MEMORANDUM FOR: SEE DISTRIBUTION

Subject: Chemical, Biological, Radiological, and Nuclear Defense (CBRND)  
Functional Needs Analysis (FNA)/Functional Solutions Analysis (FSA)

1. The Joint Requirements Office (JRO) for Chemical, Biological, Radiological and Nuclear (CBRN) Defense approves the CBRND Functional Needs Analysis (FNA)/Functional Solutions Analysis (FSA) dated October 2005. This Joint analysis has been staffed through all U.S. Armed Services, Combatant Commands, Joint Staff, Functional Capabilities Boards and Defense Intelligence Agency (DIA).

2. The JRO point of contact is Mr. Leroy Bowers, JRO-CBRN Defense, (703) 602-0880/0898.

  
HOWARD B. BROMBERG  
Major General, USA  
Director, Joint Requirements Office  
for Chemical, Biological, Radiological,  
and Nuclear Defense

Enclosures

**DISTRIBUTION:**

Chief of Staff, US Army  
Chief of Naval Operations  
Chief of Staff, US Air Force  
Commandant of the Marine Corps  
Commandant, US Coast Guard  
Assistant Secretary of Defense for Chemical, Biological, Radiological,  
Nuclear Defense  
Commander, US Central Command  
Commander, US European Command  
Commander, US Joint Forces Command  
Commander, US Northern Command  
Commander, US Pacific Command  
Commander, US Southern Command  
Commander, US Special Operations Command  
Commander, US Strategic Command  
Commander, US Transportation Command  
Commander, United Nations Command  
Commander, US Element, NORAD  
Assistant to the Secretary of Defense (NCB)  
Director, Defense Information Systems Agency  
Director, Defense Intelligence Agency  
Director, Defense Threat Reduction Agency  
Director, National Geospatial-Intelligence Agency  
Director, National Security Agency/Chief, Central Security Service  
Army Operations Deputy  
Navy Operations Deputy  
Air Force Operations Deputy  
Marine Corps Operations Deputy  
Director, Joint Program Executive Office for Chemical Biological Defense

# CHAPTER 1. INTRODUCTION

## Executive Summary

This document presents the results of the Functional Needs Analysis/Functional Solutions Analysis (FNA/FSA) for the functional area of chemical, biological, radiological, and nuclear defense (CBRND). The FNA/FSA are structured in accordance with the Chairman of the Joint Chief of Staff Instruction (CJCSI) 3170.01D, *Joint Capabilities Integration and Development System (JCIDS)*, and its companion manual, CJCSM 3170.01A, *Operation of the Joint Capabilities Integration and Development System*.

The JCIDS analysis process is composed of a structured, four-step methodology that defines functional tasks, capabilities to perform the tasks, capability gaps, and potential non-materiel and materiel solutions. Based on national defense policy and centered on a common joint warfighting construct, the analyses initiate the formal development of integrated joint capabilities, to include the identification and justification of requirements necessary to initiate development and acquisition. The requirements are derived from an analysis of existing joint force operations and include doctrine, organization, training, materiel, leadership and education, personnel, and facilities (DOTMLPF) capabilities and deficiencies.

The FNA and FSA analyze and build upon the tasks identified in the previously published Functional Area Analysis (FAA). (The Protection Functional Control Board approved the CBRND FAA on 6 January 2005.) The FNA identifies and assesses the capabilities of the joint force to perform the FAA tasks to designated standards while operating under various (physical, military, and civil) conditions. The resulting capability gaps will be prioritized via the Joint Priority List (JPL) process. The gaps identified within this FNA are addressed in the FSA. First, non-materiel (or DOTLPPF) solutions to these capability gaps are considered. Then, for those capability gaps that are not fully addressed by non-materiel solutions, potential materiel solutions are considered and presented as Ideas for Materiel Approaches (IMAs).

The FNA/FSA retains the structure of the FAA, and for the purpose of clarity, carries over some information from the FAA. In particular, the FNA/FSA restates for each task the following information:

- task title
- task definition
- derivation
- conditions

The task categorization structure of the FAA is reflected in the FNA and FSA in that tasks are categorized by level of war and “S” area. The levels of war, as found in the *Universal Joint Task List (UJTL)* are designated as follows:

- Strategic National (SN)
- Strategic Theater (ST)
- Operational (OP)
- Tactical (TA)

The four “S” areas reflect the operational elements found in the *Protection Joint Functional Concept*:

- Sense
- Shape
- Shield
- Sustain

For each task, the following are highlighted within the FNA:

- Current capabilities and deficiencies
- Projected Near-/Mid-Term (FY2006–FY2011) capabilities and deficiencies
- Projected Far-Term (FY2012–FY2020) capabilities and deficiencies

Similarly, within the FSA, the following assessments are made:

- DOTLPF solution assessment
- IMA assessment

The capability assessment of each area considered by operational “S” area and level of war is shown in the following table. The overall assessment for the area of CBRN defense is “yellow” in the current, near/mid, and far term.

Operational “S” Area by Level of War	Capability		
	Current	Near/Mid	Far
Strategic National Sense	●	●	●
Strategic Theater Sense	●	●	●
Operational Sense	●	●	●
Tactical Sense	●	●	●
Strategic National Shape	●	●	●
Strategic Theater Shape	●	●	●
Operational Shape	●	●	●
Tactical Shape	●	●	●
Strategic National Shield	●	●	●
Strategic Theater Shield	●	●	●
Operational Shield	●	●	●

Operational “S” Area by Level of War	Capability		
	Current	Near/Mid	Far
Tactical Shield	●	●	●
Strategic National Sustain	●	●	●
Strategic Theater Sustain	●	●	●
Operational Sustain	●	●	●
Tactical Sustain	●	●	●
<b>OVERALL</b>	●	●	●

The CBRND FNA/FSA is split into 17 separate chapters (or volumes), as follows:

#### CBRND FNA/FSA Chapters

Chapter Number	Title
1	Introduction
2	Strategic National Sense Tasks
3	Strategic Theater Sense Tasks
4	Operational Sense Tasks
5	Tactical Sense Tasks
6	Strategic National Shape Tasks
7	Strategic Theater Shape Tasks
8	Operational Shape Tasks
9	Tactical Shape Tasks
10	Strategic National Shield Tasks
11	Strategic Theater Shield Tasks
12	Operational Shield Tasks
13	Tactical Shield Tasks
14	Strategic National Sustain Tasks
15	Strategic Theater Sustain Tasks
16	Operational Sustain Tasks
17	Tactical Sustain Tasks

## List of Acronyms

AAS	Advanced Anticonvulsant System
ABCA	American, British, Canadian, and Australian Armies Program
ACADA	Automated Chemical Agent Detector Alarm
AChE	acetylcholinesterase
ACPLA	agent-containing particle(s) per liter of air
ACSA	Acquisition Cross-Service Agreement
A/C SPO	aircraft system program office
ACTD	Advanced Concept Technology Demonstration
AE	aeromedical evacuation
AERP	Aircrew Eye/Respiratory Protection
AF/ILEXR	Air Force Civil Engineer Readiness Program Branch
AFB	Air Force Base
AFCESA	Air Force Civil Engineer Support Agency
AFMIC	Armed Forces Medical Intelligence Center
AFRL	Air Force Research Laboratory
AMEDD	Army Medical Department
AJP	Allied Joint Publication
AMA	Analysis of Materiel Approaches
AO	area of operations
AOR	area of responsibility
AT/FP	antiterrorism/force protection
ATP-45	Allied Technical Protocol 45
BAWS	Biological Agent Warning Sensor
BDO	Battle Dress Overgarment
BIDS	Biological Integrated Detection System
BSK	Biological Sampling Kit
BTWC	Biological and Toxin Weapons Convention
BVO	Black Vinyl Overboot
BW	biological warfare
BWA	biological warfare agent
C2	Command and Control
C4ISR	Command, Control, Communications, Computers, Intelligence, Surveillance, and Reconnaissance
CAM	chemical agent monitor
CAP	crisis action planning
CAPDS	Chemical Agent Point Detector System
CARC	chemical agent-resistant coating
CASCOM	Combined Arms Support Command
CB	chemical and biological
CBA	capabilities-based assessment
CBMS	Chemical Biological Mass Spectrometer
CBPS	Chemically and Biologically Protected Shelter
CBRD	chemical, biological, and radiological defense
CBRN	chemical, biological, radiological, and nuclear

CBRND	chemical, biological, radiological, and nuclear defense
CBRNE	chemical, biological, radiological, nuclear, and high-yield explosives
CCA	contamination control area
CDC	Centers for Disease Control
CDI	Cooperative Defense Initiative
CFFC	Commander Fleet Forces Command
CFU	colony-forming unit
CJCS	Chairman of the Joint Chiefs of Staff
CJCSI	Chairman of the Joint Chiefs of Staff Instruction
CJCSM	Chairman of the Joint Chiefs of Staff Manual
CM	consequence management
CMWD	countermeasures washdown system
COA	course of action
COCOM	combatant command
COG	center of gravity
COLPRO	collective protection
COMINT	communication intelligence
CONOPs	Concept of Operations
CONUS	continental United States
COP	Common Operating Picture
COTS	commercial off-the-shelf
CRP	Contaminated Remains Pouch
CP-DEPMEDS	Chemically Protected Deployable Medical System
CPE	collective protection equipment
CPFC	Chemical Protective Footwear Cover
CPG	Chemical Protective Glove
CPHS	Chemical Protective Helmet System
CPOG	Chemical Protective Over-Garment
CPS	collective protection shelter, or collective protection system
CPU	Chemical Protective Undergarment
CRTI	(Canadian) CBRN Research and Technology Initiative
CW	chemical warfare
CWA	chemical warfare agent
CWC	Chemical Weapons Convention
DCI	Director of Central Intelligence
DCR	DOTMLPF Change Recommendation
DFU	Dry Filter Unit
DIA	Defense Intelligence Agency
DISA	Defense Information Systems Agency
DITSCAP	DoD Information Technology Security Certification and Accreditation Process
DMSS	Defense Medical Surveillance System
DNA	deoxyribose nucleic acid
DoD	U.S. Department of Defense
DOT	U.S. Department of Transportation

DOTLPF	doctrine, organization, training, leadership and education, personnel, and facilities
DOTMLPF	doctrine, organization, training, materiel, leadership and education, personnel, and facilities
DTRA	Defense Threat Reduction Agency
DTRIAC	Defense Threat Reduction Information Analysis Center
DU	depleted uranium
ECP	expedient collective protection
EDS	electrostatic decontamination system
EMP	electromagnetic pulse
EMS	emergency medical services
EOD	explosive ordnance disposal
EPW	enemy prisoner of war
ESF	Emergency Support Function
ESRCBH	Environmental Sheltering with Reduced CB Hazard
FAA	Functional Area Analysis
FAO	Food and Agriculture Organization (of the United Nations)
FDA	Food and Drug Administration
FM	frequency modulation
FM	Field Manual
FMFM	Fleet Marine Forces Manual
FNA	Functional Needs Analysis
FOC	fully operationally capable
FOUO	for official use only
FP	force protection
FSA	Functional Solutions Analysis
FTIR	Fourier transform infrared
GB	sarin
GCCS	Global Command and Control System
GCCS-J	Joint Global Command and Control System
GC/MS	gas chromatography/mass spectrometer (or spectrometry)
GD	soman
GEIS	Global Emerging Infections Surveillance and Response System
GF	cyclosarin
GIG	Global Information Grid
GIS	geographical information system
GM	Geiger-Mueller
GOTS	government off-the-shelf
GPS	Global Positioning System
GVO	Green Vinyl Overboot
HD	sulfur mustard
HHA	handheld assay
HLS	homeland security
HQ	Headquarters
HRP	Human Remains Pouch
HTA	high-threat area

---

HTH	high-test hypochlorite
HUMINT	human intelligence
IA	Implementing Arrangement
IADDS	Information Assurance Defense in Depth Standards
IAEA	International Atomic Energy Agency
IAW	in accordance with
IBADS	Interim Biological Agent Detection System
IC	intelligence community
ICAM	Improved Chemical Agent Monitor
ICD	Initial Capabilities Document
IDLH	immediately dangerous to life or health
IDN	Integrated Detection Network
IMA	Ideas for Materiel Approaches
IMINT	imagery intelligence
IMS	ionization/ion mobility spectrometry
IND	investigational new drug
IOC	initial operational capability
IPDS	Improved Chemical Agent Point Detection System
IPE	individual protective equipment
IPT	Integrated Process Team
IR	infrared
IT	information technology
ITF	International Task Force
ITWA	Initial Threat Warning Assessment
JBAIDS	Joint Biological Agent Identification and Diagnostic System
JBPDS	Joint Biological Point Detection System
JBSDS	Joint Biological Standoff Detection System
JCAD	Joint Chemical Agent Detector
JCBAWM	Joint Chemical Biological Agent Water Monitor
JCESM	Joint Service Chemical Environment Survival Mask
JCIDS	Joint Capabilities Integration and Development System
JCSD	Joint Chemical Surface Detector
JDOMS	Joint Director of Military Support
JECP	Joint Expeditionary Collective Protection
JEM	Joint Effects Model
JFC	Joint Force Commander, or Joint Functional Concept
JFCOM	Joint Forces Command
JFIRE	Joint Firefighter's Integrated Response Ensemble
JFOC	Joint Future Operational Capability
JFSC	Joint Forces Staff College
JIC	Joint Integrating Concept, or Joint Intelligence Center
JISE	joint intelligence support element
JLOTS	Joint Logistics over the Shore
JMAO	Joint Mortuary Affairs Office
JMCBDS	Joint Modular Chemical and Biological Detection System
JMET	Joint Mission Essential Task

JMETL	Joint Mission Essential Task List
JMSEL	Joint Master Scenario Events List
JNBCRS	Joint NBC Reconnaissance System
JNTC	Joint National Training Center
JOA	Joint Operations Area
JOC	Joint Operating Concept
JOEF	Joint Operational Effects Federation
JP	Joint Publication
JPACE	Joint Protective Aircrew Ensemble
JPDS	Joint Portable Decontamination System
JPID	Joint Platform Interior Decontamination
JPL	Joint Priority List
JPME	Joint Professional Military Education
JPM-IS	Joint Program Manager for Information Systems
JROC	Joint Requirements Oversight Council
JRO-CBRND	Joint Requirements Office for Chemical, Biological, Radiological, and Nuclear Defense
JSAM	Joint Service Aircrew Mask
JSGPM	Joint Service General Purpose Mask
JSIG	Joint Service Integration Group
JSLIST	Joint Service Lightweight Integrated Suit Technology
JSLNBCRS	Joint Services Lightweight NBC Reconnaissance System
JSLSCAD	Joint Service Lightweight Standoff Chemical Agent Detector
JSMG	Joint Service Materiel Group
JSPDS	Joint Service Personnel/Skin Decontamination System
JSSSED	Joint Service Sensitive Equipment Decontamination
JSTDs (LS, SS)	Joint Service Transportable Decontamination System (Large Scale, Small Scale)
JTCOPS	Joint Transportable Collective Protection System
JTF	Joint Task Force
JTMEP	Joint Medical Evacuation Program
JTTPs	Joint Tactics, Techniques, and Procedures
JULLS	Joint Universal Lessons Learned System
JWARN	Joint Warning and Reporting Network
JWC	Joint Warfighting Center
LC/MS	liquid chromatography/mass spectrometer (or spectrometry)
LIDAR	light detection and ranging
LIF	laser-induced fluorescence
M&S	modeling and simulation
MA	Mortuary Affairs
MAA	Mission Area Analysis
MADCP	Mortuary Affairs Decontamination Collection Point
MALDI-TOF	Matrix-Assisted Laser Desorption Ionization–Time of Flight
MANSCEN	Maneuver Support Center
MAT	Medical Analysis Tool
MCCDC	Marine Corps Combat Development Command

---

MeV	megaelectron-volt
MFR	Multi-Function Radiation
MGPTS	Medium General Purpose Tent System
MIS	Medical Information System
MMC	materiel management center
MNA	Mission Need Analysis
MOPP	Mission-Oriented Protective Posture
MORS	Military Operations Research Society
MORSS	Military Operations Research Society Symposium
MOU/A	memorandum of understanding/agreement
MOUT	Military Operations in Urban Terrain
MS	mass spectrometer (or spectrometry)
MSDS	Material Safety Data Sheet
MULO	Multi-purpose Overboot
MWA	military working animal
MWD	military working dog
MWE	military working equine
NARAC	National Atmospheric Release Advisory Center
NATO	North Atlantic Treaty Organization
NBC	nuclear, biological, and chemical
NBCRS	NBC Reconnaissance System
NBCRV	NBC Reconnaissance Vehicle
NCES	Net-Centric Enterprise Services
NEO	noncombatant evacuation operations
NFPA	National Fire Protection Association
NGO	nongovernmental organization
NIOSH	National Institute for Occupational Safety and Health
NIST	National Intelligence Support Team
NMCA	National Military Command Authority
NMCC	National Military Command Center
NMJIC	National Military Joint Intelligence Center
NORAD	North American Aerospace Defense Command
NR-KPP	Net Ready Key Performance Parameter
NSS	National Security Strategy
NSTM	Naval Ships Technical Manual
O/C	observer/controller
OCONUS	outside the Continental United States
OP	Operational
OPCW	Organisation for the Prohibition of Chemical Weapons
OPLAN	Operations Plan
OPME	Officer Professional Military Education
OPNAV	Office of the Chief of Naval Operations
OPTEMPO	operations tempo
ORD	Operational Requirements Document
OSD	Office of the Secretary of Defense
OSHA	Occupational Safety and Health Administration

---

PACOM	Pacific Command
PAPR	powered air-purifying respirator
PARP	poly(ADP-ribose) polymerase
PB	pyridostigmine bromide
PCR	polymerase chain reaction
PD	passive defense
PE	personal effects
PFU	plaque-forming unit
PID	photoionization detector
PIR	priority intelligence requirement
PIRS	photoacoustic infrared spectroscopy
PIU	patient isolation unit
POD	port of debarkation
POE	port of embarkation
POL	petroleum, oil, and lubricants
POM	program objective memorandum
POW	prisoner of war
QDR	Quadrennial Defense Review
QSTAG	Quadripartite Standardization Agreement
R2	rest and recuperation
RADIAC	radiation detection, identification, and computation
RAPID	Ruggedized Advanced Pathogen Identification Device
R&D	research and development
RDD	Radiological Dispersal Device
RD&E	research, development and engineering
RDECOM	Research Development and Engineering Command
RDTE&A	research, development, test, evaluation and acquisition
RESTOP	Restoration Operations
ROMO	range of military operations
ROTA	release other than attack
ROWPU	Reverse Osmosis Water Purification Unit
RSOI	reception, staging, onward movement, and integration
RT-PCR	real-time polymerase chain reaction
SAM	Surveillance and Measurement
SARS	Severe Acute Respiratory Syndrome
SAW	surface acoustic wave
SCBA	self-contained breathing apparatus
SDS	Sorbent Decontamination System
SENS	Sense
SERS	surface-enhanced Raman spectroscopy
SHA	Shape
SHLD	Shield
SITREP	situation report
SJFHQ	standing joint force headquarters
SJTF	Standing Joint Task Force
SME	subject matter expert

WRM	war reserve materiel

## 1.0 Introduction

### 1.1 Background

The Joint Requirements Oversight Council (JROC) established the Joint Requirements Office for Chemical, Biological, Radiological, and Nuclear Defense (JRO-CBRND) as a Chairman's Controlled Activity, reporting to the Chairman of the Joint Chiefs of Staff (CJCS) through the Director J-8 (*JROC Memorandum 163-02*, 9 September 2002). The JRO-CBRND assumed the duties of the Joint Service Integration Group (JSIG) in coordinating and integrating requirements for all Department of Defense (DoD) CBRND programs and acts as the CJCS focal point for all CBRND issues in passive defense (PD), force protection (FP), consequence management (CM), and homeland security (HLS). During fiscal year 2002, JSIG initiated analysis efforts to identify CBRND deficiencies, in the form of Mission Area Analysis (MAA) and Mission Need Analysis (MNA), for the functional areas of Contamination Avoidance, Protection, Restoration, and Battle Management. The JRO-CBRND, guided by the policies and procedures established in *Chairman of the Joint Chiefs of Staff Instruction (CJCSI) 3170.01B, Requirements Generation System*, has continued to oversee the Chemical and Biological Defense Information Analysis Center and other contracted organizations in the conduct of these efforts, which were completed at the end of calendar year 2003.

The recently approved *CJCSI 3170.01D, Joint Capabilities Integration and Development System* (JCIDS), dated 12 March 2004, reflects a complete rewrite of the procedures and guidance that support the requirements generation process and provides the foundation for the transition to a capabilities-based process founded on joint concepts and integrated architectures, rather than just a threat-based process. The FNA/FSA is not used to specifically support the planning, programming and budgeting for the Chemical and Biological Defense Program but is used to support the JCIDS process. The JCIDS companion manual, *Chairman of the Joint Chiefs of Staff Manual (CJCSM) 3170.01A, Operation of the Joint Capabilities Integration and Development System*, dated 12 March 2004, sets forth guidelines and procedures for operation of the JCIDS to include the conduct of JCIDS analysis.

The JCIDS analysis process is composed of a structured, four-step methodology that defines capability needs, capability gaps, and approaches to provide those capabilities within a specified functional or operational area. Based on national defense policy and centered on a common joint warfighting construct, the analyses initiate the formal development of integrated joint capabilities, to include the identification and justification of requirements necessary to initiate development and acquisition. The requirements are derived from an analysis of existing joint force operation and doctrine, organization, training, materiel, leadership and education, personnel, and facilities (DOTMLPF) capabilities and deficiencies as prescribed in CJCSI 3170.01D and CJCSI 3180.01, *JROC Programmatic Processes for Joint Experimentation and Joint Resource Change Recommendations*, 31 October 2002. As with the JCIDS analysis guidelines, the guidelines of the previous CJCSI 3170.01B led to results based on the consideration of the full range of DOTMLPF solutions; therefore, these results remain relevant to the JCIDS analysis process.

For CBRND, the JCIDS analysis process may be enhanced by engaging the Materiel Developer and the Joint Developmental and Operational Test & Evaluation communities in the Functional

Solution Analysis (FSA) when the Ideas for Material Approaches (IMAs) and DOTMLPF Change Recommendations (DCRs) are identified. Especially with new technologies, involvement as early as possible is necessary to plan for long-lead test capabilities, methodologies development, and validation.

## **1.2 Analysis Objective**

The objective of this analysis is to provide a capabilities-based assessment (CBA) that defines capability gaps, capability needs, and approaches to provide those capabilities within a specified functional or operational area. Efforts are made to suggest solutions that may be addressed through DCRs and Initial Capability Documents (ICDs) respectively. This thorough CBRND JCIDS Analysis is conducted in the form of a Functional Area Analysis (FAA), Functional Needs Analysis (FNA), and Functional Solution Analysis (FSA). This particular report documents the results of the FNA and FSA in the area of CBRND. The effort leverages, to the extent possible, the results of previous MAAs and MNAs. Information gathered during the conduct of CBRND analysis efforts initiated under *CJCSI 3170.01B* has been updated, to include Joint Staff–approved terminology and exploited to the greatest extent possible.

## **1.3 Threat Characterization**

This section provides an overview of the threat associated with each of the four “S” areas: Sense, Shape, Shield, and Sustain. For each area, an attempt is made to isolate the key components of the threats that complicate task performance in the area. For example, the first section addresses CBRN hazards from the perspective of Sense. It answers the question “What characteristics of CBRN hazards make them difficult to sense?” Similar questions are asked for the other “S” areas. However, prior to specific “S” area discussions, an overview of CBRN agents and the means to disseminate them is provided.

### **1.3.1 Overview of Chemical and Biological Agents (CB) Agents, Radiological and Nuclear (RN) Hazards, and Dissemination**

#### **1.3.1.1 Chemical Agents**

Chemical agents are substances intended for use in military operations to kill, seriously injure, or incapacitate people because of their physiological effects.<sup>1</sup> Under temperate conditions, most chemical agents are liquids, and liquid dissemination would likely be the simplest method of delivery. Both persistent agents, such as sulfur mustard (HD) and VX, and nonpersistent agents, such as sarin (GB) or Lewisite (L), can be delivered in liquid form. Chemical agents may also be disseminated as vapors, aerosols, or dusty agents. Vapors, aerosols, and dusty agents behave similarly during dissemination. Unlike liquid agents, they are significantly affected by the wind and terrain contours during dissemination.

---

<sup>1</sup> U.S. Army Center for Health Promotion and Preventive Medicine (USACHPPM). *The Medical NBC Handbook, USACHPPM Tech Guide 244*, Appendix A: Glossary of Terms and Acronyms. May 2000.

### 1.3.1.2 Biological Agents

Biological agents are microorganisms or toxins derived from microorganisms that cause disease in humans, plants, or animals or cause material deterioration.<sup>2</sup> Pathogens are likely to be disseminated as aerosols, whereas toxins can be disseminated as either aerosols or large liquid drops.<sup>3</sup> Like chemical agents, biological agents disseminated as an aerosol are spread by the wind and diffusion. High winds may increase the casualty threat for agents that are highly virulent and decay slowly. Conversely, high winds may reduce the casualty threat for less virulent agents with higher decay rates. Moderate wind speeds of 7.5–19 mph (12–30 kmph) are generally considered ideal for most biological agent dissemination.<sup>4</sup>

### 1.3.1.3 Radiological and Nuclear Hazards.

Radiological and nuclear materials contain unstable atoms that emit alpha, beta, gamma, and/or neutron radiation. Radiation-emitting atoms, termed radioisotopes or radionuclides, may be naturally occurring or artificially produced in nuclear reactors or cyclotrons. Dissemination behavior typically mimics that of aerosols.<sup>5</sup> For example, after a nuclear air burst, vaporized reaction products, unreacted material, and weapon residues condense into a fine suspension of particles 0.01–20 µm in diameter.<sup>6</sup> Quickly drawn up into the stratosphere, particularly if the explosive yield exceeds 10 kilotons, the radioactive particles are dispersed by atmospheric winds. They may remain airborne for weeks, months, and even years before eventually settling to the earth's surface as fallout. Radiological dispersal devices (RDD) disseminate radioactive materials through active (explosive) and passive (nonexplosive) means. Active dissemination of radioactive materials is more efficient than passive means, though the area of effects would likely be smaller than that of a large-scale biological attack. This expectation is largely due to the greater particle density and larger particle size expected from a radiological accident or unsophisticated RDD in comparison to highly milled biological particles expected from a sophisticated biological dispersal device.

### 1.3.2 Sense

Joint sense capabilities are challenged by technical issues related to chemical agent/toxic industrial chemical (TIC), biological agent, and radiological/nuclear hazard detection.

#### 1.3.2.1 Chemical Agent/Toxic Industrial Chemical Detection<sup>7</sup>

(For Official Use Only [FOUO]) The chemical similarity of chemical agents and TICs<sup>8</sup> to detection interferents complicates chemical agent detection. Chemical agents that have low volatilities or are able to be disseminated as aerosols also undermine detection. Furthermore, the physiological impact of some chemical agents at low doses challenges detector sensitivity. Finally, the sheer number of TICs and their similarity in chemical structure to detection interferents makes comprehensive TIC detection infeasible.

Consider ionization/ion mobility spectrometry (IMS) technology, employed by many point chemical warfare agent detector/alarms. A spectrum with a series of peaks can be generated comparing the intensity of a charge versus the travel time. Since ions of chemical agents, TICs, and other vapors have characteristic travel (mobility) times, the presence and relative amount of agent or TIC can be determined.

Nevertheless, the presence of a nontoxic chemical vapor with a similar characteristic mobility time to a toxic chemical vapor of interest may result in a false alarm since the detector may be unable to distinguish between the two chemicals. Some detectors may false alarm in the presence of aromatic vapors, cleaning compounds, smoke, fumes, and some wood preservatives.<sup>9</sup> Furthermore, since IMS requires a vapor or gas sample for analysis, detectors based on this technology may be unable to detect liquid chemical agents/TICs with low volatilities. Though they may be able to detect aerosolized agents or TICs, their reaction chambers may become contaminated, thus prolonging clearing times.

Though point detectors are typically unable to detect liquid chemical agents unless a sufficient amount of the deposited agent has volatilized and entered the point detector, liquid detection of standard chemical agents is available. Though no automated liquid detection technology exists, chemical agent detector papers can be used to manually detect liquid droplets ( $\geq 100 \mu\text{m}$  in diameter) of standard chemical agents within 30 seconds.<sup>10</sup> However, some detection papers react to some common battlefield interferents, including cleaning solvents (ammonia), DS2,

---

<sup>7</sup> Refer to the JRO *Operational Impact Assessment of Non-Traditional Agents* report, July 2003, (S/NF) for information on nontraditional agent detection.

<sup>8</sup> TICs are chemicals having a  $\text{LC}_{50}$  value of less than 100,000  $\text{mg}\cdot\text{min}/\text{m}^3$  (approximately the same as that of ammonia) in the vapor or aerosol phase in any mammalian species and produced in quantities exceeding 30 tons at one production facility. *USACHPPM Report 47-EM-6154-03: Industrial Chemical Prioritization and Determination of Critical Hazards of Concern, Technical Annex and Supporting Documents for International Task Force (ITF)-40*. November 2003. p. VII-7. (FOUO)

<sup>9</sup> National Institute of Justice. *Guide for the Selection of Chemical Agent and Toxic Industrial Material Detection Equipment for Emergency First Responders*. 2000. p. F-8

<sup>10</sup> National Institute of Justice. *Guide for the Selection of Chemical Agent and Toxic Industrial Material Detection Equipment for Emergency First Responders*. 2000. pp. F-38, -41.

