedures. 1: Less than infective dose levels/casualty-producing toxin levels against one key threat agent.

<sup>14</sup> M5 – (Yes/No) Cross-contamination is controlled? 7: Substantial (~75%).

<sup>15</sup> M6 – (Time) To initiate immediate decontamination procedures. 8: <30 seconds.

<sup>16</sup> M6 – (Time) To initiate operational decontamination procedures. 9: <1 hour.

<sup>17</sup> M7 – (Time) To conduct immediate decontamination procedures. 7: <3 minutes.

<sup>18</sup> M9 – (Percent) Of systems that require repair or replacement due to the effects of decontamination. 8: <2%.

<sup>19</sup> M10 – (Yes/No) Decontamination procedures are logistically supportable? 7: Limited negative impact on operational capability.

<sup>20</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 0: No effective decontaminant or process.

<sup>21</sup> M3 – (Level) Of biological contamination after decontamination procedures. 3: Less than infective dose levels/casualty-producing toxin-exposure levels against three key threat agents.

<sup>22</sup> M4 – (Level) Of radiological contamination after decontamination procedures. 4: <0.33 cGy/hour residual dose rate.

<sup>23</sup> M7 – (Time) To conduct operational decontamination procedures. 1: 10-19 vehicles/other large equipment items operationally decontaminated in one hour.

<sup>24</sup> M11 – (Quantity) Vehicles, weapons, and nonsensitive equipment decontaminated per hour. 1: 5–9.

<sup>25</sup> M3 – (Level) Of biological contamination after decontamination procedures. 7: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against 10 or more key threat agents.

<sup>26</sup> M5 – (Yes/No) Cross-contamination is controlled? 7: Substantial (~75%).

<sup>27</sup> M6 – (Time) To initiate immediate decontamination procedures. 9: <10 seconds.

<sup>28</sup> M7 – (Time) To conduct immediate decontamination procedures. 5: <5 minutes.

<sup>29</sup> M7 – (Time) To conduct operational decontamination procedures. 0: <10 vehicles/other large equipment items operationally decontaminated in one hour.

<sup>30</sup> M7 – (Time) To conduct operational decontamination procedures. 6: 60–69 vehicles/other large equipment items operationally decontaminated in one hour.

<sup>31</sup> M1 – (Yes/No) Contaminated by-products are controlled? 10: Yes, Complete (100%).

<sup>32</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 5: Decontaminate all CWAs, some NTAs to a level that will allow unprotected exposure.

<sup>33</sup> M4 – (Level) Of radiological contamination after decontamination procedures. 8:  $\leq 0.11$  cGy/hour residual dose rate.

<sup>34</sup> M5 – (Yes/No) Cross-contamination is controlled? 10: Complete (100%)

<sup>35</sup> M6 – (Time) To initiate operational decontamination procedures. 10: Immediately.

<sup>36</sup> M7 – (Time) To conduct operational decontamination procedures. 4: 40–49 vehicles/other large equipment items operationally decontaminated in one hour.

<sup>37</sup> M11 – (Quantity) Vehicles, weapons, and nonsensitive equipment thoroughly decontaminated per hour. 6: 30–34.

<sup>38</sup> M12 – There is effective DOTLPF in place to conduct task? 10: DOTLPF is adequate for all tasks to be performed with this system without limitations that cause significant impact upon operations.

### 17.12.3 Functional Solution Analysis

#### 17.12.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, the deficiency is then reassessed in the IMA section.

1. **Deficiency:** Some decontaminants used in current procedures are corrosive, including STB, and HTH.  
**Non-Materiel Solutions:** *Doctrine (partial):* Modify doctrine, policy, procedures, and TTPs to address noncorrosive decontamination and emphasize for selected systems and materials.
2. **Deficiency:** Runoff may be contaminated.  
**Non-Materiel Solutions:** *Doctrine (partial):* Modify doctrine to consider contaminated runoff as an operational consideration. Doctrine should address how to dispose of or neutralize runoff. *Training (partial):* Modify training to consider contaminated runoff as an operational consideration. Training should address how to dispose of or neutralize runoff. *Facilities (partial):* Supporting infrastructure to neutralize or dispose of captured contaminated runoff.
3. **Deficiency:** Current decontaminants may not neutralize all hazards.  
**Non-Materiel Solutions:** None.
4. **Deficiency:** Current operational and thorough procedures require large amounts of water.  
**Non-Materiel Solutions:** *Doctrine (partial):* Modify existing doctrine, policy, and procedures to address reduced water decontamination. *Training (partial):* Units should be trained to recognize water requirements for decontamination operations, and plan accordingly.
5. **Deficiency:** Operational and thorough procedures are manpower and equipment intensive.  
**Non-Materiel Solutions:** *Doctrine (partial):* Modify doctrine to include procedures for removing or replacing porous materials from vehicles. *Training (partial):* Modify institutional and unit-level training to include reduced manpower and equipment requirements for decontamination.
6. **Deficiency:** Inability to decontaminate porous materials.  
**Non-Materiel Solutions:** *Doctrine (partial):* Modify doctrine to include procedures for removing or replacing porous materials from vehicles.
7. **Deficiency:** Inability to decontaminate hard-to-reach places using current applicators.  
**Non-Materiel Solutions:** None.

### **17.12.3.2 IMA Assessment Summary**

Table 17.12-2 identifies which of the materiel approaches might address specific materiel gaps identified in the DOTMLPF assessment.

Table 17.12-2. TASUST 12: IMA Assessment

**17.13 Task TASUST 13: Decontaminate sensitive equipment****17.13.1 Functional Area Analysis****17.13.1.1 Definition**

To decontaminate equipment for command and control, communications and computers, along with optic systems such as night vision goggles, infrared-imaging systems, laser spotting devices, etc. Includes minimizing effects of contaminants and decontaminants on operations. Sensitive equipment may be decontaminated individually or decontaminated as part of interior decontamination if large and bulky or not readily removable from within a platform or facility. Levels of decontamination include immediate, operational, and thorough. Objectives of each of these levels are identified as follows:

- Immediate: Reduce contact hazard and limit spread of contamination.
- Operational: Gross removal of contamination.
- Thorough: Eliminate contamination prior to reissue or further use.

**17.13.1.2 Derivation**

*UJTL (TA 7, TA 7.1), Protection Joint Functional Concept.*

**17.13.1.2.1 Supported Tasks:** OPSUST 8, OPSUST 11**17.13.1.2.2 Lateral Task:** TASHA 24**17.13.1.2.3 Supporting Task:** N/A**17.13.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Extremely rough sea state. (C1.2.1.3)
2. Tropical, arctic, and arid climate. (C1.3.1)
3. All seasons. (C1.3.1.1)
4. Precipitating and stormy weather. (C1.3.1.3)
5. Hot and very cold air temperature. (C1.3.1.3.1)
6. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6.1)
7. Negligible light. (C1.3.2.1)
8. Nuclear effects. (C1.3.3.1)
9. Chemical effects. (C1.3.3.2)
10. Biological effects. (C1.3.3.3)

**Military**

1. Stressful mission. (C2.1)
2. Location—ashore/afloat/airborne. (C2.1.4.1)
3. Minimal to short time available. (C2.1.5)
4. Marginal forces allocated. (C2.2.3)
5. Low personnel capability. (C2.2.4)
6. Negligible personnel experience. (C2.2.4.5)
7. Limited, little, or no lift assets. (C2.5.2)
8. Some or no interoperability. (C2.2.6)
9. Limited or no host-nation support. (C2.8.5)
10. Ambiguous threat existence. (C2.9.3)

**Civil**

1. High mission priority. (C3.1.3.2)

**17.13.2 Functional Needs Analysis****17.13.2.1 Capabilities and Deficiencies Assessment Summary**

Table 17.13-1 presents individual and overall current, near-/mid-term, and far-term capabilities to perform the task to the designated standard. There are a total of three current capabilities used to accomplish this task and two projected capabilities to be added in the future. Capabilities exist at the immediate, operational, and thorough levels of decontamination.

**Current Capabilities and Deficiencies**

There are limited capabilities to decontaminate electronics and optics using decontaminants such as HTH, STB, soapy water, vacuums, pressurized air, and M291/M295 chemical decontamination kits. Deficiencies include the potential damage to electronic and optical systems with the use of corrosive decontaminants, as well as the inability to decontaminate circuit boards, porous, and hard-to-reach surfaces. Also, in the case of biological hazards, some capabilities, such as soap and water, may not remove all biological spores and may require a combination of decontaminants and applied procedures.

**Projected Near/Mid-Term Capabilities and Deficiencies**

The projected near/mid-term capabilities and deficiencies evaluated were associated with JSSED Increment I and JPID Increment I.

**Projected Far-Term Capabilities and Deficiencies**

The projected far-term capabilities and deficiencies evaluated were associated with JSSED Increment II and JPID Increment II.

	FAA Measure	Elaboration	Scale
M1	(Yes/No) Contaminated by-products are controlled?	Contaminated by-products are controlled. Where by-products are less than 100% controlled, measures must be in place to prevent by-products from becoming an unacceptable hazard.	10: Yes, Complete (100%). 7: Yes, Substantial (~75%). 5: Yes, Partial (~50%). 3: Yes, Minimal (~25%). 0: No, Contaminated by-products cannot be controlled and present an unacceptable hazard.

M2	(Level) Of chemical contamination after decontamination procedures.	The level of chemical contamination is acceptable after decontamination operations from a starting liquid challenge of 1 g/m <sup>2</sup> . Agents defined as current-generation CWAs, NTAs, TIMs, and TICs.	10: Decontaminate all CWAs, NTAs, TIMs to general population exposure limits. 7: Decontaminate all CWAs, all NTAs, and some TIMs to a level that will allow unprotected exposure. 5: Decontaminate all CWAs and some NTAs to a level that will allow unprotected exposure. 3: Decontaminate most CWAs to a level that will allow unprotected exposure. 0: No effective decontaminant or process.
M3	(Level) Of biological contamination after decontamination procedures.	The level of biological contamination is acceptable after decontamination procedures. Vegetative and nonvegetative bacteria are measured in CFU/m <sup>2</sup> , and viruses are measured in PFU/m <sup>2</sup> .	10: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against all 25 threat agents. 9: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against 20 or more key threat agents. 8: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against 15 or more key threat agents. 7: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against 10 or more key threat agents. 6: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against eight or more key threat agents. 5: Less than infective dose levels/casualty-producing toxin exposure levels against six or more key threat agents. 4: Less than infective dose levels/casualty-producing toxin exposure levels against four key threat agents. 3: Less than infective dose levels/casualty-producing toxin exposure levels against three key threat agents. 2: Less than infective dose levels/casualty-producing toxin exposure levels against two or more key threat agents. 1: Less than infective dose levels/casualty-producing toxin levels against one key threat agent. 0: More than infective dose levels/casualty-producing toxin exposure levels.
M4	(Level) Of radiological contamination after decontamination procedures.	The level of radiological contamination is acceptable after decontamination operations from a starting challenge of 0.4 g/m <sup>2</sup> of insoluble radioactive contaminants, 37200 µm in size and 185 GBq/m <sup>2</sup> gamma activity. 0.33 cGy/hour equates to an exposure that can cause mild incapacitation in 2.5% or less of unprotected, not previously exposed personnel.	10: Total removal to natural background level. 8: ≤0.11 cGy/hour residual dose rate. 6: ≤0.22 cGy/hour residual dose rate. 4: <0.33 cGy/hour residual dose rate. 2: 0.33 cGy/hour residual dose rate. 0: Removal capabilities limited or ineffective, allowing excessive residual dose rates >0.33 cGy/hour.
M5	(Yes/No) Cross-contamination is controlled?	Cross-contamination is controlled. Where cross-contamination is less than 100% controlled, measures must be in place to prevent cross-contamination from becoming an unacceptable hazard.	10: Yes, Complete (100%). 7: Yes, Substantial (~75%). 5: Yes, Partial (~50%). 3: Yes, Minimal (~25%). 0: No, Cross-contamination cannot be controlled and presents an unacceptable hazard.

M6	(Time) To initiate immediate, operational, and thorough decontamination procedures.	<p>Initiate immediate decontamination procedures within adequate amount of time.</p> <p>Initiate operational decontamination procedures within adequate amount of time.</p> <p>Initiate thorough decontamination procedures within adequate amount of time.</p>	<p><u>Immediate</u></p> <p>10: Immediate 9: &lt;10 seconds 8: &lt;30 seconds 7: &lt;45 seconds 6: &lt;1 minute 5: &lt;1 minute, 15 seconds 4: &lt;1 minute, 30 seconds 3: &lt;1 minute, 45 seconds 2: &lt;2 minutes 1: &lt;3 minutes 0: &gt;3 minutes</p>	<p><u>Operational</u></p> <p>10: Immediate 9: 15 minutes 8: 30 minutes 7: 45 minutes 6: &lt;1 hour 5: &lt;2 hours 4: &lt;3 hours 3: &lt;4 hours 2: &lt;5 hours 1: &lt;6 hours 0: &gt;6 hours</p>	<p><u>Thorough</u></p> <p>10: Immediate 9: 30 minutes 8: 45 minutes 7: 1 hour 6: &lt;2 hours 5: &lt;3 hours 4: &lt;4 hours 3: &lt;5 hours 2: &lt;6 hours 1: &lt;8 hours 0: &gt;8 hours</p>
M7	(Time) To conduct immediate, operational, and thorough decontamination procedures	Minimize time required to decontaminate each sensitive equipment item.	<p>10: Immediate 9: &lt;1 minute 8: &lt;2 minutes 7: &lt;3 minutes 6: &lt;4 minutes 5: &lt;5 minutes 4: &lt;6 minutes 3: &lt;8 minutes 2: &lt;10 minutes 1: &lt;30 minutes 0: &gt;30 minutes</p>		
M8	(Percent) Of systems unusable due to the effects of decontamination.	The quantity of systems that may be rendered unserviceable by decontamination process must be minimized.	<p>10: 0% 9: &lt;1% 8: &lt;2% 7: &lt;3% 6: &lt;4% 5: &lt;5% 4: &lt;6% 3: &lt;7% 2: &lt;8% 1: &lt;9% 0: ≥10%</p>		

M9	(Percent) Of systems that require repair or replacement due to the effects of decontamination.	The quantity of repairs or parts replacements required due to decontamination process must be minimized.	10: 0% 9: <1% 8: <2% 7: <3% 6: <4% 5: <5% 4: <6% 3: <7% 2: <8% 1: <9% 0: ≥10%
M10	Yes/No) Decontamination procedures are logistically supportable?	Decontamination procedures must be logistically supportable.	10: No negative impacts on operations. 7: Limited negative impact on operational capability. 5: Moderate negative impact on operational capability. 3: Major negative impact on operational capability. 0: Not logistically supportable.
M11	(Quantity) Sensitive equipment decontaminated per hour.	Number of sensitive equipment items that can be thoroughly decontaminated per hour.	10: >45 9: 41–45 8: 36–40 7: 31–35 6: 26–30 5: 21–25 4: 16–20 3: 11–15 2: 6–10 1: 2–5 0: <2
M12	There is effective DOTLPF in place to conduct task?	Refers to non-materiel elements associated with the execution of a task with the system.	10: DOTLPF is adequate for all tasks to be performed with this system without limitations that cause significant impact upon operations. 7: DOTLPF is adequate for most of the tasks to be performed with this system without limitations that cause significant impact upon operations. 5: Many critical aspects of DOTLPF for the task to be performed with this system are addressed. 3: Some critical aspects of DOTLPF for the task to be performed with this system are addressed. 0: DOTLPF is completely inadequate or does not exist for the tasks to be performed with this system.

<sup>1</sup> M1 – (Yes/No) Contaminated by-products are controlled? 7: Yes, Substantial (~75%).

<sup>2</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 3: Decontaminate most CWAs to a level that will allow unprotected exposure.

<sup>3</sup> M3 – (Level) Of biological contamination after decontamination procedures. 1: Less than infective dose levels/casualty-producing toxin levels against one key threat agent.

<sup>4</sup> M5 – (Yes/No) Cross-contamination is controlled? 7: Yes, Substantial (~75%).

<sup>5</sup> M6 – (Time) To initiate immediate decontamination procedures. 8: <30 seconds.

<sup>6</sup> M6 – (Time) To initiate operational decontamination procedures. 8: 30 minutes.

<sup>7</sup> M6 – (Time) To initiate thorough decontamination procedures. 8: 45 minutes.

<sup>8</sup> M7 – (Time) To conduct immediate, operational, and thorough decontamination procedures. 5: <5 minutes.

- <sup>26</sup> M1 – (Yes/No) Contaminated by-products are controlled? 10: Yes, Complete (100%).
- <sup>27</sup> M3 – (Level) Of biological contamination after decontamination procedures. 8: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against 15 or more key threat agents.
- <sup>28</sup> M5 – (Yes/No) Cross-contamination is controlled? 10: Yes, Complete (100%).
- <sup>29</sup> M7 – (Time) To conduct immediate, operational, and thorough decontamination procedures. 3: <8 minutes.
- <sup>30</sup> M8 – (Percent) Of systems unusable due to the effects of decontamination. 9: <1%.
- <sup>31</sup> M9 – (Percent) Of systems that require repair or replacement due to the effects of decontamination. 9: <1%.
- <sup>32</sup> M11 – (Quantity) Sensitive equipment decontaminated per hour. 2: 6–10.
- <sup>33</sup> M12 – There is effective DOTLPP in place to conduct task? 10: DOTLPP is adequate for all tasks to be performed with this system without limitations that cause significant impact upon operations.
- <sup>34</sup> M10 – Yes/No Decontamination procedures are logistically supportable? 7: Limited negative impact on operational capability.
- <sup>35</sup> M3 – (Level) Of biological contamination after decontamination procedures. 9: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against 20 or more key threat agents.
- <sup>36</sup> M4 – (Level) Of radiological contamination after decontamination procedures. 10: Total removal to natural background level.
- <sup>37</sup> M11 – (Quantity) Sensitive equipment decontaminated per hour. 10: >45.
- <sup>38</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 3: Decontaminate most CWAs to a level that will allow unprotected exposure.
- <sup>39</sup> M11 – (Quantity) Sensitive equipment decontaminated per hour. 5: 21–25.
-

### 17.13.3 Functional Solution Analysis

#### 17.13.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, the deficiency is then reassessed in the IMA section.

1. **Deficiency:** Inadequate thorough decontamination processing rate.  
**Non-Materiel Solutions:** None.
2. **Deficiency:** Decontaminants are corrosive and can damage electronics and optics.  
**Non-Materiel Solutions:** None.
3. **Deficiency:** Procedural doctrine for immediate and operational decontamination is limited, and there is no doctrine for thorough decontamination operations.  
**Non-Materiel Solutions:** *Doctrine:* Revise current doctrine.
4. **Deficiency:** Soap and water may not remove some biological spores.  
**Non-Materiel Solutions:** None.
5. **Deficiency:** Inability to decontaminate hazards on circuit boards and other porous materials.  
**Non-Materiel Solutions:** None.
6. **Deficiency:** Inability to decontaminate hard-to-reach areas using current applicators.  
**Non-Materiel Solutions:** None.

#### 17.13.3.2 IMA Assessment Summary

Table 17.13-2 identifies which of the materiel approaches might address specific materiel gaps identified in the DOTMLPF assessment.

Table 17.13-2. TASUST 13: IMA Assessment

Identified Gaps	Ideas for Materiel Approaches (IMA)							
	Reactive Nonaqueous Liquids	Reactive Gases and Vapors	Low-Temperature Thermal (Accelerated Weathering)	Sorption	Ionizing/Nonionizing Radiation	Recycling Decontaminant System	Electrostatic Decontamination System	Robotic or Semiautonomous System
Inadequate thorough decontamination processing rate.	X	X	X		X	X	X	X
Decontaminants are corrosive and can damage electronics and optics.	X	X	X	X	X			
Soap and water may not remove some biological spores.	X	X					X	
Inability to decontaminate hazards on circuit boards and other porous materials.	X	X	X		X			
Inability to decontaminate hard-to-access areas using current applicators.	X	X	X		X			

**17.14 Task TASUST 14: Decontaminate ship exteriors****17.14.1 Functional Area Analysis****17.14.1.1 Definition**

To decontaminate the exterior of floating assets such as Navy vessels and prepositioned ships. Excludes decontamination of sensitive equipment such as radar domes, phalanx systems, and communication antennas. Includes minimizing effects of contaminants and decontaminants on operations. Levels of decontamination include immediate, operational, and thorough. Objectives of each of these levels are identified as follows:

- Immediate: Minimize casualties, save lives, and minimize spread of contamination.
- Operational: Reduce level of contamination to regenerate combat power.
- Thorough: Reduce CBRN contamination to negligible risk. Can be performed and certified only by shipyards and floating dry docks.

**17.14.1.2 Derivation**

*UJTL (TA 7, TA 7.1), Protection Joint Functional Concept.*

**17.14.1.2.1 Supported Task: OPSUST 11****17.14.1.2.2 Lateral Task: TASHA 24****17.14.1.2.3 Supporting Task: N/A****17.14.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Extremely rough sea state. (C1.2.1.3)
2. Tropical, arctic, and arid climate. (C1.3.1)
3. All seasons. (C1.3.1.1)
4. Precipitating and stormy weather. (C1.3.1.3)
5. Hot and very cold air temperature. (C1.3.1.3.1)
6. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6.1)
7. Negligible light. (C1.3.2.1)
8. Nuclear effects. (C1.3.3.1)
9. Chemical effects. (C1.3.3.2)
10. Biological effects. (C1.3.3.3)

**Military**

1. Stressful mission. (C2.1)

2. Location-Afloat. (C2.1.4.1)
3. Minimal to short time available. (C2.1.5)
4. Marginal forces allocated. (C2.2.3)
5. Low personnel capability. (C2.2.4)
6. Negligible personnel experience. (C2.2.4.5)
7. Severe personnel fatigue. (C2.2.4.6)
8. Ambiguous threat existence. (C2.9.3)

### **Civil**

1. Aggressively opposed foreign public opinion. (C3.1.2)
2. Limited or negative foreign government support. (C3.1.2.3)
3. High mission priority. (C3.1.3.2)

## **17.14.2 Functional Needs Analysis**

### **17.14.2.1 Capabilities and Deficiencies Assessment Summary**

Table 17.14-1 presents individual and overall current, near-/mid-term, and far-term capabilities to perform the task to the designated standard. There are a total of five current capabilities used to accomplish this task and two projected capabilities to be added in the future. Capabilities exist at the immediate, operational, and thorough levels of decontamination.

#### **Current Capabilities and Deficiencies**

Capabilities exist at the immediate, operational, and thorough levels involving the use of countermeasure washdown systems, HTH, water, general detergents, steam, and appropriate applicators. There are some capabilities that work better than others, but effectiveness is always increased when more than one capability is utilized. The best overall capability is the use of HTH/STB for chemical and biological agents. For radiological agents, however, general detergents mixed with water are recommended. The downside of HTH/STB is that they are corrosive to surfaces and equipment and can be hazardous to personnel.

#### **Projected Near/Mid-Term Capabilities and Deficiencies**

The projected near/mid-term capabilities and deficiencies evaluated were associated with JSTDS-SS Increment I.

#### **Projected Far-Term Capabilities and Deficiencies**

The projected far-term capabilities and deficiencies evaluated were associated with JSTDS-SS Increment II and JPDS Increments I and II.

	FAA Measure	Elaboration	Scale
M1	(Yes/No) Contaminated by-products are controlled?	Contaminated by-products are controlled. Where by-products are less than 100% controlled, measures must be in place to prevent by-products from becoming an unacceptable hazard.	10: Yes, Complete (100%). 7: Yes, Substantial (~75%). 5: Yes, Partial (~50%). 3: Yes, Minimal (~25%). 0: No, Contaminated by-products cannot be controlled and present an unacceptable hazard.

M2	(Level) Of chemical contamination after decontamination procedures.	The level of chemical contamination is acceptable after decontamination operations from a starting liquid challenge of 10 g/m <sup>2</sup> . Agents defined as current-generation CWAs, NTAs, TIMs, and TICs.	10: Decontaminate all CWAs, NTAs, TIMs to general population exposure limits. 7: Decontaminate all CWAs, all NTAs, and some TIMs to a level that will allow unprotected exposure. 5: Decontaminate all CWAs and some NTAs to a level that will allow unprotected exposure. 3: Decontaminate most CWAs to a level that will allow unprotected exposure. 0: No effective decontaminant or process.
M3	(Level) Of biological contamination after decontamination procedures.	The level of biological contamination is acceptable after decontamination procedures. Vegetative and nonvegetative bacteria are measured in CFU/m <sup>2</sup> , and viruses are measured in PFU/m <sup>2</sup> .	10: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against all 25 threat agents. 9: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against 20 or more key threat agents. 8: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against 15 or more key threat agents. 7: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against 10 or more key threat agents. 6: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against eight or more key threat agents. 5: Less than infective dose levels/casualty-producing toxin exposure levels against six or more key threat agents. 4: Less than infective dose levels/casualty-producing toxin exposure levels against four key threat agents. 3: Less than infective dose levels/casualty-producing toxin exposure levels against three key threat agents. 2: Less than infective dose levels/casualty-producing toxin exposure levels against two or more key threat agents. 1: Less than infective dose levels/casualty-producing toxin levels against one key threat agent. 0: More than infective dose levels/casualty-producing toxin exposure levels.

M4	(Level) Of radiological contamination after decontamination procedures.	The level of radiological contamination is acceptable after decontamination operations from a starting challenge of 4 g/m <sup>2</sup> of insoluble radioactive contaminants, 37–200 µm in size and 185 GBq/m <sup>2</sup> gamma activity. 0.33 cGy/hour equates to an exposure that can cause mild incapacitation in 2.5% or less of unprotected, not previously exposed personnel.	10: Total removal to natural background level. 8: ≤0.11 cGy/hour residual dose rate. 6: ≤0.22 cGy/hour residual dose rate. 4: <0.33 cGy/hour residual dose rate. 2: 0.33 cGy/hour residual dose rate. 0: Removal capabilities limited or ineffective, allowing excessive residual dose rates >0.33 cGy/hour.	
M5	(Yes/No) Cross-contamination is controlled?	Cross-contamination is controlled. Where cross-contamination is less than 100% controlled, measures must be in place to prevent cross-contamination from becoming an unacceptable hazard.	10: Yes, Complete (100%). 7: Yes, Substantial (~75%). 5: Yes, Partial (~50%). 3: Yes, Minimal (~25%). 0: No, Cross-contamination cannot be controlled and presents an unacceptable hazard.	
M6	(Time) To initiate immediate and operational decontamination procedures.	Initiate immediate decontamination procedures within adequate amount of time.  Initiate operational decontamination procedures within adequate amount of time.	<u>Immediate</u> 10: Immediately 9: <1 minute 8: <2 minutes 7: <3 minutes 6: <4 minutes 5: <5 minutes 4: <7 minutes 3: <9 minutes 2: <12 minutes 1: <15 minutes 0: >15 minutes	<u>Operational</u> 10: Immediately 9: 15 minutes 8: 30 minutes 7: 45 minutes 6: <1 hour 5: <2 hours 4: <3 hours 3: <4 hours 2: <5 hours 1: <6 hours 0: >6 hours
M7	(Time) To conduct immediate and operational decontamination procedures.	Time required for one warfighter to carry out immediate or operational decontamination procedures on 300 m <sup>2</sup> of surface area.	10: Immediately 9: <1 minute 8: <2 minutes 7: <3 minutes 6: <4 minutes 5: <5 minutes 4: <7 minutes 3: <9 minutes 2: <12 minutes 1: <15 minutes 0: >15 minutes	

M8	(Percent) Of systems that require repair or replacement due to the effects of decontamination.	The quantity of repairs or parts replacements required due to decontamination process must be minimized.	10: 0% 9: <1% 8: <2% 7: <3% 6: <4% 5: <5% 4: <6% 3: <7% 2: <8% 1: <9% 0: ≥10%
M9	(Yes/No) Decontamination procedures are logistically supportable?	Decontamination procedures must be logistically supportable.	10: No negative impacts on operations. 7: Limited negative impact on operational capability. 5: Moderate negative impact on operational capability. 3: Major negative impact on operational capability. 0: Not logistically supportable.
M10	(Time) To conduct thorough decontamination.	Time required for one warfighter to carry out thorough decontamination procedures on 300 m <sup>2</sup> of surface area.	10: Immediately 9: <1 minute 8: <2 minutes 7: <3 minutes 6: <4 minutes 5: <5 minutes 4: <10 minutes 3: <15 minutes 2: <20 minutes 1: <30 minutes 0: >30 minutes
M11	(Yes/No) There is effective DOTLPF in place to conduct task?	Refers to non-materiel elements associated with the execution of a task with the system.	10: DOTLPF is adequate for all tasks to be performed with this system without limitations that cause significant impact upon operations. 7: DOTLPF is adequate for most of the tasks to be performed with this system without limitations that cause significant impact upon operations. 5: Many critical aspects of DOTLPF for the task to be performed with this system are addressed. 3: Some critical aspects of DOTLPF for the task to be performed with this system are addressed. 0: DOTLPF is completely inadequate or does not exist for the tasks to be performed with this system.

- 
- <sup>1</sup> M1 – (Yes/No) Contaminated by-products are controlled? 3: Yes, Minimal (~25%).
- <sup>2</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 3: Decontaminate most CWAs to a level that will allow unprotected exposure.
- <sup>3</sup> M3 – (Level) Of biological contamination after decontamination procedures. 3: Less than infective dose levels/casualty-producing toxin-exposure levels against three key threat agents.
- <sup>4</sup> M4 – (Level) Of radiological contamination after decontamination procedures. 4: <0.33 cGy/hour residual dose rate.
- <sup>5</sup> M5 – (Yes/No) Cross-contamination is controlled? 5: Yes, Partial (~50%).
- <sup>6</sup> M6 – (Time) To initiate immediate decontamination procedures. 9: <1 minute.
- <sup>7</sup> M6 – (Time) To initiate operational decontamination procedures. 9: 15 minutes.
- <sup>8</sup> M7 – (Time) To conduct immediate and operational decontamination procedures. 8: <2 minutes.
- <sup>9</sup> M8 – (Percent) Of systems that require repair or replacement due to the effects of decontamination. 9: <1%.
- <sup>10</sup> M9 – (Yes/No) Decontamination procedures are logistically supportable? 7: Limited negative impact on operational capability.
- <sup>11</sup> M11 – (Yes/No) There is effective DOTLPF in place to conduct task? 10: DOTLPF is adequate for all tasks to be performed with this system without limitations that cause significant impact upon operations.
- <sup>12</sup> M1 – (Yes/No) Contaminated by-products are controlled? 5: Yes, Partial (~50%).
- <sup>13</sup> M3 – (Level) Of biological contamination after decontamination procedures. 5: Less than infective dose levels/casualty-producing toxin-exposure levels against six or more key threat agents.
- <sup>14</sup> M6 – (Time) To initiate operational decontamination procedures. 8: 30 minutes.
- <sup>15</sup> M7 – (Time) To conduct immediate and operational decontamination procedures. 1: <15 minutes.
- <sup>16</sup> M9 – (Yes/No) Decontamination procedures are logistically supportable? 5: Moderate negative impact on operational capability.
- <sup>17</sup> M10 – (Time) To conduct thorough decontamination. 3: <15 minutes.
- <sup>18</sup> M11 – (Yes/No) There is effective DOTLPF in place to conduct task? 7: DOTLPF is adequate for most of the tasks to be performed with this system without limitations that cause significant impact upon operations.
- <sup>19</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 0: No effective decontaminant or process.
- <sup>20</sup> M1 – (Yes/No) Contaminated by-products are controlled? 0: No, Contaminated by-products cannot be controlled and present an unacceptable hazard.
- <sup>21</sup> M5 – (Yes/No) Cross-contamination is controlled? 0: No, cross-contamination cannot be controlled and presents an unacceptable hazard.
- <sup>22</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 5: Decontaminate all CWAs, some NTAs to a level that will allow unprotected exposure.
- <sup>23</sup> M3 – (Level) Of biological contamination after decontamination procedures. 10: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against all 25 threat agents.
- <sup>24</sup> M4 – (Level) Of radiological contamination after decontamination procedures. 10: Total removal to natural background level.
- <sup>25</sup> M5 – (Yes/No) Cross-contamination is controlled? 5: Yes, Partial (~50%).
- <sup>26</sup> M9 – (Yes/No) Decontamination procedures are logistically supportable? 3: Major negative impact on operational capability.
- <sup>27</sup> M10 – (Time) To conduct thorough decontamination. 0: >30 minutes.
- <sup>28</sup> M11 – (Yes/No) There is effective DOTLPF in place to conduct task? 5: Many critical aspects of DOTLPF for the task to be performed with this system are addressed.
- <sup>29</sup> M1 – (Yes/No) Contaminated by-products are controlled? 7: Yes, Substantial (~75%).
- <sup>30</sup> M5 – (Yes/No) Cross-contamination is controlled? 7: Yes, Substantial (~75%).
- <sup>31</sup> M7 – (Time) To conduct immediate and operational decontamination procedures. 5: <5 minutes.
- <sup>32</sup> M10 – (Time) To conduct thorough decontamination. 5: <5 minutes.
- <sup>33</sup> M1 – (Yes/No) Contaminated by-products are controlled? 10: Yes, Complete (100%).
- <sup>34</sup> M5 – (Yes/No) Cross-contamination is controlled? 10: Yes, Complete (100%).
- <sup>35</sup> M7 – (Time) To conduct immediate and operational decontamination procedures. 5: <5 minutes.
- <sup>36</sup> M3 – (Level) Of biological contamination after decontamination procedures. 4: Less than infective dose levels/casualty-producing toxin-exposure levels against four key threat agents.
- <sup>37</sup> M4 – (Level) Of radiological contamination after decontamination procedures. 6: ≤0.22 cGy/hour residual dose rate.
- <sup>38</sup> M7 – (Time) To conduct immediate and operational decontamination procedures. 3: <9 minutes.
-

<sup>39</sup> M10 – (Time) To conduct thorough decontamination. 2: <20 minutes.

### 17.14.3 Functional Solution Analysis

#### 17.14.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, the deficiency is then reassessed in the IMA section.

1. **Deficiency:** Washdown is corrosive.  
**Non-Materiel Solutions:** *Doctrine:* Include freshwater rinse after the securing of the CMWD. Include CMWD and chemical and biological (CB) detectors precautionary measures in *NWP 3-20.31*.
2. **Deficiency:** Countermeasure washdown does not neutralize CBRN contamination.  
**Non-Materiel Solutions:** None.
3. **Deficiency:** CMWD delivery system has insufficient nozzles to cover all surfaces.  
**Non-Materiel Solutions:** *Doctrine:* Increase area coverage requirements. Conduct CMWD area coverage analysis and initiate ship alteration or repair requirements as necessary.
4. **Deficiency:** Not all deck drains discharge over the side of the ship.  
**Non-Materiel Solutions:** Conduct ship exterior drainage analysis and initiate ship alteration or repair requirements as necessary.
5. **Deficiency:** Primary ship decontaminant (HTH) is hazardous and corrosive.  
**Non-Materiel Solutions:** *Doctrine (partial):* Modify doctrine to include water rinse after HTH application.
6. **Deficiency:** Limited capability to decontaminate remote and hard-to-reach surfaces using current applicators.  
**Non-Materiel Solutions:** None.
7. **Deficiency:** Inability to decontaminate ventilation system exterior inlets.  
**Non-Materiel Solutions:** *Doctrine (partial):* Develop decontamination methodology for ventilation interiors.
8. **Deficiency:** Limited capability to decontaminate painted or porous surfaces.  
**Non-Materiel Solutions:** None.
9. **Deficiency:** No doctrine for physical removal of agent from painted or porous surfaces.  
**Non-Materiel Solutions:** *Doctrine:* Need NSTM Chapter 470 Revision.

#### 17.14.3.2 IMA Assessment Summary

Table 17.14-2 identifies which of the materiel approaches might address specific materiel gaps identified in the DOTMLPF assessment.

Table 17.14-19. TASUST 14: IMA Assessment

Identified Gaps	Ideas for Materiel Approaches (IMA)																		
	Enzymes	Aqueous Oxidants/ Nucleophiles	Mixed (Water/Nonaqueous Solvent) Oxidants/Nucleophiles	Reactive Nonaqueous Liquids	Low-Temperature Thermal (Accelerated Weathering)	Sorption	Water/Steam Wash	Self-Decontaminating Coatings	(Nonaqueous) Solvent Wash	Ionizing/Nonionizing Radiation	Plasma	Containment System	Recycling Decontaminant System	Multiheaded Nozzle Accessories	Extended Range	CMWD (Ship) Modification	Large-Coverage Sprayer System	Robotic or Semiautonomous System	Electrostatic Decontamination System
Countermeasure washdown does not neutralize CBRN contamination.	X	X	X	X	X	X				X	X	X		X	X	X	X		X
Primary ship decontaminant (HTH) is hazardous and corrosive.	X	X	X	X	X	X	X	X	X			X	X	X	X				X

3. High mission priority. (C3.1.3.2)

## **17.15.2 Functional Needs Analysis**

### **17.15.2.1 Capabilities and Deficiencies Assessment Summary**

Table 17.15-1 presents individual and overall current, near-/mid-term, and far-term capabilities to perform the task to the designated standard. There are a total of five current capabilities used to accomplish this task and two projected capabilities to be added in the future. Capabilities exist at the immediate, operational, and thorough levels of decontamination associated with the decontamination of ship interiors.

#### **Current Capabilities and Deficiencies**

The current capabilities and deficiencies associated with the decontamination of ship interiors. Capabilities for ship interiors encompass HTH, STB, and soap and water applied with scrub brushes and mops. Deficiencies include the potential damage to systems with the use of corrosive decontaminants, as well as the limited ability to decontaminate porous, painted, and hard-to-reach surfaces. Other major deficiencies include the inability to decontaminate interior ventilation systems. Also with current decontaminants there is a limited capability to remove suspended agents from the atmosphere.

#### **Projected Near/Mid-Term Capabilities and Deficiencies**

The projected near/mid-term capabilities and deficiencies evaluated were associated with JPID Increment I.

#### **Projected Far-Term Capabilities and Deficiencies**

The projected near/mid-term capabilities and deficiencies evaluated were associated with JPDS Increments I and II and JPID Increment II.

	FAA Measure	Elaboration	Scale
M1	(Yes/No) Contaminated by-products are controlled?	Contaminated by-products are controlled. Where by-products are less than 100% controlled, measures must be in place to prevent by-products from becoming an unacceptable hazard.	10: Yes, Complete (100%). 7: Yes, Substantial (~75%). 5: Yes, Partial (~50%). 3: Yes, Minimal (~25%). 0: No, Contaminated by-products cannot be controlled and present an unacceptable hazard.
M2	(Level) Of chemical contamination after decontamination procedures.	The level of chemical contamination is acceptable after decontamination operations from a starting liquid challenge of 1 g/m <sup>2</sup> . Agents defined as current-generation CWAs, NTAs, TIMs, and TICs.	10: Decontaminate all CWAs, NTAs, TIMs to general population exposure limits. 7: Decontaminate all CWAs, all NTAs, and some TIMs to a level that will allow unprotected exposure. 5: Decontaminate all CWAs and some NTAs to a level that will allow unprotected exposure. 3: Decontaminate most CWAs to a level that will allow unprotected exposure. 0: No effective decontaminant or process.
M3	(Level) Of biological contamination after decontamination procedures.	The level of biological contamination is acceptable after decontamination procedures. Vegetative and nonvegetative bacteria are measured in CFU/m <sup>2</sup> and viruses are measured in PFU/m <sup>2</sup> .	10: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against all 25 threat agents. 9: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against 20 or more key threat agents. 8: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against 15 or more key threat agents. 7: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against 10 or more key threat agents. 6: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against eight or more key threat agents. 5: Less than infective dose levels/casualty-producing toxin exposure levels against six or more key threat agents. 4: Less than infective dose levels/casualty-producing toxin exposure levels against four key threat agents. 3: Less than infective dose levels/casualty-producing toxin exposure levels against three key threat agents. 2: Less than infective dose levels/casualty-producing toxin exposure levels against two or more key threat agents. 1: Less than infective dose levels/casualty-producing toxin levels against one key threat agent. 0: More than infective dose levels/casualty-producing toxin exposure levels.

M4	(Level) Of radiological contamination after decontamination procedures.	The level of radiological contamination is acceptable after decontamination operations from a starting challenge of 0.4 g/m <sup>2</sup> of insoluble radioactive contaminants, 37–200 µm in size and 185 GBq/m <sup>2</sup> gamma activity. 0.33 cGy/hour equates to an exposure that can cause mild incapacitation in 2.5% or less of unprotected, not previously exposed personnel.	10: Total removal to natural background level. 8: ≤0.11 cGy/hour residual dose rate. 6: ≤0.22 cGy/hour residual dose rate. 4: <0.33 cGy/hour residual dose rate. 2: 0.33 cGy/hour residual dose rate. 0: Removal capabilities limited or ineffective, allowing excessive residual dose rates >0.33 cGy/hour.	
M5	(Yes/No) Cross-contamination is controlled?	Cross-contamination is controlled. Where cross-contamination is less than 100% controlled, measures must be in place to prevent cross-contamination from becoming an unacceptable hazard.	10: Yes, Complete (100%). 7: Yes, Substantial (~75%). 5: Yes, Partial (~50%). 3: Yes, Minimal (~25%). 0: No, Cross-contamination cannot be controlled and presents an unacceptable hazard.	
M6	(Time) To initiate immediate and operational decontamination procedures.	Initiate immediate decontamination procedures in time to meet mission requirements.  Initiate operational decontamination procedures in time to meet mission requirements.	<u>Immediate</u> 10: Immediately 9: <1 minute 8: <2 minutes 7: <3 minutes 6: <4 minutes 5: <5 minutes 4: <7 minutes 3: <9 minutes 2: <12 minutes 1: <15 minutes 0: >15 minutes	<u>Operational</u> 10: Immediately 9: 15 minutes 8: 30 minutes 7: 45 minutes 6: <1 hour 5: <2 hours 4: <3 hours 3: <4 hours 2: <5 hours 1: <6 hours 0: >6 hours
M7	(Time) To conduct immediate and operational decontamination procedures.	Time required for one warfighter to carry out immediate and operational decontamination procedures on 300 m <sup>2</sup> of surface area.	10: Immediately 9: <1 minute 8: <2 minutes 7: <3 minutes 6: <4 minutes 5: <5 minutes 4: <7 minutes 3: <9 minutes 2: <12 minutes 1: <15 minutes 0: >15 minutes	

M8	(Percent) Of interior areas/systems unusable due to the effects of decontamination.	The quantity of systems that may be rendered unserviceable by decontamination process must be minimized.	10: 0% 9: <1% 8: <2% 7: <3% 6: <4% 5: <5% 4: <6% 3: <7% 2: <8% 1: <9% 0: ≥10%
M9	(Percent) Of systems that require repair or replacement due to the effects of decontamination.	The quantity of repairs or parts replacements required due to decontamination process must be minimized.	10: 0% 9: <1% 8: <2% 7: <3% 6: <4% 5: <5% 4: <6% 3: <7% 2: <8% 1: <9% 0: ≥10%
M10	(Yes/No) Decontamination procedures are logistically supportable?	Decontamination procedures must be logistically supportable.	10: No negative impacts on operations. 7: Limited negative impact on operational capability. 5: Moderate negative impact on operational capability. 3: Major negative impact on operational capability. 0: Not logistically supportable.
M11	(Time) To conduct thorough decontamination.	Time required for one warfighter to carry out thorough decontamination procedures on 300 m <sup>2</sup> of surface area.	10: Immediately 9: <1 minute 8: <2 minutes 7: <3 minutes 6: <4 minutes 5: <5 minutes 4: <10 minutes 3: <15 minutes 2: <20 minutes 1: <30 minutes 0: >30 minutes

M12	(Yes/No) There is effective DOTLPF in place to conduct task?	Refers to non-materiel elements associated with the execution of a task with the system.	<p>10: DOTLPF is adequate for all tasks to be performed with this system without limitations that cause significant impact upon operations.</p> <p>7: DOTLPF is adequate for most of the tasks to be performed with this system without limitations that cause significant impact upon operations.</p> <p>5: Many critical aspects of DOTLPF for the task to be performed with this system are addressed.</p> <p>3: Some critical aspects of DOTLPF for the task to be performed with this system are addressed.</p> <p>0: DOTLPF is completely inadequate or does not exist for the tasks to be performed with this system.</p>
-----	--	--	--

<sup>1</sup> M1 – (Yes/No) Contaminated by-products are controlled? 7: Yes, Substantial (~75%).

<sup>2</sup> M3 – (Level) Of biological contamination after decontamination procedures. 6: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against eight or more key threat agents.

<sup>3</sup> M5 – (Yes/No) Cross-contamination is controlled? 7: Yes, Substantial (~75%).

<sup>4</sup> M6 – (Time) To initiate immediate decontamination procedures. 5: <5 minutes.

<sup>5</sup> M6 – (Time) To initiate operational decontamination procedures. 5: <2 hours.

<sup>6</sup> M7 – (Time) To conduct immediate and operational decontamination procedures. 1: <15 minutes.

<sup>7</sup> M8 – (Percent) Of interior areas/systems unusable due to the effects of decontamination. 9: <1%.

<sup>8</sup> M9 – (Percent) Of systems that require repair or replacement due to the effects of decontamination. 7: <3%.

- <sup>38</sup> M11 – (Time) To conduct thorough decontamination. 5: <5 minutes.
- <sup>39</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 3: Decontaminate most CWAs to a level that will allow unprotected exposure.
- <sup>40</sup> M3 – (Level) Of biological contamination after decontamination procedures. 4: Less than infective dose levels/casualty-producing toxin-exposure levels against four key threat agents.

### 17.15.3 Functional Solution Analysis

#### 17.15.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, the deficiency is then reassessed in the IMA section.

1. **Deficiency:** HTH/household bleach is corrosive.  
**Non-Materiel Solutions:** None.
2. **Deficiency:** Limited ability to decontaminate remote and hard-to-reach surfaces  
**Non-Materiel Solutions:** None.
3. **Deficiency:** Inability to decontaminate ventilation system.  
**Non-Materiel Solutions:** *Doctrine (partial):* Need methodology/requirements to decontaminate ventilation systems without major disassembly.
4. **Deficiency:** Inability to decontaminate porous materials with absorbed contamination.  
**Non-Materiel Solutions:** None.
5. **Deficiency:** Liquid decontaminants incompatible with electronics and sensitive equipment.  
**Non-Materiel Solutions:** None.
6. **Deficiency:** Applicability of decontaminants in a ship interior environment is unknown.  
**Non-Materiel Solutions:** None.
7. **Deficiency:** Lack of doctrine for performing operational and thorough/detailed decontamination including responsibilities (shipyard vs. ship's crew).  
**Non-Materiel Solutions:** *Doctrine:* Need *NSTM 470/070* revisions.
8. **Deficiency:** Limited capability to remove suspended agents from atmosphere.  
**Non-Materiel Solutions:** None.
9. **Deficiency:** Inability to decontaminate contaminated boilers.  
**Non-Materiel Solutions:** *Doctrine (partial):* Need methodology/requirements to decontaminate boilers.

#### 17.15.3.2 IMA Assessment Summary

Table 17.15-2 identifies which of the materiel approaches might address specific materiel gaps identified in the DOTMLPF assessment.