“break free” (a weapons cleaner and lubricant), and some petroleum products, ostensibly because of the similarity of their chemical structures to those of the aforementioned chemical agents.

(FOUO) Numerous chemical agent detectors are not sensitive enough to detect low-dose chemical agent hazards leading to ocular and nasal effects. For example, the M90 and Chemical Agent Monitor (CAM) are not sensitive enough to provide warning of low dose hazards leading to ocular effects.<sup>11</sup>

(FOUO) According to International Task Force (ITF)-40, more than 1000 industrial chemicals potentially pose significant hazards if released in a military situation.<sup>12</sup> Consequently, the sheer number of TICs of concern makes comprehensive TIC detection infeasible. Though some detectors recognize a limited number of TICs (e.g., chlorine, hydrogen bromide, hydrogen chloride, hydrogen cyanide, hydrogen fluoride, hydrogen sulfide, and phosgene in the case of the Joint Chemical Agent Detector [JCAD])<sup>13</sup>, many detect traditional chemical agents only. Like chemical agents, many TICs have characteristic IMS mobility times similar to those of interferences, challenging IMS-based detection.

### 1.3.2.2 Biological Detection

Biological agents' potency, microscopic complexity, and similarity in molecular structure to nonpathogenic (nontoxic) biological matter directly complicate biological agent detection. The pathology (e.g., incubation period, communicability, and period of response to treatment) of numerous agents also affects the importance and time-criticality of detection.

Relative to chemical agents, most biological agents have remarkably low effective doses. Figure 1-1 shows the approximate ranges of effective doses for pathogens, toxins, and chemical warfare agents.<sup>14</sup> At the extreme, some pathogens are as much as 14 billion times more potent than chemical agents. The effective doses of toxins are typically greater than those of pathogenic agents but less than those of chemical warfare agents.

**Figure 1-1. Comparative Effective Doses (mg) of Biological Warfare, Toxins, and Chemical Warfare Agents<sup>15</sup>**

For this reason, biological agent detection systems need to exhibit an extremely high sensitivity to biological agents (i.e., capability to detect very small amounts of biological agents). Unfortunately, no detection system can recognize all potential agents of concern because identification is generally limited to a preselected set of agents, which cannot be expanded without additional equipment and/or programming. For example, the M31A2 Joint Biological Point Detection System (JBPDS) includes immunoassay tests in which each immunoassay recognizes one particular biological agent. The agent may remain an undetected hazard under specific conditions.<sup>16</sup> Line source releases from standoff distances are a prime example of attacks that can generate aerosol concentrations below threshold sensitivity levels.<sup>17</sup> Furthermore, biological detection may be inhibited or defeated by modification of normally detectable agents to render them undetectable or by interference through environmental pollution.

Biological agents are considerably more complex than chemical agents. For this reason, detection and identification technology incorporated into chemical agent detection systems is not easily transferred to biological agent detection systems. While IMS can be used to detect and identify chemical agents, the technology in its current form is unable to detect or identify biological agents.<sup>18</sup>

Since biological agents are similar in size to nonbiological particulates and in size and composition to nonpathogenic (nontoxic) atmospheric particulates, background aerosol clutter

<sup>15</sup> National Institute of Justice. *An Introduction to Biological Agent Detection Equipment for Emergency First Responders*. 2001. p. 1.

<sup>16</sup> Danzig, Richard. "Catastrophic Bioterrorism – What is to be Done?" Center for Technology and National Security Policy. Washington, DC. August 2003. pp. 10–11.

<sup>17</sup> Kilpatrick, William T., Mark W. Fagan, and Paul Murdock. "Deployment Analysis of Biological Point Detectors Deployed on Fixed-site Military Installations." Simulation Technologies, Inc. November 2001. p. 14.

<sup>18</sup> National Institute of Justice. *An Introduction to Biological Agent Detection Equipment for Emergency First Responders*, 2001. pp. 13–4, 17–19.

complicates biological detection. First, nonbiological particulates, whether naturally occurring (e.g., dust, dirt, and sand) or manmade (engine exhaust, smoke, and industrial effluents) can interfere with the trigger, which is a particle counter and traditionally the first level of biological detection. The trigger monitors the total atmospheric particulate concentration against background levels without discriminating between biological and nonbiological particulates. It activates the remaining components of the detection system if it detects an increase in the ambient particulate concentration. After hydrating and concentrating the particulates, the resulting sample is passed to a generic detection component that analyzes the particulates to determine whether they are biological in origin.<sup>19</sup> If the sample exhibits characteristics of biological particles, it is passed to the identifier. The identifier can identify the type of biological agent if the agent is in a preselected set.

It is true that biological attacks typically generate particle concentrations greater than the background levels. This tendency is illustrated in Figure 1-2, which compares particle concentrations generated by three biological weapon attacks (from backpack, submunition, and line source) to background levels. However, the figure also shows that background dust particles generated from nearby tank movement results in greater particulate concentrations than those caused by biological warfare (BW) attacks. Therefore, nonbiological particulates can cause false positives in trigger-based activating systems, consequently expending analysis consumables.

**Figure 1-2. Biological Weapon Attack Aerosol Concentrations Superimposed on Natural Bioaerosol Background at Ft. Sill, Oklahoma<sup>20</sup>**

<sup>19</sup> After determining aerosol particles to be biological, some detectors can classify the suspect aerosol by broad category (e.g., spore, bacterium, toxin/macromolecule, or virus).

<sup>20</sup> Kilpatrick, William T., Mark W. Fagan, and Paul Murdock. "Deployment Analysis of Biological Point Detectors Deployed on Fixed-site Military Installations." Simulation Technologies, Inc. November 2001. p. 13.

For this reason, many newer detection systems use cueing technology, which includes a second detector in addition to a trigger, to discriminate in real time between biological and nonbiological particulates. The second detector is frequently based on fluorescence. For example, the JBPDS includes a detector that analyzes the fluorescence of material illuminated by an ultraviolet (UV) laser. A detection of biological material combined with a rise in particle count activates the collector and initiates the identification process.<sup>21</sup>

Second, biological nonpathogenic (nontoxic) particles, such as naturally occurring pollen, molds, fungi, and bacteria (many of them uncataloged), are ubiquitous in the environment and can interfere with detection of biological agents. The presence of an aerosolized biological weapon is generally small in comparison with that of naturally occurring biological nonpathogenic particles. In addition, the concentration of the biological background can fluctuate significantly according to the season, weather, time of day, and presence of human variables. Figure 1-3 shows the fluctuations in airborne bacterial concentration during a 24-hour period at an unspecified location.

**Figure 1-3. Airborne Bacterial Concentration Fluctuation in a Single Day**<sup>22</sup>

Thus, the variability in the biological background level can cause biological detectors, both with or without cueing technology, to activate their identifiers and expend analysis consumables because only the identifier can distinguish between preselected biological agents and nonpathogenic agents.

<sup>21</sup> Note that the JBPDS's cueing technology, termed the Biological Agent Warning Sensor (BAWS), is unable to distinguish between viable and nonviable agent-containing particles because the signatures of live agents are the same as their nonviable counterparts. Kilpatrick, William T., Mark W. Fagan, and Paul Murdock. "Deployment Analysis of Biological Point Detectors Deployed on Fixed-site Military Installations." Simulation Technologies, Inc. November 2001. p. 8.

<sup>22</sup> National Institute of Justice. *An Introduction to Biological Agent Detection Equipment for Emergency First Responders*. 2001. p. 14

The potentially fast transit time of bioaerosol clouds causes additional problems for biological detection if detect-to-warn (also termed “detect-to-protect”) is the intended purpose. Recent Air Force Research Laboratory (AFRL) studies show that the warning (response) time of biological point detectors against covert or clandestine attacks must be less than the typical 10–15 minutes required to complete the immunoassay tests in order to successfully detect-to-warn those in proximity to the detector.<sup>23</sup> If a detector takes 10–15 minutes to sense an attack, the majority of unprotected personnel in the proximity of the detector will be exposed and many may receive casualty-causing doses. At the time of the detector alarm, personnel farthest downwind (and ostensibly within earshot of the detector) may be able to take protective measures and hence reduce their exposure. However, the reduction in exposed personnel is predicted to be less than 5%. Biological detectors need to alarm within minutes following initial exposure to the threshold agent concentration for personnel in the vicinity to be able to effectively protect themselves.

There are some cases in which detect-to-warn of a biological attack may be possible. For example, an urban aerosol anthrax attack is most likely to occur at dusk, when weather patterns are most favorable to keeping the particles close to the ground and thus likely to be inhaled.<sup>24</sup> If detection can be achieved within 6–10 hours after the release, people can be warned to stay away, consequently reducing exposure. Unfortunately, present anthrax detectors are usually sampled manually every 12 or 24 hours, and confirmation of findings takes between one and two days. Under this timeline, the detect-to-warn capability is essentially nonexistent.

Given the operational time of response and the pathology of anthrax, the detect-to-treat<sup>25</sup> capability (i.e., confirm presence of agent so that exposed may be treated before symptom manifestation) is also deficient. Since it is estimated that 5% of infected personnel will manifest substantial flu-like symptoms within 48 hours of the attack and a blood culture will confirm anthrax infection within 3 or 4 hours, the utility of detectors will be marginal. In these situations, medical surveillance can detect an anthrax attack as quickly as current (technically and operationally restricted) biological detection capabilities.

The pathology of smallpox, in contrast to that of anthrax, provides for a wider window of reward for detect-to-treat because a smallpox vaccination administered within approximately 96 hours after an attack is likely to protect an exposed individual. Immunization after this point is much less likely to be effective. Though there is no test that determines whether someone is infected with smallpox before he begins to manifest symptoms some 7–12 days after infection,<sup>26</sup> biological detection technology exists that can detect the aerosol release of the smallpox virus within 24–36 hours. If a smallpox attack has been confirmed, exposed individuals can be prevented from developing the disease through prompt vaccination. Consequently, in light of

---

<sup>23</sup> Kilpatrick, William T., Mark W. Fagan, and Paul Murdock. “Deployment Analysis of Biological Point Detectors Deployed on Fixed-site Military Installations.” Simulation Technologies, Inc. November 2001. pp. 10, 15.

<sup>24</sup> Danzig, Richard. “Catastrophic Bioterrorism—What is to be Done?” Center for Technology and National Security Policy. Washington, DC. August 2003. pp. 10–16.

<sup>25</sup> Detect-to-treat is also called “detect-to-verify.”

<sup>26</sup> At 10–12 days, newly infected individuals will themselves become infectious and may remain ambulatory for as much as 48 hours during this infectious period, resulting in additional infections.

pathologies of these two diseases and current detection and treatment capabilities, timely detection of a smallpox aerosol attack is more important and feasible than that of an anthrax aerosol attack.

Standoff biological detection systems are designed to detect and identify biological agents at a distance away from the aerosol/plume or from the detector system, before the agents reach the location of the system.<sup>27</sup> Active standoff technology typically uses the concept of detecting and measuring atmospheric properties by laser remote sensing or LIDAR, an acronym for “light detection and ranging.” In LIDAR, a short laser pulse is transmitted through the atmosphere, and then a portion of the radiation is reflected back to the system from a distant target or from atmospheric particles (e.g., molecules, aerosols, clouds, or dust). These systems must be line-of-sight to the suspect biological agent event. Infrared (IR)-based LIDAR systems are able to detect small aerosol particles characteristic of biological attacks (<20  $\mu\text{m}$  in diameter) out to ranges of 30–50 km, since the atmosphere is relatively transparent to electromagnetic radiation of this wavelength. IR LIDAR systems may not be able to discriminate between biological and nonbiological particles, and interferents, such as water vapor and fog, may inhibit their performance.<sup>28</sup>

Unlike IR LIDAR systems, UV LIDAR systems generally can discriminate between biological and nonbiological particles.<sup>29</sup> UV LIDAR systems illuminate biological aerosols with a strong UV laser pulse that causes biological agents to fluoresce. The red-shifted fluorescence caused by UV absorbance is detected by the systems and allows for distinguishing between biological and nonbiological aerosols. However, false positives may be caused in some systems by engine exhaust and pollens. Furthermore, the range of a typical UV LIDAR system may be limited to several kilometers<sup>30</sup> due to the relative opacity of air to UV light and the high UV background during daylight hours. UV LIDAR systems are generally more effective during low-light or nighttime operations because of the lower UV background level.

Passive standoff detection technology relies on the background electromagnetic radiation present in the environment for the detection of biological agents.<sup>31</sup> Passive standoff detection systems typically analyze the mid-IR (3–5  $\mu\text{m}$ ) or far-IR (8–12  $\mu\text{m}$ ) region of the spectrum for agent signatures. Though current IR passive standoff detection systems can detect bioaerosols immediately following their dissemination, bioaerosols quickly lose their signature and become invisible to the systems.

### 1.3.2.3 Radiological Detection

The short range of some types of radiation (particularly alpha) complicates radiological point detection capabilities. Furthermore, radionuclide identification is difficult since the energy levels of radiation emitted from a source must be quantified and analyzed for the identification to be reliable. Without such analysis, the source can be classified only according to the type of radiation it emits. Finally, in light of the properties of radiation, standoff radiological capabilities do not currently exist.

The range of alpha radiation makes its detection difficult. Whereas beta radiation can travel 7–26 ft (200–800 cm) in air from its source,<sup>32</sup> and gamma and neutron radiation, though energy dependent, generally travel farther in air than beta radiation, alpha radiation travels only 2–3 inches (5–7 cm) in air.<sup>33</sup> Consequently, alpha detectors, such as thin-window Geiger-Muller detectors, typically must be placed within an inch of the alpha-emitting source. Most alpha-emitting sources (e.g., uranium-235 and -238, americium-241, and plutonium-238 and -239) also emit gamma radiation,<sup>34</sup> though the energy level of the gamma radiation may be low enough to make it undetectable. Detection of shielded alpha emitters is particularly difficult. Alpha emitters plutonium-238, uranium-235, and thorium-232, ostensibly at an amount of 10 curies, each placed in a 2.5 cm-thick lead container, are not detected through their gamma radiation by a sodium-iodide (NaI) or plastic scintillator placed 1 m from the container.<sup>35</sup> In contrast, cobalt-60, iodide-131, cesium-137, iridium-192, phosphorus-32, strontium-90, and americium-241, under identical test conditions, are detected.

Even if a particular type of radiation can be detected, radionuclide identification of the source is difficult because the equipment needs to be able to measure the energy level of the emitted alpha, beta, or neutron particle or gamma photon since the energy of the radiation is characteristic of the radionuclide.<sup>36</sup> For example, strontium-90/yttrium-90 emits beta radiation with a maximum energy of 2.28 MeV. Gamma spectroscopy systems provide a viewable energy spectrum of emitted radiation unique to a gamma-emitting radionuclide. Modern liquid scintillation units provide an energy spectrum of beta radiation unique to a beta-emitting radionuclide.

<sup>35</sup> Alvarez, J. L. *Defining, Explaining, and Detecting Dirty Bombs*. Auxier & Associates, Inc. Knoxville, Tenn. pp. 8–9.

<sup>36</sup> Allard, David. "Answer to Question #2522 Submitted to 'Ask the Experts.'" Health Physics Society. <http://www.hps.org/publicinformation/ate/q2522.html>

Finally, in light of the properties of radioactive materials and radiation, no standoff radiological detection capability currently exists. Though exploratory research in standoff detection is being performed, current radiological detection equipment must be exposed to radiation to detect it.

### **1.3.3 Shape**

Joint Shape capabilities are challenged by data overload, bandwidth, electromagnetic pulse (EMP), jamming, and hostile cyberactivities.<sup>37</sup> Disruptions in data movement and surety can adversely impact the ability of the force to quickly and effectively identify, respond, and mitigate CBRN/TIM events.<sup>38</sup>

#### **1.3.3.1 Data Overload**

Information essential to effective CBRND requires a diverse set of data inputs, often in near-real time, from a multitude of sources. These include data elements from information sources such as medical and veterinary surveillance, patrol observations, situation reports (SITREPs), Allied Technical Protocol 45 (ATP-45) reports, CBRN survey and sampling teams, sensors, meteorology, geographical information system (GIS), geographical systems, and others. Data overload is a challenge that can impede or prevent the functioning of Shape to effectively manage CBRND. The effectiveness of CBRND Shape requires the continuing collection, correlation, analysis, and dissemination of information to ensure current situational awareness and understanding. The potential volume of information flowing to and through CBRND Shape may exceed the ability of CBRND systems and portals to accept and/or process the data.

#### **1.3.3.2 Bandwidth**

The increasing application of automated systems to collect, process, and assess information is accompanied by escalating requirements for enlarged bandwidth needed for efficient computing and communications, including data exchange, down to tactical maneuver units. CBRND<sup>39</sup> is one among many users within the force. Operations, support services, medical, logistics, and others possess requirements for the available bandwidth. Many of these requirements are critical, while others, although not critical in and of themselves, are essential to mission accomplishment. For example, targeting and routing data for Joint Task Force (JTF) aircraft as well as fire mission data are critical to mission accomplishment. Logistics movement requests for resupply fuel and foodstuffs, although not immediately impacting operations, do support sustained operations and mission accomplishment. Bandwidth requirements supporting the collection and movement of CBRND data is potentially significant and likely to conflict with other requirements. As stated previously, the volume of information likely to flow to and through CBRND Shape is plausibly substantial. Volume flow increase during and following a CBRN/TIM event is conceivable,

---

<sup>37</sup> Experimentation/exercises have not focused on how staffs at the operational and strategic levels are able to perform shape functions.

<sup>38</sup> Shape relies on Sense to provide accurate and timely data that can be analyzed and promulgated—without this data, shared awareness and shared understanding are not possible.

<sup>39</sup> Until JEM and JOEF are fielded, modeling of CBRN/TIM effects and the impact of these effects on operations will not be adequate.

thereby creating demand for additional bandwidth. Concurrently, other selected users will require added bandwidth for their data. Medical is but one of these users. Heightened information flow associated with the treatment and movement of casualties is a probable demand for available bandwidth. Available and accessible bandwidth may, therefore, act as an impediment to effective CBRND Shape.

#### **1.3.3.3 Electromagnetic Pulse**

EMP is often discussed as the result of nuclear explosions. Although this effect exists, it is not the sole potential source for EMP. EMP generation devices and certain large nonnuclear explosions can create an EMP affecting electronic devices and systems in an area. Unshielded electronics can be disrupted or cease to function, data erased or corrupted, and information transfer reduced or prevented. The effectiveness of CBRND Shape depends on continuous and accurate information flow to identify and respond to a CBRN/TIM event. The application of EMP by an adversary in an area, concurrently with or preceding a CBRN/TIM attack, may adversely impact detection and response by the joint force. Ongoing research into EMP within the international community by both the military and civilian sectors, as well as the increasing availability of cross-technologies, indicates hostile application of EMP is a possibility.

#### **1.3.3.4 Jamming**

Signal jamming is a common tactic of modern warfare. The adversary seeks to impede, disrupt, and preclude the information flow between and among elements of the force. Unsophisticated equipment possessing the capability to acquire the frequency can jam a signal. Modifiable advanced technologies are readily available on the open commercial market. A moderately sophisticated adversary can impact the ability of the force to move information and data, thereby affecting operations. CBRND Shape is a major user of information generated, collected, and transferred via wireless technologies (e.g., frequency modulation [FM], ultrahigh frequency [UHF], very high frequency [VHF], etc.). Jamming of wireless networked sensors to CBRN/TIM reconnaissance reports, as well as others, is a potential information gap that an adversary may exploit. The resulting information gap might delay CBRN/TIM detection and response.

#### **1.3.3.5 Hostile Cyberactivities**

A significant future challenge will be overt adversarial use of computer network attack. Hostile cyberactivities are not limited to the actions and activities of an adversary. Cyberattacks may also be initiated and maintained by nationals of friendly nations—including U.S. citizens—opposed to U.S. policies and activities. Third parties may also be engaged by an adversary to conduct hostile cyberactivities against the force. Information systems technologies and knowledge are widespread and easily available in the global marketplace. Operating systems are limited to a few and, with selected exceptions, are well known and understood, as are database systems. Misinformation, data corruption or destruction, software alteration, portal blocking, and more are all potential issues affecting the reliability and effectiveness of CBRND Shape. For example, if adversaries gained remote access to a dispersed CBRN/TIM Integrated Detection Network (IDN), they could create false reports of CBRN/TIM detections until the actual reports are ignored or suppress reporting of CBRN/TIM detections by the system. Or an unsophisticated

adversary could hire a third party to perform cyberattacks on the information systems of the joint force. An adversary could employ a random generation worm to overload the information portal, crashing the portal and suppressing information flow, and seize the opportunity to employ a CBRN/TIM agent. Friendly and U.S. nationals may also conduct cyberattacks against joint forces. The reasons may range from curiosity to opposition to U.S. policies and activities. An example of these types of attacks was the attempt by U.S. citizens opposed to U.S. operations in Iraq to disrupt U.S. government and military information operations.

### 1.3.3.6 Other Issues

There are challenges to shaping the battlefield that are beyond protecting computer networks from attack. Additional issues that challenge or disrupt joint Shape capabilities include the following:

- weather/meteorological and oceanographic
- intelligence (e.g., geospatial intelligence)
- ground effects (urban)
- system interoperability
- C2 early warning
- logistics information availability and accuracy
- operator data/information overload
- cognitive challenges

### 1.3.4 Shield

Joint Shield capabilities are challenged by technical issues related to individual respiratory protection against toxic industrial chemicals, individual protection against penetrating radiation, and prophylaxes for blister and nerve agent exposure.

#### 1.3.4.1 Individual Respiratory Protection against Toxic Industrial Chemicals

(FOUO) In light of the more than 1000 industrial chemicals deemed significant hazards by the International Task Force 40 (ITF-40)<sup>40</sup>, complete individual protection against all hazardous industrial chemicals is infeasible,<sup>41</sup> yet respiratory protection against the high-risk toxic industrial chemicals seems fitting. Nevertheless, military respiratory protection may be deficient in protecting against numerous, high-risk TICs, ostensibly because of difficulties in designing gas canisters that effectively bind these TICs. Assigned extreme risks ratings by ITF-40 because

---

<sup>40</sup> USACHPPM Report 47-EM-6154-03: *Industrial Chemical Prioritization and Determination of Critical Hazards of Concern, Technical Annex and Supporting Documents for International Task Force (ITF)-40*. November 2003. (FOUO)

<sup>41</sup> Note: Military nuclear, biological, and chemical respirators and protective suits were generally designed for protection against traditional chemical warfare agents, not TICs. Furthermore, in approximately 17% of the 1756 industrial chemicals evaluated by the task force, chemical flammability was either the sole critical hazard or one of the critical hazards. Most individual and collective protective equipment is not designed to protect against high temperatures and/or pressures.

of their lethality, flammability, instability, and probability of use, these chemicals are poorly adsorbed by common gas canisters. Accordingly, exposure to any of these chemicals may result in immediate penetration of a protective mask that uses one of these common gas canisters. Chemical asphyxiants, upon human internalization, cause hypoxia by either preventing uptake of oxygen in the blood (e.g., carbon monoxide) or inhibiting normal oxygen transfer either from the blood to tissues or within a cell.<sup>42</sup> In addition, fuming nitric acid, like other highly reactive materials, can degrade protective equipment.<sup>43</sup>

(FOUO) Furthermore, some hazardous industrial chemicals are simple asphyxiants, meaning that, though they may not have a direct physiological impact on the body, they displace oxygen in the air and thus cause an oxygen-deficient environment.<sup>44</sup> Therefore, an individual may need an atmosphere-supplying respirator if a significant release of these chemicals has occurred. An air-purifying respirator will be inadequate since it provides oxygen at the surrounding atmospheric level.

### 1.3.4.2 Individual Protection against Penetrating Radiation

Effectively protecting (shielding) against penetrating ionizing radiation (e.g., neutron and high-energy gamma radiation) is difficult, particularly within the context of individual protection. Whereas light clothing, gloves, or even a sheet of paper can protect against alpha radiation,<sup>45</sup> and less than one-half inch of aluminum, plastic, or glass provides adequate shielding against beta radiation,<sup>46</sup> thick and dense materials are frequently required to sufficiently protect against neutron and high-energy gamma radiation.

In regards to gamma radiation, shielding effectiveness is a function of the thickness and density of shielding material. For example, a 2.8-inch (7.2 cm)-thick barrier of water, a 1.3-inch (3.3 cm)-thick concrete barrier, a 0.4-inch (1.0 cm)-thick iron barrier, or a 0.15-inch (0.38 cm)-thick lead barrier is required to reduce the incident gamma radiation dose rate by 50% for 500

keV photons.<sup>47</sup> Since individual protective equipment (IPE) does not include thick and dense shielding, it does not provide sufficient protection from external high-energy gamma radiation.

In regards to neutron radiation, shielding effectiveness is a function of thickness and composition of the shielding material. Though materials with a high hydrogen content (e.g., water, paraffin, and damp earth),<sup>48</sup> efficiently absorb neutrons traveling through them, gamma radiation may be subsequently emitted as a result of slow neutron capture in hydrogen nuclei.<sup>49</sup> Therefore, other materials that have considerable affinities for capturing slow neutrons but do not produce significant secondary gamma radiation in the process may be used. One example of such a material is boron-10, which, upon neutron capture, produces nonpenetrating alpha particles rather than penetrating gamma radiation. Since IPE does not include neutron-shielding materials at appropriate thicknesses, it provides negligible protection against neutron radiation.

### 1.3.4.3 Medical Prophylaxes

The biochemical complexity of the effects of sulfur mustard on cellular tissue and the effects of secondary cellular processes (e.g., aging) caused by nerve agent intoxication, particularly soman, complicates medical prophylaxes for exposure to these chemical warfare agents.

#### 1.3.4.3.1 Sulfur Mustard Vesication

The biochemical complexity of HD vesication has made developing effective medical countermeasures difficult. In 1996, the first coherent model of the basic pathological processes that occur in cells and tissues exposed to HD was constructed.<sup>50</sup>

Not only can HD have many direct effects, such as alkylation of proteins and membrane components as well as inflammatory cells; in addition, it can target deoxyribose nucleic acid (DNA) with subsequent activation of poly(ADP-ribose) polymerase (PARP). PARP activation can then initiate a series of metabolic changes culminating in protease activation. The penultimate event is the epidermal-dermal separation that occurs in the lamina lucida of the basement membrane zone. As a result of major inflammatory response and changes in the tissue hydrodynamics, fluid fills the cavity formed by the epidermal-dermal separation and forms a blister.

<sup>50</sup> Smith, William J., Michael C. Babin, Robyn. C. Kiser, et al. "Development of Medical Countermeasures to Sulfur Mustard Vesication." U.S. Army Medical Research Institute of Chemical Defense and Battelle Memorial Institute. p. 2.

Now that the biochemical mechanisms of HD vesication have been elucidated, research is focusing on finding prophylactic or therapeutic compounds to inhibit one of six biochemical events: DNA alkylation, DNA strand breaks, PARP activation, disruption of calcium proteolytic activation, and inflammation.

#### 1.3.4.3.2 Nerve Agent Aging

Though medical treatment, including such drugs as atropine, oximes (2-PAM), and diazepam can be administered upon the onset of symptoms of acetylcholinesterase (AChE) inhibition, soman exposure presents an additional therapeutic challenge<sup>51</sup> because soman rapidly undergoes a second reaction, termed “aging,” which makes inhibited AChE resistant to spontaneous or oxime-mediated reactivation. Aging occurs during intoxication by other nerve agents, but aging by soman is notably rapid. The aging half-time for soman is a couple of minutes, likely an inadequate amount of time for even highly trained personnel to administer medical treatment.<sup>52</sup> Contrast the aging half-time for soman with that of sarin (several hours), tabun (more than 10 hours), and VX (two days). Pyridostigmine bromide (PB) is approved as a pretreatment for personnel at high risk for soman exposure as it temporarily masks the active site of a fraction of AChE molecules and thus protects the enzyme from irreversible reactions with soman molecules.<sup>53</sup> Nevertheless, a single PB dose does not offer prolonged protection. In guinea pigs, the maximum protective benefit of PB pretreatment against soman occurs 60 minutes after administration (protective ratio of 12.5).<sup>54</sup> Following this time, the protection afforded by the PB pretreatment begins to decrease, and at 4 hours, the protective ratio is 3.2. Because of this and other deficiencies of PB pretreatment, some research has focused on identifying proteins that can act as biological scavengers of organophosphorus compounds and that remain stable in circulation for long periods of time.<sup>55</sup> The biological scavenger needs to be able to prophylactically inactivate the internalized nerve agent before the agent reacts with the target AChE. In light of the aging time of soman, it must occur within several minutes of soman exposure.

### 1.3.5 Sustain

Joint Sustain capabilities are complicated by significant chemical, biological, radiological, and nuclear (CBRN) persistency, the potential for secondary contamination (cross-contamination), and nerve agent and toxin physiological effects.

#### 1.3.5.1 Agent Persistency

In addition to affecting Sense and Shield capabilities, the persistency of a CBRN agent significantly influences the necessity for sustaining operations, particularly decontamination. More specifically, the persistence<sup>56</sup> of chemical agents, viability of biological agents, and half-lives of radiological agents (and their daughter products) affect the ability of a military force to quickly restore operational capabilities following a CBRN incident.

##### 1.3.5.1.1 Chemical Agent Persistence

Contamination by nonpersistent chemical agents, such as hydrogen cyanide (which typically persists for minutes), does not typically require substantial decontamination efforts, though, due to the fast rate of action of most chemical agents, rapid medical diagnostics and therapeutics action may be needed to restore exposed personnel. Contamination by persistent chemical agents, such as VX (which can persist for weeks in low-temperature environments), may necessitate extensive decontamination if the agent is a significant threat in its current state and location. Personnel exposed to persistent agents may, like those exposed to nonpersistent agents, require rapid medical diagnostics and therapeutics.