Table 17.15-2. TASUST 15: IMA Assessment

<div>Ideas for Materiel Approaches (IMA)</div> <div>Identified Gaps</div>	Enzymes	Aqueous Oxidants/ Nucleophiles	Mixed (Water/Nonaqueous Solvent) Oxidants/Nucleophiles	Reactive Nonaqueous Liquids	Reactive Gases and Vapors	Low-Temperature Thermal (Accelerated Weathering)	Sorption	Water/Steam Wash	Self-Decontaminating Coatings	(Nonaqueous) Solvent Wash	Containment System	Recycling Decontaminant System	Multiheaded Nozzle Accessories	Extended Range	Large-Coverage Sprayer System	Robotic or Semiautonomous System	Electrostatic Decontamination System
HTH/household bleach is corrosive.	X	X	X	X	X	X	X	X	X	X							X

**17.16 Task TASUST 16: Decontaminate assault craft****17.16.1 Functional Area Analysis****17.16.1.1 Definition**

To decontaminate the exterior and interior of assault craft, ancillary and riverine boats, etc. Includes minimizing effects of contaminants and decontaminants on operations. Levels of decontamination include immediate, operational, and thorough. Objectives of each of these levels are identified as follows:

- Immediate: Minimize casualties, save lives, and minimize spread of contamination.
- Operational: Reduce level of contamination to regenerate combat power.
- Thorough: Reduce CBRN contamination to negligible.

**17.16.1.2 Derivation**

*UJTL (TA 7, TA 7.1), Protection Joint Functional Concept.*

**17.16.1.2.1 Supported Tasks:** OPSUST 8, OPSUST 11

**17.16.1.2.2 Lateral Task:** TASHA 24

**17.16.1.2.3 Supporting Task:** N/A

**17.16.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Extremely rough sea state. (C1.2.1.3)
2. Tropical, arctic, and arid climate. (C1.3.1)
3. All seasons. (C1.3.1.1)
4. Precipitating and stormy weather. (C1.3.1.3)
5. Hot and very cold air temperature. (C1.3.1.3.1)
6. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6.1)
7. Negligible light. (C1.3.2.1)
8. Nuclear effects. (C1.3.3.1)
9. Chemical effects. (C1.3.3.2)
10. Biological effects. (C1.3.3.3)

**Military**

1. Stressful mission. (C2.1)
2. Location—afloat. (C2.1.4.1)
3. Minimal to short time available. (C2.1.5)

4. Marginal forces allocated. (C2.2.3)
5. Low personnel capability. (C2.2.4)
6. Negligible personnel experience. (C2.2.4.5)
7. Severe personnel fatigue. (C2.2.4.6)
8. Ambiguous threat existence. (C2.9.3)

### **Civil**

1. Limited or negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)
3. High mission priority. (C3.1.3.2)

## **17.16.2 Functional Needs Analysis**

### **17.16.2.1 Capabilities and Deficiencies Assessment Summary**

Table 17.16-1 presents individual and overall current, near-/mid-term, and far-term capabilities to perform the task to the designated standard. There are five current capabilities used to accomplish this task and two projected capabilities to be added in the future.

#### **Current Capabilities and Deficiencies**

The current capabilities exist at the immediate, operational, and thorough levels involving the use of countermeasure washdown systems, HTH, water, general detergents, soapy water and the equipment to apply the decontaminants. In thorough decontamination capabilities involve gross removal of contamination using tools such as grinders, sanders, and needleguns in a shipyard or drydock environment. There are some capabilities that work better than others, but effectiveness is always increased when more than one capability is utilized. The best overall capability is the use of HTH for chemical and biological agents. For radiological agents, however, general detergents mixed with water are recommended. The negative aspects of HTH are that it has corrosive and possible toxic characteristics. These decontaminants have the ability to corrode surfaces and damage equipment on the exterior of assault craft.

#### **Projected Near/Mid-Term Capabilities and Deficiencies**

The projected near/mid-term capabilities and deficiencies evaluated were associated with JSTDS-SS Increment I.

#### **Projected Far-Term Capabilities and Deficiencies**

The projected far-term capabilities and deficiencies evaluated were associated with JSTDS-SS Increment II and JPDS Increments I and II.

	FAA Measure	Elaboration	Scale
M1	(Yes/No) Contaminated by-products are controlled?	Contaminated by-products are controlled. Where by-products are less than 100% controlled, measures must be in place to prevent cross-contamination from becoming an unacceptable hazard.	10: Yes, Complete (100%). 7: Yes, Substantial (~75%). 5: Yes, Partial (~50%). 3: Yes, Minimal (~25%). 0: No, Contaminated by-products cannot be controlled and present an unacceptable hazard.
M2	(Level) Of chemical contamination after decontamination procedures.	The level of chemical contamination is acceptable after decontamination operations from a starting liquid challenge of 10 g/m <sup>2</sup> . Agents defined as current-generation CWAs, NTAs, TIMs, and TICs.	10: Decontaminate all CWAs, NTAs, TIMs to general population exposure limits. 7: Decontaminate all CWAs, all NTAs, and some TIMs to a level that will allow unprotected exposure. 5: Decontaminate all CWAs and some NTAs to a level that will allow unprotected exposure. 3: Decontaminate most CWAs to a level that will allow unprotected exposure. 0: No effective decontaminant or process.
M3	(Level) Of biological contamination after decontamination procedures.	The level of biological contamination (to include toxins) is acceptable after decontamination operations from starting challenges of greater than $1.0 \times 10^8$ CFU/PFU/m <sup>2</sup> . Vegetative and nonvegetative bacteria are measured in CFU/m <sup>2</sup> , and viruses are measured in PFU/m <sup>2</sup> .	10: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against all threat agents. 9: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against nine or more key threat agents. 8: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against eight or more key threat agents. 7: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against seven or more key threat agents. 6: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against six or more key threat agents. 5: Less than infective dose levels/casualty-producing toxin exposure levels against five or more key threat agents. 4: Less than infective dose levels/casualty-producing toxin exposure levels against four key threat agents. 3: Less than infective dose levels/casualty-producing toxin exposure levels against three key threat agents. 2: Less than infective dose levels/casualty-producing toxin exposure levels against two or more key threat agents. 1: Less than infective dose levels/casualty-producing toxin exposure levels against one key threat agent. 0: More than infective dose levels/casualty-producing toxin exposure levels.

M4	(Level) Of radiological contamination after decontamination procedures.	The level of radiological contamination is acceptable after decontamination operations from a starting challenge of 4 g/m <sup>2</sup> of insoluble radioactive contaminants, 37–200 µm in size and 185 GBq/m <sup>2</sup> gamma activity. 0.33 cGy/hour equates to an exposure that can cause mild incapacitation in 2.5% or less of unprotected, not previously exposed personnel.	10: Total removal to natural background level. 8: ≤0.11 cGy/hour residual dose rate. 6: ≤0.22 cGy/hour residual dose rate. 4: <0.33 cGy/hour residual dose rate. 2: 0.33 cGy/hour residual dose rate. 0: Removal capabilities limited or ineffective, allowing excessive residual dose rates >0.33 cGy/hour.	
M5	(Yes/No) Cross-contamination is controlled?	Cross-contamination is controlled. Where cross-contamination is less than 100% controlled, measures must be in place to prevent cross-contamination from becoming an unacceptable hazard.	10: Yes, Complete (100%). 7: Yes, Substantial (~75%). 5: Yes, Partial (~50%). 3: Yes, Minimal (~25%). 0: No, Cross-contamination cannot be controlled and presents an unacceptable hazard.	
M6	(Time) To initiate immediate and operational decontamination procedures.	Initiate immediate decontamination procedures in time to meet mission requirements.  Initiate operational decontamination procedures in time to meet mission requirements.	<u>Immediate</u> 10: Immediately 9: <1 minute 8: <2 minutes 7: <3 minutes 6: <4 minutes 5: <5 minutes 4: <7 minutes 3: <9 minutes 2: <12 minutes 1: <15 minutes 0: >15 minutes	<u>Operational</u> 10: Immediately 9: 15 minutes 8: 30 minutes 7: 45 minutes 6: <1 hour 5: <2 hours 4: <3 hours 3: <4 hours 2: <5 hours 1: <6 hours 0: >6 hours
M7	(Time) To conduct immediate and operational decontamination procedures.	Time required for one warfighter to carry out immediate and operational decontamination procedures on 300 m <sup>2</sup> of surface area.	10: Immediately 9: <1 minute 8: <2 minutes 7: <3 minutes 6: <4 minutes 5: <5 minutes 4: <7 minutes 3: <9 minutes 2: <12 minutes 1: <15 minutes 0: >15 minutes	

M8	(Percent) Of systems that require repair or replacement due to the effects of decontamination.	The quantity of repairs or parts replacements required due to decontamination process must be minimized.	10: 0% 9: <1% 8: <2% 7: <3% 6: <4% 5: <5% 4: <6% 3: <7% 2: <8% 1: <9% 0: ≥10%
M9	(Yes/No) Decontamination procedures are logistically supportable?	Decontamination procedures must be logistically supportable.	10: No negative impacts on operations. 7: Limited negative impact on operational capability. 5: Moderate negative impact on operational capability. 3: Major negative impact on operational capability. 0: Not logistically supportable.
M10	(Time) To conduct thorough decontamination.	Time required for one warfighter to carry out thorough decontamination procedures on 300 m <sup>2</sup> of surface area.	10: Immediately 9: <1 minute 8: <2 minutes 7: <3 minutes 6: <4 minutes 5: <5 minutes 4: <10 minutes 3: <15 minutes 2: <20 minutes 1: <30 minutes 0: >30 minutes
M11	(Yes/No) There is effective DOTLPF in place to conduct task?	Refers to non-materiel elements associated with the execution of a task with the system.	10: DOTLPF is adequate for all tasks to be performed with this system without limitations that cause significant impact upon operations. 7: DOTLPF is adequate for most of the tasks to be performed with this system without limitations that cause significant impact upon operations. 5: Many critical aspects of DOTLPF for the task to be performed with this system are addressed. 3: Some critical aspects of DOTLPF for the task to be performed with this system are addressed. 0: DOTLPF is completely inadequate or does not exist for the tasks to be performed with this system.

- <sup>1</sup> M1 – (Yes/No) Contaminated by-products are controlled? 3: Yes, Minimal (~25%).
- <sup>2</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 3: Decontaminate most CWAs to a level that will allow unprotected exposure.
- <sup>3</sup> M3 – (Level) Of biological contamination after decontamination procedures. 3: Less than infective dose levels/casualty-producing toxin-exposure levels against three key threat agents.
- <sup>4</sup> M4 – (Level) Of radiological contamination after decontamination procedures. 4: <0.33 cGy/hour residual dose rate.
- <sup>5</sup> M5 – (Yes/No) Cross-contamination is controlled? 3: Yes, Minimal (~25%).
- <sup>6</sup> M6 – (Time) To initiate immediate decontamination procedures. 9: <1 minute.
- <sup>7</sup> M6 – (Time) To initiate operational decontamination procedures. 9: 15 minutes.
- <sup>8</sup> M7 – (Time) To conduct immediate and operational decontamination procedures. 8: <2 minutes
- <sup>9</sup> M8 – (Percent) Of systems that require repair or replacement due to the effects of decontamination. 9: <1%.
- <sup>10</sup> M9 – (Yes/No) Decontamination procedures are logistically supportable? 7: Limited negative impact on operational capability.
- <sup>11</sup> M11 – (Yes/No) There is effective DOTLPF in place to conduct task? 10: DOTLPF is adequate for all tasks to be performed with this system without limitations that cause significant impact upon operations.
- <sup>12</sup> M1 – (Yes/No) Contaminated by-products are controlled? 5: Yes, Partial (~50%).
- <sup>13</sup> M3 – (Level) Of biological contamination after decontamination procedures. 5: Less than infective dose levels/casualty-producing toxin-exposure levels against five or more key threat agents.
- <sup>14</sup> M6 – (Time) To initiate operational decontamination procedures. 8: 30 minutes.
- <sup>15</sup> M7 – (Time) To conduct immediate and operational decontamination procedures. 1: <15 minutes.
- <sup>16</sup> M9 – (Yes/No) Decontamination procedures are logistically supportable? 5: Moderate negative impact on operational capability.
- <sup>17</sup> M10 – (Time) To conduct thorough decontamination. 3: <15 minutes.
- <sup>18</sup> M11 – (Yes/No) There is effective DOTLPF in place to conduct task? 7: DOTLPF is adequate for most of the tasks to be performed with this system without limitations that cause significant impact upon operations.
- <sup>19</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 0: No effective decontaminant or process.
- <sup>20</sup> M1 – (Yes/No) Contaminated by-products are controlled? 0: No, Contaminated by-products cannot be controlled and present an unacceptable hazard.
- <sup>21</sup> M5 – (Yes/No) Cross-contamination is controlled? 0: No, Cross-contamination cannot be controlled and presents an unacceptable hazard.
- <sup>22</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 5: Decontaminate all CWAs, some NTAs to a level that will allow unprotected exposure.
- <sup>23</sup> M3 – (Level) Of biological contamination after decontamination procedures. 10: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against all threat agents.
- <sup>24</sup> M4 – (Level) Of radiological contamination after decontamination procedures. 10: Total removal to natural background level.
- <sup>25</sup> M5 – (Yes/No) Cross-contamination is controlled? 5: Yes, Partial (~50%).
- <sup>26</sup> M9 – (Yes/No) Decontamination procedures are logistically supportable? 3: Major negative impact on operational capability.
- <sup>27</sup> M10 – (Time) To conduct thorough decontamination. 0: >30 minutes.
- <sup>28</sup> M11 – (Yes/No) There is effective DOTLPF in place to conduct task? 5: Many critical aspects of DOTLPF for the task to be performed with this system are addressed.
- <sup>29</sup> M1 – (Yes/No) Contaminated by-products are controlled? 7: Yes, Substantial (~75%).
- <sup>30</sup> M5 – (Yes/No) Cross-contamination is controlled? 7: Yes, Substantial (~75%).
- <sup>31</sup> M7 – (Time) To conduct immediate and operational decontamination procedures. 5: <5 minutes.
- <sup>32</sup> M10 – (Time) To conduct thorough decontamination. 5: <5 minutes.
- <sup>33</sup> M1 – (Yes/No) Contaminated by-products are controlled? 10: Yes, Complete (100%).
- <sup>34</sup> M5 – (Yes/No) Cross-contamination is controlled? 10: Yes, Complete (100%)
- <sup>35</sup> M3 – (Level) Of biological contamination after decontamination procedures. 4: Less than infective dose levels/casualty-producing toxin-exposure levels against four key threat agents.
- <sup>36</sup> M7 – (Time) To conduct immediate and operational decontamination procedures. 3: <9 minutes.

### 17.16.3 Functional Solution Analysis

#### 17.16.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, the deficiency is then reassessed in the IMA section.

**1. Deficiency:** CMWD is corrosive.

**Non-Materiel Solutions:** *Doctrine:* Include freshwater rinse after CMWD has been secured in operational doctrine.

**2. Deficiency:** CMWD delivery systems have insufficient nozzles to cover all surfaces.

**Non-Materiel Solutions:** *Doctrine:* Increase area coverage requirements. *Facilities:* Conduct CMWD area coverage analysis and initiate repair requirement as necessary.

**3. Deficiency:** Effectiveness of CMWD is degraded if not activated prior to attack.

**Non-Materiel Solutions:** *Doctrine:* Include CMWD procedures and requirements into newly developed doctrine.

**4. Deficiency:** Insufficient training in procedures for assault craft decontamination.

**Non-Materiel Solutions:** *Training:* Develop a chemical, biological, and radiological defense (CBRD) Amphibious Operations Training Plan to include requirements and incorporate them into the appropriate sections of the Surface Force Training Manual, which provides guidance of the overall Surface Force Training Program.

**5. Deficiency:** HTH is corrosive to various surfaces and materials.

**Non-Materiel Solutions:** None.

**6. Deficiency:** No current doctrine on assault craft decontamination.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine for CBRD amphibious operations that include such topics as specific assault craft decontamination methodologies.

**7. Deficiency:** Inability to decontaminate ventilation system interiors.

**Non-Materiel Solutions:** None.

**8. Deficiency:** Inability to decontaminate large flexible skirt system on Landing Craft Air Cushion.

**Non-Materiel Solutions:** None.

#### 17.16.3.2 IMA Assessment Summary

Table 17.16-2 identifies which of the materiel approaches might address specific materiel gaps identified in the DOTMLPF assessment.

Table 17.16-2. TASUST 16: IMA Assessment

Identified Gaps	Ideas for Materiel Approaches (IMA)														
	Enzymes	Aqueous Oxidants/ Nucleophiles	Mixed (Water/Nonaqueous Solvent) Oxidants/Nucleophiles	Reactive Nonaqueous Liquids	Reactive Gases and Vapors	Low-Temperature Thermal (Accelerated Weathering)	Sorption	Water/Steam Wash	Self-Decontaminating Coatings	(Nonaqueous) Solvent Wash	Multiheaded Nozzle Accessories	Extended Range	Large-Coverage Sprayer System	Robotic or Semiautonomous System	Electrostatic Decontamination System
Primary decontaminant (HTH) is corrosive to various surfaces and materials.	X	X	X	X	X	X	X	X	X	X					X
Inability to decontaminate ventilation system interiors.					X						X	X	X	X	
Inability to decontaminate large flexible skirt system on Landing Craft Air Cushion.						X			X		X	X	X	X	

**17.17 Task TASUST 17: Decontaminate aircraft****17.17.1 Functional Area Analysis****17.17.1.1 Definition**

To decontaminate the exteriors and interiors of fixed-wing, rotary-wing, and tilt-rotor aircraft. Includes minimizing effects of contaminants and decontaminants on operations in a manner that is within the confines of the aircraft manufacturers' specifications. Levels of decontamination include immediate, operational, and thorough. Objectives of each of these levels are identified as follows:

- Immediate: Minimize casualties, save lives, and help limit contamination exposure and spread.
- Operational: Limit contamination exposure and spread and help to sustain operations by providing temporary and, in some cases, long-term relief from wearing IPE by crewmembers, maintainers, and passengers.
- Thorough: Reduce or eliminate the need for wearing IPE by crewmembers, maintainers, and passengers.

**17.17.1.2 Derivation**

*UJTL (TA 7, TA 7.1), Protection Joint Functional Concept.*

**17.17.1.2.1 Supported Tasks:** OPSUST 8, OPSUST 11**17.17.1.2.2 Lateral Task:** TASHA 24**17.17.1.2.3 Supporting Task:** N/A**17.17.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Extremely rough sea state. (C1.2.1.3)
2. Tropical, arctic, and arid climate. (C1.3.1)
3. All seasons. (C1.3.1.1)
4. Precipitating and stormy weather. (C1.3.1.3)
5. Hot and very cold air temperature. (C1.3.1.3.1)
6. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6.1)
7. Negligible light. (C1.3.2.1)
8. Nuclear effects. (C1.3.3.1)
9. Chemical effects. (C1.3.3.2)
10. Biological effects. (C1.3.3.3)

**Military**

1. Stressful mission. (C2.1)
2. Location—airborne/ashore/afloat. (C2.1.4.1)
3. Minimal to short time available. (C2.1.5)
4. Marginal forces allocated. (C2.2.3)
5. Low personnel capability. (C2.2.4)
6. Negligible personnel experience. (C2.2.4.5)
7. Severe personnel fatigue. (C2.2.4.6)
8. Limited, little, or no lift assets. (C2.5.2)
9. Some or no interoperability. (C2.2.6)
10. Limited or no host-nation support. (C2.8.5)
11. Ambiguous threat existence. (C2.9.3)

**Civil**

1. Limited or negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)
3. Moderate mission priority. (C3.1.3.2)

**17.17.2 Functional Needs Analysis****17.17.2.1 Capabilities and Deficiencies Assessment Summary**

Table 17.17-1 presents individual and overall current, near-/mid-term, and far-term capabilities to perform the task to the designated standard. There are a total of four current capabilities used to accomplish this task and four projected capabilities to be added in the future. Capabilities for aircraft decontamination exist at the immediate, operational, and thorough levels of decontamination.

**Current Capabilities and Deficiencies**

The current capabilities for decontaminating aircraft exteriors and aircraft interiors are limited. Standard decontaminants that can neutralize chemical or biological agents are typically not compatible with either exterior or interior aircraft materials. Using warm soapy water on large exterior surfaces is often counterproductive, as many aircraft panels are not watertight and the contamination is simply moved from the skin to areas under the aircraft's panels or even into the interior of the aircraft. Therefore, weathering, including flying, is the primary decontamination method for large exterior aircraft surfaces. For radiological contamination, however, washing with soap and water to remove contaminants may also be required, as weathering does not degrade radioactive materials as it does with chemical and biological agents. Operational decontamination on those exterior and interior surfaces that will be continually touched is performed using M295 decontamination kits or soapy (detergent) water. For interior decontamination, the use of forced hot air is also a viable option for some agents, but is ineffective against V-series nerve agents. Spot-cleaning with M295 decontamination kits or soapy (detergent) water, along with removal (when possible) of contaminated items, is

performed when possible. There is currently no proven method to decontaminate the cockpit areas of aircraft, primarily due to the presence of sensitive electronics. Additionally, many sensitive aircraft equipment items, such as wiring harnesses, are nonremovable by operational units. To ensure flight safety, nerve agent efficacy requirements for aircraft decontamination must achieve levels well below those at which the onset of meiosis could occur.

**Projected Near/Mid-Term Capabilities and Deficiencies**

The projected near/mid-term capabilities and deficiencies evaluated were associated with JSTDS-SS Increment I and JPID Increment I.

**Projected Far-Term Capabilities and Deficiencies**

The projected far-term capabilities and deficiencies evaluated were associated with JSTDS-SS Increment II, JSTDS-LS Increments I and II, JPID, Increment II and JPDS Increments I and II.

\*While the table suggests a low “yellow” rating for current overall capabilities, there is currently a lack of approved aircraft decontaminants that possess adequate efficacy to allow unprotected exposure of aircrews and maintenance personnel to decontaminated aircraft. This capability is currently materiel compatibility and technology constrained.

	FAA Measure	Elaboration	Scale
M1	(Yes/No) Contaminated by-products are controlled?	Contaminated by-products are controlled. Where by-products are less than 100% controlled, measures must be in place to prevent cross-contamination from becoming an unacceptable hazard.	10: Yes, Complete (100%). 7: Yes, Substantial (~75%). 5: Yes, Partial (~50%). 3: Yes, Minimal (~25%). 0: No, Contaminated by-products cannot be controlled and present an unacceptable hazard.
M2	(Level) Of chemical contamination after decontamination procedures.	The level of chemical contamination is acceptable after decontamination operations from a starting liquid challenge of 10 g/m <sup>2</sup> for external surfaces and 1 g/m <sup>2</sup> for internal surfaces. Agents defined as current-generation CWAs, NTAs, TIMs, and TICs.	10: Decontaminate all CWAs, NTAs, TIMs to general population exposure limits. 7: Decontaminate all CWAs, all NTAs, and some TIMs to a level that will allow unprotected exposure. 5: Decontaminate all CWAs and some NTAs to a level that will allow unprotected exposure. 3: Decontaminate most CWAs to a level that will allow unprotected exposure. 0: No effective decontaminant or process.
M3	(Level) Of biological contamination after decontamination procedures.	The level of biological contamination (to include toxins) is acceptable after decontamination operations from starting challenges of greater than $1.0 \times 10^8$ CFU/PFU/m <sup>2</sup> . Vegetative and nonvegetative bacteria are measured in CFU/m <sup>2</sup> , and viruses are measured in PFU/m <sup>2</sup> .	10: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against all threat agents. 9: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against nine or more key threat agents. 8: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against eight or more key threat agents. 7: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against seven or more key threat agents. 6: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against six or more key threat agents. 5: Less than infective dose levels/casualty-producing toxin exposure levels against five or more key threat agents. 4: Less than infective dose levels/casualty-producing toxin exposure levels against four key threat agents. 3: Less than infective dose levels/casualty-producing toxin exposure levels against three key threat agents. 2: Less than infective dose levels/casualty-producing toxin exposure levels against two or more key threat agents. 1: Less than infective dose levels/casualty-producing toxin exposure levels against one key threat agent. 0: More than infective dose levels/casualty-producing toxin exposure levels.

M4	(Level) Of radiological contamination after decontamination procedures.	The level of radiological contamination is acceptable after decontamination operations from a starting challenge of 4 g/m <sup>2</sup> for external surfaces and 0.4 g/m <sup>2</sup> for internal surfaces, of insoluble radioactive contaminants, 37–200 µm in size and 185 GBq/m <sup>2</sup> gamma activity. 0.33 cGy/hour equates to an exposure that can cause mild incapacitation in 2.5% or less of unprotected, not previously exposed personnel.	10: Total removal to natural background level. 8: ≤0.11 cGy/hour residual dose rate. 6: ≤0.22 cGy/hour residual dose rate. 4: <0.33 cGy/hour residual dose rate. 2: 0.33 cGy/hour residual dose rate. 0: Removal capabilities limited or ineffective, allowing excessive residual dose rates >0.33 cGy.	
M5	(Yes/No) Cross-contamination is controlled?	Cross-contamination is controlled. Where cross-contamination is less than 100% controlled, measures must be in place to prevent cross-contamination from becoming an unacceptable hazard.	10: Yes, Complete (100%). 7: Yes, Substantial (~75%). 5: Yes, Partial (~50%). 3: Yes, Minimal (~25%). 0: No, Cross-contamination cannot be controlled and presents an unacceptable hazard.	
M6	(Time) To initiate immediate and operational decontamination procedures.	Initiate immediate decontamination procedures in time to meet mission requirements.  Initiate operational decontamination procedures in time to meet mission requirements.	<u>Immediate</u> 10: Immediately 9: <1 minute 8: <2 minutes 7: <3 minutes 6: <4 minutes 5: <5 minutes 4: <7 minutes 3: <9 minutes 2: <12 minutes 1: <15 minutes 0: >15 minutes	<u>Operational</u> 10: Immediately 9: 15 minutes 8: 30 minutes 7: 45 minutes 6: <1 hour 5: <2 hours 4: <3 hours 3: <4 hours 2: <5 hours 1: <6 hours 0: >6 hours

M7	(Time) To conduct immediate and operational decontamination procedures.	Time required for one warfighter to carry out immediate and operational decontamination procedures on 300 m <sup>2</sup> of surface area.	10: Immediately 9: <1 minute 8: <2 minutes 7: <3 minutes 6: <4 minutes 5: <5 minutes 4: <7 minutes 3: <9 minutes 2: <12 minutes 1: <15 minutes 0: >15 minutes
M8	(Percent) Of interior areas/systems unusable due to the effects of decontamination.	The quantity of systems that may be rendered unserviceable by decontamination process must be minimized. Decontamination systems/processes require approval by aircraft system program offices (A/C SPOs).	10: 0%; system and/or process approved by all A/C SPOs. 9: <1%; system and/or process approved by all A/C SPOs. 8: <2%; system and/or process approved by all A/C SPOs. 7: <3%; system and/or process approved by all A/C SPOs. 6: <4%; system and/or process approved by all A/C SPOs. 5: <5%, system and /or process is approved by most A/C SPOs. 4: <6%; system and/or process is approved by the majority of A/C SPOs. 3: <7%; system and/or process is approved by the majority of A/C SPOs. 2: <8%; system and/or process is approved by some A/C SPOs. 1: <9%; system and/or process is approved by some A/C SPOs. 0: ≥10%; system and/or process not approved by any A/C SPO.
M9	(Percent) Of systems that require repair or replacement due to the effects of decontamination.	The quantity of repairs or parts replacements required due to decontamination process must be minimized. Decontamination systems/processes require approval by A/C SPOs.	10: 0%; system and/or process approved by all A/C SPOs. 9: <1%; system and/or process approved by all A/C SPOs. 8: <2%; system and/or process approved by all A/C SPOs. 7: <3%; system and/or process approved by all A/C SPOs. 6: <4%; system and/or process approved by all A/C SPOs. 5: <5%, system and /or process is approved by most A/C SPOs. 4: <6%; system and/or process is approved by the majority of A/C SPOs. 3: <7%; system and/or process is approved by the majority of A/C SPOs. 2: <8%; system and/or process is approved by some A/C SPOs. 1: <9%; system and/or process is approved by some A/C SPOs. 0: ≥10%; system and/or process not approved by any A/C SPO.
M10	(Yes/No) Decontamination procedures are logistically supportable?	Decontamination procedures must be logistically supportable.	10: No negative impacts on operations. 7: Limited negative impact on operational capability. 5: Moderate negative impact on operational capability. 3: Major negative impact on operational capability. 0: Not logistically supportable.

M11	(Time) To conduct thorough decontamination.	Time required for one warfighter to carry out thorough decontamination procedures on 300 m <sup>2</sup> of surface area.	10: Immediately 9: <1 minute 8: <2 minutes 7: <3 minutes 6: <4 minutes 5: <5 minutes 4: <10 minutes 3: <15 minutes 2: <20 minutes 1: <30 minutes 0: >30 minutes
M12	(Yes/No) There is effective DOTLPF in place to conduct task?	Refers to non-materiel elements associated with the execution of a task with the system.	10: DOTLPF is adequate for all tasks to be performed with this system without limitations that cause significant impact upon operations. 7: DOTLPF is adequate for most of the tasks to be performed with this system without limitations that cause significant impact upon operations. 5: Many critical aspects of DOTLPF for the task to be performed with this system are addressed. 3: Some critical aspects of DOTLPF for the task to be performed with this system are addressed. 0: DOTLPF is completely inadequate or does not exist for the tasks to be performed with this system.

<sup>1</sup> M1 – (Yes/No) Contaminated by-products are controlled? 7: Yes, Substantial (~75%).

<sup>2</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 3: Decontaminate most CWAs to a level that will allow unprotected exposure.

<sup>3</sup> M3 – (Level) Of biological contamination after decontamination procedures. 1: Less than infective dose levels/casualty-producing toxin-exposure levels against one key threat agent.

<sup>4</sup> M5 – (Yes/No) Cross-contamination is controlled? 7: Yes, Substantial (~75%).

<sup>5</sup> M6 – (Time) To initiate immediate decontamination procedures. 8: <2 minutes.

<sup>6</sup> M8 – (Percent) Of interior areas/systems unusable due to the effects of decontamination. 0: ≥10%, System and/or process not approved by any aircraft system program office (A/C SPO).

<sup>7</sup> M9 – (Percent) Of systems that require repair or replacement due to the effects of decontamination. 1: <9%; system and/or process is approved by some A/C SPOs.

<sup>8</sup> M10 – (Yes/No) Decontamination procedures are logistically supportable? 7: Limited negative impact on operational capability.

<sup>9</sup> M12 – (Yes/No) There is effective DOTLPF in place to conduct task? 7: DOTLPF is adequate for most of the tasks to be performed with this system without limitations that cause significant impact upon operations.

<sup>10</sup> M12 – (Yes/No) There is effective DOTLPF in place to conduct task? 3: Some critical aspects of DOTLPF for the task to be performed with this system are addressed.

<sup>11</sup> M1 – (Yes/No) Contaminated by-products are controlled? 3: Yes, Minimal (~25%).

<sup>12</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 0: No effective decontaminant or process.

<sup>13</sup> M3 – (Level) Of biological contamination after decontamination procedures. 3: Less than infective dose levels/casualty-producing toxin-exposure levels against three key threat agents.

<sup>14</sup> M4 – (Level) Of radiological contamination after decontamination procedures. 4: <0.33 cGy/hour residual dose rate.

<sup>15</sup> M5 – (Yes/No) Cross-contamination is controlled? 3: Yes, Minimal (~25%).

<sup>16</sup> M6 – (Time) To initiate operational decontamination procedures. 1: <6 hours.

- 
- <sup>17</sup> M7 – (Time) To conduct immediate and operational decontamination procedures. 1: <15 minutes.
- <sup>18</sup> M8 – (Percent) Of interior areas/systems unusable due to the effects of decontamination. 9: <1%; system and/or process approved by all A/C SPOs.
- <sup>19</sup> M9 – (Percent) Of systems that require repair or replacement due to the effects of decontamination. 9: <1%; system and/or process approved by all A/C SPOs.
- <sup>20</sup> M10 – (Yes/No) Decontamination procedures are logistically supportable? 5: Moderate negative impact on operational capability.
- <sup>21</sup> M11 – (Time) To conduct thorough decontamination. 1: <30 minutes.
- <sup>22</sup> M1 – (Yes/No) Contaminated by-products are controlled? 5: Yes, Partial (~50%).
- <sup>23</sup> M3 – (Level) Of biological contamination after decontamination procedures. 2: Less than infective dose levels/casualty-producing toxin-exposure levels against two or more key threat agents.
- <sup>24</sup> M5 – (Yes/No) Cross-contamination is controlled? 5: Yes, Partial (~50%).
- <sup>25</sup> M10 – (Yes/No) Decontamination procedures are logistically supportable? 3: Major negative impact on operational capability.
- <sup>26</sup> M11 – (Time) To conduct thorough decontamination. 0: >30 minutes.
- <sup>27</sup> M8 – (Percent) Of interior areas/systems unusable due to the effects of decontamination. 2: <8%; system and/or process is approved by some A/C SPOs.
- <sup>28</sup> M9 – (Percent) Of systems that require repair or replacement due to the effects of decontamination. 2: <8%; system and/or process is approved by some A/C SPOs.
- <sup>29</sup> M1 – (Yes/No) Contaminated by-products are controlled? 7: Yes, Substantial (~75%).
- <sup>30</sup> M1 – (Yes/No) Contaminated by-products are controlled? 10: Yes, Complete (100%).
- <sup>31</sup> M3 – (Level) Of biological contamination after decontamination procedures. 7: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against seven or more key threat agents.
- <sup>32</sup> M5 – (Yes/No) Cross-contamination is controlled? 10: Yes, Complete (100%).
- <sup>33</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 5: Decontaminate all CWAs, some NTAs to a level that will allow unprotected exposure.
- <sup>34</sup> M3 – (Level) Of biological contamination after decontamination procedures. 8: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against eight or more key threat agents.
- <sup>35</sup> M12 – (Yes/No) There is effective DOTLPF in place to conduct task? 10: DOTLPF is adequate for all tasks to be performed with this system without limitations that cause significant impact upon operations.
- <sup>36</sup> M8 – (Percent) Of interior areas/systems unusable due to the effects of decontamination. 5: <5%, system and /or process is approved by most A/C SPOs.
- <sup>37</sup> M9 – (Percent) Of systems that require repair or replacement due to the effects of decontamination. 5: <5%, system and /or process is approved by most A/C SPOs.
- <sup>38</sup> M12 – (Yes/No) There is effective DOTLPF in place to conduct task? 5: Many critical aspects of DOTLPF for the task to be performed with this system are addressed.
- <sup>39</sup> M6 – (Time) To initiate immediate and operational decontamination procedures. 5: <2 hours.

### 17.17.3 Functional Solution Analysis

#### 17.17.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, the deficiency is then reassessed in the IMA section.

1. **Deficiency:** Primary means to decontaminate (hot soapy water) is ineffective in decontaminating most chemical and biological hazards.  
**Non-Materiel Solutions:** *Doctrine-Partial.* The contamination of aircraft should be avoided by all means possible. Exposure of aircraft to potentially contamination-producing events should be minimized if not avoidable. Critical aircraft assets should be protected from being contaminated at all times to the maximum extent possible. Aircrews must be prepared to operate in protective clothing and equipment for extended time frames if the continued use of contaminated aircraft is required.
2. **Deficiency:** Persistent chemical hazards do not evaporate in a timely manner under normal conditions.  
**Non-Materiel Solutions:** None.
3. **Deficiency:** Inability to remove chemical agents deposited on porous/absorbent material.  
**Non-Materiel Solutions:** None.
4. **Deficiency:** Lack of doctrine for operational and thorough decontamination on board ship.  
**Non-Materiel Solutions:** *Doctrine:* Develop doctrine for procedures and requirements to decontaminate all aircraft and surfaces during flight operations in a CBRD environment to include immediate, operational, and thorough decontamination.
5. **Deficiency:** Inability to decontaminate hard-to-reach places (cracks and crevices).  
**Non-Materiel Solutions:** None.
6. **Deficiency:** Decontaminants are corrosive and can damage aircraft.  
**Non-Materiel Solutions:** None.

#### 17.17.3.2 IMA Assessment Summary

Table 17.17-2 identifies which of the materiel approaches might address specific materiel gaps identified in the DOTMLPF assessment.

Table 17.17-2. TASUST 17: IMA Assessment

Identified Gaps	Enzymes	Aqueous Oxidants/Nucleophiles	Mixed (Water/Nonaqueous Solvent) Oxidants/ Nucleophiles	Reactive Nonaqueous Liquids	Reactive Gases and Vapors	Low-Temp Thermal (Accelerated Weathering)	Sorption	Water/Steam Wash	Self-Decontaminating Coatings	(Nonaqueous) Solvent Wash	Ionizing/Nonionizing Radiation	Multiheaded Nozzle Accessories	Large-Coverage Sprayer System	Robotic or Semiautonomous System	Electrostatic Decontamination System
Primary means to decontaminate (hot soapy water) is ineffective in decontaminating most chemical and biological hazards.	X	X	X	X			X			X					
Persistent chemical hazards do not evaporate in a timely manner under normal conditions.	X					X									X
Inability to remove agent deposited on porous/absorbent material.						X		X		X		X	X	X	
Inability to decontaminate hard-to-reach places (cracks and crevices).	X	X	X	X					X	X					
Decontaminants are corrosive and can damage aircraft.	X	X	X	X	X	X	X	X	X	X					X

**17.18 Task TASUST 18: Decontaminate fixed-facility exteriors****17.18.1 Functional Area Analysis****17.18.1.1 Definition**

To decontaminate the exterior of fixed facilities such as buildings, warehouses, shelters, hangers, etc.

**17.18.1.2 Derivation**

*UJTL (TA 7, TA 7.1), Protection Joint Functional Concept.*

**17.18.1.2.1 Supported Task:** OPSUST 11

**17.18.1.2.2 Lateral Task:** TASHA 24

**17.18.1.2.3 Supporting Task:** N/A

**17.18.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Tropical, arctic, and arid climate. (C1.3.1)
2. All seasons. (C1.3.1.1)
3. Precipitating and stormy weather. (C1.3.1.3)
4. Hot and very cold air temperature. (C1.3.1.3.1)
5. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6.1)
6. Negligible light. (C1.3.2.1)
7. Nuclear effects. (C1.3.3.1)
8. Chemical effects. (C1.3.3.2)
9. Biological effects. (C1.3.3.3)
10. Varied surface materials.

**Military**

1. Stressful mission. (C2.1)
2. Marginal forces allocated. (C2.2.3)
3. Low personnel capability. (C2.2.4)
4. Negligible personnel experience. (C2.2.4.5)
5. Severe personnel fatigue. (C2.2.4.6)
6. Limited, little, or no lift assets. (C2.5.2)
7. Limited or no host-nation support. (C2.8.5)
8. Ambiguous threat existence. (C2.9.3)

**Civil**

1. Disputed legality. (C3.1.1.4)
2. Adversarial media relations. (C3.1.1.5)
3. Limited or negative foreign government support. (C3.1.2.3)
4. Aggressively opposed foreign public opinion. (C3.1.2.4)
5. Moderate mission priority. (C3.1.3.2)
6. Presence of internationally significant cultural sites. (C3.2.4)

**17.18.2 Functional Needs Analysis****17.18.2.1 Capabilities and Deficiencies Assessment Summary**

Table 17.18-1 presents individual and overall current, near-/mid-term, and far-term capabilities to perform the task to the designated standard. There are two current capabilities used to accomplish this task and three projected capabilities to be added in the future.

**Current Capabilities and Deficiencies**

The current capabilities exist at the immediate, operational, and thorough levels involving the use of STB, HTH, DF-200 Decontamination foam, and soap and water, applied with applicators such as M12A1, M17 Lightweight Decontamination System. Deficiencies include the inability to decontaminate hard-to-reach areas and porous materials such as building materials, along with the lack of a neutralizing, noncorrosive decontaminant.

**Projected Near/Mid-Term Capabilities and Deficiencies**

The projected near/mid-term capabilities and deficiencies evaluated were associated with JSTDS-SS Increment I.

**Projected Far-Term Capabilities and Deficiencies**

The projected far-term capabilities and deficiencies evaluated were associated with JSTDS-LS Increments I AND II and JPDS Increments I and II.

Table 17.18-1. TASUST 18: Capabilities and Deficiencies Assessment

Capabilities	M1	M2	M3	M4	M5	M6	M7	M8
<b>Current</b>								
HTH/STB	5 <sup>1</sup>	3 <sup>2</sup>	5 <sup>3</sup>	N/A	5 <sup>4</sup>	5 <sup>5</sup>	4 <sup>6</sup>	3 <sup>7</sup>
Flushing/ Hot soapy water	3 <sup>8</sup>	0 <sup>9</sup>	3 <sup>10</sup>	4 <sup>11</sup>	3 <sup>12</sup>	5	4	3
<b>Near/Mid-Term</b>								
JSTDS-SS Increment I	7 <sup>13</sup>	3	5	4	7 <sup>14</sup>	5	4	5 <sup>15</sup>
<b>Far-Term</b>								
JSTDS-LS Increment I/II	10 <sup>16</sup>	5 <sup>17</sup>	5	4	10 <sup>18</sup>	5	6 <sup>19</sup>	5
JPDS Increment I/II	10	5	5	4	10	5	6	5
<b>Current Overall Capabilities</b>	3	3	3	4	3	5	4	3
<b>Near/Mid-Term Overall Capabilities</b>	7	3	5	4	7	5	4	5
<b>Far-Term Overall Capabilities</b>	10	5	5	4	10	5	6	5

	FAA Measure	Elaboration	Scale
M1	(Yes/No) Contaminated by-products are controlled?	Contaminated by-products are controlled. Where by-products are less than 100% controlled, measures must be in place to prevent cross-contamination from becoming an unacceptable hazard.	10: Yes, Complete (100%). 7: Yes, Substantial (~75%). 5: Yes, Partial (~50%). 3: Yes, Minimal (~25%). 0: No, Contaminated by-products cannot be controlled and present an unacceptable hazard.
M2	(Level) Of chemical contamination after decontamination procedures.	The level of chemical contamination is acceptable after decontamination operations from a starting liquid challenge of 10 g/m <sup>2</sup> for external surfaces and 1 g/m <sup>2</sup> for internal surfaces. Agents defined as current-generation CWAs, NTAs, TIMs, and TICs.	10: Decontaminate all CWAs, NTAs, TIMs to general population exposure limits. 7: Decontaminate all CWAs, all NTAs, and some TIMs to a level that will allow unprotected exposure. 5: Decontaminate all CWAs and some NTAs to a level that will allow unprotected exposure. 3: Decontaminate most CWAs to a level that will allow unprotected exposure. 0: No effective decontaminant or process.

M3	(Level) Of biological contamination after decontamination procedures.	The level of biological contamination (to include toxins) is acceptable after decontamination operations from starting challenges of greater than $1.0 \times 10^8$ CFU/PFU/m <sup>2</sup> . Vegetative and nonvegetative bacteria are measured in CFU/m <sup>2</sup> , and viruses are measured in PFU/m <sup>2</sup> .	<p>10: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against all threat agents.</p> <p>9: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against nine or more key threat agents.</p> <p>8: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against eight or more key threat agents.</p> <p>7: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against seven or more key threat agents.</p> <p>6: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against six or more key threat agents.</p> <p>5: Less than infective dose levels/casualty-producing toxin exposure levels against five or more key threat agents.</p> <p>4: Less than infective dose levels/casualty-producing toxin exposure levels against four key threat agents.</p> <p>3: Less than infective dose levels/casualty-producing toxin exposure levels against three key threat agents.</p> <p>2: Less than infective dose levels/casualty-producing toxin exposure levels against two or more key threat agents.</p> <p>1: Less than infective dose levels/casualty-producing toxin exposure levels against one key threat agent.</p> <p>0: More than infective dose levels/casualty-producing toxin exposure levels.</p>
M4	(Level) Of radiological contamination after decontamination procedures.	The level of radiological contamination is acceptable after decontamination operations from a starting challenge of 4 g/m <sup>2</sup> of insoluble radioactive contaminants, 37–200 µm in size and 185 GBq/m <sup>2</sup> gamma activity. 0.33 cGy/hour equates to an exposure that can cause mild incapacitation in 2.5% or less of unprotected, not previously exposed personnel.	<p>10: Total removal to natural background level.</p> <p>8: ≤0.11 cGy/hour residual dose rate.</p> <p>6: ≤0.22 cGy residual dose rate.</p> <p>4: &lt;0.33 cGy/hour residual dose rate.</p> <p>2: 0.33 cGy residual dose rate.</p> <p>0: Removal capabilities limited or ineffective, allowing excessive residual dose rates &gt;0.33 cGy/hour.</p>
M5	(Yes/No) Cross-contamination is controlled?	Cross-contamination is controlled. Where cross-contamination is less than 100% controlled, measures must be in place to prevent cross-contamination from becoming an unacceptable hazard.	<p>10: Yes, Complete (100%).</p> <p>7: Yes, Substantial (~75%).</p> <p>5: Yes, Partial (~50%).</p> <p>3: Yes, Minimal (~25%).</p> <p>0: No, Cross-contamination cannot be controlled and presents an unacceptable hazard.</p>

M6	(Yes/No) Decontamination procedures are logistically supportable?	Decontamination procedures must be logistically supportable.	10: No negative impacts on operations. 7: Limited negative impact on operational capability. 5: Moderate negative impact on operational capability. 3: Major negative impact on operational capability. 0: Not logistically supportable.
M7	(Time) To complete the decontamination mission for fixed sites.	Time required to conduct thorough decontamination on 3000 m <sup>2</sup> of surface area.	10: Immediately 9: <15 minutes 8: <30 minutes 7: <45 minutes 6: <1 hour 5: <1.5 hours 4: <2 hours 3: <2.5 hours 2: <3 hours 1: <4 hours 0: >4 hours
M8	(Yes/No) There is effective DOTLPF in place to conduct task?	Refers to non-materiel elements associated with the execution of a task with the system.	10: DOTLPF is adequate for all tasks to be performed with this system without limitations that cause significant impact upon operations. 7: DOTLPF is adequate for most of the tasks to be performed with this system without limitations that cause significant impact upon operations. 5: Many critical aspects of DOTLPF for the task to be performed with this system are addressed. 3: Some critical aspects of DOTLPF for the task to be performed with this system are addressed. 0: DOTLPF is completely inadequate or does not exist for the tasks to be performed with this system.

<sup>1</sup> M1 – (Yes/No) Contaminated by-products are controlled? 5: Yes, Partial (~50%).

<sup>2</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 3: Decontaminate most CWAs to a level that will allow unprotected exposure.

<sup>3</sup> M3 – (Level) Of biological contamination after decontamination procedures. 5: Less than infective dose levels/casualty-producing toxin-exposure levels against five or more key threat agents.

<sup>4</sup> M5 – (Yes/No) Cross-contamination is controlled? 5: Yes, Partial (~50%).

<sup>5</sup> M6 – (Yes/No) Decontamination procedures are logistically supportable? 5: Moderate negative impact on operational capability.

<sup>6</sup> M7 – (Time) To complete the decontamination mission for fixed sites. 4: <2 hours.