In addition to a chemical agent's vapor pressure<sup>57</sup> (related to the rate in which the agent evaporates), meteorological conditions, such as atmospheric temperature, wind speed, precipitation, and air stability, as well as surface parameters, such as surface temperature, vegetation, and contact surface, affect the agent's outdoor persistence. A chemical agent with a low vapor pressure on a sorbent, porous, nonreactive surface (e.g., sand) in a cold (temperature slightly above agent's freezing point), stable, windless, environment without precipitation or vegetation persists for the greatest amount of time. In contrast, a chemical agent with a high vapor pressure on a nonsorbent, nonporous surface (e.g., chemical-resistant surface) in a hot, unstable, high-wind environment with heavy precipitation and vegetation persists for the least amount of time.<sup>58</sup> A nonpersistent agent may remain a hazard in a confined space where the evaporated agent accumulates. Therefore, decontamination may be required in a poorly ventilated, confined space, even though it may not be required outdoors.

---

<sup>56</sup> Persistence is rarely defined quantitatively, though one reference defines it as the time required for a 1500-fold agent density decrease. Sage, G. W., and P. H. Howard. "Environmental Fate Assessments of Chemical Agents HD and VX." Syracuse Research Corporation. Syracuse, N.Y. June 1989. p. 5.

<sup>57</sup> A chemical's volatility is related to its vapor pressure. Hence, a chemical with a high vapor pressure is typically highly volatile.

<sup>58</sup> Headquarters, Department of the Army, Department of the Air Force, United States Marine Corps. *FM 3-6/FMFM 7-11-H/AFM 1-5-7: Field Behavior of NBC Agents (Including Smoke and Incendiaries)*, Chapter 1: Chemical Agents. Washington, D.C. November 1986.

### 1.3.5.1.2 Biological Agent Viability

Whereas persistence is used to describe the longevity of the hazard posed by a chemical agent, viability is typically used to describe the longevity of the biological hazard because only biological agents viable for infection are generally hazardous. For those biological agents that remain viable for long periods of time, thorough equipment and fixed-site decontamination may be necessary since passive decontamination (weathering) may be impractical. Consider that under ideal conditions, non-spore-forming microorganisms can remain viable for up to 100 days,<sup>59</sup> and *Bacillus anthracis* (anthrax) spores can survive for decades.<sup>60</sup> Yet anthrax spores exposed to the direct rays of the sun will not stay viable for more than a few hours if deposited on a hard flat surface.<sup>61</sup> Table 1-1 includes information on the persistence (and other properties) of pathogens and toxins of military importance.

A biological agent's viability is affected by its concentration, exposure to UV radiation and pollutants, environmental temperature, humidity, and the contacting surface material. Biological agents disseminated at low to moderate temperatures (ideally slightly above the freezing temperature of water) in unpolluted, humid environments with little or no UV radiation exposure remain viable for the greatest amount of time. Conversely, biological agents disseminated in polluted, dry environments at extreme temperatures and high UV radiation exposure remain viable for the least amount of time.<sup>62</sup>

Disease (Etiologic Agent)	Persistence of Etiologic Agent <sup>63</sup>	Likely Methods of Dissemination <sup>64</sup>	Transmissibility Man to Man <sup>65</sup>
<b>Bacteria and Rickettsia</b>			
Anthrax ( <i>Bacillus anthracis</i> )	Spores are highly stable	Aerosol	No
Brucellosis ( <i>Brucellae abortus, melitensis, suis, and canis</i> )	High in wet soil and food	Aerosol, food supply	Via contact with lesions
Glanders ( <i>Burkholderia mallei</i> ) and melioidosis ( <i>Burkholderia pseudomallei</i> )	Stable in soil and water ( <i>B. pseudomallei</i> )	Aerosol	Negligible
Plague ( <i>Yersinia pestis</i> )	Up to one year in soil; 270 days in live tissue	Aerosol, infected vectors	High
Q Fever ( <i>Coxiella burnetii</i> )	Months on wood and sand	Aerosol, food supply	No
Tularemia ( <i>Francisella tularensis</i> )	Months in moist soil or other media	Aerosol	No
<b>Viruses</b>			
Smallpox (variola major)	Stable	Aerosol	High
Viral equine encephalitis (e.g., Western, Eastern, and Venezuelan equine encephalitis)	Relatively unstable	Aerosol, infected vectors	Low
Viral hemorrhagic fevers (e.g., Marburg, Ebola)	Relatively unstable—depends on agent	Aerosol	Moderate
<b>Toxins</b>			
Botulism ( <i>Clostridium botulinum</i> )	Weeks in nonmoving water and food	Food/water supply, aerosol	No
Ricin ( <i>Ricinus communis</i> )	Stable	Aerosol	No
Staphylococcal enterotoxin B ( <i>Staphylococcus aureus</i> )	Stable, resistant to freezing	Aerosol, food/water supply	No
T-2 Mycotoxins	Stable	Aerosol, food/water supply	No

### 1.3.5.1.3 Radiological and Nuclear Hazard Half-life

Radiological and nuclear contaminants decay at rates proportional to their half-lives, defined as the amount of time required for half of the species' nuclei to undergo radioactive decay. However, many radioisotopes successively decay into other radioactive elements before becoming stable. Though iodine-135 has a half-life of only 6.7 hours, one of its daughter products, cesium-135, has a half-life of 2.3 million years. Following a nuclear explosion, strontium-90 and cesium-137, two reaction by-products with half-lives of approximately 30 years, cause significant long-term fallout hazards because the radioisotopes can be ingested

through foods which have incorporated them.<sup>66</sup> Since these and many other radioisotopes (and their daughter products) have long half-lives, radiological decontamination of equipment and fixed sites may be necessary to restore operations.

**Table 1-2. Radioactive Materials of Military Significance and Selected Properties<sup>67</sup>**

Radioactive Material*	Radiation Type	Half-Life <sup>68</sup>
<i>Americium-241</i>	Alpha (gamma in daughter products)	458 years
<i>Cesium-137</i>	Beta/gamma	30.2 years
<i>Cobalt-60</i>	Beta/gamma	5.26 years
Depleted uranium	Limited alpha/beta/gamma (no threat)	$4.51 \times 10^9$ years
<i>Iodine-131, -132, -134, -135</i>	Beta/some gamma	8.06 days, 2.29 hours, 53 months, 6.7 hours
Phosphorus-32	Beta	14.3 days
<i>Plutonium-239, -238</i>	Alpha	$2.44 \times 10^4$ years, 86.4 years
Radium-226	Alpha (beta/gamma in daughter products)	1622 years
<i>Strontium-90</i>	Beta	29 years
<i>Tritium-3</i>	Beta (no threat)	12.6 years
<i>Uranium-238, -235, -239</i>	Alpha/beta/gamma	$4.51 \times 10^9$ years, $7.13 \times 10^8$ years, 23.5 months

\* Italicized materials are reactants or products of nuclear fission or fusion reactions.

### 1.3.5.2 Secondary Contamination (Cross-Contamination)

The potential for secondary contamination or cross-contamination (i.e., additional contamination following initial deposition through dissemination), complicates sustaining activities, particularly decontamination. Chemical agents can interact with the surface material, inhibiting decontamination, and risking personnel or other material to exposure. Biological and radiological particles deposited on a surface can become airborne again.<sup>69</sup> These phenomena disrupt efforts to recover essential functions that are free from the effects of CBRN hazards and to return operational capabilities to preincident levels.

#### 1.3.5.2.1 Chemical Agent Adsorption/Absorption

Adsorption and absorption of chemical agents deposited on the surfaces of certain materials (e.g., soil, sand, brick, stone, cement, wood, paints, plastics, rubber, canvas, leather, cotton, and

<sup>66</sup> Headquarters, Departments of the Army, the Navy, and the Air Force. *FM 8-9/NAVMED-P-5059/AFJMAN 44-151: NATO Handbook on the Medical Aspects of NBC Defensive Operations AMedP-6(B)*, Section 320. February 1996.

<sup>68</sup> Friedlander, G, Kennedy, J.W., Macias, E.S., et. al. *Nuclear and Radiochemistry*. John Wiley & Sons. 3<sup>rd</sup> Ed. July 1981.

<sup>69</sup> Garland, J.A., Watterson, J., Jayasekera, P.N., et. Al. "The Hazard From Reaerosolised Biological Warfare Agents." European Research Office of the U.S. Army. London, England. August 1999. p. 5

woolens) can significantly inhibit decontamination.<sup>70</sup> Adsorption, the physical adherence of a molecule to a surface, proceeds rapidly as the agent distributes across the surface and seeps into cracks and crevices. Absorption, the transfer of a diffused molecule into a material's interior, proceeds more slowly. Adsorbed agent is resistant to physical removal, but can be removed by organic solvents or chemical decontaminants. Absorbed agent is even more resistant to removal by physical or chemical means, and the use of nonaqueous decontaminants can actually cause chemical agents to penetrate even deeper into the material because of solubility effects.<sup>71</sup>

Temporary nuclear, biological, and chemical (NBC)-resistant covers over vulnerable equipments offer protective measures to avoid agent deposition as well as adsorption/desorption on any type of material surfaces.

If only surface contamination is removed, typically through weathering or active decontamination, the remaining sorbed agent (both adsorbed and absorbed) will desorb for days, months, and even years, depending on the agent, material, surface temperature, and boundary layer flow rate. It is possible for a surface to remain a cross-contamination concern as a result of desorption even though it appears free of surface contamination. Assessments based solely on measured vapor evolution rates may not adequately predict the direct contact hazard present at the desorbing surface. For example, a more severe degree of injury can be caused by direct contact with mustard-contaminated surfaces without detectable liquid on them than can be explained simply by vapor evolution. For this reason, detection of agent vapor alone is insufficient in determining whether a surface is a potential direct contact hazard.

#### 1.3.5.2.2 Biological and Radiological Hazard Reaerosolization/Resuspension

Reaerosolization and resuspension<sup>72</sup> of biological agents and radiological particles can extend the contamination area, resulting in additional casualties and greater decontamination efforts. Typically caused by the wind and human activities, reaerosolization and resuspension can occur long after the initial agent dissemination, and under ideal conditions the resultant airborne concentration can be of the same order as that of the original dissemination. Approximately two to three months following the Chernobyl accident, radioactive particle resuspension replaced dissemination from the breached reactor as the dominant contributor to airborne radioisotope concentrations.<sup>73</sup> In this incident, resuspension of the radioactive particles resulted in a long-term

---

<sup>70</sup> Carlon, Hugh R. "Contact Hazard: An Overview." U.S. Army Armament Munitions Chemical Command. Aberdeen Proving Ground, Md. January 1990. pp. 7–15.

<sup>71</sup> Trapp, Ralf. *The Detoxification and Natural Degradation of Chemical Warfare Agents*. Stockholm International Peace Research Institute. London. 1985. p. 73.

<sup>72</sup> Ostensibly, "reaerosolization" and "resuspension" are synonymous. "Reaerosolization" is frequently associated with biological agent particles, whereas "resuspension" usually refers to radiological and inert particles. Garland, J. A., J. Watterson, P. N. Jayasekera, et al. "The Hazard from Reaerosolised Biological Warfare Agents." European Research Office of the U.S. Army. London. August 1999. p. 5.

<sup>73</sup> Garland, J. A., J. Watterson, P. N. Jayasekera, et al. "The Hazard from Reaerosolised Biological Warfare Agents." European Research Office of the U.S. Army. London. August 1999. p. 12.

secondary hazard. Resuspended contaminants were detected across Europe and much of the Northern hemisphere over several years after the accident.<sup>74</sup>

Numerous factors, including wind speed, time since deposition, particle size, surface properties (such as roughness and moisture content), and mechanical disturbance, affect the likelihood and extent of particle reaerosolization. Biological and radiological agent particles of small particle sizes, deposited on rough, moist surfaces for a long period since deposition, and exposed to low wind speeds and little mechanical disturbance are unlikely to be significantly reaerosolized. Conversely, biological and radiological agent particles of large particle sizes, deposited on smooth, dry surfaces for a short period since deposition, and exposed to high wind speeds and extensive mechanical disturbance are likely to be significantly reaerosolized.

### **1.3.5.3 Medical Treatment**

Seizure activity induced by nerve agent exposure, dissimilarities in mechanism of action between toxin classes, and the fast rate of action of some toxins complicates medical treatment.

#### **1.3.5.3.1 Medical Treatment for Nerve Agent-Induced Seizures**

Significant AChE inhibition through exposure to organophosphorus compounds does not cause just acute, life-threatening consequences. Individuals who survive significant exposure will likely experience electrical seizure activity.<sup>75</sup> Traditional medical treatment will not afford sufficient protection against seizure activity, which is the most critical factor in development of brain damage following nerve agent exposure.<sup>76</sup> Anticonvulsants such as diazepam can arrest chemical agent-induced seizures when administered shortly after seizure onset; however, their effectiveness wanes after approximately 20 minutes, allowing seizures to recur.<sup>77</sup> Unless seizure activity is permanently arrested, neuropathology and long-term behavioral effects may result. The risk of nerve agent-induced brain damage is so significant that, besides head trauma, nerve agent exposure is considered the main neurological threat on the modern battlefield. For this reason, a considerable amount of research is being devoted to developing neuroprotective adjunct drugs capable of preventing development of delayed neuronal cell death when administered one or more hours after the onset of seizures.

---

### 1.3.5.3.2 Medical Treatment for Toxin Exposure

Effective medical treatment for toxin exposure is complicated by the different mechanisms of action between toxin classes and the fast rate of action of some toxins.

Unlike chemical agents, toxins are categorized under many classes, and they differ widely in their mechanism of action.<sup>78</sup> For example, saxitoxin, a neurotoxin produced by marine dinoflagellate, blocks nerve conduction directly and causes death by paralyzing muscles of respiration. Microcystin, produced by blue-green algae, binds specifically to an important enzyme of liver cells and only damages the liver. Ricin, derived from the bean of the castor plant, blocks protein synthesis in many cells of the body.

Furthermore, though not as fast-acting as nerve agents, some toxins incapacitate quickly enough to offer little time for therapy. After inhalation of a lethal dose of saxitoxin, death can occur within minutes. Unprotected soldiers who inhaled a lethal dose would likely die quickly unless artificial ventilation were administered immediately. Others cause few or no clinical symptoms of intoxication for many hours, yet they initiate irreversible biochemical processes within minutes or several hours, which lead to severe debilitation or death several days later. Though symptoms and death may not occur for hours, a lethal dose of microcystin will result in irreversible damage to the liver within 15–60 minutes after exposure. Moreover, though inhaled ricin may not present signs of intoxication for 12–24 hours, the toxin causes irreversible biochemical reactions within 60–90 minutes of exposure.

For these and other reasons, development of effective medical treatments for toxin exposure is difficult. In light of dissimilarities in mechanisms of action between toxins, current treatments, with few exceptions, are not effective against more than one toxin. Medical treatment must be fast-acting because of the short delay before irreversible damage occurs following internalization of some toxins. Finally, since many toxins, including neurotoxins, affect fundamental biochemical mechanisms within the body, drugs that block or reverse these effects are often debilitating or toxic themselves. One notable exception is rifampin, an antituberculosis drug, which safely stops lethal intoxication by microcystin if given to laboratory animals therapeutically within 15–30 minutes of exposure.

## 1.4 Methodology

This section provides an overview of the methodology used in conducting the FNA and FSA. It outlines the context, assumptions, data collection, and specific steps used in the analysis. As much as possible, the analysis tracks the steps presented in the guiding instruction and manual (CJCSI 3170.01D and CJCSM 3170.01A).

---

<sup>78</sup> Franz, David R. *Defense Against Toxin Weapons*. U.S. Army Medical Research Institute of Infectious Diseases. Ft. Detrick, Md. 1997.

### 1.4.1 Context

Passive CBRND has four operational elements, which serve as key capability categories: Sense, Shape, Shield, and Sustain. Figure 1-4 displays the interrelationship between these four “S” elements.

**Figure 1-4. CBRND Operational Elements**

The JRO *Baseline Capability Assessment* describes the four operational elements as follows:

- **Sense**—The capability to continually provide the information about the CBRN/TIM situation at a time and place by detecting, identifying, and quantifying CBRN/TIM hazards in air, water, on land, on personnel, equipment, or facilities. This capability includes detecting, identifying, and quantifying those CBRN/TIM hazards in all physical states (solid, liquid, gas).
- **Shape**—The ability to characterize the CBRN hazard to the force commander—develop a clear understanding of the current and predicted CBRN situation; collect, query, and assimilate info from sensors, intelligence, medical, etc., in near-real time to inform personnel, provide actual and potential impacts of CBRN hazards; envision critical Sense, Shield, and Sustain end states (preparation for operations); and visualize the sequence of events that moves the force from its current state to those end states.
- **Shield**—The capability to shield the force from harm caused by CBRN/TIM hazards by preventing or reducing individual and collective exposures, applying prophylaxes to prevent or mitigate negative physiological effects, and protecting critical equipment.
- **Sustain**—The ability to conduct decontamination and medical actions that enable the quick restoration of combat power, maintain/recover essential functions that are free from the effects of CBRN/TIM hazards, and facilitate the return to preincident operational capability as soon as possible.

These elements are defined to be comprehensive while being mutually exclusive. The comprehensiveness of these elements is designed to ensure that any CBRND task performed by the joint force, Service unit, staff, or organization could fit underneath one of these elements.

The mutual exclusivity of these elements is designed to ensure that any CBRND task performed by any joint organization or Service unit (i.e., Navy, Marine Corps, Army, Air Force, or Coast Guard) or combat support agency will fit in only one place in the element structure. The tasks outlined in this FNA and FSA are organized under these elements.

Another architecture under which the FNA and FSA tasks are aligned is derived from the *Universal Joint Task List (UJTL)*. This architecture encompasses the levels of war:

- Strategic (National and Theater)
- Operational
- Tactical

The *UJTL* defines these levels as follows:

The **strategic level of war** is divided into two sublevels: strategic national (SN), which encompasses DoD, Service, and interagency tasks, and strategic theater (ST), which encompasses combatant command tasks. Establishing these sublevels provides clarity and focus for task development and execution. At this level, a nation, often as a member of a group of nations, determines national or multinational (alliance or coalition) security objectives and guidance and develops and uses national resources to accomplish these objectives. Activities at this level establish national and multinational military objectives, sequence initiatives, define limits, and assess risks for the use of military and other instruments of national power, develop global plans or theater war plans to achieve these objectives, and provide military forces and other capabilities in accordance with strategic plans.

At the **operational (OP) level of war**, campaigns and major operations are planned, conducted, and sustained to accomplish strategic objectives within theaters or areas of operations. Activities at this level link tactics and strategy by establishing operational objectives needed to accomplish the strategic objectives, sequencing events to achieve the operational objectives, initiating actions, and applying resources to bring about and sustain these events. These activities imply a broader dimension of time or space than do tactics; they ensure the logistic, administrative, and CBRND support of tactical forces and provide the means by which tactical successes are exploited and sustained to achieve strategic objectives.

At the **tactical (TA) level of war**, battles and engagements are planned and executed to accomplish military objectives assigned to tactical units or task forces. Activities at this level focus on the ordered arrangement and maneuver of combat elements in relation to each other and to the enemy to achieve combat objectives.

Using the CBRND Operational Elements and the *UJTL* levels of war, the tasks within this FNA and FSA are presented in the coming chapters as shown in Figure 1-5. In other words, for each cell of Figure 1-5, an associated list of tasks was developed. For example, a specific task list was developed for the area of Strategic Theater/Shape. Separate and distinct lists are generated for the other cells.

S-Element Level of War	Sense	Shape	Shield	Sustain
Strategic National				
Strategic Theater		Specific tasks to be performed		
Operational				
Tactical				

Figure 1-5. CBRND FNA and FSA Architectures

### 1.4.2 Assumptions

Assumptions for this analysis include the following:

- FAA-developed tasks, conditions, and standards will remain relevant over the time frame of the analysis (near, mid-, and far term).
- Threat-related technologies or applications area represented through the Initial Threat Warning Assessment (ITWA) for CBRND (dated 14 July 2004) provided by the Defense Intelligence Agency (DIA) in conjunction with this effort.
- Current and planned materiel/equipment development programs will produce materiel/equipment that performs in accordance with development requirements as stated in the operational requirements documents and capability development documents.

### 1.4.3 Data Collection

Data collected during four previous study efforts, including the Contamination Avoidance, Protection, Battle Management, and Restoration MAAs and MNAs, was leveraged for the FNA and FSA. Additional information was requested, as needed, to complete the FNA and FSA. A complete listing of contacts follows, organized by MAA and MNA topic area.

#### Contamination Avoidance

- Maneuver Support Center (MANSCEN), Ft. Leonard Wood, MO
- U.S. Army Chemical School, Ft. Leonard Wood, MO
- Research Development and Engineering Command (RDECOM), Edgewood, MD
- Air Force Civil Engineer Support Agency (AFCESA), Tyndall Air Force Base (AFB), FL
- Air Combat Command, United States Air Force (USAF), Langley AFB, VA
- Nuclear, Biological, and Chemical Requirements, U.S. Army Training and Doctrine Command (TRADOC), Ft. Monroe, VA

- Commander Fleet Forces Command (CFFC), Norfolk, VA
- U.S. Army Office of the Surgeon General, Alexandria, VA
- NBC Requirements, Marine Corps Combat Development Command (MCCDC), Quantico, VA
- Headquarters (HQ), U.S. Coast Guard, Washington, DC
- HQ, USAF, Air Force Civil Engineer Readiness Program Branch (AF/ILEXR), Washington, DC
- Office of the Chief of Naval Operations (OPNAV) N70, U.S. Navy, Washington, DC
- JSMG CAM Review, Fredericksburg, VA
- Medical Requirements Subpanel, JSIG (All Service Medical Representatives)
- NBC Contamination Avoidance Material and Technology Working Group, RDECOM, Edgewood Arsenal, MD
- Medical Chemical and Biological Defense Research Program, USAMRMC, Ft. Detrick, MD
- 2002 Chemical and Biological National Security Program Summer Meeting, Crystal City, VA
- U.S. SOCOM, McDill AFB, Tampa, FL
- Stand-off Detection Conference, Williamsburg, VA
- Series of Strategy-to-Task working group meetings
- Rapid Detection Technologies for Food and Water Supply Safety and Security Conference, Washington, DC (2004)
- Biological-Chemical Detection Symposium, Washington DC (2004)
- Second TIC/TIM Symposium, Richmond VA (2004)

#### Protection

- MORS Urban Analysis Workshop, Johns Hopkins Applied Physics Laboratory
- MANSCEN, Ft. Leonard Wood, MO
- U.S. Army Chemical School, Ft. Leonard Wood, MO
- RDECOM, Edgewood, MD
- RDECOM, Natick, MA
- AFCESA, Tyndall AFB, FL
- Air Combat Command, USAF, Langley AFB, VA
- NBC Requirements, U.S. Army TRADOC, Ft. Monroe, VA
- CFFC, Norfolk, VA
- Naval Surface Warfare Center, Panama City, FL
- HQ AFRL, Tyndall AFB, FL
- U.S. Army Office of the Surgeon General, Alexandria, VA
- NBC Requirements, MCCDC, Quantico, VA
- OPNAV N70, U.S. Navy, Washington, DC
- HQ, U.S. Coast Guard, Washington, DC
- HQ, USAF, AF/ILEXR, Washington, DC
- JSMG CAM Review, Fredericksburg, VA
- Protection Symposium Wargame, Tyndall AFB (All Service Representatives, Combat Development, and Materiel Development)
- Medical Requirements Subpanel, JSIG (All Service Medical Representative)

- NBC Protection—Individual Protection Material and Technology Working Group; RDECOM, Edgewood Arsenal, MD
- NBC Protection—Collective Protection (COLPRO) Material and Technology Working Group; RDECOM, Edgewood Arsenal, MD
- DoD Canine Program Management Office
- Medical Chemical and Biological Defense Research Program; USAMRMC, Ft. Detrick, MD
- 2002 Chemical and Biological National Security Program Summer Meeting, Crystal City, VA
- SOCOM, McDill AFB, Tampa, FL
- 2002 Special Operations Forces (SOF) Chemical and Biological Conference, Tampa, FL
- DoD Canine Program Management Office, Air Force Security Forces Center, Lackland AFB, TX
- DoD Military Working Dog Veterinary Services Facility, Lackland AFB, TX
- U.S. Army Veterinary Corps, Ft. Sam Houston, TX
- Army Medical Department Center and School

#### Battle Management

- 2002 and 2003 Chemical and Biological National Security Program Summer Meetings, Crystal City, VA
- National Defense University Counter Proliferation Symposium
- Defense Threat Reduction Agency (DTRA) Test and Diagnostics Symposium, George Mason University, Fairfax, VA
- Network Centric Warfare Conference, Tyson Corners, VA
- Medical Requirements Subpanel, JSIG
- 2002 and 2003 SOF CB Conference, Tampa, FL
- Series of Battle Information Management Front End Analysis Integrated Process Team (IPT) meetings (2003)
- Battle Management Conference, Williamsburg, VA
- NBC Requirements, MCCDC, U.S. Marine Corps (USMC), Quantico, VA
- Chemical-Biological Defense Industrial Base Symposium, Pittsburgh, PA
- World Wide Chemical Conferences (2002 and 2003), Ft. Leonard Wood, MO
- The Warfighter/Users Vignette Working Group for CBRN Battlespace Information Management MAA, Crystal City, VA
- 2002 DoD Interoperability Conference, Mesa, AZ
- HQ, Joint Forces Command (JFCOM)
- HQ, AFRL, Tyndall AFB, FL
- RDECOM, Edgewood, MD
- HQ, AFCESA, Tyndall AFB, FL
- HQ, Air Combat Command (USAF), Langley AFB, VA
- U.S. Army TRADOC, Ft. Monroe, VA
- OPNAV N70, U.S. Navy, Washington, DC
- CFFC, Norfolk, VA
- U.S. Army Office of the Surgeon General, Alexandria, VA
- Medical Chemical and Biological Defense Research Program, USAMRMC, Ft. Detrick, MD

- CBRNE IPTs, Orlando, FL, and Las Vegas, NV
- Interservice/Industry Training, Simulation and Education Conference, Orlando, FL
- Shape Integrated Concept Team, Alexandria, VA
- Joint Effects Model (JEM) and Joint Operational Effects Federation (JOEF) Operational Requirements Document Meetings
- Network Enterprise Conference, Tyson's Corner, VA
- MANSCEN, Ft. Leonard Wood, MO
- Chemical School, Ft. Leonard Wood, MO
- Joint National Training Capability Conference, Alexandria, VA
- Enterprise Integration Conference, Tyson's Corner, VA
- MORSS Future Warrior Conference 71st Military Operations Research Society Symposium (MORSS), Quantico USMC Base, VA
- 2002 DoD Interoperability Conference, Mesa, AZ

#### Restoration

- Restoration Operations Program, DTRA
- Mortuary Affairs Center, U.S. Army Quartermaster Center and School, Ft. Lee, VA
- RDECOM, Edgewood, MD
- 84<sup>th</sup> Chemical Battalion at the U.S. Army Chemical School, Ft. Leonard Wood, MO
- Decontamination instructors with the Navy, Air Force, and Marine Corps Service Detachment, Ft. Leonard Wood, MO
- AFCESA, Tyndall AFB, FL
- Air Mobility Command
- Chemical Biological Incident Response Force, Indian Head, MD
- Naval Surface Forces, Atlantic
- Naval Facilities Engineering Command
- Office of Emergency Preparedness
- American Nuclear, Biological, and Chemical Delegation to the American, British, Canadian, and Australian Armies' Program
- DoD Military Working Dog Veterinary Services Facility, Lackland AFB, TX
- Army Medical Department Center and School
- Joint Readiness Clinical Advisory Board
- Defense Threat Reduction Agency
- Defense Advanced Research Projects Agency
- Walter Reed Army Institute of Research
- U.S. Army Medical Research Institute of Infectious Disease
- U.S. Army Medical Research Institute of Chemical Defense
- Armed Forces Radiobiology Research Institute
- Joint Program Executive Office
- Joint Vaccine Acquisition Program
- USAMRMC
- Department of Energy
- Decontamination ICT, Arlington, VA

- DoD Canine Program Management Office, Air Force Security Forces Center, Lackland AFB, TX
- DoD Military Working Dog Veterinary Services Facility, Lackland AFB, TX
- US Army Veterinary Corps, Ft. Sam Houston, TX

Additionally, Battelle recently visited combatant commands as part of ongoing assistance efforts. Part of the assistance effort, whether for training, exercise, or planning assistance, includes an analysis of command CBRND requirements. Pertinent data have been incorporated into the FAA. Combatant commands visited include the following:

- U.S. Central Command (USCENTCOM)
- U.S. Northern Command (USNORTHCOM)
- U.S. Southern Command (USSOUTHCOM)
- U.S. Strategic Command (USSTRATCOM)
- U.S. Pacific Command (USPACOM)
- Joint Forces Command/Joint Warfighting Center (JFCOM/JWC)
- U.S. Special Operations Command (USSOCOM)
- U.S. Transportation Command (USTRANSCOM)
- North American Aerospace Defense Command (NORAD)
- U.S. European Command (USEUCOM)

#### **1.4.4      FAA Results**

The FNA process builds upon the results of the FAA process. The primary purpose of the FAA was to identify CBRND tasks that the force must be able to perform to succeed in assigned missions. The tasks derived from the *UJTL* represent clearly defined and measurable activities accomplished by individuals, staffs, and organizations. The tasks are observable and measurable, and described using a single verb.

The task lists developed during the FAA included the following elements: task title, definition, derivation, measures, and conditions. Each of these elements provides the basis for the FNA and FSA process. For that reason, each of the elements identified during the FAA process (with the exception of the measures which will be discussed more at length in a subsequent section) are included in the FNA and FSA and are part of the task analysis of Chapters 2–17.

#### **1.4.5      FNA**

The FNA assesses the ability of the current (i.e., FY2005), near/mid-term (i.e., FY2006–FY2011) and far-term (i.e., FY2012–FY2020) joint capabilities to accomplish the tasks that the FAA identified under the full range of operating conditions and to the designated standards. Using the tasks identified in the FAA as primary input, the FNA produces as output a list of capability gaps or shortcomings that require solutions. It may also identify redundancies in capabilities that reflect inefficiencies.

The FNA describes the capability gap, overlap, or problem in operational and/or broad effects-based terms. Future adversarial threat capabilities and scientific and technological developments are considered.

The FNA analysis includes the following four-step process, which will be described in more detail in subsequent sections:

1. Translate FAA measures into standards.
2. Determine how conditions will affect task performance.
3. Determine task linkages.
4. Determine and characterize current and projected capabilities to perform the task to designated standard and assess deficiencies in identified capabilities.

#### 1.4.5.1 Standard Development

The FNA process requires the development of standards. Standards are created when measures that have been developed as part of the task development process during the FAA are quantified. The measures developed for the CBRND FAA tasks focus on a key element of the task that, when achieved, contribute to the overall accomplishment of the activity at hand (task attainment). Most standards are quantifiable and determine how well the task is performed. Since the measures have been converted into standards for the FNA, the measures from the FAA are not repeated in this document.

During the FAA, measures were broken down into two parts: first, the criterion that describes the unit of capacity by which to gauge acceptable levels of performance and, second, a performance statement describing the element of the task to be gauged. A complete FAA measure combines these two elements—criterion and performance statement. Examples of complete measures are shown in Table 1-3.

**Table 1-3. Example Measures**

<b>Criterion</b>	<b>Performance Statement</b>
Hours	Between radiation surveys
Months	From request for OPLAN until transmitted
Yes/No	TIMs threat analysis conducted?

When a specific value is assigned to a criterion, it becomes a quantified criterion (e.g., 5 days, 15 instances, 80%). A standard is created when the quantified criterion is attached to a performance statement as displayed in Figure 1-6.

**Figure 1-6. Quantified Criterion Relationship**

There are problems associated with translating measures into standards, specifically the process of assigning a specific value to a criterion. Research determined that standards do not exist in

many cases. For example, one of the standards associated with the decontamination tasks relates to how well the contamination was removed. No documentation currently identifies an acceptable level of contamination other than to state that the contamination should not be detectable. The problem associated with this type of documentation is that the acceptable level depends on the capability of detectors that do not currently detect to a level of “zero.” Selecting a specific value to assign to a criterion in these cases cannot be done with scientific data and evidence that support a specific value. In these instances, a more generic value may have been selected, such as “Remove contamination to a level that meets operational objectives.” These objectives can then be determined on a case-by-case basis, taking into consideration operational requirements and the mission as determined by the commander. In some cases, generic “yes” or “no” values may have been selected as the quantification. In those few cases, where documentation to support a standard was found, the documented standard was used.

#### 1.4.5.2 Task Conditions

Conditions were identified as part of the FAA process. A condition is the state of the environment in which a task is to be performed. As in the *UJTL*, conditions are categorized as follows:

- Physical conditions: land, sea, air, or space
- Military conditions: mission, forces, C4ISR (Command, Control, Communications, Computers, Intelligence, Surveillance, and Reconnaissance), movement, firepower, protection, sustainment, threat, or conflict
- Civil conditions: political, cultural, or economic.

The FNA process bears in mind these conditions. Conditions have the potential to significantly affect or degrade the performance of a task to some level. In cases where documentation is available to document the degradation level, the specific limitation is addressed, and the reference provided. For example, documentation states that the CAM/Improved Chemical Agent Monitor (ICAM) requires up to 8 hours to warm up after 30 days of storage; therefore, the condition “minimum time available” is applicable and may degrade the ability of the CAM/ICAM to perform to the designated standard—“chemical hazards are detected in near-real time.” In other cases, where specific documentation of the degradation is not available, the conditions are only listed.

#### 1.4.5.3 Capability and Deficiency Assessments

Capability and deficiency assessments were conducted for each task using the following three-step process:

1. Identify individual capabilities to perform a particular task that are currently available (FY2005) or expected to be available in near/mid-term future (FY2006–FY2011) or far-term future (FY2012–FY2020).
2. Assess each individual capability for its ability to perform the task to the designated standards. Include corresponding descriptions of capabilities and deficiencies in table endnotes.

3. Rate current and projected overall capabilities to perform the task to each designated standard by performing simple arithmetic averages of relevant individual capability scores (i.e., scores of those individual capabilities available or expected to be available in a particular time period).

By analogy, the score indicating the overall capability to perform the task to all designated standards was calculated by performing a simple arithmetic average of the scores indicating the overall capability to perform the task to individual designated standards. By this protocol, the overall capability to perform the task across all designated standards was assessed separately for the current, near/mid-term, and far-term periods.

Most upper-level tasks, in contrast to most tactical tasks, are based on non-materiel elements. For many of these tasks identifying and assessing individual capabilities was not useful or possible. In these cases, only the overall current and projected capabilities were evaluated.

The cells containing the information on an individual or overall capability to perform a task to a designated standard were color-coded using red, amber, and green to indicate the status of the capability. If a capability scored 0–3, 4–7, or 8–10 according to a particular measure's scale, then the corresponding cell was colored red, amber, or green, respectively. In some cases, calculated scores were not whole numbers. For example, most overall capability scores, whether relative to a particular standard or across all designated standards, were not whole numbers since they were usually averages of multiple individual scores. In these instances, the presented score was the calculated score rounded up or down depending on whether the tenth-place number was 5 or more. Because of number rounding, cells (or stoplights) were ultimately color coded red, amber, or green according to the score as stated in Table 1-4.

**Table 1-4. Capability Color Coding**

Assigned Color	Score
Green	8–10
Yellow	4–7
Red	0–3

In qualitative terms, green, amber, and red typically indicate the following about a capabilities:

- “Green” typically indicates a full capability to perform the task to the designated standard or standards.
- “Amber” typically indicates a partial capability to perform the task to the designated standard or standards.
- “Red” typically indicates little or no capability to perform the task to the designated standard or standards.

In some analysis chapters, the above color coding definitions were expanded upon to better characterize the status of the examined capabilities. In these cases, detailed definitions are provided at the beginning of the chapter.

### 1.4.6 FSA

The FSA is a three-part analysis consisting of a DOTMLPF analysis, an assessment of potential Ideas for Materiel Approaches and an Analysis of Materiel Approaches (AMA). This document addresses only the DOTMLPF analysis and IMA assessment. AMAs are being addressed as separate efforts. The FSA is an operationally based assessment of all potential DOTMLPF approaches to solving (or mitigating) one or more of the capability gaps (needs) identified in the FNA. The needs identified in the FNA are inputs to the FSA. The FSA identifies potential solutions, including integrated DOTMLPF changes that leverage existing materiel capabilities; product improvements to existing materiel or facilities; adoption of interagency or foreign materiel solutions; and finally, initiation of new materiel programs. Identified capability needs or redundancies establish the basis for developing materiel approaches in ICD and/or DOTMLPF approaches.

#### 1.4.6.1 DOTMLPF Analysis

The first analysis in the FSA is to determine whether an integrated DOTMLPF approach can fill the capability gaps identified in the FNA. There are three potential solutions to meeting the capability gaps, including (a) the gap can be completely addressed through non-materiel solutions in the areas of DOTLPF, (b) the gap can be addressed through a partial non-materiel solution in DOTLPF but also requires a materiel solution, and (c) the gap can be addressed only through a materiel solution. In cases where the gap can be addressed through a materiel solution, it is assumed that DOTLPF changes will also be necessary to support the materiel change. The changes in DOTLPF associated with new materiel solutions are not addressed in this analysis.

##### 1.4.6.1.1 DOTMLPF Definitions

Working definitions for DOTMLPF used by the study team during the analysis are as follows:

**Doctrine:** Joint doctrine encompasses the fundamental principles that guide the employment of U.S. military forces in coordinated action toward a common objective. Though neither policy nor strategy, joint doctrine serves to make U.S. strategy and policy effective in the application of U.S. military power. Joint doctrine is based on extant capabilities. Joint doctrine is authoritative guidance and will be followed except when, in the judgment of the commander, exception circumstances dictate otherwise (CJCSI 5120.02).

**Organization:** Organization focuses on the missions, staffing, structures, funding, organic resources, organizational values and priorities, products, and services of organizations necessary to successfully perform their mission. It includes the visual representations of these organizations, their characteristics, and the opportunities and challenges to using them to conduct and perform the assigned mission. Each aspect of organization is reviewed and evaluated. The assessment of organization includes reviewing primary and secondary missions, staffing at all levels, management structures and lines of authority, current and projected funding, types and amounts of organic resources (material and non-material such as people, equipment, procedures, supplies, etc.), inherent organization priorities such as warfighting or lifesaving, and the products and services provided by the organization. The assessment identifies necessary modifications to enable integrated DOTMLPF.

**Training:** Joint training encompasses military training based on joint doctrine or Joint Tactics, Techniques, and Procedures (JTTPs) to prepare joint forces and/or joint staffs to respond to strategic and operational requirements deemed necessary by combatant commanders to execute their assigned missions. Joint training involves forces of two or more military departments interacting with a combatant commander or subordinate joint force commander, involves joint forces and/or joint staffs, and is conducted using joint doctrine or JTTPs (CJCSM 3500.03A).

**Materiel:** Materiel includes products that are traditionally associated with the defense acquisition process such as weapons, platforms, communication equipment, medical equipment, transportation, training software, etc. It is assumed that any new materiel solution will need to have changes throughout DOTMLPF to support the new materiel. These changes associated with new materiel were not identified as part of the FSA process.

**Leadership:** Professional development of the joint commander is the product of a learning continuum that comprises training, experience, education, and self-improvement. The role of Professional Military Education and Joint Professional Military Education is to provide the education needed to complement training, experience, and self-improvement to produce the most professionally competent individual possible.

**Personnel:** Personnel category seeks to ensure qualified personnel are available to support a capability. It includes identification of physiological and/or psychological prerequisites (e.g., 20/20 vision, not color blind, not claustrophobic, lifting and carrying weight requirements, etc.) and the knowledge, skills, abilities, and competencies necessary to perform a position, job, or task. It also includes the determination of the applicable specialties and quantities necessary of the primary users, maintenance personnel, and support functions for the integrated DOTMLPF. This effort may require changes to existing specialties or the addition of new specialties or subspecialties.

**Facilities:** Facilities are the infrastructure and include supplies; engineering support; buildings; roads; and the activities necessary to build, maintain, and support operations and/or systems. Current facilities capabilities are identified and reviewed. Additions, changes, and deletions to existing facilities are specified in the assessment.

#### 1.4.6.2 IMA Assessment

The second and final step in the FSA process is the IMA assessment. Only those identified gaps from the DOTMLPF assessment that require a materiel solution are addressed in the IMA process. Research, subject matter experts, and small working groups were used to identify materiel approaches to provide the required capabilities. The collaborative nature of this effort is meant to develop potential solutions in an integrated fashion that reflect the future requirements of joint force commanders. The process leverages subject matter expertise from a variety of sources in identifying possible materiel approaches. The assessment includes existing and future materiel programs that can be modified to meet the capability need. The integrated DOTMLPF implications of any proposed materiel solution are considered throughout the process.

## 1.5 Task Analysis Structure

Each task in Chapters 2–17 is organized by the following elements:

- Task Title—A brief, summary statement of the task to be performed.
- Definition—Statement that provides meaning, detail, and context to the task so that one can picture the activity being performed. Includes examples of what the task includes and does not include.
- Derivation—List of documentation that defines where the task is derived from in the national strategies, Joint Future Operational Capabilities, Operations Plans (OPLANs), Concept Plans, or *UJTL*. Subtasks may be derived from documented tasks.
- Conditions—List of environmental factors accompanied by a descriptor that impact the performance of the task but are not tasks themselves.
- Individual and Overall Capability and Deficiency Assessment—Table that lists and summarizes current (FY2005) and projected near/mid-term (FY2006–FY2011) and far-term (FY2012–FY2020) individual capabilities (and associated deficiencies) to perform the task to the designated standards. It also rates current and projected overall capabilities to perform the task to the designated standards.
- DOTMLPF Assessment—Table that identifies each deficiency listed in the overall capability and deficiency assessment and provides recommended non-materiel and materiel solutions in accordance with DOTMLPF methodology.
- IMA Assessment—Table that identifies materiel approaches to provide the required capabilities for deficiencies requiring a materiel solution.

## 1.6 Report Structure

The remainder of the study is structured as follows:

- Chapter 2—Strategic National Sense Task Analysis. Contains the complete analysis of Strategic National Sense CBRND tasks, including relevant FAA information as well as results of the FNA and FSA.
- Chapter 3—Strategic Theater Sense Task Analysis. Contains the complete analysis of Strategic Theater Sense CBRND tasks, including relevant FAA information as well as results of the FNA and FSA.
- Chapter 4—Operational Sense Task Analysis. Contains the complete analysis of Operational Sense CBRND tasks, including relevant FAA information as well as results of the FNA and FSA.
- Chapter 5—Tactical Sense Task Analysis. Contains the complete analysis of Tactical Sense CBRND tasks, including relevant FAA information as well as results of the FNA and FSA.
- Chapter 6—Strategic National Shape Task Analysis. Contains the complete analysis of Strategic National Shape CBRND tasks, including relevant FAA information as well as results of the FNA and FSA.
- Chapter 7—Strategic Theater Shape Task Analysis. Contains the complete analysis of Shape CBRND tasks, including relevant FAA information as well as results of the FNA and FSA.

- Chapter 8—Operational Shape Task Analysis. Contains the complete analysis of Operational Shape CBRND tasks, including relevant FAA information as well as results of the FNA and FSA.
- Chapter 9—Tactical Shape Task Analysis. Contains the complete analysis of Tactical Shape CBRND tasks, including relevant FAA information as well as results of the FNA and FSA.
- Chapter 10—Strategic National Shield Task Analysis. Contains the complete analysis of Strategic National Shield CBRND tasks, including relevant FAA information as well as results of the FNA and FSA.
- Chapter 11—Strategic Theater Shield Task Analysis. Contains the complete analysis of Strategic Theater Shield CBRND tasks, including relevant FAA information as well as results of the FNA and FSA.
- Chapter 12—Operational Shield Task Analysis. Contains the complete analysis of Operational Shield CBRND tasks, including relevant FAA information as well as results of the FNA and FSA.
- Chapter 13—Tactical Shield Task Analysis. Contains the complete analysis of Tactical Shield CBRND tasks, including relevant FAA information as well as results of the FNA and FSA.
- Chapter 14—Strategic National Sustain Task Analysis. Contains the complete analysis of Strategic National Sustain CBRND tasks, including relevant FAA information as well as results of the FNA and FSA.
- Chapter 15—Strategic Theater Sustain Task Analysis. Contains the complete analysis of Strategic Theater Sustain CBRND tasks, including relevant FAA information as well as results of the FNA and FSA.
- Chapter 16—Operational Sustain Task Analysis. Contains the complete analysis of Operational Sustain CBRND tasks, including relevant FAA information as well as results of the FNA and FSA.
- Chapter 17—Tactical Sustain Task Analysis. Contains the complete analysis of Tactical Sustain CBRND tasks, including relevant FAA information as well as results of the FNA and FSA.

## **CHAPTER 2. STRATEGIC NATIONAL SENSE TASKS**

## Table of Contents

List of Acronyms .....	ii
2.0 Strategic National Sense .....	1
2.1 Task SENSES 1: Sense the decision of a nation-state or transnational organization to initiate a CBRN/TIM weapons program.....	4
2.2 Task SENSES 2: Sense the acquisition of components of a CBRN/TIM weapons program .....	10
2.3 Task SENSES 3: Sense CBRN/TIM weapons program production facility preparation .....	16
2.4 Task SENSES 4: Sense the production of CBRN/TIM agents and delivery systems.....	22
2.5 Task SENSES 5: Sense CBRN/TIM weaponization.....	28
2.6 Task SENSES 6: Sense preparations to test and testing of CBRN/TIM agents/weapons .....	34
2.7 Task SENSES 7: Sense the storage locations of CBRN/TIM weapons or components .....	40
2.8 Task SENSES 8: Sense the operational deployment of CBRN/TIM weapons or units.....	46
2.9 Task SENSES 9: Sense CBRN/TIM offensive and defensive training activities .....	52
2.10 Task SENSES 10: Sense the presence and identity and monitor the movement and location of CBRN/TIM expertise.....	58
2.11 Task SENSES 11: Sense the employment of CBRN/TIM weapons .....	62
2.12 Task SENSES 12: Sense global CBRN/TIM hazards due to employment or ROTA of CBRN/TIM weapons or materials .....	67
2.13 Task SENSES 13: Monitor compliance of signatories to treaties that touch on CBRN/TIM matters (e.g., Chemical Weapons Convention) and states that are eliminating their WMD CBRN treaty signatories and elimination states for compliance .....	71
2.14 Task SENSES 14: Monitor international scientific and technology developments for potential CBRN/TIM implications.....	73
2.15 Task SENSES 15: Provide Sense Global Family of Engagement Plan policies and guidelines to combatant commanders .....	77
2.16 Task SENSES 16: Provide global screening for endemic disease and/or hazardous substances in the environment .....	81
2.17 Task SENSES 17: Develop global environmental background data including climatology .....	85

## **2.0 Strategic National Sense**

### **2.0.1 Introduction**

At the strategic level of war, a nation, often as a member of a group of nations, determines national or multinational (alliance or coalition) security objectives and guidance and develops and uses national resources to accomplish these objectives. Activities at this level establish national and multinational military objectives, sequence initiatives, define limits and assess risks for the use of military and other instruments of national power, develop global plans or theater war plans to achieve these objectives, and provide military forces and other capabilities in accordance with strategic plans. The strategic national sublevel encompasses U.S. Department of Defense (DoD), service, and interagency tasks. Seventeen strategic national sense tasks were identified in the chemical, biological, radiological, and nuclear (CBRN) Functional Area Analysis (FAA) including a task for elimination operations. However, the detailed analysis of the elimination tasks has been deferred to the Joint Requirements Office for Chemical, Biological, Radiological, and Nuclear Defense (JRO-CBRND)–sponsored FAA/Functional Needs Analysis (FNA) of the weapons of mass destruction (WMD) elimination and interdiction functional areas.

This chapter, detailing the Strategic National Sense area, restates relevant information from the CBRND FAA, including a description of each of the 17 Strategic National Sense tasks, derivation of the task, an indication of other linked tasks, and the pertinent conditions. The FNA section addresses the capability and deficiency analysis and a brief description of potential near-term changes. Once all the capabilities are considered, the assessment concludes with a separate, overarching look at the entire capability spectrum to identify remaining gaps and/or synergies. The Functional Solutions Analysis (FSA) section addresses possible solutions for the deficiencies identified in the FNA section. The non-materiel solutions addressed reflect one or more of the six areas of DOTLPP: doctrine, organization, training, leadership, personnel, and facilities. Most of the Strategic National Sense tasks involve required capabilities of major staffs or staff sections within DoD. In those areas where a DoD staff or agency needs to interact within the interagency, the task focuses on DoD capabilities required to facilitate the interaction.

### **2.0.2 FNA Summary**

The table below summarizes the overall current and projected capability to perform the Strategic National Sense tasks identified in the CBRND FAA. The overall capability to conduct Strategic National Level Sense Tasks (SNSSENSs) in the current time frame is assessed as “yellow.” The Joint Staff Directorate for Intelligence, J-2, is responsible for working with national-level organizations to obtain intelligence that is required to support joint operations. Per joint intelligence doctrine, the J-2 is responsible for coordinating all intelligence-related CBRN functions pertaining to adversary employment of CBRN weapons with the appropriate CBRN staff element, but because of documented training, education, and experience issues, J2 personnel may not have a full grasp of what needs to be coordinated. As the Chairman of the Joint Chiefs of Staff’s single source of expertise in addressing CBRND issues involving the warfighter, JRO-CBRND must proactively engage the J2 to determine the adequacy of current and projected national-level intelligence capabilities to sense all elements of global CBRN/TIM weapons proliferation. For the purposes of this analysis, current capabilities are listed and issues that need to be further assessed and clarified are provided for JRO-CBRND action. While the J2

and national intelligence organizations have the responsibility to gather intelligence on CBRN threat-related issues, they do not have the requisite understanding of CBRN issues to fully address the requirements without assistance from JRO-CBRND. It is projected that improvements due to coordination/doctrine, organization, training, materiel, leadership and education, personnel, and facilities (DOTMLPF) enhancements will dramatically improve DoD's ability to articulate and assess Sense requirements, but the overall status will remain "yellow" due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

**Table 2.0-1. Strategic National Sense Summary FNA Findings**

CBRN Strategic National Sense Task Number	CBRN Strategic National Sense Task Title	Capability		
		Current	Near/Mid	Far
SNSSENS 1	Sense the decision of a nation-state or transnational organization to initiate a CBRN/TIM weapons program.	●	●	●
SNSSENS 2	Sense the acquisition of components of a CBRN/TIM weapons program.	●	●	●
SNSSENS 3	Sense CBRN/TIM weapons program production facility preparation.	●	●	●
SNSSENS 4	Sense the production of CBRN/TIM agents and delivery systems.	●	●	●
SNSSENS 5	Sense CBRN/TIM weaponization.	●	●	●
SNSSENS 6	Sense preparations to test and testing of CBRN/TIM agents/weapons.	●	●	●
SNSSENS 7	Sense the storage locations of CBRN/TIM weapons or components.	●	●	●
SNSSENS 8	Sense the operational deployment of CBRN/TIM weapons or units.	●	●	●
SNSSENS 9	Sense CBRN/TIM offensive and defensive training activities.	●	●	●
SNSSENS 10	Sense the presence and identity and monitor the movement and location of CBRN/TIM expertise.	●	●	●
SNSSENS 11	Sense the employment of CBRN/TIM weapons.	●	●	●

### 2.0.3 FSA Summary

The paragraphs below summarize the assessment of all potential DOTMLPF solutions for the capability gaps identified in the FNA section.

#### 2.0.3.1 DOTMLPF

The DOTMLPF solutions identified in this chapter include basic actions required to better prepare the appropriate staffs. No training or experimentation has taken place to facilitate the formulation of tactics, techniques, and procedures (TTPs) designed to facilitate the ability of intelligence personnel to assess CBRND Sense requirements. It is imperative that these exercises take place and lessons learned be integrated into doctrine, TTPs, and guidance. Other solutions include the development of leader education programs for both CBRND and intelligence staff officers and a detailed analysis of how the intelligence community is organized, trained, and staffed to perform CBRN intelligence analysis and collection activities. In the case of hazards involving non-U.S. allies or countries that restrict information, current doctrine, techniques, and procedures may not be adequate. It is imperative that additional exercises/experimentation take place and lessons learned be integrated into doctrine, TTPs, and guidance.

#### 2.0.3.2 Ideas for Materiel Approaches

There are no materiel requirements.

## **2.1 Task SNSENS 1: Sense the decision of a nation-state or transnational organization to initiate a CBRN/TIM weapons program**

### **2.1.1 Functional Area Analysis**

#### **2.1.1.1 Definition**

To obtain information and data from all sources that determine the strategic decision of a nation-state or transnational organization (terrorists, cultists) to initiate a CBRN/toxic industrial material (TIM) weapons program. Areas of interest include activities and situations that could indicate that deliberations are taking place considering the initiation of a CBRN/TIM weapons program. Of particular importance is information relating to the reasoning behind the pursuit of CBRN/TIM weapons; therefore, it is important to collect information indicating the adversaries' objectives for using CBRN/TIM and their concept of use to obtain those objectives. This task includes collecting information on key foreign leadership/decision makers involved in the CBRN/TIM weapons program deliberation process and cultural factors that may influence decisions. Information is also collected on the nature and characteristics of theater and regional areas of interest that would impact on CBRN/TIM programmatic decisions. This task also includes collecting counterintelligence information, ballistic missile information that could be related to the initiation of a CBRN/TIM weapons program, and information on terrorist activities.

#### **2.1.1.2 Derivation**

*UJTL (SN 9.1.3, SN 2.4.1.2, SN 8.1.10), JP (2-0, 2-02).*

#### **2.1.1.2.1 Supported Task: N/A**

#### **2.1.1.2.2 Lateral Task: SNSHA 1**

#### **2.1.1.2.3 Supporting Tasks: STSENS 5, STSENS 6**

#### **2.1.1.3 Condition**

Perform this task under conditions of:

##### **Physical. NA**

##### **Military**

1. Negligible intelligence database. (C2.4.2)
2. Negligible intelligence access. (C2.4.2)
3. Conventional and terrorist threat form. (C2.9.2)
4. Prehostilities state of conflict. (C2.10.1)

**Civil**

1. Negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)

**2.1.2 Functional Needs Analysis****2.1.2.1 Capability and Deficiency Assessment Summary**

Table 2.1-1 discusses the only capability that currently exists to perform the task to the designated standards. There is only one capability that exists, and no other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The Joint Staff Directorate for Intelligence, J-2, is responsible for working with national-level organizations to obtain intelligence that is required to support joint operations. Per joint intelligence doctrine, the J-2 is responsible for coordinating all intelligence-related CBRN functions pertaining to adversary employment of CBRN weapons with the appropriate CBRN staff element, but because of documented training, education, and experience issues, J2 personnel may not have a full grasp of what needs to be coordinated. As the Chairman of the Joint Chiefs of Staff's single source of expertise in addressing CBRND issues involving the warfighter, JRO-CBRND must proactively engage the J2 to determine the adequacy of current and projected national-level intelligence capabilities to sense the decision of a nation-state or transnational organization to initiate a CBRN/TIM weapons program. For the purposes of this analysis, current capabilities are listed and issues that need to be further assessed and clarified are provided for JRO-CBRND action.

**Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Near/mid-term experimentation results (as recommended in this Joint Capabilities Integration and Development System [JCIDS] analysis) may lead to development of new capabilities. It is projected that improvements due to coordination/DOTMLPF enhancements will dramatically improve DoD's ability to articulate and assess Sense requirements, but the overall status will remain "yellow" due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

**Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. New organizational structures or other capabilities resulting from near/mid-term experimentation results (as recommended in this JCIDS analysis) may dramatically improve DoD's ability to develop intelligence indicators for sensing the decision of a nation-state or transnational organization to initiate a CBRN/TIM weapons program, but the overall status is projected to remain "yellow" due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

**Table 2.1-1. SSENS 1: Capability and Deficiency Assessment**

<b>Capability: Joint Staff Director for Intelligence, J-2</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>
<b>Current Overall Capability<sup>1</sup></b>	Y <sup>2</sup>	Y <sup>3</sup>	G <sup>4</sup>	Y <sup>5</sup>	Y <sup>6</sup>
<b>Near/Mid-Term Overall Capability</b>	Y <sup>7</sup>	Y	G	Y	Y
<b>Far-Term Overall Capability<sup>8</sup></b>	Y <sup>9</sup>	Y	G	Y	Y

	<b>FAA Measure</b>	<b>Scale</b>
M1	Warning time/indicators are provided before actual decision to initiate CBRN/TIM weapons program.	G – Yes, Y – Limited, R – No
M2	Transnational organizations considering CBRN/TIM weapons programs are identified.	G – Yes, Y – Limited, R – No
M3	Assessments of overall nation-states or transnational organizations that may be considering CBRN/TIM programs are provided.	G – Yes, Y – Limited, R – No
M4	Countries that have made the decision to initiate CBRN/TIM weapons programs have been detected and identified.	G – Yes, Y – Limited, R – No
M5	Strategic surprise does not occur.	G – Yes, Y – Limited, R – No

<sup>1</sup> Joint intelligence and CBRN publications do not adequately address this issue. JRO-CBRND is not adequately staffed and organized to meet its intelligence-related responsibilities. The J2 staff is not adequately trained/educated in CBRN issues. CBRN staff officers are not adequately trained/educated in intelligence issues. Experimentation does not provide feedback on intelligence indicators for this task. JPME does not adequately cover the fusion of intelligence/CBRN issues.

<sup>2</sup> The J-2 works with various national-level organizations to ensure that activities and situations that could indicate that deliberations considering the initiation of a CBRN/TIM weapons program are taking place are identified prior to a decision to proceed. Techniques and procedures to facilitate this process and to provide useful indicators may not be adequate.

<sup>3</sup> The J-2 works with various national-level organizations to identify transnational organizations that may be considering initiating CBRN/TIM weapons programs. Techniques and procedures to facilitate this process and to provide useful indicators may not be adequate.

<sup>4</sup> Nothing precludes the providing of assessments of overall nation-states or transnational organizations that may be considering CBRN/TIM programs once they are identified and need to know is certified.

<sup>5</sup> The J-2 works with various national-level organizations to detect and identify countries that have made the decision to initiate CBRN/TIM weapons programs. Techniques and procedures to facilitate this process and to provide useful indicators may not be adequate.

<sup>6</sup> The J-2 works with various national-level organizations to ensure that strategic surprise does not occur. Adequate resources and means may not be sufficiently applied to ensure that the decision of a nation-state or transnational organization to initiate a CBRN/TIM weapons program is detected.

<sup>7</sup> Near- and mid-term improvements for all measures will depend upon the emphasis placed upon and efficacy of experimentation which will be designed to close knowledge gaps.

<sup>8</sup> DOTMLPF to support task should improve if effective experimentation closes knowledge gaps.