<sup>7</sup> M8 – (Yes/No) There is effective DOTLPF in place to conduct task? 3: Some critical aspects of DOTLPF for the task to be performed with this system are addressed.

<sup>8</sup> M1 – (Yes/No) Contaminated by-products are controlled? 3: Yes, Minimal (~25%).

<sup>9</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 0: No effective decontaminant or process.

<sup>10</sup> M3 – (Level) Of biological contamination after decontamination procedures. 3: Less than infective dose levels/casualty-producing toxin-exposure levels against three key threat agents.

<sup>11</sup> M4 – (Level) Of radiological contamination after decontamination procedures. 4: <0.33 cGy/hour residual dose rate.

<sup>12</sup> M5 – (Yes/No) Cross-contamination is controlled? 3: Yes, Minimal (~25%).

- <sup>13</sup> M1 – (Yes/No) Contaminated by-products are controlled? 7: Yes, Substantial (~75%).
- <sup>14</sup> M5 – (Yes/No) Cross-contamination is controlled? 7: Yes, Substantial (~75%).
- <sup>15</sup> M8 – (Yes/No) There is effective DOTLPF in place to conduct task? 5: Many critical aspects of DOTLPF for the task to be performed with this system are addressed.
- <sup>16</sup> M1 – (Yes/No) Contaminated by-products are controlled? 10: Yes, Complete (100%).
- <sup>17</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 5: Decontaminate all CWAs, some NTAs to a level that will allow unprotected exposure.
- <sup>18</sup> M5 – (Yes/No) Cross-contamination is controlled? 10: Yes, Complete (100%).
- <sup>19</sup> M7 – (Time) To complete the decontamination mission for fixed sites. 6: <1 hour.

### 17.18.3 Functional Solution Analysis

#### 17.18.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, the deficiency is then reassessed in the IMA section.

**1. Deficiency:** Immediate response capability is limited.

**Partial Non-Materiel Solutions:** *Doctrine (partial):* Promulgate doctrine, policy, procedures, and TTPs for immediate response capability to assess and characterize contamination and mitigate resolve contamination. *Organization (partial):* Develop organization structures, capacities, and considerations to support decontamination. *Training (partial):* Develop institutional and unit-level training, exercises, and evaluations, including participation by surrounding civil authorities as appropriate, to perform decontamination of contaminated facilities. *Leadership (partial):* Provide awareness for contaminated facilities through operations, training, and guidance for prioritization of decontamination efforts to maintain operational capabilities, willingness, and ability to adapt and change tasking as necessary to consider presence of contamination and maintain operational effectiveness. *Personnel (partial):* Develop requirements necessary for eligible civilians to support missions and to meet minimum standards for safe use of CBRND resources. *Facilities (partial):* Supporting infrastructure (e.g., power production, water management, logistics, etc.) to support planned decontamination efforts.

**2. Deficiency:** Time required for weathering may be extensive.

**Non-Materiel Solutions:** *Doctrine:* Modify doctrine to include more specific procedures for weathering of contaminated facilities. *Training:* Train individuals on weathering risks, processes, and procedures.

**3. Deficiency:** Runoff may be contaminated.

**Non-Materiel Solutions:** *Doctrine (partial):* Modify doctrine to consider contaminated runoff as an operational consideration. Doctrine should address how to dispose of or neutralize runoff. *Training (partial):* Modify training to consider contaminated runoff as an operational consideration. Training should address how to dispose of or neutralize runoff.

**4. Deficiency:** Decontaminants may be incompatible with each other.

**Non-Materiel Solutions:** *Doctrine (partial):* Change doctrine to provide procedures so that decontaminants can be used in series in some way that will reduce the ill effects of the incompatibility. *Training (partial):* Modify soldier training to ensure understanding of the incompatibilities and the solutions.

**5. Deficiency:** Persistent spores difficult to decontaminate.

**Non-Materiel Solutions:** None.

**6. Deficiency:** Operational and thorough decontamination procedures are time/labor-intensive.

**Non-Materiel Solutions:** *Doctrine (partial):* Modify existing doctrine, policy, and procedures to address reduced manpower and equipment requirements for decontamination. *Training (partial):* Modify institutional and unit-level training to include reduced manpower and equipment requirements for decontamination.

7. **Deficiency:** Inability to decontaminate hard-to-reach areas using current applicators.

**Non-Materiel Solutions:** None.

8. **Deficiency:** Inability to decontaminate absorbent materials.

**Non-Materiel Solutions:** *Doctrine (partial):* Modify doctrine to include procedures for removing or replacing porous materials.

### 17.18.3.2 IMA Assessment Summary

Table 17.18-2 identifies which of the materiel approaches might address specific materiel gaps identified in the DOTMLPF assessment.

Table 17.18-2. TASUST 18: IMA Assessment

Identified Gaps	Ideas for Materiel Approaches (IMA)																		
	Enzymes	Aqueous Oxidants/ Nucleophiles	Mixed (Water/Nonaqueous Solvent) Oxidants/Nucleophiles	Reactive Nonaqueous Liquids	Reactive Gases and Vapors	Low-Temperature Thermal (Accelerated Weathering)	Sorption	Water/Steam Wash	Self-Decontaminating Coatings	(Nonaqueous) Solvent Wash	Ionizing/Nonionizing Radiation	Plasma	Containment System	Recycling Decontaminant System	Multiheaded nozzle	Extended Range	Large-Coverage Sprayer System	Robotic or Semiautonomous System	Electrostatic Decontamination System
Runoff may be contaminated.	X			X	X			X	X			X	X	X					X

Inability to decontaminate hard-to-reach areas using current applicators.	X	X	X	X		X	X	X	X	X					X	X	X	X	
Inability to decontaminate absorbent materials.										X									

**17.19 Task TASUST 19: Decontaminate fixed-facility interiors****17.19.1 Functional Area Analysis****17.19.1.1 Definition**

To decontaminate the interior of fixed facilities such as buildings, warehouses, shelters, hangers, etc. Includes minimizing effects of contaminants and decontaminants on operations.

**17.19.1.2 Derivation**

*UJTL (TA 7, TA 7.1), Protection Joint Functional Concept.*

**17.19.1.2.1 Supported Task:** OPSUST 11

**17.19.1.2.2 Lateral Task:** TASHA 24

**17.19.1.2.3 Supporting Task:** N/A

**17.19.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Hot and very cold air temperature. (C1.3.1.3.1)
2. Negligible light. (C1.3.2.1)
3. Nuclear effects. (C1.3.3.1)
4. Chemical effects. (C1.3.3.2)
5. Biological effects. (C1.3.3.3)
6. Varied surface materials.

**Military**

1. Stressful mission. (C2.1)
2. Marginal forces allocated. (C2.2.3)
3. Low personnel capability. (C2.2.4)
4. Negligible personnel experience. (C2.2.4.5)
5. Severe personnel fatigue. (C2.2.4.6)
6. Limited, little, or no lift assets. (C2.5.2)
7. Limited or no host-nation support. (C2.8.5)
8. Ambiguous threat existence. (C2.9.3)

**Civil**

1. Disputed legality. (C3.1.1.4)
2. Adversarial media relations. (C3.1.1.5)

3. Limited or negative foreign government support. (C3.1.2.3)
4. Aggressively opposed foreign public opinion. (C3.1.2.4)
5. High mission priority. (C3.1.3.2)
6. Presence of internationally significant cultural sites. (C3.2.4)

## **17.19.2 Functional Needs Analysis**

### **17.19.2.1 Capabilities and Deficiencies Assessment Summary**

Table 17.19-1 presents individual and overall current, near-/mid-term, and far-term capabilities to perform the task to the designated standard. There are three current capabilities used to accomplish this task and two projected capabilities to be added in the future.

#### **Current Capabilities and Deficiencies**

The principal capabilities associated with the decontamination of fixed facility interiors include STB, HTH, and soap and water. These decontaminants are applied using applicators such as scrub brushes, mops, rags as well as gas generators. Current deficiencies include the lack of doctrine and TTPs for interior decontamination, inability to decontaminate porous materials and hard-to-reach areas such as ventilation systems, and the lack of noncorrosive decontaminants.

#### **Projected Near/Mid-Term Capabilities and Deficiencies**

The projected near/mid-term capabilities and deficiencies evaluated were associated with JPID Increment I.

#### **Projected Far-Term Capabilities and Deficiencies**

The projected near/mid-term capabilities and deficiencies evaluated were associated with JPID Increment II and JPDS Increments I and II.

Table 17.19-1. TASUST 19: Capabilities and Deficiencies Assessment

	FAA Measure	Elaboration	Scale
M1	(Yes/No) Contaminated by-products are controlled?	Contaminated by-products are controlled. Where by-products are less than 100% controlled, measures must be in place to prevent cross-contamination from becoming an unacceptable hazard.	10: Yes, Complete (100%). 7: Yes, Substantial (~75%). 5: Yes, Partial (~50%). 3: Yes, Minimal (~25%). 0: No, Contaminated by-products cannot be controlled and present an unacceptable hazard.
M2	(Level) Of chemical contamination after decontamination procedures.	The level of chemical contamination is acceptable after decontamination operations from a starting liquid challenge of 1 g/m <sup>2</sup> . Agents defined as current-generation CWAs, NTAs, TIMs, and TICs.	10: Decontaminate all CWAs, NTAs, TIMs to general population exposure limits. 7: Decontaminate all CWAs, all NTAs, and some TIMs to a level that will allow unprotected exposure. 5: Decontaminate all CWAs and some NTAs to a level that will allow unprotected exposure. 3: Decontaminate most CWAs to a level that will allow unprotected exposure. 0: No effective decontaminant or process.

M3	(Level) Of biological contamination after decontamination procedures.	The level of biological contamination (to include toxins) is acceptable after decontamination operations from starting challenges of greater than $1.0 \times 10^8$ CFU/PFU/m <sup>2</sup> . Vegetative and nonvegetative bacteria are measured in CFU/m <sup>2</sup> , and viruses are measured in PFU/m <sup>2</sup> .	10: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against all threat agents. 9: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against nine or more key threat agents. 8: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against eight or more key threat agents. 7: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against seven or more key threat agents. 6: 0 CFU/PFU/m <sup>2</sup> —total removal or neutralization of toxins against six or more key threat agents. 5: Less than infective dose levels/casualty-producing toxin exposure levels against five or more key threat agents. 4: Less than infective dose levels/casualty-producing toxin exposure levels against four key threat agents. 3: Less than infective dose levels/casualty-producing toxin exposure levels against three key threat agents. 2: Less than infective dose levels/casualty-producing toxin exposure levels against two or more key threat agents. 1: Less than infective dose levels/casualty-producing toxin exposure levels against one key threat agent. 0: More than infective dose levels/casualty-producing toxin exposure levels.
M4	(Level) Of radiological contamination after decontamination procedures.	The level of radiological contamination is acceptable after decontamination operations from a starting challenge of 0.4 g/m <sup>2</sup> of insoluble radioactive contaminants, 37–200 µm in size and 185 GBq/m <sup>2</sup> gamma activity. 0.33 cGy/hour equates to an exposure that can cause mild incapacitation in 2.5% or less of unprotected, not previously exposed personnel.	10: Total removal to natural background level. 8: ≤0.11 cGy/hour residual dose rate. 6: ≤0.22 cGy/hour residual dose rate. 4: <0.33 cGy/hour residual dose rate. 2: 0.33 cGy residual dose rate. 0: Removal capabilities limited or ineffective, allowing excessive residual dose rates >0.33 cGy.
M5	(Yes/No) Cross-contamination is controlled?	Cross-contamination is controlled. Where cross-contamination is less than 100% controlled, measures must be in place to prevent cross-contamination from becoming an unacceptable hazard.	10: Yes, Complete (100%). 7: Yes, Substantial (~75%). 5: Yes, Partial (~50%). 3: Yes, Minimal (~25%). 0: No, Cross-contamination cannot be controlled and presents an unacceptable hazard.

M6	(Time) To conduct decontamination.	Time required to conduct thorough decontamination on 3000 m <sup>2</sup> of surface area.	10: Immediately 9: <15 minutes 8: <30 minutes 7: <45 minutes 6: <1 hour 5: <2 hours 4: <4 hours 3: <6 hours 2: <8 hours 1: <12 hours 0: >12 hours
M7	(Percent) Of interior areas/systems unusable due to the effects of decontamination.	The quantity of systems that may be rendered unserviceable by decontamination process must be minimized.	10: 0% 9: <1% 8: <2% 7: <3% 6: <4% 5: <5% 4: <6% 3: <7% 2: <8% 1: <9% 0: ≥10%
M8	(Percent) Of interior area/systems and contents/materials that require repair or replacement due to the effects of decontamination.	The quantity of repairs or parts replacements required due to decontamination process must be minimized.	10: 0% 9: <1% 8: <2% 7: <3% 6: <4% 5: <5% 4: <6% 3: <7% 2: <8% 1: <9% 0: ≥10%
M9	(Yes/No) Decontamination procedures are logistically supportable?	Decontamination procedures must be logistically supportable.	10: No negative impacts on operations. 7: Limited negative impact on operational capability. 5: Moderate negative impact on operational capability. 3: Major negative impact on operational capability. 0: Not logistically supportable.

M10	(Yes/No) There is effective DOTLPF in place to conduct task?	Refers to non-materiel elements associated with the execution of a task with the system.	10: DOTLPF is adequate for all tasks to be performed with this system without limitations that cause significant impact upon operations. 7: DOTLPF is adequate for most of the tasks to be performed with this system without limitations that cause significant impact upon operations. 5: Many critical aspects of DOTLPF for the task to be performed with this system are addressed. 3: Some critical aspects of DOTLPF for the task to be performed with this system are addressed. 0: DOTLPF is completely inadequate or does not exist for the tasks to be performed with this system.
-----	--	--	---

<sup>1</sup> M1 – (Yes/No) Contaminated by-products are controlled? 5: Yes, Partial (~50%).

<sup>2</sup> M3 – (Level) Of biological contamination after decontamination procedures. 5: Less than infective dose levels/casualty-producing toxin-exposure levels against five or more key threat agents.

<sup>3</sup> M5 – (Yes/No) Cross-contamination is controlled? 5: Yes, Partial (~50%).

<sup>4</sup> M6 – (Time) To conduct decontamination. 1: <12 hours.

<sup>5</sup> M7 – (Percent) Of interior areas/systems unusable due to the effects of decontamination. 5: <5%.

<sup>6</sup> M8 – (Percent) Of interior area/systems and contents/materials that require repair or replacement due to the effects of decontamination. 0: ≥10%.

<sup>7</sup> M9 – (Yes/No) Decontamination procedures are logistically supportable? 3: Major negative impact on operational capability.

<sup>8</sup> M10 – (Yes/No) There is effective DOTLPF in place to conduct task? 3: Some critical aspects of DOTLPF for the task to be performed with this system are addressed.

<sup>9</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 3: Decontaminate most CWAs to a level that will allow unprotected exposure.

<sup>10</sup> M1 – (Yes/No) Contaminated by-products are controlled? 3: Yes, Minimal (~25%).

<sup>11</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 0: No effective decontaminant or process.

<sup>12</sup> M3 – (Level) Of biological contamination after decontamination procedures. 3: Less than infective dose levels/casualty-producing toxin-exposure levels against three key threat agents.

<sup>13</sup> M4 – (Level) Of radiological contamination after decontamination procedures. 4: <0.33 cGy/hour residual dose rate.

<sup>14</sup> M5 – (Yes/No) Cross-contamination is controlled? 3: Yes, Minimal (~25%).

<sup>15</sup> M8 – (Percent) Of interior area/systems and contents/materials that require repair or replacement due to the effects of decontamination. 5: <5%.

<sup>16</sup> M1 – (Yes/No) Contaminated by-products are controlled? 10: Yes, Complete (100%)

<sup>17</sup> M3 – (Level) Of biological contamination after decontamination procedures. 7: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against seven or more key threat agents.

<sup>18</sup> M5 – (Yes/No) Cross-contamination is controlled? 10: Yes, Complete (100%).

<sup>19</sup> M6 – (Time) To conduct decontamination. 3: <6 hours.

<sup>20</sup> M7 – (Percent) Of interior areas/systems unusable due to the effects of decontamination. 9: <1%.

<sup>21</sup> M8 – (Percent) Of interior area/systems and contents/materials that require repair or replacement due to the effects of decontamination. 8: <2%.

<sup>22</sup> M10 – (Yes/No) There is effective DOTLPF in place to conduct task? 7: DOTLPF is adequate for most of the tasks to be performed with this system without limitations that cause significant impact upon operations.

<sup>23</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 5: Decontaminate all CWAs, some NTAs to a level that will allow unprotected exposure.

<sup>24</sup> M3 – (Level) Of biological contamination after decontamination procedures. 8: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against eight or more key threat agents.

<sup>25</sup> M4 – (Level) Of radiological contamination after decontamination procedures. 8: ≤0.11 cGy/hour residual dose rate.

<sup>26</sup> M10 – (Yes/No) There is effective DOTLPF in place to conduct task? 10: DOTLPF is adequate for all tasks to be performed with this system without limitations that cause significant impact upon operations.

<sup>27</sup> M1 – (Yes/No) Contaminated by-products are controlled? 7: Yes, Substantial (~75%).

<sup>28</sup> M5 – (Yes/No) Cross-contamination is controlled? 7: Yes, Substantial (~75%).

<sup>29</sup> M9 – (Yes/No) Decontamination procedures are logistically supportable? 5: Moderate negative impact on operational capability.

<sup>30</sup> M8 – (Percent) Of interior area/systems and contents/materials that require repair or replacement due to the effects of decontamination. 1: <9%.

### 17.19.3 Functional Solution Analysis

#### 17.19.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, the deficiency is then reassessed in the IMA section.

- 1. Deficiency:** Insufficient doctrine to provide specific procedure for interior fixed-facility immediate decontamination.  
**Non-Materiel Solutions:** *Doctrine:* Revise current doctrine *FM 3-11.34* to include interior facility immediate, operational, and thorough decontamination. *Organization:* Organizational structures (e.g., manning, tasking, etc.) and capabilities to complete immediate decontamination of facility interiors to including addressing organizational issues (e.g., who provides CBRND equipment, support forces to train and equip, etc.) related to provision of CBRND resources to eligible civilians (e.g., civilian contractors, government employees, etc.). *Training:* Institutional and unit-level training and evaluations, including participation by surrounding civil authorities as appropriate, for facility interior immediate decontamination. *Personnel:* Requirements eligible civilians supporting the mission meet minimum standards for use of CBRND equipment. *Facilities:* Designate supporting infrastructure for conducting decontamination and residual management.
- 2. Deficiency:** Runoff may be contaminated.  
**Non-Materiel Solutions:** *Doctrine (partial):* Modify doctrine to consider contaminated runoff as an operational consideration. Doctrine should address how to dispose of or neutralize runoff. *Training (partial):* Modify training to consider contaminated runoff as an operational consideration. Training should address how to dispose of or neutralize runoff.
- 3. Deficiency:** Decontaminants incompatible with each other.  
**Non-Materiel Solutions:** *Doctrine (partial):* Change doctrine to provide procedures so that decontaminants can be used in series in some way that will reduce the ill effects of the incompatibility. *Training (partial):* Modify soldier training to ensure understanding of the incompatibilities and the solutions.
- 4. Deficiency:** Many decontaminants are toxic and corrosive (HTH/STB/paraformaldehyde, etc.).  
**Non-Materiel Solutions:** None.
- 5. Deficiency:** Peroxyacetic acid is caustic and corrosive at concentrations of 10% or greater.  
**Non-Materiel Solutions:** None.
- 6. Deficiency:** Peroxyacetic acid can be used on only hard surfaces.  
**Non-Materiel Solutions:** None.
- 7. Deficiency:** Flushing does not neutralize agents.  
**Non-Materiel Solutions:** None.

- 8. Deficiency:** Some use of decontaminants requires additional operator protection.  
**Non-Materiel Solutions:** *Training (partial):* Institutional and unit-level training in CBRND protective equipment for decontamination operations *Personnel (partial):* Requirements eligible civilians supporting the mission meet minimum standards for use of CBRND equipment.
- 9. Deficiency:** Areas difficult to reach for decontamination.  
**Non-Materiel Solutions:** None.
- 10. Deficiency:** Toxic agent sodium bisulfate is used to break down the chlorine dioxide gas.  
**Non-Materiel Solutions:** None.
- 11. Deficiency:** Chlorine dioxide can produce architectural damage, damage to electrical equipment, and/or produce strain resistance to antimicrobials.  
**Non-Materiel Solutions:** None.
- 12. Deficiency:** Radiological contamination removal is time-intensive.  
**Non-Materiel Solutions:** None.
- 13. Deficiency:** Ventilation decontamination will require more time and extensive labor and costs.  
**Non-Materiel Solutions:** *Doctrine (partial):* Develop doctrine for fixed facility interior decontamination to ensure efficient, cost-effective operations *Training (partial):* Train individuals on fixed-facility interior decontamination procedures.
- 14. Deficiency:** Time/labor/high cost–intensive.  
**Non-Materiel Solutions:** None.
- 15. Deficiency:** Inability to decontaminate porous materials.  
**Non-Materiel Solutions:** None.

#### 17.19.3.2 IMA Assessment Summary

Table 17.19-2 identifies which of the materiel approaches might address specific materiel gaps identified in the DOTMLPF assessment.

Table 17.19-31. TASUST 19: IMA Assessment

Identified Gaps	Ideas for Materiel Approaches (IMA)

**17.20 Task TASUST 20: Decontaminate open areas****17.20.1 Functional Area Analysis****17.20.1.1 Definition**

To decontaminate terrain that must be occupied or cannot otherwise be avoided.

**17.20.1.2 Derivation**

*UJTL (TA 7, TA 7.1), Protection Joint Functional Concept.*

**17.20.1.2.1 Supported Tasks: OPSUST 8, OPSUST 11****17.20.1.2.2 Lateral Task: TASHA 24****17.20.1.2.3 Supporting Task: N/A****17.20.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Tropical, arctic, and arid climate. (C1.3.1)
2. All seasons. (C1.3.1.1)
3. Precipitating and stormy weather. (C1.3.1.3)
4. Hot and very cold air temperature. (C1.3.1.3.1)
5. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6.1)
6. Negligible light. (C1.3.2.1)
7. Nuclear effects (C1.3.3.1)
8. Chemical effects. (C1.3.3.2)
9. Biological effects. (C1.3.3.3)
10. Variety of surfaces to be decontaminated (i.e., soil, concrete).

**Military**

1. Stressful mission. (C2.1)
2. Marginal forces allocated. (C2.2.3)
3. Low personnel capability. (C2.2.4)
4. Negligible personnel experience. (C2.2.4.5)
5. Severe personnel fatigue. (C2.2.4.6)
6. Limited, little, or no lift assets. (C2.5.2)
7. Little or no reception facilities. (C2.5.4.1)
8. Little pier space. (C2.5.4.1.1)
9. Little or no bed-down facilities. (C2.5.4.2.1)
10. Limited or no host-nation support. (C2.8.5)

## 11. Ambiguous threat existence. (C2.9.3)

### Civil

1. Disputed legality. (C3.1.1.4)
2. Adversarial media relations. (C3.1.1.5)
3. Limited or negative foreign government support. (C3.1.2.3)
4. Aggressively opposed foreign public opinion. (C3.1.2.4)
5. Moderate mission priority. (C3.1.3.2)
6. Presence of internationally significant cultural sites. (C3.2.4)

## 17.20.2 Functional Needs Analysis

### 17.20.2.1 Capabilities and Deficiencies Assessment Summary

Table 17.20-1 presents individual and overall current, near-/mid-term, and far-term capabilities to perform the task to the designated standard. There are five current capabilities used to accomplish this task and two projected capabilities to be added in the future.

#### Current, Near/Mid-Term Capabilities and Deficiencies

The current capabilities and deficiencies associated with the decontamination of terrain include weathering, flushing with water, soil removal, covering and neutralizing with appropriate decontaminants. Deficiencies include the requirement for large amounts of personnel, equipment and time, as well as the ineffectiveness of the process.