<sup>9</sup> Once knowledge gaps are closed, concepts may be refined, and new capabilities will be proposed and refined as a result of experimentation.

## 2.1.3 Functional Solution Analysis

### 2.1.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the Ideas for Materiel Approaches (IMA) section.

1. **Deficiency:** Techniques and procedures to facilitate providing warning time and to provide useful indicators may not be adequate.  
**Non-Materiel Solutions:** *Doctrine:* JRO-CBRND must work with J2 and/or national intelligence organizations to develop effective techniques and procedures to facilitate providing warning time and to provide useful indicators. *Training:* JRO-CBRND must test all techniques and procedures by integrating them into their experimentation campaign plan and developing lessons learned and actionable recommendations.
2. **Deficiency:** Techniques and procedures to facilitate identifying transnational organizations considering CBRN/TIM weapons programs and to provide useful indicators may not be adequate.  
**Non-Materiel Solutions:** *Doctrine:* JRO-CBRND must work with J2 and/or national intelligence organizations to develop effective techniques and procedures to facilitate identifying transnational organizations considering CBRN/TIM weapons programs and to provide useful indicators.
3. **Deficiency:** Techniques and procedures to facilitate identifying countries that have made the decision to initiate CBRN/TIM weapons programs and to provide useful indicators may not be adequate.  
**Non-Materiel Solutions:** *Doctrine:* JRO-CBRND must work with J2 and/or national intelligence organizations to develop effective techniques and procedures to facilitate identifying countries that have made the decision to initiate CBRN/TIM weapons programs and to provide useful indicators.
4. **Deficiency:** Adequate resources and means may not be sufficiently applied to ensure that the decision of a nation-state or transnational organization to initiate a CBRN/TIM weapons program is detected.  
**Non-Materiel Solutions:** *Organization:* The CBRN organization or staffing of the J2 as well as each national intelligence organization must be analyzed from a DoD standpoint to ensure that they can provide required CBRN intelligence concerning CBRN hazards. These hazards need to be detected, identified, and quantified for Shape to provide a clear understanding of the current and *predicted* CBRN situation to the commander. An organization dedicated to providing CBRN technical expertise and assistance to the J2 and national-level intelligence organizations should be established. *Training:* JRO-CBRND must work with J2 and/or national intelligence organizations to develop effective training for analysts as well as those managing all means of collection. The training must allow analysts and collection managers the means by which to determine inadequacy of collection mechanisms and a means to make recommendations for improvement. *Leadership:* JRO-CBRND must work with J2 and/or national intelligence

organizations to develop an effective CBRN education program for analysts as well as those managing all means of collection. The education process must provide analysts and collection managers with the tools they need to assess the efficacy of their analysis and collection efforts. *Personnel*: Personnel should not be assigned to intelligence analysis or collection activities vital to CBRN areas without requisite CBRN education and/or experience. *Facilities*: Training requirements should be analyzed and special training facilities developed/modified if required.

5. **Deficiency**: Joint intelligence and CBRN publications do not adequately address this issue.

**Non-Materiel Solutions**: *Doctrine*: Joint intelligence and CBRN publications must be enhanced to adequately address this issue and to interface with each other so that roles and responsibilities are clearly delineated.

6. **Deficiency**: JRO-CBRND is not adequately staffed and organized to meet its intelligence-related responsibilities.

**Non-Materiel Solutions**: *Organization*: JRO-CBRND should have a staff section dedicated to resolving CBRN intelligence community issues. JRO-CBRND must be better integrated into the J-2 and through the J-2 assess the organizational capabilities of DIA, CIA, and DTRA. *Personnel*: JRO-CBRND should have adequate trained/experienced personnel assigned to man a staff section dedicated to resolving CBRN intelligence community issues.

7. **Deficiency**: The J2 staff is not adequately trained/educated in CBRN issues.

**Non-Materiel Solutions**: *Training*: Develop training that will enable the J2 staff to better understand their CBRN role and enhance their ability to obtain intelligence that is required to support the Shape function of Strategic National CBRND. *Leadership*: Develop an education program that will enable the J2 staff to better understand their CBRN role and enhance their ability to obtain intelligence that is required to support the Shape function of Strategic National CBRND.

8. **Deficiency**: CBRN staff officers are not adequately trained/educated in intelligence issues.

**Non-Materiel Solutions**: *Training*: Develop training programs that allow CBRN staff officers to better support the CBRN intelligence process. *Leadership*: Develop education programs that allow CBRN staff officers to better understand the CBRN intelligence process and their roles and responsibilities.

9. **Deficiency**: Experimentation/red teaming does not provide feedback on intelligence indicators for this task.

**Non-Materiel Solutions**: *Training*: JRO-CBRND must work with J2 and/or national intelligence organizations to integrate this task into both intelligence and CBRN experimentation campaign plans.

10. **Deficiency**: Joint Professional Military Education (JPME) does not adequately cover the fusion of intelligence/CBRN issues.

**Non-Materiel Solutions:** *Leadership:* Integrate intelligence/CBRN fusion issues into JPME.

- 11. Deficiency:** DoD CBRN experts detailed to the national intelligence organizations do not receive adequate preparation, support, or debriefing for DoD lessons learned.

**Non-Materiel Solutions:** *Organization:* Ensure that CBRN organizations that provide DoD detailees to national intelligence organizations are proactive in ensuring their institutional CBRN intelligence needs are both understood and met and that the detailees they provide are prepared in every way. *Leadership:* CBRN DoD detailees to national intelligence organizations must be provided with formal educational preparation.

*Personnel:* CBRN DoD detailees to national intelligence organizations must possess adequate skill and experience.

#### **2.1.3.2 IMA Assessment Summary**

N/A

## **2.2 Task SENSE 2: Sense the acquisition of components of a CBRN/TIM weapons program**

### **2.2.1 Functional Area Analysis**

#### **2.2.1.1 Definition**

To obtain information and data from all sources that determine when a nation-state or transnational organization is acquiring components essential to a CBRN/TIM weapons program. Areas of interest include activities and situations that could indicate that personnel with special expertise in CBRN/TIM weapons development are being recruited. Other areas could include the acquisition of chemicals that could be used as precursors of chemical agents, biological cultures or organisms, radioisotopes, or radiological ores. Specialized equipment acquisitions or development, even dual-use items that could have nonweapons application, should be identified as applicable. Equipment and clothing required for protection during CBRN/TIM weapons development would be of interest. Development of weapons systems or munitions that could be used to employ CBRN/TIM weapons also should be noted. Information developed by this task may contribute to Task SENSE 1.

#### **2.2.1.2 Derivation**

*UJTL (SN 9.2.2, SN 2.2.1, SN 8.1.10), JP (2-0, 2-01, 2-02).*

##### **2.2.1.2.1 Supported Task: N/A**

##### **2.2.1.2.2 Lateral Task: SNSHA 1**

##### **2.2.1.2.3 Supporting Task: N/A**

#### **2.2.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

#### **Military**

1. Negligible intelligence database. (C2.4.2)
2. Negligible theater intelligence access. (C2.4.2)
3. Conventional and terrorist threat form. (C2.9.2)
4. Prehostilities state of conflict. (C2.10.1)

#### **Civil**

1. Negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)

## **2.2.2 Functional Needs Analysis**

### **2.2.2.1 Capability and Deficiency Assessment Summary**

Table 2.2-1 discusses the only capability that currently exists to perform the task to the designated standards. There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The Joint Staff Directorate for Intelligence, J-2, is responsible for working with national-level organizations to obtain intelligence that is required to support joint operations. Per joint intelligence doctrine, the J-2 is responsible for coordinating all intelligence-related CBRN functions pertaining to adversary employment of CBRN weapons with the appropriate CBRN staff element, but because of documented training, education, and experience issues, J2 personnel may not have a full grasp of what needs to be coordinated. As the Chairman of the Joint Chiefs of Staff's single source of expertise in addressing CBRN defense issues involving the warfighter, JRO-CBRND must proactively engage the J2 to determine the adequacy of current and projected national-level intelligence capabilities to sense the acquisition of components of a CBRN/TIM weapons program. For the purposes of this analysis, current capabilities are listed and issues that need to be further assessed and clarified are provided for JRO-CBRND action.

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Near/mid-term experimentation results (as recommended in this JCIDS analysis) may lead to development of new capabilities. It is projected that improvements due to coordination/DOTMLPF enhancements will dramatically improve DoD's ability to articulate and assess Sense requirements, but the overall status will remain "yellow" due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. New organizational structures or other capabilities resulting from near/mid-term experimentation results (as recommended in this JCIDS analysis) may dramatically improve DoD's ability to develop intelligence indicators for sensing the acquisition of components of a CBRN/TIM weapons program, but the overall status is projected to remain "yellow" due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

<b>Far-Term Overall Capability<sup>6</sup></b>	Y <sup>7</sup>	Y	Y

	<b>FAA Measure</b>	<b>Scale</b>
M1	Countries or transnational organizations acquiring CBRN/TIM weapons program components are detected and identified.	G – Yes, Y – Limited, R – No
M2	Intelligence on countries or transnational organizations performing research and development or acquiring CBRN/TIM weapons program components is accurate.	G – Yes, Y – Limited, R – No
M3	Strategic surprise does not occur.	G – Yes, Y – Limited, R – No

<sup>1</sup> Joint intelligence and CBRN publications do not adequately address this issue. JRO-CBRND is not adequately staffed and organized to meet its intelligence-related responsibilities. The J2 staff is not adequately trained/educated in CBRN issues. CBRN staff officers are not adequately trained/educated in intelligence issues. Experimentation does not provide feedback on intelligence indicators for this task. JPME does not adequately cover the fusion of intelligence/CBRN issues.

<sup>2</sup> The J-2 works with various national-level organizations to ensure accuracy of intelligence on countries or transnational organizations acquiring CBRN/TIM weapons program components. Techniques and procedures to facilitate this process and to ensure accuracy are not adequate.

<sup>3</sup> The J-2 works with various national-level organizations to ensure accuracy of intelligence on countries or transnational organizations acquiring CBRN/TIM weapons program components. Techniques and procedures to facilitate this process and to ensure accuracy may not be adequate.

<sup>4</sup> The J-2 works with various national-level organizations to ensure that strategic surprise does not occur. Adequate resources and means may not be sufficiently applied to ensure countries or transnational organizations acquiring CBRN/TIM weapons program components are detected.

<sup>5</sup> Near- and mid-term improvements for all measures will depend upon the emphasis placed upon and efficacy of experimentation which will be designed to close knowledge gaps.

<sup>6</sup> DOTMLPF to support task should improve if effective experimentation closes knowledge gaps.

<sup>7</sup> Once knowledge gaps are closed, concepts may be refined, and new capabilities will be proposed and refined as a result of experimentation.

## 2.2.3 Functional Solution Analysis

### 2.2.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the (IMA section).

1. **Deficiency:** Techniques and procedures to facilitate detecting and identifying countries or transnational organizations acquiring CBRN/TIM weapons program components may not be adequate.

**Non-Materiel Solutions:** *Doctrine:* JRO-CBRND must work with J2 and/or national intelligence organizations to develop effective techniques and procedures for detecting and identifying countries or transnational organizations acquiring CBRN/TIM weapons program components and to provide useful indicators. These indicators must include any and all components that could be used in a CBRN/TIM weapons program, where they can be acquired, what dual uses (legitimate research or industry) the components might be already serving, and signatures that might indicate the components are being acquired or shipped.

2. **Deficiency:** Techniques and procedures to ensure accurate intelligence on countries or transnational organizations acquiring CBRN/TIM weapons program components may not be adequate.

**Non-Materiel Solutions:** *Doctrine:* JRO-CBRND must work with J2 and/or national intelligence organizations to develop effective techniques and procedures to ensure accurate intelligence on countries or transnational organizations acquiring CBRN/TIM weapons program components and to develop metrics to measure accuracy.

3. **Deficiency:** Adequate resources and means may not be sufficiently applied to ensure that a nation-state or transnational acquiring CBRN/TIM weapons program components is detected.

**Non-Materiel Solutions:** *Organization:* The CBRN organization or staffing of the J2 as well as each national intelligence organization must be analyzed from a DoD standpoint to ensure that they can provide required CBRN intelligence concerning CBRN hazards. These hazards need to be detected, identified, and quantified for Shape to provide a clear understanding of the current and *predicted* CBRN situation to the commander. An organization dedicated to providing CBRN technical expertise and assistance to the J2 and national-level intelligence organizations should be established. *Training:* JRO-CBRND must work with J2 and/or national intelligence organizations to develop effective training for analysts as well as those managing all means of collection. The training must allow analysts and collection managers the means by which to determine inadequacy of collection mechanisms and a means to make recommendations for improvement. *Leadership:* JRO-CBRND must work with J2 and/or national intelligence organizations to develop an effective CBRN education program for analysts as well as those managing all means of collection. The education process must provide analysts and collection managers with the tools they need to assess the efficacy of their analysis and collection efforts. *Personnel:* Personnel should not be assigned to intelligence analysis or

collection activities vital to CBRN areas without requisite CBRN education and/or experience. *Facilities:* Training requirements should be analyzed and special training facilities developed/modified if required.

4. **Deficiency:** Joint intelligence and CBRN publications do not adequately address this issue.

**Non-Materiel Solutions:** *Doctrine:* Joint intelligence and CBRN publications must be enhanced to adequately address this issue and to interface with each other so that roles and responsibilities are clearly delineated.

5. **Deficiency:** JRO-CBRND is not adequately staffed and organized to meet its intelligence-related responsibilities.

**Non-Materiel Solutions:** *Organization:* JRO-CBRND should have a staff section dedicated to resolving CBRN intelligence community issues. *Personnel:* JRO-CBRND should have adequate trained/experienced personnel assigned to man a staff section dedicated to resolving CBRN intelligence community issues.

6. **Deficiency:** The J2 staff is not adequately trained/educated in CBRN issues.

**Non-Materiel Solutions:** *Training:* Develop training that will enable the J2 staff to better understand their CBRN role and enhance their ability to obtain intelligence that is required to support the Shape function of Strategic National CBRND. *Leadership:* Develop an education program that will enable the J2 staff to better understand their CBRN role and enhance their ability to obtain intelligence that is required to support the Shape function of Strategic National CBRND.

7. **Deficiency:** CBRN staff officers are not adequately trained/educated in intelligence issues.

**Non-Materiel Solutions:** *Training:* Develop training programs that allow CBRN staff officers to better support the CBRN intelligence process. *Leadership:* Develop education programs that allow CBRN staff officers to better understand the CBRN intelligence process and their roles and responsibilities.

8. **Deficiency:** Experimentation/red teaming does not provide feedback on intelligence indicators for this task.

**Non-Materiel Solutions:** *Training:* JRO-CBRND must work with J2 and/or national intelligence organizations to integrate this task into both intelligence and CBRN experimentation campaign plans.

9. **Deficiency:** JPME does not adequately cover the fusion of intelligence/CBRN issues.

**Non-Materiel Solutions:** *Leadership:* Integrate intelligence/CBRN fusion issues into JPME.

10. **Deficiency:** DoD CBRN experts detailed to the national intelligence organizations do not receive adequate preparation, support, or debriefing for DoD lessons learned.

**Non-Materiel Solutions:** *Organization:* Ensure that CBRN organizations that provide DoD detailees to national intelligence organizations are proactive in ensuring their

institutional CBRN intelligence needs are both understood and met and that the detailees they provide are prepared in every way. *Leadership*: CBRN DoD detailees to national intelligence organizations must be provided with JPME. *Personnel*: CBRN DoD detailees to national intelligence organizations must possess adequate skill and experience.

**2.2.3.2 IMA Assessment Summary**

N/A

## **2.3 Task SENSES 3: Sense CBRN/TIM weapons program production facility preparation**

### **2.3.1 Functional Area Analysis**

#### **2.3.1.1 Definition**

To obtain information and data from all sources that determine when a nation-state or transnational organization is acquiring components for and/or preparing CBRN/TIM weapons program production facility acquisition and preparation. Areas of interest include activities and situations that could indicate that personnel with special expertise in CBRN/TIM weapons production facility preparation are being recruited or that specialized materials are being acquired.

#### **2.3.1.2 Derivation**

*UJTL (SN 9.1.3, SN 2.4.1.2, SN 8.1.10), JP (2-0, 2-02).*

##### **2.3.1.2.1 Supported Task: N/A**

##### **2.3.1.2.2 Lateral Task: SNSHA 1**

##### **2.3.1.2.3 Supporting Task: N/A**

#### **2.3.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

##### **Military**

1. Negligible intelligence database. (C2.4.2)
2. Negligible theater intelligence access. (C2.4.2)
3. Conventional and terrorist threat form. (C2.9.2)
4. Prehostilities state of conflict. (C2.10.1)

##### **Civil**

1. Negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)

## **2.3.2 Functional Needs Analysis**

### **2.3.2.1 Capability and Deficiency Assessment Summary**

Table 2.3-1 discusses the only capability that currently exists to perform the task to the designated standards. There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The Joint Staff Directorate for Intelligence, J-2, is responsible for working with national-level organizations to obtain intelligence that is required to support joint operations. Per joint intelligence doctrine, the J-2 is responsible for coordinating all intelligence-related CBRN functions pertaining to adversary employment of CBRN weapons with the appropriate CBRN staff element. However, due to documented training, education, and experience issues, J2 personnel may not have a full grasp of what needs to be coordinated. As the Chairman of the Joint Chiefs of Staff's single source of expertise in addressing CBRN defense issues involving the warfighter, JRO-CBRND must proactively engage the J2 to determine the adequacy of current and projected national-level intelligence capabilities to sense CBRN/TIM weapons program production facility preparation. For the purposes of this analysis, current capabilities are listed and issues that need to be further assessed and clarified are provided for JRO-CBRND action.

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Near/mid-term experimentation results (as recommended in this JCIDS analysis) may lead to development of new capabilities. It is projected that improvements due to coordination/DOTMLPF enhancements will dramatically improve DoD's ability to articulate and assess Sense requirements, but the overall status will remain "yellow" due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. New organizational structures or other capabilities resulting from near/mid-term experimentation results (as recommended in this JCIDS analysis) may dramatically improve DoD's ability to develop intelligence indicators for sensing CBRN/TIM weapons program production facility preparation, but the overall status is projected to remain "yellow" due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

**Table 2.3-1. SNSSENS 3: Capability and Deficiency Assessment**

<b>Capability: Joint Staff Directorate for Intelligence, J-2</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>Y<sup>2</sup></b>	<b>Y<sup>3</sup></b>	<b>Y<sup>4</sup></b>
<b>Near/Mid-Term Overall Capability</b>	<b>Y<sup>5</sup></b>	<b>Y</b>	<b>Y</b>
<b>Far-Term Overall Capability<sup>6</sup></b>	<b>Y<sup>7</sup></b>	<b>Y</b>	<b>Y</b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Countries or transnational organizations preparing CBRN/TIM weapons program production facilities are detected and identified.	G – Yes, Y – Limited, R – No
M2	Intelligence on countries or transnational organizations preparing CBRN/TIM weapons program production facilities is accurate.	G – Yes, Y – Limited, R – No
M3	Strategic surprise does not occur.	G – Yes, Y – Limited, R – No

<sup>1</sup> Joint intelligence and CBRN publications do not adequately address this issue. JRO-CBRND is not adequately staffed and organized to meet its intelligence-related responsibilities. The J2 staff is not adequately trained/educated in CBRN issues. CBRN staff officers are not adequately trained/educated in intelligence issues. Experimentation does not provide feedback on intelligence indicators for this task. JPME does not adequately cover the fusion of intelligence/CBRN issues.

<sup>2</sup> The J-2 works with various national-level organizations to detect and identify countries or transnational preparing CBRN/TIM weapons program production facilities. Techniques and procedures to facilitate this process and to provide useful indicators may not be adequate.

<sup>3</sup> The J-2 works with various national-level organizations to ensure accuracy of intelligence on countries or transnational preparing CBRN/TIM weapons program production facilities. Techniques and procedures to facilitate this process and to ensure accuracy may not be adequate.

<sup>4</sup> The J-2 works with various national-level organizations to ensure that strategic surprise does not occur. Adequate resources and means may not be sufficiently applied to ensure countries or transnational organizations preparing CBRN/TIM weapons program production facilities are detected.

<sup>5</sup> Near- and mid-term improvements for all measures will depend upon the emphasis placed upon and efficacy of experimentation which will be designed to close knowledge gaps.

<sup>6</sup> DOTMLPF to support task should improve if effective experimentation closes knowledge gaps.

<sup>7</sup> Once knowledge gaps are closed, concepts may be refined, and new capabilities will be proposed and refined as a result of experimentation.

### 2.3.3 Functional Solution Analysis

#### 2.3.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Techniques and procedures to facilitate detecting and identifying countries or transnational organizations preparing CBRN/TIM weapons program production facilities may not be adequate.

**Non-Materiel Solutions:** *Doctrine:* JRO-CBRND must work with J2 and/or national intelligence organizations to develop effective techniques and procedures for detecting and identifying countries or transnational organizations preparing CBRN/TIM weapons program production facilities and to provide useful indicators. These indicators must include any and all types of facilities that could be used for production in a CBRN/TIM weapons program, what features they might possess, what dual uses (legitimate research or industry) the facilities might be already serving, and signatures that might indicate specific construction techniques, filter or safety facilities, and construction equipment.

2. **Deficiency:** Techniques and procedures to ensure accurate intelligence on countries or transnational organizations preparing CBRN/TIM weapons program production facilities may not be adequate.

**Non-Materiel Solutions:** *Doctrine:* JRO-CBRND must work with J2 and/or national intelligence organizations to develop effective techniques and procedures to ensure accurate intelligence on countries or transnational organizations preparing CBRN/TIM weapons program production facilities and to develop metrics to measure accuracy.

3. **Deficiency:** Adequate resources and means may not be sufficiently applied to ensure that a nation-state or transnational organization preparing CBRN/TIM weapons program production facilities is detected.

**Non-Materiel Solutions:** *Organization:* The CBRN organization or staffing of the J2 as well as each national intelligence organization must be analyzed from a DoD standpoint to ensure that they can provide required CBRN intelligence concerning CBRN hazards. These hazards need to be detected, identified, and quantified for Shape to provide a clear understanding of the current and predicted CBRN situation to the commander. An organization dedicated to providing CBRN technical expertise and assistance to the J2 and national-level intelligence organizations should be established. *Training:* JRO-CBRND must work with J2 and/or national intelligence organizations to develop effective training for analysts as well as those managing all means of collection. The training must allow analysts and collection managers the means by which to determine inadequacy of collection mechanisms and a means to make recommendations for improvement. *Leadership:* JRO-CBRND must work with J2 and/or national intelligence organizations to develop an effective CBRN education program for analysts as well as those managing all means of collection. The education process must provide analysts and collection managers with the tools they need to assess the efficacy of their analysis and collection efforts. *Personnel:* Personnel should not be assigned to intelligence analysis or

collection activities vital to CBRN areas without requisite CBRN education and/or experience. *Facilities:* Training requirements should be analyzed and special training facilities developed/modified if required.

4. **Deficiency:** Joint intelligence and CBRN publications do not adequately address this issue.

**Non-Materiel Solutions:** *Doctrine:* Joint intelligence and CBRN publications must be enhanced to adequately address this issue and to interface with each other so that roles and responsibilities are clearly delineated.

5. **Deficiency:** JRO-CBRND is not adequately staffed and organized to meet its intelligence-related responsibilities.

**Non-Materiel Solutions:** *Organization:* JRO-CBRND should have a staff section dedicated to resolving CBRN intelligence community issues. *Personnel:* JRO-CBRND should have adequate trained/experienced personnel assigned to man a staff section dedicated to resolving CBRN intelligence community issues.

6. **Deficiency:** The J2 staff is not adequately trained/educated in CBRN issues.

**Non-Materiel Solutions:** *Training:* Develop training that will enable the J2 staff to better understand their CBRN role and enhance their ability to obtain intelligence that is required to support the Shape function of Strategic National CBRND. *Leadership:* Develop an education program that will enable the J2 staff to better understand their CBRN role and enhance their ability to obtain intelligence that is required to support the Shape function of Strategic National CBRND.

7. **Deficiency:** CBRN staff officers are not adequately trained/educated in intelligence issues.

**Non-Materiel Solution:** *Training:* Develop training programs that allow CBRN staff officers to better support the CBRN intelligence process. *Leadership:* Develop education programs that allow CBRN staff officers to better understand the CBRN intelligence process and their roles and responsibilities.

8. **Deficiency:** Experimentation/red teaming does not provide feedback on intelligence indicators for this task.

**Non-Materiel Solutions:** *Training:* JRO-CBRND must work with J2 and/or national intelligence organizations to integrate this task into both intelligence and CBRN experimentation campaign plans.

9. **Deficiency:** JPME does not adequately cover the fusion of intelligence/CBRN issues.

**Non-Materiel Solutions:** *Leadership:* JRO-CBRND must work with J2 and/or national intelligence organizations to integrate this task into both intelligence and CBRN experimentation campaign plans.

10. **Deficiency:** DoD CBRN experts detailed to the national intelligence organizations do not receive adequate preparation, support, or debriefing for DoD lessons learned.

**Non-Materiel Solution:** *Organization:* Ensure that CBRN organizations that provide DoD detailees to national intelligence organizations are proactive in ensuring their institutional CBRN intelligence needs are both understood and met and that the detailees they provide are prepared in every way. *Leadership:* CBRN DoD detailees to national intelligence organizations must be provided with formal educational preparation. *Personnel:* CBRN DoD detailees to national intelligence organizations must possess adequate skill and experience.

<b>Far-Term Overall Capability<sup>6</sup></b>	<b>Y<sup>7</sup></b>	<b>Y</b>	<b>Y</b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Countries or transnational organizations initiating CBRN/TIM weaponization are detected and identified.	G – Yes, Y – Limited, R – No
M2	Intelligence on countries or transnational organizations initiating CBRN/TIM weaponization is accurate.	G – Yes, Y – Limited, R – No
M3	Strategic surprise does not occur.	G – Yes, Y – Limited, R – No

<sup>1</sup> Joint intelligence and CBRN publications do not adequately address this issue. JRO-CBRND is not adequately staffed and organized to meet its intelligence-related responsibilities. The J2 staff is not adequately trained/educated in CBRN issues. CBRN staff officers are not adequately trained/educated in intelligence issues. Experimentation does not provide feedback on intelligence indicators for this task. JPME does not adequately cover the fusion of intelligence/CBRN issues.

<sup>2</sup> The J-2 works with various national-level organizations to detect and identify countries or transnational organizations initiating CBRN/TIM weaponization. Techniques and procedures to facilitate this process and to provide useful indicators may not be adequate.

<sup>3</sup> The J-2 works with various national-level organizations to ensure accuracy of intelligence on countries or transnational organizations initiating CBRN/TIM weaponization. Techniques and procedures to facilitate this process and to ensure accuracy may not be adequate.

<sup>4</sup> The J-2 works with various national-level organizations to ensure that strategic surprise does not occur. Adequate resources and means may not be sufficiently applied to ensure countries or transnational organizations initiating CBRN/TIM weaponization are detected.

<sup>5</sup> Near- and mid-term improvements for all measures will depend upon the emphasis placed upon and efficacy of experimentation which will be designed to close knowledge gaps.

<sup>6</sup> DOTMLPF to support task should improve if effective experimentation closes knowledge gaps.

<sup>7</sup> Once knowledge gaps are closed, concepts may be refined, and new capabilities will be proposed and refined as a result of experimentation.

### 2.5.3 Functional Solution Analysis

#### 2.5.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** Techniques and procedures to facilitate detecting and identifying countries or transnational organizations initiating CBRN/TIM weaponization may not be adequate.  
**Non-Materiel Solutions:** *Doctrine:* JRO-CBRND must work with J2 and/or national intelligence organizations to develop effective techniques and procedures for detecting and identifying countries or transnational organizations initiating CBRN/TIM weaponization and to provide useful indicators. These indicators must include the means to determine when mating of agents or nuclear devices to delivery systems is taking place; special procedures used in the mating process; production schedules; procedures for bringing together the components; distances between production areas, weaponization areas, and storage areas; weaponization rate; and safety measures.
- 2. Deficiency:** Techniques and procedures to ensure accurate intelligence on countries or transnational organizations initiating CBRN/TIM weaponization may not be adequate.  
**Non-Materiel Solutions:** *Doctrine:* JRO-CBRND must work with J2 and/or national intelligence organizations to develop effective techniques and procedures to ensure accurate intelligence on countries or transnational organizations initiating CBRN/TIM weaponization and to develop metrics to measure accuracy.
- 3. Deficiency:** Adequate resources and means may not be sufficiently applied to ensure that a nation-state or transnational organization initiating CBRN/TIM weaponization is detected.  
**Non-Materiel Solutions:** *Organization:* The CBRN organization or staffing of the J2 as well as each national intelligence organization must be analyzed from a DoD standpoint to ensure that they can provide required CBRN intelligence concerning CBRN hazards. These hazards need to be detected, identified, and quantified for Shape to provide a clear understanding of the current and *predicted* CBRN situation to the commander. An organization dedicated to providing CBRN technical expertise and assistance to the J2 and national-level intelligence organizations should be established. *Training:* JRO-CBRND must work with J2 and/or national intelligence organizations to develop effective training for analysts as well as those managing all means of collection. The training must allow analysts and collection managers the means by which to determine inadequacy of collection mechanisms and a means to make recommendations for improvement. *Leadership:* JRO-CBRND must work with J2 and/or national intelligence organizations to develop an effective CBRN education program for analysts as well as those managing all means of collection. The education process must provide analysts and collection managers with the tools they need to assess the efficacy of their analysis and collection efforts. *Personnel:* Personnel should not be assigned to intelligence analysis or collection activities vital to CBRN areas without requisite CBRN education and/or

experience. *Facilities:* Training requirements should be analyzed and special training facilities developed/modified if required.

4. **Deficiency:** Joint intelligence and CBRN publications do not adequately address this issue.

**Non-Materiel Solutions:** *Doctrine:* Joint intelligence and CBRN publications must be enhanced to adequately address this issue and to interface with each other so that roles and responsibilities are clearly delineated.

5. **Deficiency:** JRO-CBRND is not adequately staffed and organized to meet its intelligence-related responsibilities.

**Non-Materiel Solutions:** *Organization:* JRO-CBRND should have a staff section dedicated to resolving CBRN intelligence community issues. *Personnel:* JRO-CBRND should have adequately trained/experienced personnel assigned to man a staff section dedicated to resolving CBRN intelligence community issues.

6. **Deficiency:** The J2 staff is not adequately trained/educated in CBRN issues.

**Non-Materiel Solutions:** *Training:* Develop training that will enable the J2 staff to better understand their CBRN role and enhance their ability to obtain intelligence that is required to support the Shape function of Strategic National CBRND. *Leadership:* Develop an education program that will enable the J2 staff to better understand their CBRN role and enhance their ability to obtain intelligence that is required to support the Shape function of Strategic National CBRND.

7. **Deficiency:** CBRN staff officers are not adequately trained/educated in intelligence issues.

**Non-Materiel Solutions:** *Training:* Develop training programs that allow CBRN staff officers to better support the CBRN intelligence process. *Leadership:* Develop education programs that allow CBRN staff officers to better understand the CBRN intelligence process and their roles and responsibilities.

8. **Deficiency:** Experimentation/red teaming does not provide feedback on intelligence indicators for this task.

**Non-Materiel Solutions:** *Training:* JRO-CBRND must work with J2 and/or national intelligence organizations to integrate this task into both intelligence and CBRN experimentation campaign plans.

9. **Deficiency:** JPME does not adequately cover the fusion of intelligence/CBRN issues.

**Non-Materiel Solutions:** *Leadership:* Integrate intelligence/CBRN fusion issues into JPME.

10. **Deficiency:** DoD CBRN experts detailed to the national intelligence organizations do not receive adequate preparation, support, or debriefing for DoD lessons learned.

**Non-Materiel Solutions:** *Organization:* Ensure that CBRN organizations that provide DoD detailees to national intelligence organizations are proactive in ensuring their institutional CBRN intelligence needs are both understood and met and that the detailees

they provide are prepared in every way. *Leadership*: CBRN DoD detailees to national intelligence organizations must be provided with formal educational preparation.

*Personnel*: CBRN DoD detailees to national intelligence organizations must possess adequate skill and experience.

**2.5.3.2 IMA Assessment Summary**

N/A

## **2.6 Task SENSES 6: Sense preparations to test and testing of CBRN/TIM agents/weapons**

### **2.6.1 Functional Area Analysis**

#### **2.6.1.1 Definition**

To obtain information and data from all sources that indicate a state or nonstate actor is preparing to test or is conducting tests of CBRN/TIM agents or weapons and delivery systems. Areas of interest include types and characteristics of agents or weapons and delivery systems, test results, and personnel involved in test programs (skills and biographies). Also of interest are the characteristics of the testing grids, agent/weapon transport modes, storage locations of test materials, safety and security precautions employed, and ambient meteorological conditions as well as those during testing.

#### **2.6.1.2 Derivation**

*UJTL (SN 9.1.3, SN 2.4.1.2, SN 8.1.10), JP (2-0, 2-02).*

**2.6.1.2.1 Supported Task:** N/A

**2.6.1.2.2 Lateral Task:** SNSHA 1

**2.6.1.2.3 Supporting Task:** N/A

#### **2.6.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

#### **Military**

1. Negligible intelligence database. (C2.4.2)
2. Negligible theater intelligence access. (C2.4.2)
3. Conventional and terrorist threat form. (C2.9.2)
4. Prehostilities state of conflict (C2.10.1)

#### **Civil**

1. Negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)

## **2.6.2 Functional Needs Analysis**

### **2.6.2.1 Capability and Deficiency Assessment Summary**

Table 2.6-1 discusses the only capability that currently exists to perform the task to the designated standards. There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The Joint Staff Directorate for Intelligence, J-2, is responsible for working with national-level organizations to obtain intelligence that is required to support joint operations. Per joint intelligence doctrine, the J-2 is responsible for coordinating all intelligence-related CBRN functions pertaining to adversary employment of CBRN weapons with the appropriate CBRN staff element, but because of documented training, education, and experience issues, J2 personnel may not have a full grasp of what needs to be coordinated. As the Chairman of the Joint Chiefs of Staff's single source of expertise in addressing CBRN defense issues involving the warfighter, JRO-CBRND must proactively engage the J2 to determine the adequacy of current and projected national-level intelligence capabilities to sense preparations to test and testing of CBRN/TIM agents/weapons. For the purposes of this analysis, current capabilities are listed and issues that need to be further assessed and clarified are provided for JRO-CBRND action.

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Near/mid-term experimentation results (as recommended in this JCIDS analysis) may lead to development of new capabilities. It is projected that improvements due to coordination/DOTMLPF enhancements will dramatically improve DoD's ability to articulate and assess Sense requirements, but the overall status will remain "yellow" due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. New organizational structures or other capabilities resulting from near/mid-term experimentation results (as recommended in this JCIDS analysis) may dramatically improve DoD's ability to develop intelligence indicators for sensing preparations to test and testing of CBRN/TIM agents/weapons but the overall status is projected to remain "yellow" due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

**Table 2.6-1. SSENS 6: Capability and Deficiency Assessment**

<b>Capability: Joint Staff Directorate for Intelligence, J-2</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>Y<sup>2</sup></b>	<b>Y<sup>3</sup></b>	<b>Y<sup>4</sup></b>
<b>Near/Mid-Term Overall Capability</b>	<b>Y<sup>5</sup></b>	<b>Y</b>	<b>Y</b>
<b>Far-Term Overall Capability<sup>6</sup></b>	<b>Y<sup>7</sup></b>	<b>Y</b>	<b>Y</b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	States or nonstate actors preparing to test and testing CBRN/TIM agents/weapons and delivery systems are detected and identified.	G – Yes, Y – Limited, R – No
M2	Intelligence on states, nonstate actors and technical personnel involved with test program is accurate.	G – Yes, Y – Limited, R – No
M3	Strategic surprise does not occur.	G – Yes, Y – Limited, R – No

<sup>1</sup> Joint intelligence and CBRN publications do not adequately address this issue. JRO-CBRND is not adequately staffed and organized to meet its intelligence-related responsibilities. The J2 staff is not adequately trained/educated in CBRN issues. CBRN staff officers are not adequately trained/educated in intelligence issues. Experimentation does not provide feedback on intelligence indicators for this task. JPME does not adequately cover the fusion of intelligence/CBRN issues.

<sup>2</sup> The J-2 works with various national-level organizations to detect and identify countries or transnational preparing to test and testing CBRN/TIM agents/weapons and delivery systems. Techniques and procedures to facilitate this process and to provide useful indicators may not be adequate.

<sup>3</sup> The J-2 works with various national-level organizations to ensure accuracy of intelligence on countries or transnational organizations preparing to test and testing CBRN/TIM agents/weapons and delivery systems. Techniques and procedures to facilitate this process and to ensure accuracy may not be adequate.

<sup>4</sup> The J-2 works with various national-level organizations to ensure that strategic surprise does not occur. Adequate resources and means may not be sufficiently applied to ensure countries or transnational organizations preparing to test and testing CBRN/TIM agents/weapons and delivery systems are detected.

<sup>5</sup> Near- and mid-term improvements for all measures will depend upon the emphasis placed upon and efficacy of experimentation which will be designed to close knowledge gaps.

<sup>6</sup> DOTMLPF to support task should improve if effective experimentation closes knowledge gaps.

<sup>7</sup> Once knowledge gaps are closed, concepts may be refined, and new capabilities will be proposed and refined as a result of experimentation.

## 2.6.3 Functional Solution Analysis

### 2.6.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Techniques and procedures to facilitate detecting and identifying countries or transnational organizations preparing to test and testing CBRN/TIM agents/weapons and delivery systems may not be adequate.

**Non-Materiel Solutions:** *Doctrine:* JRO-CBRND must work with J2 and/or national intelligence organizations to develop effective techniques and procedures for detecting and identifying countries or transnational organizations preparing to test and testing CBRN/TIM agents/weapons and delivery systems and to provide useful indicators. These indicators must include the means to determine agent types, nuclear weapon types and yields being tested, TIMS being tested, means by which to release TIMS in testing, delivery modes or systems being tested, and testing capacities and schedules. Also required is information on characteristics of the testing grids, agent/weapon transport modes, storage locations of test materials, safety and security precautions employed, and ambient meteorological conditions during testing.

2. **Deficiency:** Techniques and procedures to ensure accurate intelligence on countries or transnational organizations preparing to test and testing CBRN/TIM agents/weapons and delivery systems may not be adequate.

**Non-Materiel Solutions:** *Doctrine:* JRO-CBRND must work with J2 and/or national intelligence organizations to develop effective techniques and procedures to ensure accurate intelligence on countries or transnational organizations preparing to test and testing CBRN/TIM agents/weapons and delivery systems and to develop metrics to measure accuracy.

3. **Deficiency:** Adequate resources and means may not be sufficiently applied to ensure that a nation-state or transnational organization preparing to test and testing CBRN/TIM agents/weapons and delivery systems is detected.

**Non-Materiel Solutions:** *Organization:* The CBRN organization or staffing of the J2 as well as each national intelligence organization must be analyzed from a DoD standpoint to ensure that they can provide required CBRN intelligence concerning CBRN hazards. These hazards need to be detected, identified, and quantified for Shape to provide a clear understanding of the current and predicted CBRN situation to the commander. An organization dedicated to providing CBRN technical expertise and assistance to the J2 and national-level intelligence organizations should be established. *Training:* JRO-CBRND must work with J2 and/or national intelligence organizations to develop effective training for analysts as well as those managing all means of collection. The training must allow analysts and collection managers the means by which to determine inadequacy of collection mechanisms and a means to make recommendations for improvement. *Leadership:* JRO-CBRND must work with J2 and/or national intelligence organizations to develop an effective CBRN education program for analysts as well as

those managing all means of collection. The education process must provide analysts and collection managers with the tools they need to assess the efficacy of their analysis and collection efforts. *Personnel*: Personnel should not be assigned to intelligence analysis or collection activities vital to CBRN areas without requisite CBRN education and/or experience. *Facilities*: Training requirements should be analyzed and special training facilities developed/modified if required.

4. **Deficiency**: Joint intelligence and CBRN publications do not adequately address this issue.

**Non-Materiel Solutions**: *Doctrine*: Joint intelligence and CBRN publications must be enhanced to adequately address this issue and to interface with each other so that roles and responsibilities are clearly delineated.

5. **Deficiency**: JRO-CBRND is not adequately staffed and organized to meet its intelligence-related responsibilities.

**Non-Materiel Solutions**: *Organization*: JRO-CBRND should have a staff section dedicated to resolving CBRN intelligence community issues. *Personnel*: JRO-CBRND should have adequate trained/experienced personnel assigned to man a staff section dedicated to resolving CBRN intelligence community issues.

6. **Deficiency**: The J2 staff is not adequately trained/educated in CBRN issues.

**Non-Materiel Solutions**: *Training*: Develop training that will enable the J2 staff to better understand their CBRN role and enhance their ability to obtain intelligence that is required to support the Shape function of Strategic National CBRND. *Leadership*: Develop an education program that will enable the J2 staff to better understand their CBRN role and enhance their ability to obtain intelligence that is required to support the Shape function of Strategic National CBRND.

7. **Deficiency**: CBRN staff officers are not adequately trained/educated in intelligence issues.

**Non-Materiel Solutions**: *Training*: Develop training programs that allow CBRN staff officers to better support the CBRN intelligence process. *Leadership*: Develop education programs that allow CBRN staff officers to better understand the CBRN intelligence process and their roles and responsibilities.

8. **Deficiency**: Experimentation/red teaming does not provide feedback on intelligence indicators for this task.

**Non-Materiel Solutions**: *Training*: JRO-CBRND must work with J2 and/or national intelligence organizations to integrate this task into both intelligence and CBRN experimentation campaign plans.

9. **Deficiency**: JPME does not adequately cover the fusion of intelligence/CBRN issues.

**Non-Materiel Solutions**: *Leadership*: Integrate intelligence/CBRN fusion issues into JPME.

**10. Deficiency:** DoD CBRN experts detailed to the national intelligence organizations do not receive adequate preparation, support, or debriefing for DoD lessons learned.

**Non-Materiel Solutions:** *Organization:* Ensure that CBRN organizations that provide DoD detailees to national intelligence organizations are proactive in ensuring their institutional CBRN intelligence needs are both understood and met and that the detailees they provide are prepared in every way. *Leadership:* CBRN DoD detailees to national intelligence organizations must be provided with formal educational preparation.

*Personnel:* CBRN DoD detailees to national intelligence organizations must possess adequate skill and experience.

**Non-Materiel Solutions:** *Organization:* Ensure that CBRN organizations that provide DoD detailees to national intelligence organizations are proactive in ensuring their institutional CBRN intelligence needs are both understood and met and that the detailees they provide are prepared in every way. *Leadership:* CBRN DoD detailees to national

intelligence organizations must be provided with formal educational preparation.

*Personnel:* CBRN DoD detailees to national intelligence organizations must possess adequate skill and experience.

### **2.7.3.2 IMA Assessment Summary**

N/A

## **2.8 Task SENSES 8: Sense the operational deployment of CBRN/TIM weapons or units**

### **2.8.1 Functional Area Analysis**

#### **2.8.1.1 Definition**

To obtain information and data from all sources that determine when a nation-state or transnational organization is preparing to conduct or is conducting an operational deployment of CBRN/TIM weapons. Includes information on civil and military plans related to deployment, training conducted by military forces and civilians, and the overall CBRN/TIM defensive preparedness of military forces (e.g., vaccine and antidote production and solicitation).

#### **2.8.1.2 Derivation**

*UJTL (SN 9.1.3, SN 2.4.1.2, SN 8.1.10), JP (2-0, 2-02).*

**2.8.1.2.1 Supported Task:** N/A

**2.8.1.2.2 Lateral Task:** SNSHA 1

**2.8.1.2.3 Supporting Task:** STSENS 2

#### **2.8.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

#### **Military**

1. Transnational organization
  - a. Negligible intelligence database. (C2.4.2)
  - b. Negligible theater intelligence access. (C2.4.2)
2. Nation-states
  - a. Marginal intelligence database. (C2.4.2)
  - b. Difficult theater intelligence access. (C2.4.2)

#### **Common Military Conditions**

1. Conventional and terrorist threat form. (C2.9.2)

#### **Civil**

1. Negative foreign government support. (C3.1.2.3)

2. Aggressively opposed foreign public opinion. (C3.1.2.4)

## **2.8.2 Functional Needs Analysis**

### **2.8.2.1 Capability and Deficiency Assessment Summary**

Table 2.8-1 discusses the only capability that currently exists to perform the task to the designated standards. There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The Joint Staff Directorate for Intelligence, J-2, is responsible for working with national-level organizations to obtain intelligence that is required to support joint operations. Per joint intelligence doctrine, the J-2 is responsible for coordinating all intelligence-related CBRN functions pertaining to adversary employment of CBRN weapons with the appropriate CBRN staff element, but because of documented training, education, and experience issues, J2 personnel may not have a full grasp of what needs to be coordinated. As the Chairman of the Joint Chiefs of Staff's single source of expertise in addressing CBRN defense issues involving the warfighter, JRO-CBRND must proactively engage the J2 to determine the adequacy of current and projected national-level intelligence capabilities to the operational deployment of CBRN/TIM weapons or units. For the purposes of this analysis, current capabilities are listed and issues that need to be further assessed and clarified are provided for JRO-CBRND action.

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Near/mid-term experimentation results (as recommended in this JCIDS analysis) may lead to development of new capabilities. It is projected that improvements due to coordination/DOTMLPF enhancements will dramatically improve DoD's ability to articulate and assess Sense requirements, but the overall status will remain "yellow" due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. New organizational structures or other capabilities resulting from near/mid-term experimentation results (as recommended in this JCIDS analysis) may dramatically improve DoD's ability to develop intelligence indicators for sensing the operational deployment of CBRN/TIM weapons or units but the overall status is projected to remain "yellow" due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

**Table 2.8-1. SSENS 8: Capability and Deficiency Assessment**

<b>Capability: Joint Staff Director for Intelligence, J-2</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>
<b>Current Overall Capability<sup>1</sup></b>	Y <sup>2</sup>	Y <sup>3</sup>	G <sup>4</sup>	Y <sup>5</sup>
<b>Near/Mid-Term Overall Capability</b>	Y <sup>6</sup>	Y	G	Y
<b>Far-Term Overall Capability<sup>7</sup></b>	Y <sup>8</sup>	Y	G	Y

	<b>FAA Measure</b>	<b>Scale</b>
M1	Deploying CBRN/TIM weapons/units/teams are detected and identified.	G – Yes, Y – Limited, R – No
M2	Intelligence relating to deploying CBRN/TIM weapons/units is accurate.	G – Yes, Y – Limited, R – No
M3	Deployment warning is provided to national authorities.	G – Yes, Y – Limited, R – No
M4	Strategic surprise does not occur.	G – Yes, Y – Limited, R – No

<sup>1</sup> Joint intelligence and CBRN publications do not adequately address this issue. JRO-CBRND is not adequately staffed and organized to meet its intelligence-related responsibilities. The J2 staff is not adequately trained/educated in CBRN issues. CBRN staff officers are not adequately trained/educated in intelligence issues. Experimentation does not provide feedback on intelligence indicators for this task. JPME does not adequately cover the fusion of intelligence/CBRN issues.

<sup>2</sup> The J-2 works with various national-level organizations to detect and identify countries or transnational organizations deploying CBRN/TIM weapons/units/teams. Techniques and procedures to facilitate this process and to provide useful indicators may not be adequate.

<sup>3</sup> The J-2 works with various national-level organizations to ensure accuracy of intelligence on countries or transnational organizations deploying CBRN/TIM weapons/units/teams. Techniques and procedures to facilitate this process and to ensure accuracy may not be adequate.

<sup>4</sup> Nothing precludes providing deployment warning to national authorities once the deployment is identified, detected, and confirmed.

<sup>5</sup> The J-2 works with various national-level organizations to ensure that strategic surprise does not occur. Adequate resources and means may not be sufficiently applied to ensure countries or transnational organizations deploying CBRN/TIM weapons/units/teams are detected.

<sup>6</sup> Near- and mid-term improvements for all measures will depend upon the emphasis placed upon and efficacy of experimentation which will be designed to close knowledge gaps.

<sup>7</sup> DOTMLPF to support task should improve if effective experimentation closes knowledge gaps.

<sup>8</sup> Once knowledge gaps are closed, concepts may be refined, and new capabilities will be proposed and refined as a result of experimentation.

## 2.8.3 Functional Solution Analysis

### 2.8.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Techniques and procedures to facilitate detecting and identifying countries or transnational organizations deploying CBRN/TIM weapons/units/teams may not be adequate.

**Non-Materiel Solutions:** *Doctrine:* JRO-CBRND must work with J2 and/or national intelligence organizations to develop effective techniques and procedures for detecting and identifying countries or transnational organizations deploying CBRN/TIM weapons/units/teams and to provide useful indicators. These indicators must include the means to determine agent types, nuclear weapon types and yields, TIMS being considered, means by which to release TIMS, delivery modes or systems, and production capacities and schedules.

2. **Deficiency:** Techniques and procedures to ensure accurate intelligence on countries or transnational organizations deploying CBRN/TIM weapons/units/teams may not be adequate.

**Non-Materiel Solutions:** *Doctrine:* JRO-CBRND must work with J2 and/or national intelligence organizations to develop effective techniques and procedures to ensure accurate intelligence on countries or transnational organizations deploying CBRN/TIM weapons/units/teams and to develop metrics to measure accuracy.

3. **Deficiency:** Adequate resources and means may not be sufficiently applied to ensure that a nation-state or transnational organization deploying CBRN/TIM weapons/units/teams is detected.

**Non-Materiel Solutions:** *Organization:* The CBRN organization or staffing of the J2 as well as each national intelligence organization must be analyzed from a DoD standpoint to ensure that they can provide required CBRN intelligence concerning CBRN hazards. These hazards need to be detected, identified, and quantified for Shape to provide a clear understanding of the current and predicted CBRN situation to the commander. An organization dedicated to providing CBRN technical expertise and assistance to the J2 and national-level intelligence organizations should be established. *Training:* JRO-CBRND must work with J2 and/or national intelligence organizations to develop effective training for analysts as well as those managing all means of collection. The training must allow analysts and collection managers the means by which to determine inadequacy of collection mechanisms and a means to make recommendations for improvement. *Leadership:* JRO-CBRND must work with J2 and/or national intelligence organizations to develop an effective CBRN education program for analysts as well as those managing all means of collection. The education process must provide analysts and collection managers with the tools they need to assess the efficacy of their analysis and collection efforts. *Personnel:* Personnel should not be assigned to intelligence analysis or collection activities vital to CBRN areas without requisite CBRN education and/or

experience. *Facilities:* Training requirements should be analyzed and special training facilities developed/modified if required.

4. **Deficiency:** Joint intelligence and CBRN publications do not adequately address this issue.

**Non-Materiel Solutions:** *Doctrine:* Joint intelligence and CBRN publications must be enhanced to adequately address this issue and to interface with each other so that roles and responsibilities are clearly delineated.

5. **Deficiency:** JRO-CBRND is not adequately staffed and organized to meet its intelligence-related responsibilities.

**Non-Materiel Solutions:** *Organization:* JRO-CBRND should have a staff section dedicated to resolving CBRN intelligence community issues. *Personnel:* JRO-CBRND should have adequately trained/experienced personnel assigned to man a staff section dedicated to resolving CBRN intelligence community issues.

6. **Deficiency:** The J2 staff is not adequately trained/educated in CBRN issues.

**Non-Materiel Solutions:** *Training:* Develop training that will enable the J2 staff to better understand their CBRN role and enhance their ability to obtain intelligence that is required to support the Shape function of Strategic National CBRND. *Leadership:* Develop an education program that will enable the J2 staff to better understand their CBRN role and enhance their ability to obtain intelligence that is required to support the Shape function of Strategic National CBRND.

7. **Deficiency:** CBRN staff officers are not adequately trained/educated in intelligence issues.

**Non-Materiel Solutions:** *Training:* Develop training programs that allow CBRN staff officers to better support the CBRN intelligence process. *Leadership:* Develop education programs that allow CBRN staff officers to better understand the CBRN intelligence process and their roles and responsibilities.

8. **Deficiency:** Experimentation/red teaming does not provide feedback on intelligence indicators for this task.

**Non-Materiel Solutions:** *Training:* JRO-CBRND must work with J2 and/or national intelligence organizations to integrate this task into both intelligence and CBRN experimentation campaign plans.

9. **Deficiency:** JPME does not adequately cover the fusion of intelligence/CBRN issues.

**Non-Materiel Solutions:** *Leadership:* Integrate intelligence/CBRN fusion issues into JPME.

10. **Deficiency:** DoD CBRN experts detailed to the national intelligence organizations do not receive adequate preparation, support, or debriefing for DoD lessons learned.

**Non-Materiel Solutions:** *Organization:* Ensure that CBRN organizations that provide DoD detailees to national intelligence organizations are proactive in ensuring their institutional CBRN intelligence needs are both understood and met and that the detailees

they provide are prepared in every way. *Leadership*: CBRN DoD detailees to national intelligence organizations must be provided with formal educational preparation.

*Personnel*: CBRN DoD detailees to national intelligence organizations must possess adequate skill and experience.

**2.8.3.2 IMA Assessment Summary**

N/A

## **2.9 Task SENSE 9: Sense CBRN/TIM offensive and defensive training activities**

### **2.9.1 Functional Area Analysis**

#### **2.9.1.1 Definition**

To obtain information and data from all sources indicating a state or nonstate actor is preparing to conduct or is conducting CBRN/TIM offensive and/or defensive training activities. Areas of interest include types and characteristics of simulants/agents or weapons and delivery systems being used in the training or providing the training stimulus, types and designations of units conducting the training, skills and biographies of trainers and administrators, offensive and defensive techniques employed, and protective materials and equipment used by those training. Also of interest are decontamination or medical procedures used in conjunction with the training.

#### **2.9.1.2 Derivation**

*UJTL (SN 9.1.3, SN 2.4.1.2, SN 8.1.10), JP (2-0, 2-02).*

**2.9.1.2.1 Supported Task:** N/A

**2.9.1.2.2 Lateral Task:** SNSHA 1

**2.9.1.2.3 Supporting Task:** N/A

#### **2.9.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

#### **Military**

1. Negligible intelligence database. (C2.4.2)
2. Negligible theater intelligence access. (C2.4.4)
3. Conventional and terrorist threat form. (C.2.9.2)
4. Prehostilities state of conflict. (C2.10.1)

#### **Civil**

1. Negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)

## **2.9.2 Functional Needs Analysis**

### **2.9.2.1 Capability and Deficiency Assessment Summary**

Table 2.9-1 discusses the only capability that currently exists to perform the task to the designated standards. There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The Joint Staff Directorate for Intelligence, J-2, is responsible for working with national-level organizations to obtain intelligence that is required to support joint operations. Per joint intelligence doctrine, the J-2 is responsible for coordinating all intelligence-related CBRN functions pertaining to adversary employment of CBRN weapons with the appropriate CBRN staff element, but because of documented training, education, and experience issues, J2 personnel may not have a full grasp of what needs to be coordinated. As the Chairman of the Joint Chiefs of Staff's single source of expertise in addressing CBRN defense issues involving the warfighter, JRO-CBRND must proactively engage the J2 to determine the adequacy of current and projected national-level intelligence capabilities to sense CBRN/TIM offensive and defensive training activities. For the purposes of this analysis, current capabilities are listed and issues that need to be further assessed and clarified are provided for JRO-CBRND action.

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Near/mid-term experimentation results (as recommended in this JCIDS analysis) may lead to development of new capabilities. It is projected that improvements due to coordination/DOTMLPF enhancements will dramatically improve DoD's ability to articulate and assess Sense requirements, but the overall status will remain "yellow" due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. New organizational structures or other capabilities resulting from near/mid-term experimentation results (as recommended in this JCIDS analysis) may dramatically improve DoD's ability to develop intelligence indicators for sensing CBRN/TIM offensive and defensive training activities but the overall status is projected to remain at "yellow."

**Table 2.9-1. SNSSENS 9: Capability and Deficiency Assessment**

<b>Capability: Joint Staff Directorate for Intelligence, J-2</b>	<b>M1</b>	<b>M2</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>Y<sup>2</sup></b>	<b>Y<sup>3</sup></b>
<b>Near/Mid-Term Overall Capability</b>	<b>Y<sup>4</sup></b>	<b>Y</b>
<b>Far-Term Overall Capability<sup>5</sup></b>	<b>Y<sup>6</sup></b>	<b>Y</b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	States or nonstate actors preparing to conduct or conducting CBRN/TIM offensive and/or defensive training activities are detected and identified.	G – Yes, Y – Limited, R – No
M2	Intelligence on states, nonstate actors and trainers involved with CBRN/TIM offensive and/or defensive training activities is complete and accurate.	G – Yes, Y – Limited, R – No

<sup>1</sup> Joint intelligence and CBRN publications do not adequately address this issue. JRO-CBRND is not adequately staffed and organized to meet its intelligence-related responsibilities. The J2 staff is not adequately trained/educated in CBRN issues. CBRN staff officers are not adequately trained/educated in intelligence issues. Experimentation does not provide feedback on intelligence indicators for this task. JPME does not adequately cover the fusion of intelligence/CBRN issues.

<sup>2</sup> The J-2 works with various national-level organizations to detect and identify countries or transnational organizations preparing to conduct or conducting CBRN/TIM offensive and/or defensive training activities. Techniques and procedures to facilitate this process and to provide useful indicators may not be adequate.

<sup>3</sup> The J-2 works with various national-level organizations to ensure completeness and accuracy of intelligence on countries or transnational organizations preparing to conduct or conducting CBRN/TIM offensive and/or defensive training activities. Techniques and procedures to facilitate this process and to ensure completeness and accuracy may not be adequate.

<sup>4</sup> Near- and mid-term improvements for all measures will depend upon the emphasis placed upon and efficacy of experimentation which will be designed to close knowledge gaps.

<sup>5</sup> DOTMLPF to support task should improve if effective experimentation closes knowledge gaps.

<sup>6</sup> Once knowledge gaps are closed, concepts may be refined, and new capabilities will be proposed and refined as a result of experimentation.

## 2.9.3 Functional Solution Analysis

### 2.9.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Techniques and procedures to facilitate detecting and identifying countries or transnational organizations preparing to conduct or conducting CBRN/TIM offensive and/or defensive training activities may not be adequate.

**Non-Materiel Solutions:** *Doctrine:* JRO-CBRND must work with J2 and/or national intelligence organizations to develop effective techniques and procedures for detecting and identifying countries or transnational organizations preparing to conduct or conducting CBRN/TIM offensive and/or defensive training activities and to provide useful indicators. For offensive CBRN training, these techniques and indicators must include the means to determine the types of individuals and units conducting training, types and numbers of CBRN weapons systems used for training, durations and timing of training, whether simulants or attenuated or real CBRN weapons are used, sizes and location of training ranges, special equipment used at ranges, and safety security measures. For defensive CBRN training, these techniques and indicators must include the means to determine the types of individuals and units conducting training; the types of CBRN protective equipment, clothing, and collective protection used; types of decontamination, detection, and medical response employed; types of special CBRN defensive units training; types and numbers of CBRN weapons systems used for training; durations and timing of training; whether simulants or attenuated or real CBRN weapons are used; sizes and location of training ranges; special equipment used at ranges; and safety security measures

2. **Deficiency:** Adequate resources and means may not be sufficiently applied to ensure that a nation-state or transnational organization preparing to conduct or conducting CBRN/TIM offensive and/or defensive training activities is accurately and completely detected.