#### Projected Far-Term Capabilities and Deficiencies

The projected far-term capabilities and deficiencies evaluated were associated with JSTDSS Increment II and JSTDSS-LS Increments I and II.

Table 17.20-1. TASUST 20: Capabilities and Deficiencies Assessment

Vegetative and nonvegetative bacteria are measured in CFU/m <sup>2</sup> , and viruses are measured in PFU/m <sup>2</sup> .	<p>10: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against all threat agents.</p> <p>9: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against nine or more key threat agents.</p> <p>8: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against eight or more key threat agents.</p> <p>7: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against seven or more key threat agents.</p> <p>6: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against six or more key threat agents.</p> <p>5: Less than infective dose levels/casualty-producing toxin exposure levels against five or more key threat agents.</p> <p>4: Less than infective dose levels/casualty-producing toxin exposure levels against four key threat agents.</p> <p>3: Less than infective dose levels/casualty-producing toxin exposure levels against three key threat agents.</p> <p>2: Less than infective dose levels/casualty-producing toxin exposure levels against two or more key threat agents.</p> <p>1: Less than infective dose levels/casualty-producing toxin exposure levels against one key threat agent.</p> <p>0: More than infective dose levels/casualty-producing toxin exposure levels.</p>
M4	(Level) Of radiological contamination after decontamination procedures.	The level of radiological contamination is acceptable after decontamination operations from a starting challenge of 0.4 g/m <sup>2</sup> of insoluble radioactive contaminants, 37–200 µm in size and 185 GBq/m <sup>2</sup> gamma activity. 0.33 cGy/hour equates to an exposure that can cause mild incapacitation in 2.5% or less of unprotected, not previously exposed personnel.	<p>10: Total removal to natural background level.</p> <p>8: ≤0.11 cGy/hour residual dose rate.</p> <p>6: ≤0.22 cGy/hour residual dose rate.</p> <p>4: &lt;0.33 cGy residual dose rate.</p> <p>2: 0.33 cGy/hour residual dose rate.</p> <p>0: Removal capabilities limited or ineffective, allowing excessive residual dose rates &gt;0.33 cGy.</p>
M5	(Yes/No) Cross-contamination is controlled?	Cross-contamination is controlled. Where cross-contamination is less than 100% controlled, measures must be in place to prevent cross-contamination from becoming an unacceptable hazard.	<p>10: Yes, Complete (100%).</p> <p>7: Yes, Substantial (~75%).</p> <p>5: Yes, Partial (~50%).</p> <p>3: Yes, Minimal (~25%).</p> <p>0: No, Cross-contamination cannot be controlled and presents an unacceptable hazard.</p>

M6	(Yes/No) Decontamination procedures are logistically supportable?	Decontamination procedures must be logistically supportable.	10: No negative impacts on operations. 7: Limited negative impact on operational capability. 5: Moderate negative impact on operational capability. 3: Major negative impact on operational capability. 0: Not logistically supportable.
M7	(Time) To conduct decontamination.	Time required to decontaminate 10,000 m <sup>2</sup> of surface area.	10: Immediately 9: <15 minutes 8: <30 minutes 7: <45 minutes 6: <1 hour 5: <2 hours 4: <3 hours 3: <4 hours 2: <8 hours 1: <12 hours 0: >12 hours
M8	(Yes/No) There is effective DOTLPF in place to conduct task?	Refers to non-materiel elements associated with the execution of a task with the system.	10: DOTLPF is adequate for all tasks to be performed with this system without limitations that cause significant impact upon operations. 7: DOTLPF is adequate for most of the tasks to be performed with this system without limitations that cause significant impact upon operations. 5: Many critical aspects of DOTLPF for the task to be performed with this system are addressed. 3: Some critical aspects of DOTLPF for the task to be performed with this system are addressed. 0: DOTLPF is completely inadequate or does not exist for the tasks to be performed with this system.

<sup>1</sup> M1 – (Yes/No) Contaminated by-products are controlled? 3: Yes, Minimal (~25%).

<sup>2</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 0: No effective decontaminant or process.

<sup>3</sup> M4 – (Level) Of radiological contamination after decontamination procedures. 4: <0.33 cGy residual dose rate.

<sup>4</sup> M5 – (Yes/No) Cross-contamination is controlled? 3: Yes, Minimal (~25%).

<sup>5</sup> M6 – (Yes/No) Decontamination procedures are logistically supportable? 3: Major negative impact on operational capability.

<sup>6</sup> M7 – (Time) To conduct decontamination. 0: >12 hours.

<sup>7</sup> M8 – (Yes/No) There is effective DOTLPF in place to conduct task? 3: Some critical aspects of DOTLPF for the task to be performed with this system are addressed.

<sup>8</sup> M3 – (Level) Of biological contamination after decontamination procedures. 0: More than infective dose levels/casualty-producing toxin-exposure levels.

<sup>9</sup> M7 – (Time) To conduct decontamination. 3: <4 hours.

<sup>10</sup> M1 – (Yes/No) Contaminated by-products are controlled? 5: Yes, Partial (~50%).

<sup>11</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 3: Decontaminate most CWAs to a level that will allow unprotected exposure.

<sup>12</sup> M3 – (Level) Of biological contamination after decontamination procedures. 5: Less than infective dose levels/casualty-producing toxin-exposure levels against five or more key threat agents.

<sup>13</sup> M5 – (Yes/No) Cross-contamination is controlled? 5: Yes, Partial (~50%).

<sup>14</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 5: Decontaminate all CWAs, some NTAs to a level that will allow unprotected exposure.

<sup>15</sup> M6 – (Yes/No) Decontamination procedures are logistically supportable? 0: Not logistically supportable.

<sup>16</sup> M6 – (Yes/No) Decontamination procedures are logistically supportable? 5: Moderate negative impact on operational capability.

<sup>17</sup> M7 – (Time) To conduct decontamination. 5: <2 hours.

<sup>18</sup> M8 – (Yes/No) There is effective DOTLPF in place to conduct task? 7: DOTLPF is adequate for most of the tasks to be performed with this system without limitations that cause significant impact upon operations.

### 17.20.3 Functional Solution Analysis

#### 17.20.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, the deficiency is then reassessed in the IMA section.

1. **Deficiency:** No capability to respond and deliver decontaminant in a timely manner.  
**Partial Non-Materiel Solutions:** *Doctrine/Training (partial):* Develop doctrine and training to ensure efficient response.
2. **Deficiency:** Time required for weathering may be extensive.  
**Non-Materiel Solutions:** *Doctrine (partial):* Modify doctrine to include more specific procedures for weathering of terrain. *Training (partial):* Train individuals on weathering risks, processes, and procedures.
3. **Deficiency:** Removing significant amounts of contaminated soil are time, labor and materiel intensive.  
**Non-Materiel Solutions:** None.
4. **Deficiency:** Use of STB slurry is time- and material-sensitive.  
**Non-Materiel Solutions:** None.
5. **Deficiency:** Lack of efficient applicators for large areas.  
**Non-Materiel Solutions:** None.
6. **Deficiency:** Flushing is less effective against thickened agents.  
**Non-Materiel Solutions:** None.
7. **Deficiency:** Covering is only applicable to alpha and some beta emitters, ineffective for gamma emitters.  
**Non-Materiel Solutions:** *Doctrine:* Develop procedures to quickly and effectively remove gamma hazards.

#### 17.20.3.2 IMA Assessment Summary

There are four physical processes and five chemical processes as well as containment and a recycle system that are applicable for the decontamination of personnel. Table 17.20-2 identifies which of the materiel approaches might address specific materiel gaps identified in the DOTMLPF assessment.

Table 17.20-2. TASUST 20: IMA Assessment

<div>Identified Gaps</div> <div>Ideas for Materiel Approaches (IMA)</div>	Enzymes	Aqueous Oxidants/ Nucleophiles	Mixed (Water/Nonaqueous Solvent) Oxidants/ Nucleophiles	Reactive Nonaqueous Liquids	Low-Temperature Thermal (Accelerated Weathering)	Nonaqueous Solvents	Extended Range	Aerial Delivery Platform	Large-Coverage Sprayer System	Robotic or Semiautonomous System
Covering is applicable only to alpha and some beta emitters, ineffective for gamma emitters.										X
Agent may eventually penetrate covering.										X

**17.21 Task TASUST 21: Decontaminate cargo and supplies, including POL, ammunition, and packaged food****17.21.1 Functional Area Analysis****17.21.1.1 Definition**

To decontaminate pallets, containers, and their packaging materials, along with supplies such as petroleum, oil, and lubricants (POL); ammunition; and packaged food. Includes minimizing effects of contaminants and decontaminants on operations.

**17.21.1.2 Derivation**

*UJTL (TA 7, TA 7.1), Protection Joint Functional Concept.*

**17.21.1.2.1 Supported Tasks: OPSUST 8, OPSUST 11****17.21.1.2.2 Lateral Task: TASHA 24****17.21.1.2.3 Supporting Task: N/A****17.21.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Extremely rough sea state. (C1.2.1.3)
2. Tropical, arctic, and arid climate. (C1.3.1)
3. All seasons. (C1.3.1.1)
4. Precipitating and stormy weather. (C1.3.1.3)
5. Hot and very cold air temperature. (C1.3.1.3.1)
6. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6.1)
7. Negligible light. (C1.3.2.1)
8. Nuclear effects. (C1.3.3.1)
9. Chemical effects. (C1.3.3.2)
10. Biological effects. (C1.3.3.3)

**Military**

1. Stressful mission. (C2.1)
2. Location—ashore/afloat. (C2.1.4.1)
3. Minimal to short time available. (C2.1.5)
4. Marginal forces allocated. (C2.2.3)
5. Some to no interoperability. (C2.2.6)
6. Low personnel capability. (C2.2.4)
7. Negligible personnel experience. (C2.2.4.5)

8. Severe personnel fatigue. (C2.2.4.6)
9. Limited, little, or no lift assets. (C2.5.2)
10. Negligible CONUS resupply. (C2.8.3)
11. Limited or no host-nation support. (C2.8.5)
12. Limited or negligible commercial procurement. (C2.8.6)
13. Ambiguous threat existence. (C2.9.3)

### **Civil**

1. Limited or negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)
3. Moderate mission priority. (C3.1.3.2)

## **17.21.2 Functional Needs Analysis**

### **17.21.2.1 Capabilities and Deficiencies Assessment Summary**

Table 17.21-1 presents individual and overall current, near-/mid-term, and far-term capabilities to perform the task to the designated standard. There are 10 current capabilities used to accomplish this task and one projected capability to be added in the future.

#### **Current Capabilities and Deficiencies**

The current capabilities and deficiencies associated with the decontamination of cargo and supplies (including POL, ammunition, and packaged food). According to subject matter experts, the decontamination of fuel is not required. For the others, weathering is the principal capability if time allows; however, alternatives include the use of STB, HTH, and soap and water applied with appropriate applicators or scrub brushes and wipes. Many of these decontaminants are corrosive and may have damaging effects. Weathering is time-consuming.

#### **Projected Near/Mid-Term Capabilities and Deficiencies**

In the near/mid-term future, the introduction of the JSTDS decontamination system will provide specified decontaminants, if required, capable of rapidly decontaminating CBRN/TIM hazards from the surfaces of cargo and supplies (including POL, ammunition, and packaged food).

#### **Projected Far-Term Capabilities and Deficiencies**

In the far-term future, the JSTDS decontamination system will provide specified decontaminants, if required, capable of rapidly decontaminating CBRN/TIM hazards on cargo and supplies (including POL, ammunition, and packaged food).

	FAA Measure	Elaboration	Scale
M1	(Yes/No) Contaminated by-products are controlled?	Contaminated by-products are controlled. Where by-products are less than 100% controlled, measures must be in place to prevent cross-contamination from becoming an unacceptable hazard.	10: Yes, Complete (100%). 7: Yes, Substantial (~75%). 5: Yes, Partial (~50%). 3: Yes, Minimal (~25%). 0: No, Contaminated by-products cannot be controlled and present an unacceptable hazard.
M2	(Level) Of chemical contamination after decontamination procedures.	The level of chemical contamination is acceptable after decontamination operations from a starting liquid challenge of 10 g/m <sup>2</sup> . Agents defined as current-generation CWAs, NTAs, TIMs, and TICs.	10: Decontaminate all CWAs, NTAs, TIMs to general population exposure limits. 7: Decontaminate all CWAs, all NTAs, and some TIMs to a level that will allow unprotected exposure. 5: Decontaminate all CWAs and some NTAs to a level that will allow unprotected exposure. 3: Decontaminate most CWAs to a level that will allow unprotected exposure. 0: No effective decontaminant or process.

M3	(Level) Of biological contamination after decontamination procedures.	The level of biological contamination (to include toxins) is acceptable after decontamination operations from starting challenges of greater than $1.0 \times 10^8$ CFU/PFU/m <sup>2</sup> . Vegetative and nonvegetative bacteria are measured in CFU/m <sup>2</sup> , and viruses are measured in PFU/m <sup>2</sup> .	<p>10: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against all threat agents.</p> <p>9: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against nine or more key threat agents.</p> <p>8: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against eight or more key threat agents.</p> <p>7: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against seven or more key threat agents.</p> <p>6: 0 CFU/PFU/m<sup>2</sup>—total removal or neutralization of toxins against six or more key threat agents.</p> <p>5: Less than infective dose levels/casualty-producing toxin exposure levels against five or more key threat agents.</p> <p>4: Less than infective dose levels/casualty-producing toxin exposure levels against four key threat agents.</p> <p>3: Less than infective dose levels/casualty-producing toxin exposure levels against three key threat agents.</p> <p>2: Less than infective dose levels/casualty-producing toxin exposure levels against two or more key threat agents.</p> <p>1: Less than infective dose levels/casualty-producing toxin exposure levels against one key threat agent.</p> <p>0: More than infective dose levels/casualty-producing toxin exposure levels.</p>
M4	(Level) Of radiological contamination after decontamination procedures.	The level of radiological contamination is acceptable after decontamination operations from a starting challenge of 0.4 g/m <sup>2</sup> of insoluble radioactive contaminants, 37–200 µm in size and 185 GBq/m <sup>2</sup> gamma activity. 0.33 cGy/hour equates to an exposure that can cause mild incapacitation in 2.5% or less of unprotected, not previously exposed personnel.	<p>10: Total removal to natural background level.</p> <p>8: ≤0.11 cGy/hour residual dose rate.</p> <p>6: ≤0.22 cGy/hour residual dose rate.</p> <p>4: &lt;0.33 cGy/hour residual dose rate.</p> <p>2: 0.33 cGy/hour residual dose rate.</p> <p>0: Removal capabilities limited or ineffective, allowing excessive residual dose rates &gt;0.33 cGy.</p>
M5	(Yes/No) Cross-contamination is controlled?	Cross-contamination is controlled. Where cross-contamination is less than 100% controlled, measures must be in place to prevent cross-contamination from becoming an unacceptable hazard.	<p>10: Yes, Complete (100%).</p> <p>7: Yes, Substantial (~75%).</p> <p>5: Yes, Partial (~50%).</p> <p>3: Yes, Minimal (~25%).</p> <p>0: No, Cross-contamination cannot be controlled and presents an unacceptable hazard.</p>

M6	(Time) To initiate decontamination procedures.	Initiate thorough decontamination procedures within adequate amount of time.	10: Immediately 9: 15 minutes 8: 30 minutes 7: 45 minutes 6: <1 hour 5: <2 hours 4: <3 hours 3: <4 hours 2: <5 hours 1: <6 hours 0: >6 hours
M7	(Time) To conduct decontamination procedures.	Time required per item for thorough decontamination.	10: Immediately 9: <1 minute 8: <2 minutes 7: <3 minutes 6: <4 minutes 5: <5 minutes 4: <7 minutes 3: <9 minutes 2: <12 minutes 1: <15 minutes 0: >15 minutes
M8	(Percent) Of cargo/supplies unusable due to the effects of decontamination.	The quantity of cargo/supplies that may be rendered unserviceable by decontamination process must be minimized.	10: 0% 9: <1% 8: <2% 7: <3% 6: <4% 5: <5% 4: <6% 3: <7% 2: <8% 1: <9% 0: ≥10%

M9	(Percent) Of cargo/supplies that require repair or replacement due to the effects of decontamination.	The quantity of repairs or parts replacements required due to decontamination process must be minimized.	10: 0% 9: <1% 8: <2% 7: <3% 6: <4% 5: <5% 4: <6% 3: <7% 2: <8% 1: <9% 0: ≥10%
M10	(Yes/No) Decontamination procedures are logistically supportable?	Decontamination procedures must be logistically supportable.	10: No negative impacts on operations. 7: Limited negative impact on operational capability. 5: Moderate negative impact on operational capability. 3: Major negative impact on operational capability. 0: Not logistically supportable.
M11	There is effective DOTLPP in place to conduct task?	Refers to non-materiel elements associated with the execution of a task with the system.	10: DOTLPP is adequate for all tasks to be performed with this system without limitations that cause significant impact upon operations. 7: DOTLPP is adequate for most of the tasks to be performed with this system without limitations that cause significant impact upon operations. 5: Many critical aspects of DOTLPP for the task to be performed with this system are addressed. 3: Some critical aspects of DOTLPP for the task to be performed with this system are addressed. 0: DOTLPP is completely inadequate or does not exist for the tasks to be performed with this system.

<sup>1</sup> M1 – (Yes/No) Contaminated by-products are controlled? 7: Yes, Substantial (~75%).

<sup>2</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 3: Decontaminate most CWAs to a level that will allow unprotected exposure.

<sup>3</sup> M3 – (Level) Of biological contamination after decontamination procedures. 5: Less than infective dose levels/casualty-producing toxin-exposure levels against five or more key threat agents.

<sup>4</sup> M5 – (Yes/No) Cross-contamination is controlled? 7: Yes, Substantial (~75%).

<sup>5</sup> M6 – (Time) To initiate decontamination procedures. 8: 30 minutes.

<sup>6</sup> M7 – (Time) To conduct decontamination procedures. 1: <15 minutes.

<sup>7</sup> M8 – (Percent) Of cargo/supplies unusable due to the effects of decontamination. 0: ≥10%.

<sup>8</sup> M9 – (Percent) Of cargo/supplies that require repair or replacement due to the effects of decontamination. 0: ≥10%.

<sup>9</sup> M10 – (Yes/No) Decontamination procedures are logistically supportable? 3: Major negative impact on operational capability.

<sup>10</sup> M11 – There is effective DOTLPP in place to conduct task? 5: Many critical aspects of DOTLPP for the task to be performed with this system are addressed.

<sup>11</sup> M6 – (Time) To initiate decontamination procedures. 9: 15 minutes.

<sup>12</sup> M1 – (Yes/No) Contaminated by-products are controlled? 3: Yes, Minimal (~25%).

<sup>13</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 0: No effective decontaminant or process.

<sup>14</sup> M3 – (Level) Of biological contamination after decontamination procedures. 3: Less than infective dose levels/casualty-producing toxin-exposure levels against three key threat agents.

<sup>15</sup> M4 – (Level) Of radiological contamination after decontamination procedures. 4: <0.33 cGy/hour residual dose rate.

<sup>16</sup> M5 – (Yes/No) Cross-contamination is controlled? 3: Yes, Minimal (~25%).

<sup>17</sup> M7 – (Time) To conduct decontamination procedures. 5: <5 minutes.

<sup>18</sup> M11 – There is effective DOTLPF in place to conduct task? 7: DOTLPF is adequate for most of the tasks to be performed with this system without limitations that cause significant impact upon operations.

<sup>19</sup> M1 – (Yes/No) Contaminated by-products are controlled? 10: Yes, Complete (100%).

<sup>20</sup> M2 – (Level) Of chemical contamination after decontamination procedures. 5: Decontaminate all CWAs, some NTAs to a level that will allow unprotected exposure.

<sup>21</sup> M5 – (Yes/No) Cross-contamination is controlled? 10: Yes, Complete (100%).

<sup>22</sup> M11 – There is effective DOTLPF in place to conduct task? 10: DOTLPF is adequate for all tasks to be performed with this system without limitations that cause significant impact upon operations.

<sup>23</sup> M10 – (Yes/No) Decontamination procedures are logistically supportable? 5: Moderate negative impact on operational capability.

### 17.21.3 Functional Solution Analysis

#### 17.21.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, the deficiency is then reassessed in the IMA section.

1. **Deficiency:** Some decontaminants may damage sensitive parts on ammunition.  
**Non-Materiel Solutions:** None.
2. **2 Deficiency:** Decontaminants, such as STB/HTH, may remove critical markings or corrode ammunition.  
**Non-Materiel Solutions:** *Doctrine (partial):* Modify doctrine to include more detailed ammunition-specific decontamination protocol.
3. **Deficiency:** Weathering is time-consuming.  
**Non-Materiel Solutions:** *Doctrine (partial):* Modify doctrine to include specific weathering procedures.
4. **Deficiency:** Cargo support items such as netting and wood pallets may absorb chemical agents.  
**Non-Materiel Solutions:** None.

#### 17.21.3.2 IMA Assessment Summary

Table 17.21-2 identifies which of the materiel approaches might address specific materiel gaps identified in the DOTMLPF assessment.

Table 17.21-2 TASUST 21: IMA Assessment

Identified Gaps	Ideas for Materiel Approaches (IMA)													
	Enzymatic	Aqueous Oxidants/Nucleophiles	Mixed (Water/Nonaqueous Solvent) Oxidants/Nucleophiles	Reactive Nonaqueous Liquids	Reactive Gases and Vapors	Low-Temperature Thermal (Accelerated Weathering)	Sorption	Water/Steam Wash	Self-Decontaminating Coatings	(Nonaqueous) Solvent Wash	Ionizing/Nonionizing Radiation	Plasma	Robotic or Semiautonomous System	Electrostatic Decontamination System

**17.22 Task TASUST 22: Conduct transload operations****17.22.1 Functional Area Analysis****17.22.1.1 Definition**

To support force deployment and sustainment operations by conducting the transload of cargo and passengers. This task includes the movement of cargo/passengers from uncontaminated to contaminated lift platforms for subsequent movement into contaminated air/sea ports of debarkation. Retrograde cargo and redeploying passengers departing contaminated areas must be thoroughly decontaminated to meet internationally accepted decontamination standards (when available).

**17.22.1.2 Derivation**

Perform this task under conditions of:

**Physical**

1. Extremely rough sea state. (C1.2.1.3)
2. Tropical, arctic, and arid climate. (C1.3.1)
3. All seasons. (C1.3.1.1)
4. Precipitating and stormy weather. (C1.3.1.3)
5. Hot and very cold air temperature. (C1.3.1.3.1)
6. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6.1)
7. Negligible light. (C1.3.2.1)
8. Persistent CBRN effects. (C1.3.3.1-3)

**Military**

1. Stressful mission. (C2.1)
2. Marginal forces allocated. (C2.2.3)
3. Some or no interoperability. (C2.2.6)
4. Low personnel capability. (C2.2.4)
5. Negligible personnel experience. (C2.2.4.5)
6. Severe personnel fatigue. (C2.2.4.6)

7. Limited, little, or no lift assets (C2.5.2)
8. Limited or no host-nation support. (C2.8.5)
9. Ambiguous treat existence. (C2.9.3)

### **Civil**

- Limited or negative foreign government support. (C3.1.2.3)
- Aggressively opposed foreign public opinion. (C3.1.2.4)
- High mission priority. (C3.1.2.4)

## **17.22.2 Functional Needs Analysis**

### **17.22.2.1 Capabilities and Deficiencies Assessment Summary**

Table 17.22-1 shows the capabilities and deficiencies associated with conducting isolation operations. Capabilities encompass the component or unit commander establishing specific plans and executing transload operations following directives passed down from the joint task force (JTF) commander. Deficiencies include limited resources to conduct transload operations.