**Non-Materiel Solutions:** *Doctrine:* JRO-CBRND must work with J2 and/or national intelligence organizations to develop effective techniques and procedures to ensure complete and accurate intelligence on countries or transnational organizations initiating the production of CBRN/TIM agents and delivery systems and to develop metrics to measure accuracy. *Organization:* The CBRN organization or staffing of the J2 as well as each national intelligence organization must be analyzed from a DoD standpoint to ensure that they can provide required CBRN intelligence concerning CBRN hazards. These hazards need to be detected, identified, and quantified for Shape to provide a clear understanding of the current and predicted CBRN situation to the commander. An organization dedicated to providing CBRN technical expertise and assistance to the J2 and national-level intelligence organizations should be established. *Training:* JRO-CBRND must work with J2 and/or national intelligence organizations to develop effective training for analysts as well as those managing all means of collection. The training must allow analysts and collection managers the means by which to determine

inadequacy of collection mechanisms and a means to make recommendations for improvement. *Leadership*: JRO-CBRND must work with J2 and/or national intelligence organizations to develop an effective CBRN education program for analysts as well as those managing all means of collection. The education process must provide analysts and collection managers with the tools they need to assess the efficacy of their analysis and collection efforts. *Personnel*: Personnel should not be assigned to intelligence analysis or collection activities vital to CBRN areas without requisite CBRN education and/or experience. *Facilities*: Training requirements should be analyzed and special training facilities developed/modified if required.

3. **Deficiency**: Joint intelligence and CBRN publications do not adequately address this issue.

**Non-Materiel Solutions**: *Doctrine*: Joint intelligence and CBRN publications must be enhanced to adequately address this issue and to interface with each other so that roles and responsibilities are clearly delineated.

4. **Deficiency**: JRO-CBRND is not adequately staffed and organized to meet its intelligence-related responsibilities.

**Non-Materiel Solutions**: *Organization*: JRO-CBRND should have a staff section dedicated to resolving CBRN intelligence community issues. *Personnel*: JRO-CBRND should have adequate trained/experienced personnel assigned to man a staff section dedicated to resolving CBRN intelligence community issues.

5. **Deficiency**: The J2 staff is not adequately trained/educated in CBRN issues.

**Non-Materiel Solutions**: *Training*: Develop training that will enable the J2 staff to better understand their CBRN role and enhance their ability to obtain intelligence that is required to support the Shape function of Strategic National CBRND. *Leadership*: Develop an education program that will enable the J2 staff to better understand their CBRN role and enhance their ability to obtain intelligence that is required to support the Shape function of Strategic National CBRND.

6. **Deficiency**: CBRN staff officers are not adequately trained/educated in intelligence issues.

**Non-Materiel Solutions**: *Training*: Develop training programs that allow CBRN staff officers to better support the CBRN intelligence process. *Leadership*: Develop education programs that allow CBRN staff officers to better understand the CBRN intelligence process and their roles and responsibilities.

7. **Deficiency**: Experimentation/red teaming does not provide feedback on intelligence indicators for this task.

**Non-Materiel Solutions**: *Training*: JRO-CBRND must work with J2 and/or national intelligence organizations to integrate this task into both intelligence and CBRN experimentation campaign plans.

8. **Deficiency**: JPME does not adequately cover the fusion of intelligence/CBRN issues.

**Non-Materiel Solutions:** *Leadership:* Integrate intelligence/CBRN fusion issues into JPME.

9. **Deficiency:** DoD CBRN experts detailed to the national intelligence organizations do not receive adequate preparation, support, or debriefing for DoD lessons learned.

**Non-Materiel Solutions:** *Organization:* Ensure that CBRN organizations that provide DoD detailees to national intelligence organizations are proactive in ensuring their institutional CBRN intelligence needs are both understood and met and that the detailees they provide are prepared in every way. *Leadership:* CBRN DoD detailees to national intelligence organizations must be provided with formal educational preparation.

*Personnel:* CBRN DoD detailees to national intelligence organizations must possess adequate skill and experience.

### 2.9.3.2 IMA Assessment Summary

N/A

## **2.10 Task SENSES 10: Sense the presence and identity and monitor the movement and location of CBRN/TIM expertise**

### **2.10.1 Functional Area Analysis**

#### **2.10.1.1 Definition**

To obtain information and data from all sources indicating the presence and identity of state or nonstate actors with significant CBRN/TIM expertise. Once these personnel are located and identified and it is determined that their contributions to CBRN/TIM programs warrant significant scrutiny, they will be monitored and their activities, contacts, and facilities visited reported. Personnel of interest include scientists, researchers, engineers, weapons and employment experts, librarians, logistics personnel, safety and security personnel, communications personnel, and any other personnel determined to be significant contributors to offensive or defensive CBRN/TIM programs.

#### **2.10.1.2 Derivation**

*UJTL (SN 9.1.3, SN 2.4.1.2, SN 8.1.10), JP (2-0, 2-02).*

#### **2.10.1.2.1 Supported Task: N/A**

#### **2.10.1.2.2 Lateral Task: SNSHA 1**

#### **2.10.1.2.3 Supporting Task: N/A**

#### **2.10.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

#### **Military**

1. Negligible intelligence database. (C2.4.2)
2. Negligible theater intelligence access. (C2.4.4)
3. Conventional and terrorist threat form. (C2.9.2)
4. Prehostilities state of conflict. (C2.10.1)

#### **Civil**

1. Negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)

## **2.10.2 Functional Needs Analysis**

### **2.10.2.1 Capability and Deficiency Assessment Summary**

Table 2.10-1 discusses the only capability that currently exists to perform the task to the designated standards. There is only one capability that exists, and no other capability is projected that will accomplish this task

#### **Current Capability and Deficiency**

The Joint Staff Directorate for Intelligence, J-2, is responsible for working with national-level organizations to obtain intelligence that is required to support joint operations. Per joint intelligence doctrine, the J-2 is responsible for coordinating all intelligence-related CBRN functions pertaining to adversary employment of CBRN weapons with the appropriate CBRN staff element, but because of documented training, education, and experience issues, J2 personnel may not have a full grasp of what needs to be coordinated. As the Chairman of the Joint Chiefs of Staff's single source of expertise in addressing CBRN defense issues involving the warfighter, JRO-CBRND must proactively engage the J2 to determine the adequacy of current and projected national-level intelligence capabilities to sense the presence and identity and monitor the movement and location of CBRN/TIM expertise. For the purposes of this analysis, current capabilities are listed as "green," and issues that need to be further assessed and clarified are provided for JRO-CBRND action.

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Near/mid-term experimentation results (as recommended in this JCIDS analysis) may lead to development of new capabilities. It is projected that improvements due to coordination/DOTMLPF enhancements will dramatically improve DoD's ability to articulate and assess Sense requirements. The overall status will remain "green" although there is some inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. New organizational structures or other capabilities resulting from near/mid-term experimentation results (as recommended in this JCIDS analysis) may dramatically improve DoD's ability to develop intelligence indicators for sensing the presence and identity and monitoring the movement and location of CBRN/TIM expertise. The overall status is projected to remain "green" although there remains some inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

**Table 2.10-1. SNSSENS 10: Capability and Deficiency Assessment**

<b>Capability: Joint Staff Directorate for Intelligence, J-2</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>
<b>Current Overall Capability<sup>1</sup></b>	Y <sup>2</sup>	G <sup>3</sup>	G <sup>4</sup>	G <sup>5</sup>
<b>Near/Mid-Term Overall Capability</b>	Y <sup>6</sup>	G	G	G
<b>Far-Term Overall Capability<sup>7</sup></b>	Y <sup>8</sup>	G	G	G

	<b>FAA Measure</b>	<b>Scale</b>
M1	A screening methodology exists to select those CBRN/TIM experts who need to be targeted.	G – Yes, Y – Limited, R – No
M2	CBRN/TIM experts who meet the screening criteria are detected and identified.	G – Yes, Y – Limited, R – No
M3	Detected/identified CBRN/TIM experts are monitored and significant data collected.	G – Yes, Y – Limited, R – No
M4	Significant data are transmitted to appropriate agencies.	G – Yes, Y – Limited, R – No

<sup>1</sup> The DoD CBRN community has not developed guidelines and procedures that will facilitate the process of sensing the presence of and identifying and monitoring the movement and location of CBRN/TIM expertise.

<sup>2</sup> Nothing precludes the development of a screening methodology to select those CBRN/TIM experts that need to be targeted. A methodology to select those CBRN/TIM experts that need to be targeted has not been developed.

<sup>3</sup> Nothing precludes detecting and identifying CBRN/TIM experts who meet the screening criteria, once it is developed. Basic methods for surveillance methods to detect and identify personnel are well established.

<sup>4</sup> Nothing precludes monitoring and collecting significant data on CBRN/TIM experts who meet the screening criteria and have been detected and identified. Basic methods for monitoring and collection are well established.

<sup>5</sup> Nothing precludes transmitting significant data to appropriate agencies as long as what is significant is defined.

<sup>6</sup> Near- and mid-term improvements for all measures will depend upon the emphasis placed upon and efficacy of experimentation which will be designed to close knowledge gaps.

<sup>7</sup> DOTMLPF to support task should improve if effective experimentation closes knowledge gaps.

<sup>8</sup> Once knowledge gaps are closed, concepts may be refined, and new capabilities will be proposed and refined as a result of experimentation.

### 2.10.3 Functional Solution Analysis

#### 2.10.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** A methodology to select those CBRN/TIM experts that need to be targeted has not been developed.

**Non-Materiel Solutions:** *Doctrine:* Developing a screening methodology to select those CBRN/TIM experts that need to be targeted will be a significant undertaking that will require extensive input from the DoD CBRN community. A wide range of academic, scientific, medical, and industrial engineering disciplines, all with dual-use application, can contribute to offensive CBRN programs or using TIM for offensive/terrorism purposes. Indicators must be developed that can link potential expertise to suspected CBRN programs or terrorist cells. JRO-CBRND must work with the J2 to contribute to screening methodologies to be used by the intelligence community to select those CBRN/TIM experts that need to be targeted.

2. **Deficiency:** The DoD CBRN community has not developed guidelines and procedures that will facilitate the process of sensing the presence of and identifying and monitoring the movement and location of CBRN/TIM expertise.

**Non-Materiel Solutions:** *Doctrine:* JRO-CBRND must work with J2 and/or national intelligence organizations to develop effective guidelines and procedures to facilitate this task.

#### 2.10.3.2 IMA Assessment Summary

N/A

## **2.11 Task SENSES 11: Sense the employment of CBRN/TIM weapons**

### **2.11.1 Functional Area Analysis**

#### **2.11.1.1 Definition**

To obtain information and data from all sources that determine when a nation-state or transnational organization is preparing to or is employing CBRN/TIM weapons. Areas of interest include when the weapons will be employed, targets selected, weapons systems involved, agents involved, locations of weapons systems, and forces/personnel involved in the employment. Extracts information from the medical, operational, intelligence, and environmental communities to identify potential biological warfare activities. Includes verification of first use.

#### **2.11.1.2 Derivation**

*UJTL (SN 9.1.3, SN 2.4.1.2, SN 2.4.2.1, SN 8.1.10), JP (2-0, 2-02).*

##### **2.11.1.2.1 Supported Task: N/A**

##### **2.11.1.2.2 Lateral Task: SNSHA 1**

##### **2.11.1.2.3 Supporting Task: STSENS 3**

#### **2.11.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Atmospheric CBRN/TIM effects. (C1.3.3)

##### **Military**

1. Stressful mission. (C2.1)
2. No mission preparation. (C2.1.3)
3. Negligible personnel experience. (C2.2.4.5)
4. Conventional and terrorist threat form. (C2.9.2)

##### **Civil**

1. Limited foreign government support. (C3.1.2.3)

## **2.11.2 Functional Needs Analysis**

### **2.11.2.1 Capability and Deficiency Assessment Summary**

Table 2.11-1 discusses the only capability that currently exists to perform the task to the designated standards. There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The Joint Staff Directorate for Intelligence, J-2, is responsible for working with national-level organizations to obtain intelligence that is required to support joint operations. Per joint intelligence doctrine, the J-2 is responsible for coordinating all intelligence-related CBRN functions pertaining to adversary employment of CBRN weapons with the appropriate CBRN staff element, but because of documented training, education, and experience issues, J2 personnel may not have a full grasp of what needs to be coordinated. As the Chairman of the Joint Chiefs of Staff's single source of expertise in addressing CBRN defense issues involving the warfighter, JRO-CBRND must proactively engage the J2 to determine the adequacy of current and projected national-level intelligence capabilities to sense when a nation-state or transnational organization is preparing to or is employing CBRN/TIM weapons. For the purposes of this analysis, current capabilities are listed and issues that need to be further assessed and clarified are provided for JRO-CBRND action.

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Near/mid-term experimentation results (as recommended in this JCIDS analysis) may lead to development of new capabilities. It is projected that improvements due to coordination/DOTMLPF enhancements will dramatically improve DoD's ability to articulate and assess Sense requirements, but the overall status will remain "yellow" due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. New organizational structures or other capabilities resulting from near/mid-term experimentation results (as recommended in this JCIDS analysis) may dramatically improve DoD's ability to develop intelligence indicators for sensing imminent or actual employment of CBRN weapons but the overall status is projected to remain "yellow" due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

**Table 2.11-1. SSENS 11: Capability and Deficiency Assessment**

<b>Capability: Joint Staff Director for Intelligence, J-2</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>Y<sup>2</sup></b>	<b>Y<sup>3</sup></b>	<b>Y<sup>4</sup></b>	<b>Y<sup>5</sup></b>	<b>Y<sup>6</sup></b>
<b>Near/Mid-Term Overall Capability</b>	<b>Y<sup>7</sup></b>	<b>Y</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>
<b>Far-Term Overall Capability<sup>8</sup></b>	<b>Y<sup>9</sup></b>	<b>Y</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Unambiguous attack warning is provided.	G – Yes, Y – Limited, R – No
M2	CBRN/TIM attacks are detected and identified.	G – Yes, Y – Limited, R – No
M3	Reports of CBRN/TIM attacks are accurate.	G – Yes, Y – Limited, R – No
M4	First use is verified.	G – Yes, Y – Limited, R – No
M5	Accurate attack assessments are provided.	G – Yes, Y – Limited, R – No

<sup>1</sup> Joint intelligence and CBRN publications do not adequately address the issue of sensing the terrorist use of CBRN weapons, the use of TIM as a weapon, or third-party situations where U.S. resources can not be brought to bear.

<sup>2</sup> The J-2 works with the J-3 and various national-level organizations to provide unambiguous CBRN/TIM attack warning. In the case of determining if a nation-state has conducted a CBRN attack against U.S. forces, the process is mature and effective. In the event of terrorist use of CBRN, it may be difficult or impossible to attribute the attack and in the case of a biological attack or attacks involving TIM it may be difficult to determine if it is a natural disease outbreak or an accident. In the event of use not involving U.S. forces or allies it may be difficult to gain required information. Techniques and procedures to facilitate this process when it involves terrorists or non-U.S. allies and to provide unambiguous warning may not be adequate.

<sup>3</sup> The J-2 works with the J-3 and various national-level organizations to detect and identify CBTN/TIM attacks. In the case of a nation-state conducting a CBRN attack against U.S. forces, the process is mature and effective. In the event of terrorist use of CBRN, it may be difficult or impossible to detect or identify the attack and in the case of a biological attack or attacks involving TIM it may be difficult to determine if it is a natural disease outbreak or an accident. In the event of use not involving U.S. forces or allies it may be difficult to gain required information. Techniques and procedures to facilitate this process when it involves terrorists or non-U.S. allies and to detect or identify attacks may not be adequate.

<sup>4</sup> Methods and procedures for accurately reporting CBRN attacks against U.S. forces are mature and effective. Methods and procedures for accurately reporting third-party, terrorist and TIM attacks may not be adequate.

<sup>5</sup> Methods and procedures for verifying first use of CBRN against U.S. forces are mature and effective. Methods and procedures for verifying first use in third-party, terrorist and TIM attacks may not be adequate.

<sup>6</sup> Methods and procedures for providing accurate attack assessments when CBRN is used against U.S. forces are mature and effective. Methods and procedures providing accurate attack assessments in third-party, terrorist and TIM attacks may not be adequate.

<sup>7</sup> Near- and mid-term improvements for all measures will depend upon the emphasis placed upon and efficacy of experimentation which will be designed to close knowledge gaps.

<sup>8</sup> DOTMLPF to support task should improve if effective experimentation closes knowledge gaps.

<sup>9</sup> Once knowledge gaps are closed, concepts may be refined, and new capabilities will be proposed and refined as a result of experimentation.

### 2.11.3 Functional Solution Analysis

#### 2.11.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Techniques and procedures involving sensing of terrorist CBRN attacks may not be adequate.

**Non-Materiel Solutions:** *Doctrine:* Using the results of both experimentation and exercises, develop TTPs that will address all issues surrounding sensing the CBRN attacks of terrorists. Issues to be resolved include detecting and identifying the attacks, providing unambiguous warning of attacks or impending attacks, providing accurate reports and assessments and verification techniques and procedures. *Training:* Develop an experimentation/exercise campaign to address all issues surrounding the sensing of CBRN attacks of terrorists at the strategic national level.

2. **Deficiency:** Techniques and procedures involving sensing of small biological attacks may not be adequate.

**Non-Materiel Solutions:** *Doctrine:* Using the results of both experimentation and exercises, develop TTPs that will address all issues surrounding sensing of small biological attacks. Issues to be resolved include detecting and identifying the attacks, providing unambiguous warning of attacks or impending attacks, providing accurate reports and assessments and verification techniques and procedures. *Training:* Develop an experimentation/exercise campaign to address all issues surrounding the sensing of small biological attacks at the strategic national level.

3. **Deficiency:** Techniques and procedures involving sensing of TIM attacks may not be adequate.

**Non-Materiel Solutions:** *Doctrine:* Using the results of both experimentation and exercises, develop TTPs that will address all issues surrounding sensing of TIM attacks. Issues to be resolved include detecting and identifying the attacks, providing unambiguous warning of attacks or impending attacks, providing accurate reports and assessments and verification techniques and procedures. *Training:* Develop an experimentation/exercise campaign to address all issues surrounding the sensing of TIM attacks at the strategic national level.

4. **Deficiency:** Techniques and procedures involving sensing of third-party attacks may not be adequate.

**Non-Materiel Solutions:** *Doctrine:* Using the results of both experimentation and exercises, develop TTP that will address all issues surrounding sensing third party CBRN attacks. Issues to be resolved include detecting and identifying the attacks, providing unambiguous warning of attacks or impending attacks, providing accurate reports and assessments and verification techniques and procedures. *Training:* Develop an experimentation/exercise campaign to address all issues surrounding the sensing of third party CBRN attacks at the strategic national level.

- 5. Deficiency:** Joint intelligence and CBRN publications do not adequately address the issue of sensing the terrorist use of CBRN weapons, the use of TIMs as a weapon, or third-party situations where U.S. resources can not be brought to bear.

**Non-Materiel Solutions:** *Doctrine:* Integrate all lessons learned and procedures into appropriate joint publications.

#### **2.11.3.2 IMA Assessment Summary**

N/A

## **2.12 Task SENSES 12: Sense global CBRN/TIM hazards due to employment or ROTA of CBRN/TIM weapons or materials**

### **2.12.1 Functional Area Analysis**

#### **2.12.1.1 Definition**

To obtain information and data from all sources that determine the location and source of global CBRN/TIM hazards due to employment or release other than attack (ROTA) of CBRN/TIM weapons or materials. Areas of interest include detecting, identifying, and quantifying those CBRN/TIM hazards in all physical states (solid, liquid, gas). Enables the continued monitoring and identification of hazards in support of shaping, shielding, and sustaining.

#### **2.12.1.2 Derivation**

*UJTL (SN 9.1.3, SN 2.4.1.2, SN 2.4.2.1), JP (2-0, 2-02, 3-11).*

##### **2.12.1.2.1 Supported Task: N/A**

##### **2.12.1.2.2 Lateral Task: SNSHA 1**

##### **2.12.1.2.3 Supporting Task: STSENS 4**

#### **2.12.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Atmospheric CBRN/TIM effects. (C1.3.3)

##### **Military**

1. Stressful mission. (C2.1)
2. No mission preparation. (C2.1.3)
3. Negligible personnel experience. (C2.2.4.5)

##### **Civil**

1. Correct interdepartmental/interagency relationships. (C3.1.1.3)
2. TIMs are present. (C3.3.7.5)

## **2.12.2 Functional Needs Analysis**

### **2.12.2.1 Capability and Deficiency Assessment Summary**

Table 2.12-1 discusses the capabilities that currently exist to perform the task to the designated standard. These are the only capabilities that exist and no other capabilities are projected that will accomplish this task.

#### **Current Capability and Deficiency**

The Joint Staff Directorates for Intelligence and Operations are able under most circumstances to effectively sense global CBRN/TIM hazards due to employment or ROTA of CBRN/TIM weapons or materials. As the Chairman of the Joint Chiefs of Staff's single source of expertise in addressing CBRN defense issues involving the warfighter, JRO-CBRND must proactively engage the J-2 and J-3 to determine the adequacy of current and projected national-level operational and intelligence capabilities to sense when global CBRN/TIM hazards due to employment or ROTA of CBRN/TIM weapons or materials are present. For the purposes of this analysis, current capabilities are listed and issues that need to be further assessed and clarified are provided for JRO-CBRND action.

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capabilities are currently projected for the near/mid term. Near/mid-term experimentation results (as recommended in this JCIDS analysis) may lead to development of new capabilities. It is projected that improvements due to coordination/DOTMLPF enhancements will dramatically improve DoD's ability to articulate and improve Sense requirements, but the overall assessment will remain as "green."

#### **Projected Far-Term Capability and Deficiency**

No other capabilities are currently projected for the far-term future. New organizational structures or other capabilities resulting from near/mid-term experimentation results (as recommended in this JCIDS analysis) may continue to improve the ability to sense global CBRN/TIM hazards due to employment or ROTA of CBRN/TIM weapons or materials.

**Table 2.12-1 SENSES 12: Capability and Deficiency Assessment**

Capability/Measure	M1	M2	M3
<b>Current</b>			
<b>J-2</b>	Y <sup>1</sup>	Y <sup>2</sup>	G <sup>3</sup>
<b>J-3</b>	G <sup>4</sup>	G <sup>5</sup>	G <sup>6</sup>
<b>Near/Mid</b>			
<b>J-2</b>	G <sup>7</sup>	G	G
<b>J-3</b>	G	G	G
<b>Far</b>			
<b>J-2</b>	G	G	G
<b>J-3</b>	G	G	G
<b>Current Overall Capability</b>	G	G	G
<b>Near/Mid-Term Overall Capability</b>	G	G	G
<b>Far-Term Overall Capability</b>	G	G	G

	FAA Measure	Scale
M1	Hazards are detected and identified.	G – Yes, Y – Limited, R – No
M2	Reports on hazards are accurate.	G – Yes, Y – Limited, R – No
M3	Hazard warning is provided.	G – Yes, Y – Limited, R – No

<sup>1</sup> The J-2 works with the J-3 and various national-level organizations to detect and identify CBTN/TIM hazards. In the case of a nation-state conducting a CBRN attack against U.S. forces, the process is mature and effective. While it may not be possible to attribute CBRN/TIM hazards as attacks, it will be possible to detect and identify hazards. In the event of use not involving U.S. forces or allies it may be difficult to gain required information. Techniques and procedures to facilitate this process when it involves non-U.S. allies or countries that restrict information and access may not be adequate.

<sup>2</sup> Methods and procedures for accurately reporting hazards involving U.S. forces are mature and effective. Methods and procedures for accurately reporting hazards involving non-U.S. allies or countries that restrict information and access may not be adequate.

<sup>3</sup> Once a hazard or potential hazard is detected and identified, nothing precludes providing global warning.

<sup>4</sup> The deputy director for current operations is responsible for the National Military Command Center operations and command and control systems, ongoing current operations, and future plans in support of the combatant commanders. The National Military Command Center will coordinate all information, and in conjunction with the J-2, deconflict and assess the hazard reports and send out taskings worldwide for further required detection, identification, or monitoring missions within the capabilities of operational forces. Interagency coordination will be required for detection and identification outside of military capabilities.

<sup>5</sup> Nothing precludes accurate reports within the operational capabilities of the combatant commands. The J-3 must coordinate within the interagency for information or requirements outside of military capabilities.

<sup>6</sup> Once a hazard or potential hazard is detected and identified, nothing precludes providing global warning.

<sup>7</sup> Processes will be developed to facilitate data collection when it involves non-U.S. allies or countries that restrict information and access.

### 2.12.3 Functional Solution Analysis

#### 2.12.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** In the event of global CBRN/TIM hazards not involving U.S. forces or allies, it may be difficult to detect or identify hazards and gain required information.  
**Non-Materiel Solutions:** *Doctrine:* Using the results of both experimentation and exercises, develop TTPs that address all issues surrounding sensing global CBRN/TIM hazards due to employment or ROTA of CBRN/TIM weapons or materials. Issues to be resolved include detecting and identifying hazards when they affect non-U.S. allies or countries that restrict information and access.
- 2. Deficiency:** In the event of global CBRN/TIM hazards involving non-U.S. allies or countries that restrict information and access it may be difficult to gain accurate required information.  
**Non-Materiel Solutions:** *Doctrine:* Using the results of both experimentation and exercises, develop TTPs that will address all accuracy issues surrounding sensing global CBRN/TIM hazards due to employment or ROTA of CBRN/TIM weapons or materials. Issues to be resolved include determining how to accurately gain information on hazards when they affect non-U.S. allies or countries that restrict information and access.
- 3. Deficiency:** Joint intelligence and CBRN publications do not adequately address the issue of sensing global hazards in third-party situations where U.S. resources cannot be brought to bear.  
**Non-Materiel Solutions:** *Doctrine:* Integrate all information concerning actions to be taken when hazards affect non-U.S. allies or countries that restrict information and access and integrate lessons learned and procedures developed through experimentation into appropriate joint publications.
- 4. Deficiency:** Experimentation and training may not be conducted as frequently and extensively as required in order to identify capability gaps and required enhancements.  
**Non-Materiel Solutions:** *Training:* Conduct experimentation and training as required in order to identify capability gaps and required enhancements.

#### 2.12.3.2 IMA Assessment Summary

N/A

## **2.13 Task SENSES 13: Monitor compliance of signatories to treaties that touch on CBRN/TIM matters (e.g., Chemical Weapons Convention) and states that are eliminating their WMD CBRN treaty signatories and elimination states for compliance**

### **2.13.1 Functional Area Analysis**

#### **2.13.1.1 Definition**

To use national means to determine whether CBRN treaty signatories and those states voluntarily or involuntarily participating in CBRN elimination procedures are in compliance.

#### **2.13.1.2 Derivation**

*UJTL (SN 9.1.3, SN 9.2.3, SN 2.4.1.2, SN 2.4.2.1), JP (2-0, 2-02, 3-11).*

##### **2.13.1.2.1 Supported Task: N/A**

##### **2.13.1.2.2 Lateral Task: SNSHA 1**

##### **2.13.1.2.3 Supporting Task: STSENS 5**

#### **2.13.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. CBRN threat form. (C1.3.3.1-3)

##### **Military**

1. Cooperative nation
  - a. Partial preexisting arrangements. (C2.1.1.2)
  - b. Limited military commitments from other nations. (C2.1.1.7)
  - c. Limited host nation support. (C2.8.5)
2. Uncooperative nation
  - a. No preexisting arrangements. (C2.1.1.2)
  - b. Negligible military commitments from other nations. (C2.1.1.7)
  - c. No host nation support. (C2.8.5)

##### **Common Military Conditions**

1. Limited personnel expertise. (C2.2.4.5)

**Civil**

1. Cooperative nation
  - a. Limited foreign government support. (C3.1.2.3)
2. Uncooperative nation
  - a. Negative foreign government support. (C3.1.2.3)

**This task is analyzed in the WMD Interdiction and Elimination JCIDS.**

## **2.14 Task SENSES 14: Monitor international scientific and technology developments for potential CBRN/TIM implications**

### **2.14.1 Functional Area Analysis**

#### **2.14.1.1 Definition**

To use national means to gather information on international scientific and technology developments, assess the information for applicability to CBRN/TIM weapons use, and distribute the information to agencies that require the information. Tracks international developments in biology, chemistry, nuclear physics, and nanotechnologies that could affect the development or use of CBRN/TIM weapons. Fuses this information with other intelligence and operational and environmental data to provide guidance for planning.