#### **Current Capabilities and Deficiencies**

The component or unit commander must plan and execute a transload operation, which comprises the transfer of cargo and personnel from a strategic aircraft into a tactical aircraft. Table 17.22-1 shows overall capabilities and deficiencies associated with conducting transload operations. Deficiencies include the lack of developed plans to conduct transload operations. Other deficiencies involve the lack of preexisting agreements that allow forces to cross borders and utilize host-nation or foreign nation's assets. In addition, personnel lack training in the conduct of transload operations. The overall current capability is "yellow."

#### **Projected Near/Mid-Term Capabilities and Deficiencies**

No foreseeable change in capability in the near/mid term. The overall capability in the near/mid term remains "yellow."

#### **Projected Far-Term Capabilities and Deficiencies**

Improvements in decontamination capability and the incorporation of the results of exercises and experiments will improve DOTLPF in the far term. Overall capability will improve to "green."

Table 17.22-1. TASUST 22: Capabilities and Deficiencies Assessment

Capability: Transload Operations	M1	M2	M3	M4	M5
Current Overall Capabilities	8	8	6	8	6
Near/Mid-Term Overall Capabilities	8	8	6	8	6
Far-Term Overall Capabilities	8	8	10	8	10

	FAA Measure	Elaboration	Scale
M1	Clean and contaminated zones are established at the transload site to separate clean and dirty lift assets, cargo, and passengers.	The establishment of clean and contaminated zones at the transload site used to separate clean and dirty lift assets, cargo, and passengers.	8–10: Full capability to establish clean and contaminated zones. 4–7: Partial capability to establish clean and contaminated zones. 1–3: Limited capability to establish clean and contaminated zones. 0: No capability to establish clean and contaminated zones.
M2	An exchange zone is established to prevent the spread of contaminants.	The establishment of exchange zones at the transload site is used to prevent the spread of contamination.	8–10: Full capability to establish an exchange zone. 4–7: Partial capability to establish an exchange zone. 1–3: Limited capability to establish an exchange zone. 0: No capability to establish an exchange zone.
M3	Retrograde cargo and redeploying personnel at the transload site are decontaminated to internationally accepted standards (when available) by the unit of assignment.	The cargo and personnel (OCONUS) are decontaminated to internationally accepted standards (when available) by the assigned decontamination unit.	8–10: Full capability to decontaminate cargo and personnel. 4–7: Partial capability to decontaminate cargo and personnel. 1–3: Limited capability to decontaminate cargo and personnel. 0: No capability to decontaminate cargo and personnel.
M4	Cargo/passenger transload site is identified for transload of deploying forces and sustainment cargo from uncontaminated to contaminated lift assets for movement into contaminated ports of debarkation.	The cargo and/or passenger transload site is identified for transload of deploying forces and sustainment cargo from uncontaminated to contaminated lift assets for movement into contaminated ports of debarkation or final destination.	8–10: Full capability to identify transload site. 4–7: Partial capability to identify transload site. 1–3: Limited capability to identify transload site. 0: No capability to identify transload site.
M5	There is effective DOTLPF in place to conduct task.	Assessment of the extent of DOTLPF to enable task performance.	8–10: Complete DOTLPF in place to execute task. 4–7: Partial DOTLPF in place to execute task. 1–3: Limited DOTLPF in place to execute task. 0: No DOTLPF in place to execute task.

### 17.22.3 Functional Solution Analysis

#### 17.22.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or there are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

**1. Deficiency:** Lack of training to support transload operations.

**Non-Materiel Solutions:** *Training:* Develop new training programs that will provide knowledge, skills, and abilities for units conducting transload operations. Programs include training areas and facilities for units to stay proficient and rehearse various transload mission scenarios.

**2. Deficiency:** Lack of defined treaties and agreements to allow transload operations.

**Non-Materiel Solutions:** *Doctrine:* Develop treaties and agreements with coalition nations and host-nations to support transload operations. *Facilities:* The agreements must include crossing borders and the execution of missions to conduct transload operations such as airfield utilization.

#### 17.22.3.2 IMA Assessment Summary

The analysis of this task has determined the need for non-materiel solutions only, and therefore no IMAs are required.

**17.23 Task TASUST 23: Produce potable water in a contaminated environment****17.23.1 Functional Area Analysis****17.23.1.1 Definition**

To produce potable water from a contaminated source. The spectrum includes individual means of production as well as large-scale efforts.

**17.23.1.2 Derivation**

*UJTL (TA 7, TA 7.1), Protection Joint Functional Concept.*

**17.23.1.2.1 Supported Tasks:** OPSUST 8, OPSUST 11

**17.23.1.2.2 Lateral Task:** N/A

**17.23.1.2.3 Supporting Task:** N/A

**17.23.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Somewhat accessible subsurface water. (C1.1.2.3)
2. High saline content. (C1.2.1.5)
3. Great ocean ice thickness. (C1.2.1.11)
4. Arctic and arid climate. (C1.3.1)
5. Very cold air temperature. (C1.3.1.3.1)
6. Nuclear effects. (C1.3.3.1)
7. Chemical effects. (C1.3.3.2)
8. Biological effects. (C1.3.3.3)

**Military**

1. Stressful mission. (C2.1)
2. Location—ashore/afloat. (C2.1.4.1)
3. Minimal to short time available. (C2.1.5)
4. Marginal forces allocated. (C2.2.3)
5. Low personnel capability. (C2.2.4)
6. Severe personnel fatigue. (C2.2.4.6)
7. Some or no interoperability. (C2.2.6)
8. Limited, little, or no lift assets. (C2.5.2)
9. Limited or no host-nation support. (C2.8.5)
10. Limited or negligible commercial procurement. (C2.8.6)
11. Ambiguous threat existence. (C2.9.3)

**Civil**

1. Limited or negative foreign government support. (C3.1.2.3)
2. High mission priority. (C3.1.3.2)

**17.23.2 Functional Needs Analysis****17.23.2.1 Capabilities and Deficiencies Assessment Summary**

Table 17.23-1 shows the current capabilities and deficiencies for the production of potable water. Capabilities include reverse osmosis, batch chlorination, and filtering. Deficiencies include the inability to purify chemically and radiologically contaminated water on an individual basis as well as a limited number of reverse osmosis water purification units (ROWPUs) with centralized production and distribution.

**Current Capabilities and Deficiencies**

Reverse osmosis is a purification process in which filtered water is pumped against a semipermeable membrane under great pressure. The membrane allows product water to pass through while rejecting the impurities, both suspended and dissolved. Extremely high pressures must be used to get a useful volume of water passing through a unit area of membrane. Chlorine is the disinfectant agent usually specified for military use. Presently, this is the only widely accepted agent that destroys organisms in water and leaves an easily detectable residual that serves as a tracer element. Sudden disappearance of chlorine residual signals potential contamination in the system. No other available disinfectant is as acceptable or adaptable for potable water treatment operations as chlorine. A major disadvantage is that chlorine reacts with certain organic compounds to form trihalomethanes, a known carcinogen. Table 17.23-1 lists the overall capabilities and deficiencies associated with the bulk water production (reverse osmosis and chemical means) and whether the means are adequate for current operations. Individual and small unit water production is nonexistent for chemically and radiological contaminated water. There are currently no projected capabilities being assessed that would increase effectiveness in conducting and completing this task.

**Projected Near/Mid-Term Capabilities and Deficiencies**

No foreseeable change in capability in the near/mid term.

**Projected Far-Term Capabilities and Deficiencies**

No foreseeable change in capability in the far term.

Table 17.23-1. TASUST 23: Capabilities and Deficiencies Assessment

System/Measure	M1	M2	M3	M4	M5
<b>Current</b>					
Reverse Osmosis Water Purification Unit (Chemical, Biological, Radiological)	8	10	6	6	8
Chemical Disinfectants (Biological) Chlorination	8	3	8	6	6
<b>Current Overall Capabilities</b>	8	7	7	6	7
<b>Near/Mid-Term Overall Capabilities</b>	8	7	7	6	7
<b>Far-Term Overall Capabilities</b>	8	7	7	6	7

	FAA Measure	Elaboration	Scale
M1	Volume/time to complete decontamination process.	Assessment of the acceptability of water throughput rates to meet operational requirement.	8–10: Acceptable throughput to meet operational requirement. 4–7: Marginal throughput to meet operational requirement. 1–3: Limited throughput to meet operational requirement. 0: Throughput does not meet operational requirement.
M2	Water is potable.	Extent to which capability yields potable water under varying circumstances and in the presence of range of contaminants.	8–10: Capability yields potable water in all circumstances and under full range of contaminants. 4–7: Capability yields potable water under most circumstances and with most contaminants. 1–3: Capability yields potable water only under select circumstances or for select contaminants. 0: Capability is ineffective in producing potable water.
M3	Decontamination procedures are logistically supportable.	Extent to which decontamination procedures are logistically supportable.	8–10: Capability and procedures are fully supportable. 4–7: Capability and procedures are somewhat supportable. 1–3: Capability and procedures can only be supported with great effort. 0: Capability and procedures are not logistically supportable.
M4	Coordination exists with water purification assets.	Extent to which coordination is performed with all purification assets, including unit leadership, medical, logistics, and purification unit.	8–10: Complete coordination with all assets (leadership, medical, logistics, etc.). 4–7: Partial coordination. 1–3: Limited coordination. 0: No coordination of assets.
M5	There is effective DOTLPF in place to conduct task.	Extent to which DOTLPF exists to support execution of the task.	8–10: Complete DOTLPF in place to execute task. 4–7: Partial DOTLPF in place to execute task. 1–3: Limited DOTLPF in place to execute task. 0: No DOTLPF in place to execute task.

### 17.23.3 Functional Solution Analysis

#### 17.23.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or there are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** No individual capability to purify water that has been contaminated by chemical or radioactive materials.  
**Non-Materiel Solutions:** None.
2. **Deficiency:** The number of ROWPUs and centralized distribution and production are limited.  
**Non-Materiel Solutions:** *Doctrine:* Increased use of bottled and brick water sources in lieu of additional water purification teams and equipment could provide additional water supplies at the expense of heavy logistical burdens in transportation and distributions. *Personnel:* Additions of personnel and equipment could reduce loads placed on existing teams.
3. **Deficiency:** Current chemical disinfectants do not neutralize some spores. (Biological)  
**Non-Materiel Solutions:** None.

#### 17.23.3.2 IMA Assessment Summary

Table 17.23-2 identifies which of the materiel approaches might address specific materiel gaps identified in the DOTMLPF assessment.

Table 17.23-2. TASUST 23: IMA Assessment

<div>Identified Gaps</div> <div>Ideas for Materiel Approaches (IMA)</div>	Coagulation Sediment Filtration	Granular Activated Carbon	Microfiltration	Lime Softening	Ion Exchange	Reverse Osmosis	Ultrafiltration	Disinfection, Chlorine	Disinfection, Ozone	Disinfection, UV Irradiation
No individual capability to purify water that has been contaminated by chemical or radioactive materials.		X			X		X			X
Limited number of ROWPUs and centralized distribution and production. (More efficient field-expedient replacement with a lighter, logistical tail possibly portable).	X	X	X	X	X	X	X	X	X	X
Does not neutralize some spores. (Biological)			X		X	X	X	X	X	X

**17.24 Task TASUST 24: Conduct tactical risk assessment of units, equipment, facilities, activities, or terrain that are contaminated for restoration prioritization and timing****17.24.1 Functional Area Analysis****17.24.1.1 Definition**

To assess units, equipment, facilities, activities, or terrain that are contaminated to determine restoration prioritization and whether or not the timing of such operations must be modified to fit the tactical situation. The component commander makes this assessment in the context of his tactical priorities. Decisions are designed to preserve operational tempo.

**17.24.1.2 Derivation**

OPSUST 3.

**17.24.1.2.1 Supported Tasks:** OPSUST 1, OPSUST 6, OPSUST 8, OPSUST 9, OPSUST 10, OPSUST 11

**17.24.1.2.2 Lateral Task:** TASHA 6

**17.24.1.2.3 Supporting Task:** N/A

**17.24.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Persistent CBR effects. (C1.3.3.1-3)

**Military**

1. Stressful mission. (C2.1)
2. No mission preparation. (C2.1.3)
3. Negligible personnel experience. (C2.2.4.5)
4. Moderate rear-area security. (C2.7.1)
5. Fully developed state of conflict. (C2.10.1)

**Civil**

1. Limited foreign government support. (C3.1.2.3)

## **17.24.2 Functional Needs Analysis**

### **17.24.2.1 Capabilities and Deficiencies Assessment Summary**

Table 17.24-1 discusses the capability that currently exists to perform the task to the designated standard. Any tactical unit staff has a team of operational planners and command and control specialists and most have CBRN subject matter experts. This team of experts has the skill to conduct tactical risk assessment of units, equipment, facilities, activities, or terrain that are contaminated for restoration prioritization and timing, but there are some deficiencies that impact on the speed they will be able to operate.

#### **Current Capabilities and Deficiencies**

Any tactical unit staff has the ability to assist the unit commander to direct, control, and coordinate operations of assigned and attached forces, to assess units, equipment, facilities, activities, or terrain that are contaminated to determine restoration prioritization and to coordinate plan for changes required by the status of subordinate component commands. Table 17.24-1 lists the overall capabilities and deficiencies associated with the staff's ability to assess contamination reports for operational degradation implications and restoration operation requirements. While the staff has the ability to manually assess the situation and determine priorities, it is unlikely they will be able to meet the time requirements without automated assistance and the development of specific doctrine and TTPs. There are currently no projected capabilities being assessed that would increase effectiveness in conducting and completing this task.

#### **Projected Near/Mid-Term Capabilities and Deficiencies**

There are currently no projected capabilities being assessed that would increase effectiveness in conducting and completing this task.

#### **Projected Far-Term Capabilities and Deficiencies**

There are currently no projected capabilities being assessed that would increase effectiveness in conducting and completing this task.

**Table 17.24-1. TASUST 24: Capabilities and Deficiencies Assessment**

<b>Capability: Tactical Unit Staff</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>	<b>M6</b>	<b>M7</b>	<b>M8</b>	<b>M9</b>
<b>Current Overall Capabilities</b>	6	6	6	6	6	6	6	6	3
<b>Near/Mid-Term Overall Capabilities</b>	6	6	6	6	6	6	6	6	3
<b>Far-Term Overall Capabilities</b>	6	6	6	6	6	6	6	6	3

	<b>FAA Measure</b>	<b>Elaboration</b>	<b>Scale</b>
M1	Time after contamination until reports are received.	Capability enables rapid reporting of contamination.	8–10: Full capability. 4–7: Partial capability. 1–3: Limited capability. 0: No capability.
M2	Time after contamination reports are received until unit operational risk assessment is completed.	Capability enables rapid assessment of contamination reports.	8–10: Full capability. 4–7: Partial capability. 1–3: Limited capability. 0: No capability.
M3	Time after unit operational risk assessment is completed that operation priorities are determined.	Capability enables rapid formulation of operational priorities.	8–10: Full capability. 4–7: Partial capability. 1–3: Limited capability. 0: No capability.
M4	Percent accuracy of data transmitted/disseminated.	None required.	8–10: Accuracy of transmitted/disseminated data is very good. 4–7: Accuracy of transmitted/disseminated data is good. 1–3: Accuracy of transmitted/disseminated data is poor. 0: Accuracy of transmitted/disseminated data is very poor.
M5	Percent of information passed within established time criteria.	Capability enables rapid transmission/dissemination of information.	8–10: Full capability. 4–7: Partial capability. 1–3: Limited capability. 0: No capability.
M6	Percent accuracy of unit operational risk assessment.	None required.	8–10: Accuracy of assessment is very good. 4–7: Accuracy of assessment is good. 1–3: Accuracy of assessment is poor. 0: Accuracy of assessment is very poor.
M7	Percent accuracy of restoration operation priority determination.	None required.	8–10: Accuracy of priority determination is very good. 4–7: Accuracy of priority determination is good. 1–3: Accuracy of priority determination is poor. 0: Accuracy of priority determination is very poor.

M8	Time required to modify restoration operation priority determination after substantive operational changes are assessed.	Capability enables rapid modification of restoration operation priorities.	8–10: Full capability. 4–7: Partial capability. 1–3: Limited capability. 0: No capability.
M9	There is effective DOTLPF in place to conduct task.	Assessment of the extent of DOTLPF to enable task performance.	8–10: Complete DOTLPF in place to execute task. 4–7: Partial DOTLPF in place to execute task. 1–3: Limited DOTLPF in place to execute task. 0: No DOTLPF in place to execute task.

### 17.24.3 Functional Solution Analysis

#### 17.24.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** The current capability is not automated, slowing down the process.  
**Non-Materiel Solutions:** None.
2. **Deficiency:** More detailed specific information and checklists useful for time-sensitive situations are not available.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs to include time-saving procedures and checklists.
3. **Deficiency:** A restoration exercise focused on risk assessment of units, equipment, facilities, activities or terrain that is contaminated for restoration prioritization and timing has not been conducted.  
**Non-Materiel Solutions:** *Training:* Conduct an exercise (or experimentation) that will produce lessons learned and actionable recommendations.
4. **Deficiency:** After unit operational risk assessment is completed, there are no TTPs to help determine restoration operation priorities.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs that provide guidance on restoration prioritization and timing.
5. **Deficiency:** No doctrine has been developed.  
**Non-Materiel Solutions:** *Doctrine:* Promulgate doctrine that provides information on tactical risk assessment of units, equipment, facilities, activities, or terrain that are contaminated for restoration prioritization and timing.
6. **Deficiency:** The linkage of restoration operations and operational risk assessment is not integrated into leader education.  
**Non-Materiel Solutions:** *Leadership:* Leader education should provide a command and staff focus on tactical risk assessment of units, equipment, facilities, activities, or terrain that are contaminated for restoration prioritization and timing.

#### 17.24.3.2 IMA Assessment Summary

Table 17.24-2 is a possible idea for a materiel approach and a corresponding description of that idea. There is the possibility of an automated information distribution software and system that are applicable for conducting tactical risk assessment of units, equipment, facilities, activities, or terrain that are contaminated for restoration prioritization and timing.

**Table 17.24-2. TASUST 24: IMA Assessment**

<b>Capability Gap</b>	<b>Idea for Materiel Approach</b>	<b>Description</b>
The current capability is not automated, slowing down the process.	Automated information distribution software and system	<p>Based on the inability to conduct a tactical risk assessment of units, equipment, facilities, activities, or terrain that are contaminated and to disseminate information necessary for restoration prioritization in a rapid and accurate method.</p> <p>There is a requirement for automated systems that will collect, organize, and disseminate information rapidly and accurately to prioritize restoration efforts.</p>

**17.25 Task TASUST 25: Assess the impact of restoration activities on tactical objectives****17.25.1 Functional Area Analysis****17.25.1.1 Definition**

To make an assessment that determines how the required restoration activities of key units, facilities, or equipment will impact current or projected tactical objectives. Some contaminated units or facilities must undergo restoration operations within a short time period or risk becoming completely combat ineffective.

**17.25.1.2 Derivation**

OPSUST 4.

**17.25.1.2.1 Supported Tasks:** OPSUST 2, OPSUST 3, OPSUST 4, OPSUST 7, OPSUST 8, OPSUST 9, OPSUST 10, OPSUST 11

**17.25.1.2.2 Lateral Task:** TASHA 7

**17.25.1.2.3 Supporting Task:** N/A

**17.25.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Persistent CBR effects. (C1.3.3.1-3)

**Military**

1. Stressful mission. (C2.1)
2. No mission preparation. (C2.1.3)
3. Negligible personnel experience. (C2.2.4.5)
4. Moderate rear-area security. (C2.7.1)
5. Fully developed state of conflict. (C2.10.1)

**Civil**

1. Limited foreign government support (C3.1.2.3)

## **17.25.2 Functional Needs Analysis**

### **17.25.2.1 Capabilities and Deficiencies Assessment Summary**

Table 17.25-1 discusses a capability that currently exists to perform the task to the designated standard. Any tactical unit staff has a team of operational planners and command and control specialists and most have CBRN subject matter experts. This team of experts has the skill to assess the impact of restoration activities on tactical objectives, but there are some deficiencies that impact on the speed they will be able to operate.

#### **Current Capabilities and Deficiencies**

Any tactical unit staff has the ability to assist the unit commander to direct, control, and coordinate operations of assigned and attached forces and to provide tactical guidance to forces with contaminated units. Table 17.25-1 lists the overall capabilities and deficiencies associated with the staff's ability to assess the impact of restoration activities on tactical objectives. While the staff has the ability to assess the situation and determine priorities, it is unlikely they will be able to meet the time requirements without automated assistance and the development of specific doctrine and TTPs. The overall current assessment is "red."

#### **Projected Near/Mid-Term Capabilities and Deficiencies**

Capability will improve in the near/mid-term as results of the Restoration Operations Advanced Capability Technology Demonstration are incorporated into DOTLPF and TTPs. The overall assessment will improve to "yellow."

#### **Projected Far-Term Capabilities and Deficiencies**

The capability will continue to improve in the far-term as additional exercises and experiments focus on restoration operations. Improvements will be evident in TTPs and DOTLPF. Further, the fielding of automated systems will improve the time and accuracy of restoration operation assessments. The overall assessment will improve to "green" in the far term.

**Table 17.25-1. TASUST 25: Capabilities and Deficiencies Assessment**

<b>Capability: Tactical Unit Staff.</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>
<b>Current Overall Capabilities</b>	5	5	0	5	0
<b>Near/Mid-Term Overall Capabilities</b>	5	5	5	10	5
<b>Far-Term Overall Capabilities</b>	10	10	10	10	10

	<b>FAA Measure</b>	<b>Elaboration</b>	<b>Scale</b>
M1	Time to make determination of restoration operation impact on tactical objectives.	Capability enables determination of restoration operation impact in a timely manner.	8–10: Full capability. 4–7: Partial capability. 1–3: Limited capability. 0: No capability.
M2	Instances of incorrect assessments of impact of restoration operations.	Capability enables the accurate assessment of the impact of restoration operations.	8–10: Full capability. 4–7: Partial capability. 1–3: Limited capability. 0: No capability.
M3	Procedures and checklists are developed to facilitate the ability to assess the impact of required restoration activities on tactical objectives.	Extent to which capability has procedures and checklists.	8–10: Complete procedures and checklists exist. 4–7: Partial procedures and checklists exist. 1–3: Very limited procedures and checklists exist. 0: No procedures or checklists exist.
M4	Joint exercises/experimentation provide lessons learned on procedures for determining restoration operation impact on tactical objectives.	Extent to which exercises and experiments address restoration operations.	8–10: Full range of exercises and experiments in restoration operations. 4–7: Exercises and experiments sometimes address restoration operations. 1–3: Exercises and experiments rarely address restoration operations. 0: Exercises and experiments never address restoration operations.
M5	Effective DOTLPF is in place to conduct this task.	Assessment of the extent of DOTLPF to enable task performance.	8–10: Complete DOTLPF in place to execute task. 4–7: Partial DOTLPF in place to execute task. 1–3: Limited DOTLPF in place to execute task. 0: No DOTLPF in place to execute task.

### 17.25.3 Functional Solution Analysis

#### 17.25.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** The current capability is not automated, slowing down the process. Accuracy is limited to human actions.  
**Non-Materiel Solutions:** None.
2. **Deficiency:** No doctrine or TTPs have been developed.  
**Non-Materiel Solutions:** *Doctrine:* Promulgate Doctrine and TTPs that provide information on assessing the impact of restoration activities on tactical objectives should be developed.
3. **Deficiency:** This assessment process is not integrated into leader education.  
**Non-Materiel Solutions:** *Leadership:* Leader education should provide a command and staff focus on tactical risk assessment of units, equipment, facilities, activities, or terrain that are contaminated for restoration prioritization and timing.

#### 17.25.3.2 IMA Assessment Summary

Table 17.25-2 identifies which of the materiel approaches might address specific materiel gaps identified in the DOTMLPF assessment.

**Table 17.25-2. TASUST 25: IMA Assessment**

<b>Capability Gap</b>	<b>Idea for Materiel Approach</b>	<b>Description</b>
The current capability is not automated, slowing down the process. Accuracy is limited to human actions.	Automated information distribution software and system	<p>Based on the inability to conduct a tactical risk assessment of units, equipment, facilities, activities, or terrain that are contaminated and to disseminate information necessary for restoration prioritization in a rapid and accurate method.</p> <p>There is a requirement for automated systems that will collect, organize, and disseminate information rapidly and accurately to prioritize restoration efforts.</p>

**17.26 Task TASUST 26: Provide tactical guidance to forces with contaminated units****17.26.1 Functional Area Analysis****17.26.1.1 Definition**

To provide specific, tailored tactical guidance to forces that have some or all of their units contaminated. The component commander may determine that some critical units or facilities must continue essential operations for a specified period of time despite contamination, prior to conducting restoration operations. to provide adequate guidance, a complete picture of the projected degradation of the unit/facility over time must be available to the component commander.

**17.26.1.2 Derivation**

OPSUST 5.

**17.26.1.2.1 Supported Tasks:** OPSUST 5, OPSUST 8, OPSUST 11

**17.26.1.2.2 Lateral Task:** TASHA 10

**17.26.1.2.3 Supporting Task:** N/A

**17.26.1.3 Condition**

Perform this task under conditions of.

**Physical**

1. Persistent CBR effects. (C1.3.3.1-3)

M2	Time for commander to forward and disseminate contaminated unit assessment.	Capability enables rapid formulation of and dissemination of contaminated unit assessment	8–10: Full capability. 4–7: Partial capability. 1–3: Limited capability. 0: No capability.
M3	Time to assess current situation and formulate revised plan of action.	Capability to rapidly assess current unit situation and formulate revised plan of action.	8–10: Full capability. 4–7: Partial capability. 1–3: Limited capability. 0: No capability.
M4	Percent of time contamination of forces occurs without options available.	Capability to develop options in the event of force contamination.	8–10: Full capability. 4–7: Partial capability. 1–3: Limited capability. 0: No capability.
M5	Time for component commander to formulate crisis assessment.	Capability to rapidly assess current joint force situation.	8–10: Full capability. 4–7: Partial capability. 1–3: Limited capability. 0: No capability.
M6	Time to adjust original plan for alternate operations (after recognizing planning assumptions invalid).	Capability to rapidly formulate alternate operations in response to joint force contamination.	8–10: Full capability. 4–7: Partial capability. 1–3: Limited capability. 0: No capability.
M7	Time to compile appropriate reports.	Capability to rapidly compile appropriate reports concerning unit contamination.	8–10: Full capability. 4–7: Partial capability. 1–3: Limited capability. 0: No capability.

M8	Time to generate and forward component commander's situation report (SITREP).	Capability to rapidly generate and forward component commander's SITREP to higher headquarters.	8–10: Full capability. 4–7: Partial capability. 1–3: Limited capability. 0: No capability.
M9	Courses of action (COAs) are evaluated to find which are suitable, feasible, acceptable, and complete after assessing capabilities of contaminated units.	Capability to rapidly evaluate COAs for employment of units affected by contamination.	8–10: Full capability. 4–7: Partial capability. 1–3: Limited capability. 0: No capability.
M10	Milestone criteria for plan development are met.	Capability to meet plan development milestone criteria after a COA has been chosen.	8–10: Full capability. 4–7: Partial capability. 1–3: Limited capability. 0: No capability.
M11	Time to complete new executable operational plans and orders (after receipt of commander's estimate).	Capability to rapidly complete executable operational plans and orders after receipt of commander's estimate.	8–10: Full capability. 4–7: Partial capability. 1–3: Limited capability. 0: No capability.
M12	Effective DOTLPF exists to conduct this task.	Assessment of the extent of DOTLPF to enable task performance.	8–10: Complete DOTLPF in place to execute task. 4–7: Partial DOTLPF in place to execute task. 1–3: Limited DOTLPF in place to execute task. 0: No DOTLPF in place to execute task.

<sup>1</sup> No doctrine has been developed. This task is not a standard part of training. This formulation of guidance process is not integrated into leader education.

### 17.26.3 Functional Solution Analysis

#### 17.26.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Contamination information is not automatically updated for the joint force.  
**Non-Materiel Solutions:** None.
2. **Deficiency:** There are no standardized assessment procedures.  
**Non-Materiel Solutions:** *Doctrine:* Develop standardized assessment procedures.
3. **Deficiency:** TTPs on how to specifically adjust original plan for alternate operations and for assessing COAs to find which are suitable, feasible, acceptable, and complete after assessing capabilities of contaminated units do not exist.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs on how to specifically adjust original plan for alternate operations and for assessing COAs to find which are suitable, feasible, acceptable, and complete after assessing capabilities of contaminated units.
4. **Deficiency:** Doctrine has not been developed.  
**Non-Materiel Solutions:** *Doctrine:* Develop doctrine on providing tactical guidance to forces with contaminated units.
5. **Deficiency:** This task is not integrated as a standard part of training.  
**Non-Materiel Solutions:** *Training:* Integrate this task into unit training and develop guidelines for how to do so.
6. **Deficiency:** This assessment process is not integrated into leader education.  
**Non-Materiel Solutions:** *Leadership:* Leader education should provide a command and staff focus on providing tactical guidance to forces with contaminated units.

#### 17.26.3.2 IMA Assessment Summary

Table 17.26-2 is a possible idea for a materiel approach and a corresponding description of that idea. There is the possibility of an automated information distribution software and system that would assist in collecting, organizing, and disseminating contamination information to support the development of assessments and tactical guidance when forces are contaminated.

**Table 17.26-2. TASUST 26: IMA Assessment**

<b>Capability Gap</b>	<b>Idea for Materiel Approach</b>	<b>Description</b>
Contamination information is not automatically updated for the joint force.	Automated information distribution software and system	<p>Based on the inability to conduct a tactical risk assessment of units, equipment, facilities, or activities that are contaminated and to disseminate timely tactical guidance.</p> <p>There is a requirement for automated systems that will collect, organize, and disseminate information rapidly and accurately in order to support development of assessments and tactical guidance.</p>

**17.27 Task TASUST 27: Conduct salvage operations to recover critical materiel****17.27.1 Functional Area Analysis****17.27.1.1 Definition**

To plan, conduct, and control the recovery of critical materiel that is determined salvageable but also may require decontamination prior to retrograde to CONUS or movement to another theater. Includes the recovery, evacuation, and reclamation of damaged, discarded, condemned, or abandoned allied or enemy materiel, ships, craft, and floating equipment for reuse, repair, refabrication, or scrapping. Also includes naval salvage operations such as harbor and channel clearance, diving, hazardous towing and rescue tug services and the recovery of materiel, ships, craft, and floating equipment sunk offshore or elsewhere stranded.

**17.27.1.2 Derivation**

OPSUST 3, OPSUST 9, and OPSUST 12.

**17.27.1.2.1 Supported Tasks:** OPSUST 8, OPSUST 11, OPSUST 13

**17.27.1.2.2 Lateral Task:** N/A

**17.27.1.2.3 Supporting Task:** N/A

**17.27.1.3 Condition**

Perform this task under conditions of:

**Physical**

Mountainous, jungle, desert, and arctic terrain. (C1.1.1)

Steep terrain slope. (C1.1.1.3)

Extensive obstacles to movement. (C1.1.3.4)

Low route availability. (C1.1.3.5)

Deep ocean depth. (C1.2.1.1)

Rough sea state. (C1.2.1.3)

Extremely cold ocean temperature. (C1.2.1.4)

All ocean features. (C1.2.1.6)

Poor divers/swimmers underwater visibility. (C1.2.1.14)

Strong divers/swimmers ocean currents. (C1.2.1.16)

Irregular ocean bottom. (C1.2.2)

Harsh littoral characteristics. (C1.2.4)

High shipping presence. (C1.2.6)

Artic, tropical, and arid climate. (C1.3.1)

Summer and winter season. (C1.3.1.1)

Stormy weather. (C1.3.1.3)

Hot and very cold air temperature. (C1.3.1.3.1)

High surface-wind velocity. (C1.3.1.3.3)  
Liquid, freezing, and frozen precipitation. (C1.3.1.3.6)  
Heavy precipitation intensity. (C1.3.1.3.6.2)  
Extreme turbulence and wind shear. (C1.3.1.3.8)  
Moderately high altitude. (C1.3.1.3.9)  
Very low visibility. (C1.3.2)  
Negligible light. (C1.3.2.1)  
Moderate obscurants. (C1.3.2.2)  
Moderate nuclear effects. (C1.3.3.1)  
Moderate nuclear blast/thermal effects. (C1.3.3.1.1)  
Moderate nuclear radiation effects. (C1.3.3.1.2)  
Persistent blood, blister, choking, incapacitating nerve chemical effects. (C1.3.3.2)  
All pathogens and toxins, biological effects. (C1.3.3.3)

### **Military**

1. Stressful mission. (C2.1)
2. No preexisting arrangements. (C2.1.1.2)
3. Major military commitments to other nations. (C2.1.1.6)
4. Negligible military commitments from other nations. (C2.1.1.7)
5. Partially completed mission preparation. (C2.1.3)
6. Ashore, afloat location. (C2.1.4.1)
7. Two theaters. (C2.1.4.2)
8. Very long intertheater distance. (C2.1.4.4)
9. Short time available. (C2.1.5)
10. Very short mission duration. (C2.1.5.2)
11. Weak forces assigned. (C2.2.1)
12. Marginal forces allocated. (C2.2.3)
13. Low personnel capability. (C2.2.4)
14. Negligible personnel experience. (C2.2.4.5)
15. No interoperability. (C2.2.6)
16. Little or no lift assets. (C2.5.2)
17. Little or no sealift assets. (C2.5.2.1)
18. Limited rear-area security. (C2.7.1)
19. Slow pipeline responsiveness. (C2.8.3.1)
20. No host-nation support. (C2.8.5)
21. Nuclear, chemical and biological threat form. (C2.9.2)
22. Fully developed state of conflict. (C2.10.1)

### **Civil**

1. Negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)

## **17.27.2 Functional Needs Analysis**

### **17.27.2.1 Capabilities and Deficiencies Assessment Summary**

Table 17.27-1 discusses the capability that currently exists to perform the task to the designated standard. Any tactical unit and staff that have a salvage capability can perform this task, but there are some deficiencies that affect the efficiency with which a salvage unit can perform under contamination conditions.

#### **Current Capabilities and Deficiencies**

Any tactical unit and staff with the ability to conduct salvage operations have the ability to conduct salvage operations to recover critical materiel in a contaminated environment/situation. Table 17.27-1 lists the overall capabilities and deficiencies associated with the tactical unit/staff's ability to conduct salvage operations to recover critical materiel in a contaminated environment/situation. In particular, specific doctrine and TTPs that address salvage operations in a chemical, biological, and radiological or nuclear contaminated environment do not exist. Issues such as planning, personal protective equipment, and decontamination are several aspects of salvage operations that must be addressed by procedures and doctrine.

#### **Projected Near/Mid-Term Capabilities and Deficiencies**

There are currently no projected capabilities being assessed that would increase effectiveness in conducting and completing this task.

#### **Projected Far-Term Capabilities and Deficiencies**

There are currently no projected capabilities being assessed that would increase effectiveness in conducting and completing this task.

Table 17.27-1. TASUST 27: Capabilities and Deficiencies Assessment

Capability: Tactical Unit Staff.	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10	M11	M12
Current Overall Capabilities	N/A	N/A	5	5	N/A	5	N/A	6	N/A	N/A	N/A	3
Near/Mid-Term Overall Capabilities	N/A	N/A	5	5	N/A	5	N/A	6	N/A	N/A	N/A	3
Far-Term Overall Capabilities	N/A	N/A	5	5	N/A	5	N/A	6	N/A	N/A	N/A	3

	FAA Measure	Elaboration	Scale
M1	Percent of total losses.	Fraction of recovered items and materiel that cannot be repaired or reused. N/A—This is situation-specific and will vary.	8–10: Most recovered items and materiel can be repaired or reused. 4–7: Some recovered items and materiel can be repaired or reused. 1–3: Little recovered items and materiel can be repaired or reused. 0: No recovered items and materiel can be repaired or reused.
M2	Percent of items recovered.	Fraction of proposed items to be salvaged that are actually recovered. N/A—This is situation-specific and will vary.	8–10: Most items to be salvaged can be recovered. 4–7: Some items to be salvaged can be recovered. 1–3: Few items to be salvaged can be recovered. 0: No items to be salvaged can be recovered.
M3	Percent of contaminated items that cannot be processed in accordance with appropriate regulations.	Capability to decontaminate and repair or reuse salvaged items.	8–10: Most contaminated items can be processed. 4–7: Some contaminated items can be processed. 1–3: Few contaminated items can be processed. 0: No contaminated items can be processed.
M4	Time to appropriately dispose of hazardous material.	Capability to dispose of hazardous material from salvage operations, in a timely manner	8–10: Full capability. 4–7: Partial capability. 1–3: Limited capability. 0: No capability.
M5	Percent of items recovered and salvaged for further use.	Fraction of items recovered that can be used. N/A—This is situation-specific and will vary.	8–10: Most recovered items can be repaired or reused. 4–7: Some recovered items can be repaired or reused. 1–3: Little recovered items can be repaired or reused. 0: No recovered items can be repaired or reused.
M6	Percent of items returned to rear areas for additional decontamination.	Fraction of salvaged items that require additional decontamination in rear areas.	8–10: No items are returned to rear areas for additional decontamination. 4–7: Few items are returned to rear areas for additional decontamination. 1–3: Some items are returned to rear areas for additional decontamination. 0: Most items are returned to rear areas for decontamination.
M7	Percent increase in combat capability.	Increase in combat capability from recovery and repair of salvaged equipment. N/A—This is situation-specific and will vary.	8–10: Substantial increase in combat capability. 4–7: Some increase in combat capability. 1–3: Little increase in combat capability. 0: No increase in combat capability.

M8	Time to conduct salvage.	Capability to conduct salvage operations in a timely manner.	8–10: Most salvage operations can be conducted in a timely manner. 4–7: Some salvage operations can be conducted in a timely manner. 1–3: Few salvage operations can be conducted in a timely manner. 0: No salvage operations can be conducted in a timely manner.
M9	Percent of total materiel disposed of that is contaminated.	Fraction of materiel that is disposed of in a contaminated state. N/A—This is situation-specific and will vary.	8–10: No disposed-of materiel is contaminated. 4–7: Little disposed-of materiel is contaminated. 1–3: Some disposed-of materiel is contaminated. 0: Most disposed-of materiel is contaminated.
M10	Percent of items requiring decontamination.	Fraction of items to be salvaged that are contaminated. NA—This is situation-specific and will vary.	8–10: No items to be salvaged are contaminated. 4–7: Few items to be salvaged are contaminated. 1–3: Some items to be salvaged are contaminated. 0: Most items to be salvaged are contaminated.
M11	Percent of items designated as critical that are recovered and decontaminated within designated time frame.	Fraction of critical items that are recovered and decontaminated in a timely manner. NA—This is situation-specific and will vary.	8–10: Most critical items are recovered and decontaminated in a timely manner. 4–7: Some critical items are recovered and decontaminated in a timely manner. 1–3: Few critical items are recovered and decontaminated in a timely manner. 0: No critical items are recovered and decontaminated in a timely manner.
M12	There is effective DOTLPF in place to conduct this task.	Assessment of the extent of DOTLPF to enable task performance.	8–10: Complete DOTLPF in place to execute task. 4–7: Partial DOTLPF in place to execute task. 1–3: Limited DOTLPF in place to execute task. 0: No DOTLPF in place to execute task.

### 17.27.3 Functional Solution Analysis

#### 17.27.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Procedures to guide recovery of salvageable contaminated critical materiel do not exist.  
**Non-Materiel Solutions:** *Doctrine:* Develop standardized procedures to guide recovery of salvageable contaminated critical materiel.
2. **Deficiency:** There is no specific listing of what can or cannot be decontaminated during salvage operations.  
**Non-Materiel Solutions:** *Doctrine:* Develop a listing of what can or cannot be decontaminated during salvage operations.
3. **Deficiency:** There are no TTPs for disposal in conjunction with salvage operations.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs on how to specifically conduct hazardous disposal in conjunction with salvage operations.
4. **Deficiency:** No specific doctrine exists that has been developed through actionable results of experimentation or lessons learned from exercises.  
**Non-Materiel Solutions:** *Doctrine:* Develop doctrine on recovery of salvageable contaminated critical materiel.
5. **Deficiency:** This task is not integrated into salvage operation training or exercises.  
**Non-Materiel Solutions:** *Training:* Integrate this task into unit training/exercises and develop guidelines for how to do so.

#### 17.27.3.2 IMA Assessment Summary

The analysis of this task has determined the need for non-materiel solutions only, and therefore no IMAs are required.

**17.28 Task TASUST 28: Conduct exploitation operations****17.28.1 Functional Area Analysis****17.28.1.1 Definition**

To conduct exploitation operations. A component commander may be directed by the JTF commander to conduct exploitation operations for the explicit purpose of eliminating the CBRN weapons or capabilities held by an adversary. Specifically, these include U.S. military operations across the range of military operations (ROMO). The assigned task of exploitation includes locating, characterizing, and securing CBRN materiel, weapons, equipment, personnel, and infrastructure, and developing appropriate forensic evidence. Also, it includes field decontamination as required.

**17.28.1.2 Derivation**

OPSUST 14, *Combatant Commander's Planning Guide for WMD Elimination Operations (Draft)*, UJTL (TA 7, TA 7.1).

**17.28.1.2.1 Supported Tasks:** OPSUST 8, OPSUST 11, OPSUST 14

**17.28.1.2.2 Lateral Task:** N/A

**17.28.1.2.3 Supporting Task:** N/A

**17.28.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Mountainous, desert, jungle, arctic terrain. (C1.1.1)
2. Significant urbanization. (C1.1.3.1)
3. Rough sea state. (C1.2.1.3)
4. Tropical, arid, arctic climate. (C1.3.1)
5. Summer, winter season. (C1.3.1.1)
6. Stormy weather. (C1.3.1.3)
7. Hot and very cold air temperature. (C1.3.1.3.1)
8. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6)
9. Heavy precipitation intensity. (C1.3.1.3.6.2)
10. Low visibility. (C1.3.2)
11. Negligible light. (C1.3.2.1)
12. Moderate obscurants. (C1.3.2.2)
13. Moderate nuclear effects. (C1.3.3.1)
14. Persistent blood, blister, choking, incapacitating nerve chemical effects. (C1.3.3.2)
15. All pathogens and toxins, biological effects. (C1.3.3.3)

**Military**

1. Cooperative nation
  - a. Partial preexisting arrangements. (C2.1.1.2)
  - b. Limited military commitments from other nations.(C2.1.1.7)
  - c. Limited host-nation support. (C2.8.5)
2. Uncooperative nation
  - a. No preexisting arrangements. (C2.1.1.2)
  - b. Negligible military commitments from other nations. (C2.1.1.7)
  - c. No host-nation support. (C2.8.5)
3. Common military conditions
  - a. Limited personnel expertise. (C2.2.4.5)
  - b. Chemical, biological, radiological or nuclear threat form. (C2.9.2)

**Civil**

1. Cooperative nation
  - a. Limited foreign government support. (C3.1.2.3)
2. Uncooperative nation
  - a. Negative foreign government support. (C3.1.2.3)
3. Common civil conditions
  - a. Moderate restraints on action. (C3.1.3.4)

**This task is analyzed in the WMD Interdiction and Elimination JCIDS Analysis.**

**17.29 Task TASUST 29: Conduct disposition or destruction operations****17.29.1 Functional Area Analysis****17.29.1.1 Definition**

To conduct disposition or destruction operations. A component or unit commander may be directed by the JTF commander to conduct disposition or destruction operations for the explicit purpose of eliminating the CBRN weapons or capabilities held by an adversary. Specifically, these may include U.S. military operations across the ROMO. The assigned task of disposition or destruction includes destroying, dismantling, rendering safe, removing, transferring, or otherwise verifiably disposing of CBRN materiel, weapons, equipment, and infrastructure. It also includes operations to prevent/reduce the chance for misuse of sensitive materiel.

**17.29.1.2 Derivation**

OPSUST 14, *Combatant Commander's Planning Guide for WMD Elimination Operations (Draft)*, UJTL (TA 7, TA 7.1).

**17.29.1.2.1 Supported Tasks:** OPSUST 8, OPSUST 11, OPSUST 14

**17.29.1.2.2 Lateral Task:** N/A

**17.29.1.2.3 Supporting Task:** N/A

**17.29.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Mountainous, desert, jungle, arctic terrain. (C1.1.1)
2. Significant urbanization. (C1.1.3.1)
3. Rough sea state. (C1.2.1.3)
4. Tropical, arid, arctic climate. (C1.3.1)
5. Summer, winter season. (C1.3.1.1)
6. Stormy weather. (C1.3.1.3)
7. Hot and very cold air temperature. (C1.3.1.3.1)
8. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6)
9. Heavy precipitation intensity. (C1.3.1.3.6.2)
10. Low visibility. (C1.3.2)
11. Negligible light. (C1.3.2.1)
12. Moderate obscurants. (C1.3.2.2)
13. Moderate nuclear effects. (C1.3.3.1)
14. Persistent blood, blister, choking, incapacitating nerve chemical effects. (C1.3.3.2)
15. All pathogens and toxins, biological effects. (C1.3.3.3)

**Military**

1. Cooperative nation
  - a. Partial preexisting arrangements. (C2.1.1.2)
2. Limited military commitments from other nations. (C2.1.1.7)
  - a. Limited host-nation support. (C2.8.5)
3. Uncooperative nation
  - a. No preexisting arrangements. (C2.1.1.2)
  - b. Negligible military commitments from other nations. (C2.1.1.7)
  - c. No host-nation support. (C2.8.5)
4. Common military conditions
  - a. Limited personnel expertise. (C2.2.4.5)
  - b. Chemical, biological, radiological or nuclear threat form. (C2.9.2)

**Civil**

1. Cooperative nation
  - a. Limited foreign government support. (C3.1.2.3)
2. Uncooperative nation
  - a. Negative foreign government support. (C3.1.2.3)
3. Common civil conditions
  - a. Moderate restraints on action. (C3.1.3.4)

**This task is analyzed in the WMD Interdiction and Elimination JCIDS Analysis.**

**17.30 Task TASUST 30: Conduct monitoring and redirection operations****17.30.1 Functional Area Analysis****17.30.1.1 Definition**

To conduct monitoring and redirection operations. A component or unit commander may be directed by the JTF commander to conduct monitoring and redirection operations for the explicit purpose of eliminating the CBRN weapons or capabilities held by an adversary. Specifically, these include U.S. military operations across the ROMO. The assigned task of monitoring and redirection includes monitoring, inspecting, and redirecting/converting former CBRN programs, facilities, and personnel.

**17.30.1.2 Derivation**

OPSUST 14, *Combatant Commander's Planning Guide for WMD Elimination Operations (Draft)*, UJTL (TA 7, TA 7.1).

**17.30.1.2.1 Supported Tasks:** OPSUST 8, OPSUST 11, OPSUST 14

**17.30.1.2.2 Lateral Task:** TASHA 1

**17.30.1.2.3 Supporting Task:** N/A

**17.30.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Mountainous, desert, jungle, arctic terrain. (C1.1.1)
2. Significant urbanization. (C1.1.3.1)
3. Rough sea state. (C1.2.1.3)
4. Tropical, arid, arctic climate. (C1.3.1)
5. Summer, winter season. (C1.3.1.1)