#### **2.14.1.2 Derivation**

*UJTL (SN 9.1.3, SN 2.4.2.5), JP (2-0, 2-02).*

##### **2.14.1.2.1 Supported Task: N/A**

##### **2.14.1.2.2 Lateral Task: SNSHA 1**

##### **2.14.1.2.3 Supporting Task: STSENS 6**

#### **2.14.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military.** N/A

**Civil**

1. Limited foreign government support. (C3.1.2.3)
2. Moderately opposed foreign public opinion. (C3.1.2.4)

### **2.14.2 Functional Needs Analysis**

#### **2.14.2.1 Capability and Deficiency Assessment Summary**

Table 2.14-1 discusses the only capability that currently exists to perform the task to the designated standards. There is only one capability that exists, and no other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The Joint Staff Directorate for Intelligence, J-2, is responsible for working with national-level organizations to obtain intelligence that is required to support joint operations. Per joint intelligence doctrine, the J-2 is responsible for coordinating all intelligence-related CBRN functions pertaining to adversary employment of CBRN weapons with the appropriate CBRN staff element, but because of documented training, education, and experience issues, J2 personnel may not have a full grasp of what needs to be coordinated. As the Chairman of the Joint Chiefs of Staff's single source of expertise in addressing CBRN defense issues involving the warfighter, JRO-CBRND must proactively engage the J2 to determine the adequacy of current and projected national-level intelligence capabilities to monitor international scientific and technology developments for potential CBRN/TIM implications. For the purposes of this analysis, current capabilities are listed and issues that need to be further assessed and clarified are provided for JRO-CBRND action. The overall current assessment is "yellow."

**Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Near/mid-term experimentation results (as recommended in this JCIDS analysis) may lead to development of new capabilities. It is projected that improvements due to coordination/DOTMLPF enhancements will dramatically improve DoD's ability to monitor international scientific and technology developments for potential CBRN/TIM implications resulting in a capability projection of "green."

**Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. New organizational structures or other capabilities resulting from near/mid-term experimentation results (as recommended in this JCIDS analysis) may continue to improve DoD's ability to monitor international scientific and technology developments for potential CBRN/TIM implications.

**Table 2.14-1. SSENS 14: Capability and Deficiency Assessment**

<b>Capability: Joint Staff Directorate for Intelligence, J-2</b>	<b>M1</b>	<b>M2</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>Y<sup>2</sup></b>	<b>Y<sup>3</sup></b>
<b>Near/Mid-Term Overall Capability<sup>4</sup></b>	<b>G<sup>5</sup></b>	<b>G<sup>6</sup></b>
<b>Far-Term Overall Capability</b>	<b>G</b>	<b>G</b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Strategic surprise does not occur due to science and technology developments.	G – Yes, Y – Limited, R – No
M2	International scientific and technology developments with applicability to CBRN/TIM weapons are detected and cataloged.	G – Yes, Y – Limited, R – No

<sup>1</sup> Joint intelligence and CBRN publications do not adequately address this issue.

<sup>2</sup> The J-2 works with various national-level organizations to ensure that strategic surprise does not occur. There may not be adequate linkage between the implications of international scientific and technology developments for CBRN/TIM weapons and operational impacts.

<sup>3</sup> The J-2 works with various national-level organizations to ensure that information relating to international scientific and technology developments for CBRN/TIM weapons are available if required. Joint intelligence and CBRN officers may not be fully aware of what is required or important.

<sup>4</sup> In the mid term, joint intelligence and CBRN publications can be updated to adequately address this issue.

<sup>5</sup> In the mid term, problems with determining appropriate and effective linkage between the implications of international scientific and technology developments for CBRN/TIM weapons and operational impacts can be identified and corrected as a result of experimentation.

<sup>6</sup> In the mid term, intelligence/CBRND fusion issues can be identified and corrected as a result of experimentation.

### 2.14.3 Functional Solution Analysis

#### 2.14.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** There may not be adequate linkage between the implications of international scientific and technology developments for CBRN/TIM weapons and operational impacts.

**Non-Materiel Solutions:** *Training:* Develop an experimentation plan to determine the linkage between the implications of international scientific and technology developments for CBRN/TIM weapons and operational impacts. Integrate lessons learned into TTPs and procedures that the J2 can coordinate with the intelligence community.

2. **Deficiency:** Joint intelligence and CBRN officers may not be fully aware of what is required or important.

**Non-Materiel Solutions:** *Leadership:* Integrate TTPs developed through experimentation into leader education for both intelligence and CBRN staff officers.

3. **Deficiency:** Joint intelligence and CBRN publications do not adequately address this issue.

**Non-Materiel Solutions:** *Doctrine:* Integrate TTPs developed through experimentation into both intelligence and CBRN joint publications.

#### 2.14.3.2 IMA Assessment Summary

N/A

## **2.15 Task SENSES 15: Provide Sense Global Family of Engagement Plan policies and guidelines to combatant commanders**

### **2.15.1 Functional Area Analysis**

#### **2.15.1.1 Definition**

To formulate policy for Sense “Global Family of Engagement Plans” and to provide this policy, as well as specific guidelines, to combatant commanders for execution. The Chairman of the Joint Chiefs of Staff (CJCS), in conjunction with interagency partners, coordinates and develops these policy and guidelines. Because the threat of CBRN/TIM weapons is of concern to all nations and potential allies, offering assistance in establishing Sense capabilities, through training or equipment, can help forge new friendships and cooperation. It will also make Sense issues easier to address in remote or austere areas if the host nation has an existing Sense capability.

#### **2.15.1.2 Derivation**

*UJTL (SN 9.1.3, SN 8, SN 7.5, SN 5.4.3), CJCSM 3113.01A.*

##### **2.15.1.2.1 Supported Task: N/A**

##### **2.15.1.2.2 Lateral Tasks: SNSHA 8, SNSHA 11**

##### **2.15.1.2.3 Supporting Task: STSENS 7**

#### **2.15.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. No preexisting arrangements. (C 2.1.1.2)
2. Limited personnel expertise. (C2.2.4.5)

**Civil.** N/A

### **2.15.2 Functional Needs Analysis**

#### **2.15.2.1 Capability and Deficiency Assessment Summary**

Table 2.15-1 discusses the only capability that currently exists to perform the task to the designated standards. There is only one capability that exists, and no other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The CJCS has numerous responsibilities to include, but not limited to, preparing and reviewing joint policies and guidelines, etc. The “Global Family of Engagement Plans” is the phrase used in the Theater Engagement Planning (TEP) Joint Manual (*CJCSM 3113.01a*) to describe action mandated by *Defense Planning Guidance FY 2002–2007, 6 April 2000* to develop a process to globally integrate all military engagement activities. The TEPs from each geographic combatant commander or designated Executive Agent are integrated into the “Global Family of Engagement Plans,” which is approved by the CJCS and forwarded to the Under Secretary of Defense for Policy for review. This process and the review and any guidance or support to aid combatant commanders in the initial development of the TEPs are a strategic national-level activity and from the standpoint of Sense, Shape, Shield, and Sustain, as embodied in the CBRND Enabling Concept, must be accomplished, at a minimum, with the technical assistance and support of JRO-CBRND. “Sense Global Family of Engagement Plans” implies the integration of Sense CBRND Enabling Concept ideas into any policies and guidelines that would impact on combatant command development of TEPs. Current overall assessment is “red.”

**Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Near/mid-term experimentation results (as recommended in this JCIDS analysis) may lead to development of new capabilities. It is projected that improvements due to coordination/DOTMLPF enhancements will dramatically improve DoD’s ability to articulate and provide Sense “Global Family of Engagement Plans” and to provide policy, as well as specific guidelines, to combatant commanders for execution. The overall status should improve to “yellow” due to these initiatives but is not anticipated to improve more than that due to the inherent difficulties posed by international relations.

**Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. The overall status is likely to remain “yellow” due to the inherent difficulties posed by international relations.

**Table 2.15-1. SENSES 15. Capability and Deficiency Assessment**

<b>Capability: CJCS</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>R<sup>2</sup></b>	<b>R<sup>3</sup></b>	<b>R<sup>4</sup></b>
<b>Near/Mid-Term Overall Capability</b>	<b>Y<sup>5</sup></b>	<b>Y</b>	<b>Y</b>
<b>Far-Term Overall Capability</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Sense Global Family of Engagement Plan policies and guidelines are established.	G – Yes, Y – Limited, R – No
M2	Existing policies and guidelines are updated regularly.	G – Yes, Y – Limited, R – No
M3	Joint exercises/experimentation provide feedback on efficacy of policy and guidelines.	G – Yes, Y – Limited, R – No

<sup>1</sup> No doctrine, i.e., staff guidance or joint TTPs, has been established specifically for restoration operations.

<sup>2</sup> No. Although generic guidance exists in CJCSM 3113.01a, the “Global Family of Engagement Plans” does not include Sense initiatives.

<sup>3</sup> There are no policies or guidelines to update.

<sup>4</sup> While there have been many joint exercises, an exercise focused on restoration operations and the efficacy of Sense “Global Family of Engagement Plan” policies and guidelines has not been conducted.

<sup>5</sup> The overall status should improve to “yellow” due to a multitude of initiatives but is not anticipated to improve more than that due to the inherent difficulties posed by international relations.

### 2.15.3 Functional Solution Analysis

#### 2.15.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** CBRN Sense considerations are not included in the “Global Family of Engagement Plans.”

**Non-Materiel Solutions:** *Doctrine:* Ensure that “Global Family of Engagement Plans” policies and guidelines include CBRN Sense considerations.
- 2. Deficiency:** No exercises focused on CBRN Sense considerations.

**Non-Materiel Solutions:** *Doctrine:* Establish working groups to establish policies and guidelines that include CBRN Sense considerations into TEP. *Training:* Develop exercises that include CBRN Sense considerations and focus on gathering information of the efficacy of Global Family of Engagement planning. *Facilities:* Incorporate into Joint National Training Capability.
- 3. Deficiency:** No doctrine, i.e., staff guidance or joint TTPs (JTTPs), has been established in support of this task.

**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, i.e., staff guidance/policies, (Chairman of the Joint Chiefs of Staff Instruction [CJCSI], Chairman of the Joint Chiefs of Staff Manual [CJCSM], or JTTPs). Such policies and guidelines should be included in documents like CJCSM 3113.01A Theater Engagement Planning, Defense Planning Guidance, the Joint Staff Capabilities Plan, and any CBRN-specific publications might provide guidance on CBRN defense integration into TEP.
- 4. Deficiency:** No training on this task provides feedback.

**Non-Materiel Solutions:** *Training:* Develop training on Global Family of Engagement Plan CBRN Sense considerations so that lessons learned can be gathered.
- 5. Deficiency:** No JPME education on Global Family of Engagement Planning including CBRN Sense considerations.

**Non-Materiel Solutions:** *Leadership:* Develop JPME leader education on Global Family of Engagement Plan CBRN Sense considerations. Provide materials to the Joint Forces Staff College so they can use CBRN Sense considerations as a TEP example.

#### 2.15.3.2 IMA Assessment Summary

N/A

## **2.16 Task SENSES 16: Provide global screening for endemic disease and/or hazardous substances in the environment**

### **2.16.1 Functional Area Analysis**

#### **2.16.1.1 Definition**

To use national means to provide global screening for endemic diseases and/or hazardous substances in the environment. All interagency capabilities are employed to ensure that endemic diseases and/or hazardous substances in the environment are detected and that national military forces are warned and appropriate preventive action is taken.

#### **2.16.1.2 Derivation**

*UJTL (SN 4.3.3, SN 9.1.3).*

##### **2.16.1.2.1 Supported Task: N/A**

##### **2.16.1.2.2 Lateral Task: SNSHA 1**

##### **2.16.1.2.3 Supporting Task: STSENS 8**

#### **2.16.1.3 Condition**

Perform this task under conditions of:

##### **Military**

1. Partial preexisting arrangements. (C2.1.1.2)

##### **Civil**

1. Limited foreign government support. (C3.1.2.3)
2. Moderately opposed foreign public opinion. (C3.1.2.4)

### **2.16.2 Functional Needs Analysis**

#### **2.16.2.1 Capability and Deficiency Assessment Summary**

Table 2.16-1 discusses the only capability that exists to perform the task to the designated standards.

#### **Current Capability and Deficiency**

Resources and DOTMLPF exist to support CJCS staff information and data collection, processing, and correlation from a variety of sources (national, international, military, civilian, etc.) to identify potential hazards and endemic diseases for evaluation and assessment of their probable impact and the necessary protective measures. The DoD Global Emerging Infections

Surveillance and Response System (GEIS) and Armed Forces Medical Intelligence Center (AFMIC) maintain active surveillance for infectious diseases that might affect military personnel, readiness, and operations and are resources for the CJCS staff. Dissemination of warnings to national strategic forces identifying these potential hazards and diseases, and the associated protective measures are incorporated within existing doctrine. Deficiencies are related to the level of automation of information and data resources and their compatibility.

**Projected Near/Mid-Term Capability and Deficiency**

No foreseeable changes in the near/mid term.

**Projected Far-Term Capability and Deficiency**

No foreseeable changes in the far term.

**Table 2.16-3. SSENS 16: Capability and Deficiency Assessment**

<b>Capability: CJCS</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>Y<sup>2</sup></b>	<b>Y<sup>3</sup></b>	<b>Y<sup>4</sup></b>	<b>Y<sup>5</sup></b>
<b>Near/Mid-Term Overall Capability</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>
<b>Far-Term Overall Capability</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	All diseases/hazards are identified.	G – Yes, Y – Limited, R – No
M2	Medical, operational, intelligence, and environmental data are correlated.	G – Yes, Y – Limited, R – No
M3	Diseases/hazards are identified in time to warn forces and take appropriate preventive measures.	G – Yes, Y – Limited, R – No
M4	Diseases/hazards are identified in time to treat forces.	G – Yes, Y – Limited, R – No

<sup>1</sup> Adequate DOTLPF exists to conduct this task.

<sup>2</sup> Limited. Pathogens of military importance are identified. Outbreaks of new or mutated diseases assessed by the Centers for Disease Control and/or World Health Organization are reviewed by AFMIC for inclusion. The DoD GEIS also provides information on infectious diseases that pose a threat to personnel or reduce medical readiness. Other types of hazards are reviewed for their impact upon military forces, depending upon type and scope. For example, ITF-40 assesses a number of industrial chemicals for their potential impact. However, ITF-40 does not assess all the potential industrial chemicals, possibly existing within an area of interest. Information must be collected, processed, and correlated from a variety of sources (national, international, military, civilian, etc.) to identify potential hazards and endemic diseases for evaluation and assessment of their probable impact and the necessary protective measures.

<sup>3</sup> Limited. Resources such as the Centers for Disease Control, World Health Organization, International Atomic Energy Agency, AFMIC, GEIS, North Atlantic Treaty Organization, Food and Agriculture Organization, and others are identified as reliable sources for data and information about most areas of interest. However, much of the information and data must be collected, processed, correlated, evaluated, and assessed manually. Many resource systems are not integrated or are not automated. Information systems within DoD and other government agencies are frequently stovepiped and the information must be manually transferred from one system to another. Additionally, data structures and fields are not always compatible between systems impacting application of data transfer utilities.

<sup>4</sup> Limited. Diseases and hazards within an area of interest are not static. These change overtime. National Strategic plan implementation processes incorporate requirements for ensuring currency of information and decisioning parameters. Adjustments are made as necessary. Identification of endemic diseases and hazards of military importance are disseminated and are accompanied with guidance on preventive measures. Changes to this information is disseminated throughout operations. However, the largely manual nature of the current process is time consuming and the potential exists for exposure prior to receipt of warning.

<sup>5</sup> Limited. Capability relies on in-country intelligence and data, which may be of questionable reliability.

### 2.16.3 Functional Solution Analysis

#### 2.16.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** Not all potential hazards have been assessed for their military importance. For example, ITF-40 does not assess all the potential industrial chemicals possibly existing within an area of interest.  
**Non-Materiel Solutions:** *Doctrine:* Expand existing doctrine to include all potential TIC hazards. *Leadership:* Build leadership awareness of potential gap in existing information and potential sources for information and data.
- 2. Deficiency:** Data structures and fields are not always compatible between systems impacting application of data transfer utilities.  
**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, processes, and procedures for Defense Information Systems Agency (DISA)-compatible data mining of DoD and non-DoD legacy systems.
- 3. Deficiency:** The largely manual nature of the current process is time-consuming, and the potential exists for exposure prior to receipt of warning.  
**Non-Materiel Solutions:** *Leadership:* Develop leadership awareness of issues associated with information collection and processing and the need for force preparedness and prior knowledge of hazards/diseases of military importance in area of interest.

#### 2.16.3.2 IMA Assessment Summary

N/A

## **2.17 Task SENSES 17: Develop global environmental background data including climatology**

### **2.17.1 Functional Area Analysis**

#### **2.17.1.1 Definition**

To use national means to obtain and assess global environmental background data (including climatology) for potential CBRN/TIM implications. All interagency capabilities are employed to obtain this information and to ensure that national military forces have access to processed data.

#### **2.17.1.2 Derivation**

*UJTL (SN 9.1.3, SN 2.2.1).*

##### **2.17.1.2.1 Supported Task: N/A**

##### **2.17.1.2.2 Lateral Task: SNSHA 1**

##### **2.17.1.2.3 Supporting Task: STSENS 9**

#### **2.17.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Partial preexisting arrangements. (C2.1.1.2)

**Civil**

1. Limited foreign government support. (C3.1.2.3)
2. Moderately opposed foreign public opinion. (C3.1.2.4)

### **2.17.2 Functional Needs Analysis**

#### **2.17.2.1 Capability and Deficiency Assessment Summary**

Table 2.17-1 discusses the various DoD and national capabilities that currently exist to perform the task to the designated standards. Located at the University of California's Lawrence Livermore National Laboratory, the National Atmospheric Release Advisory Center (NARAC) is a national support and resource center for planning, real-time assessment, emergency response, and detailed studies of incidents involving a wide variety of hazards, including nuclear, radiological, chemical, biological or natural emissions. NARAC is a distributed system, providing modeling and geographical information tools for deployment to an end user's

computer system, as well as real-time access to global meteorological and geographical databases and advanced three-dimensional model predictions from the national center. DoD operates a military environmental service system to provide specialized global meteorological, space, environmental, and oceanographic analysis and prediction services in support of military forces. Minor deficiencies in capability include the need to integrate CBRN considerations into environmental and climatology processes, TTPs, and doctrine. In addition, more awareness of the NARAC program is needed through education.

**Current Capability and Deficiency**

Current capabilities are robust and mature with only minor deficiencies in data currency and program awareness.

**Projected Near/Mid-Term Capability and Deficiency**

Capabilities will improve only as a result of improved CBRN experimentation and integration into exercises.

**Projected Far-Term Capability and Deficiency**

Capabilities will improve only as a result of improved CBRN experimentation and integration into exercises.

**Table 2.17-1. SNSSENS 17: Capability and Deficiency Assessment**

3.9 Task STSENS 9: Develop theater environmental background data including climatology .....	38

## 3.0 Strategic Theater Sense

### 3.0.1 Introduction

At the strategic level of war, a nation, often as a member of a group of nations, determines national or multinational (alliance or coalition) security objectives and guidance, and develops and uses national resources to accomplish these objectives. Activities at this level establish national and multinational military objectives, sequence initiatives; define limits and assess risks for the use of military and other instruments of national power, develop global plans or theater war plans to achieve these objectives, and provide military forces and other capabilities in accordance with strategic plans. The strategic theater (ST) sublevel encompasses combatant command (COCOM) tasks. Nine strategic theater sense tasks were identified in the chemical, biological, radiological, and nuclear (CBRN) Functional Area Analysis (FAA) including a task for elimination operations. However, the detailed analysis of the elimination tasks has been deferred to the Joint Requirements Office for Chemical, Biological, Radiological, and Nuclear Defense (JRO-CBRND)–sponsored FAA/Functional Needs Analysis (FNA) of the weapons of mass destruction (WMD) elimination and interdiction functional areas.

This chapter, detailing the Strategic Theater Sense area, restates relevant information from the CBRND FAA, including a description of each of the nine Strategic Theater Sense tasks, derivation of the task, an indication of other linked tasks, and the pertinent conditions. The FNA section addresses the capability and deficiency analysis and a brief description of potential near-term changes. Once all the capabilities are considered, the assessment concludes with a separate, overarching look at the entire capability spectrum to identify remaining gaps and/or synergies. The FSA section addresses possible solutions for the deficiencies identified in the FNA section. The non-materiel solutions address one or more of the six areas of DOTLPP: doctrine, organization, training, leadership, personnel, and facilities. Most of the Strategic Theater Sense tasks involve required capabilities of major staffs or staff sections within the U.S. Department of Defense (DoD). In those areas where a DoD staff or agency needed to interact within the interagency, the task focused on DoD capabilities required to facilitate the interaction.

### 3.0.2 FNA Summary

The table below summarizes the overall current and projected capability to perform the Strategic Theater Sense tasks identified in the CBRND Defense (CBRND) FAA. The overall capability to conduct Strategic Theater Level Sense tasks (STSENSs) in the current time frame is assessed as “yellow.” The COCOM J-2 is responsible for working with national/theater-level organizations to obtain intelligence that is required to support joint theater operations. Per joint intelligence doctrine, the J-2 is responsible for coordinating all intelligence-related CBRN functions pertaining to adversary employment of CBRN weapons with the appropriate CBRN staff element. But because of documented training, education, and experience issues, J2 personnel may not have a full grasp of what needs to be coordinated. As the COCOM commander’s main source of expertise in addressing CBRN defense issues involving the warfighter, the COCOM CBRND staff must proactively engage the J2 to determine the adequacy of current and projected theater-level intelligence capabilities to sense the operational deployment of CBRN weapons in theater. To be proactive, the COCOM CBRND staff must be better prepared on intelligence/CBRND fusion issues. For the purposes of this analysis, current capabilities are

listed, and issues that need to be further assessed and clarified are provided for JRO-CBRND action. While the J2 and theater intelligence organizations have the responsibility to gather intelligence on CBRN threat-related issues, they do not have the requisite understanding of CBRN issues to fully address the requirements without assistance from the COCOM CBRND staff. It is projected that improvements due to coordination/DOTLPF enhancements will dramatically improve the ability of the COCOM staff to articulate and assess Sense requirements, but the overall status will remain “yellow” due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

**Table 3.0-1. Strategic Theater Sense Summary FNA Findings**

CBRN Strategic Theater Sense Task Number	CBRN Strategic Theater Sense Task Title	Capability		
		Current	Near/Mid	Far
STSENS 1	Sense the storage locations of CBRN/TIM weapons or components in theater.	●	●	●
STSENS 2	Sense the operational deployment of CBRN/TIM weapons in theater.	●	●	●

### 3.0.3 FSA Summary

The paragraphs below summarize the assessment of all potential solutions for the capability gaps identified in the FNA section.

**3.0.3.1 DOTLPF**

The DOTLPF solutions identified in this chapter include basic actions required to better prepare the appropriate staffs. No training or experimentation has taken place to facilitate the formulation of tactics, techniques, and procedures (TTPs) designed to facilitate the ability of intelligence personnel to assess CBRND “sense” requirements. It is imperative that these exercises take place and lessons learned be integrated into doctrine, TTPs, and guidance. Other solutions include the development of leader education programs for both CBRND and intelligence staff officers so that they are better prepared to understand the correlation between proliferation or theater scientific/technology developments and potential CBRN/ toxic industrial material (TIM) operational implications. A detailed analysis of how the theater intelligence/CBRN community is organized and staffed to perform CBRN intelligence analysis and collection activities must be conducted. In the case of hazards involving non-U.S. allies or countries that restrict information, it is imperative that appropriate exercises/experimentation take place and lessons learned be integrated into doctrine, TTPs, and guidance.

**3.0.3.2 IMA**

There are no materiel requirements.

### **3.1 Task STSENS 1: Sense the storage locations of CBRN/TIM weapons or components in theater**

#### **3.1.1 Functional Area Analysis**

##### **3.1.1.1 Definition**

To obtain information and data from all sources that determine where a military force or transnational organization is storing CBRN/TIM weapons or components. Areas of interest include storage locations, storage capacities, safety precautions, prevailing meteorological conditions at sites, types of weapons or components stored, and facility entrances.

##### **3.1.1.2 Derivation**

*UJTL (ST 9.6, ST 2, ST 2.2.1).*

**3.1.1.2.1 Supported Task:** SSENS 7

**3.1.1.2.2 Lateral Task:** STSHA 1

**3.1.1.2.3 Supporting Task:** OPSSENS 1

##### **3.1.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

##### **Military**

1. Negligible intelligence database. (C2.4.2)
2. Negligible theater intelligence access. (C2.4.2)
3. Conventional and terrorist threat form. (C2.9.2)

##### **Civil**

1. Negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)

#### **3.1.2 Functional Needs Analysis**

##### **3.1.2.1 Capability and Deficiency Assessment Summary**

Table 3.1-1 discusses the only capability that currently exists to perform the task to the designated standards. There is only one capability that exists, and no other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The COCOM J-2 assists the commander of a combatant command by providing higher echelon, up to and including the National Military Joint Intelligence Center (NMJIC), and subordinate commands with a single, coordinated CBRN intelligence picture by fusing national and theater intelligence into all-source estimates and assessments. The COCOM J-2 is responsible for working with national/theater-level organizations to obtain intelligence required to support joint theater operations. Per joint intelligence doctrine, the J-2 is responsible for coordinating all intelligence-related CBRN functions pertaining to adversary employment of CBRN weapons with the appropriate CBRN staff element, but because of documented training, education, and experience issues, J2 personnel may not have a full grasp of what needs to be coordinated. As the COCOM commander's main source of expertise in addressing CBRN defense issues involving the warfighter, the COCOM CBRND staff must proactively engage the J2 to determine the adequacy of current and projected theater-level intelligence capabilities to sense the storage locations of CBRN/TIM weapons or components. To be proactive, the COCOM CBRND staff must be better prepared on intelligence/CBRND fusion issues. For the purposes of this analysis, current capabilities are listed, and issues that need to be further assessed and clarified are provided for JRO-CBRND action.

**Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Near/mid-term experimentation results (as recommended in this Joint Capabilities Integration and Development System [JCIDS] analysis) may lead to development of new capabilities. It is projected that improvements due to coordination/DOTLPF enhancements will dramatically improve the ability of the COCOM staff to sense the storage locations of CBRN/TIM weapons or components in theater. The overall status will remain "yellow" due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

**Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. New organizational structures or other capabilities resulting from near/mid-term experimentation results (as recommended in this JCIDS analysis) may dramatically improve the ability of the COCOM staff to develop intelligence indicators for sensing the storage locations of CBRN/TIM weapons or components in theater, but the overall status is projected to remain "yellow" due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

**Table 3.1-1. STSENS 1: Capability and Deficiency Assessment**

<b>Capability: Combatant Command J-2</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>Y<sup>2</sup></b>	<b>Y<sup>3</sup></b>	<b>Y<sup>4</sup></b>
<b>Near/Mid-Term Overall Capability</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>
<b>Far-Term Overall Capability<sup>5</sup></b>	<b>Y</b>	<b>Y</b>	<b>Y</b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Storage locations of CBRN/TIM weapons or components are detected and identified.	G – Yes, Y – Limited, R – No
M2	Strategic surprise does not occur.	G – Yes, Y – Limited, R – No
M3	Intelligence on storage locations of CBRN/TIM weapons or components is accurate.	G – Yes, Y – Limited, R – No

<sup>1</sup> Joint intelligence and CBRN publications do not adequately address this issue. The COCOM CBRN staff is not adequately staffed and organized to meet its intelligence-related responsibilities. The COCOM J2 staff is not adequately trained/educated in CBRN issues. CBRN staff officers are not adequately trained/educated in intelligence issues. Experimentation does not provide feedback on intelligence indicators for this task. JPME does not adequately cover the fusion of intelligence/CBRN issues.

<sup>2</sup> The COCOM J-2 works with various national/theater-level organizations to determine where a nation-state or transnational organization is storing CBRN/TIM weapons or components. Techniques and procedures to facilitate this process and to provide useful indicators may not be adequate.

<sup>3</sup> The COCOM J-2 works with various national/theater-level organizations to ensure that strategic surprise does not occur. Adequate resources and means may not be sufficiently applied in determining where a nation-state or transnational organization is storing CBRN/TIM weapons or components.

<sup>4</sup> The COCOM J-2 works with various national/theater-level organizations to ensure accuracy of intelligence determining where a nation-state or transnational organization is storing CBRN/TIM weapons or components. Techniques and procedures to facilitate this process and to ensure accuracy may not be adequate.

<sup>5</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

### 3.1.3 Functional Solution Analysis

#### 3.1.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the Ideas for Materiel Approaches (IMA) section.

1. **Deficiency:** Techniques and procedures to facilitate detecting and where a nation-state or transnational organization is storing CBRN/TIM weapons or components may not be adequate.

**Non-Materiel Solutions:** *Doctrine:* JRO-CBRND must work with the COCOM J2 and/or theater intelligence organizations to develop effective theater techniques and procedures for detecting and identifying where a nation-state or transnational organization is storing CBRN/TIM weapons or components and to provide useful indicators. These indicators must include types of storage facilities, techniques for storage in unlikely locations, storage capacities, safety and security measures, transport and agent release techniques, and storage capacity.

2. **Deficiency:** Techniques and procedures to ensure accurate intelligence on where a nation-state or transnational organization is storing CBRN/TIM weapons or components may not be adequate.

**Non-Materiel Solutions:** *Doctrine:* JRO-CBRND must work with the COCOM J2 and/or theater intelligence organizations to develop effective techniques and procedures to ensure accurate theater intelligence on where a nation-state or transnational organization is storing CBRN/TIM weapons or components and to develop metrics to measure accuracy.

3. **Deficiency:** Adequate resources and means may not be sufficiently applied to accurately determine where a nation-state or transnational organization is storing CBRN/TIM weapons or components.

**Non-Materiel Solutions:** *Organization:* The CBRN organization or staffing of the COCOM J2 as well as each theater intelligence organization must be analyzed from a CBRN standpoint to ensure that they can provide required CBRN intelligence concerning CBRN hazards. These hazards need to be detected, identified, and quantified for Shape to provide a clear understanding of the current and predicted CBRN situation to the commander.

*Training:* JRO-CBRND must work with the COCOM J2 and/or theater intelligence organizations to develop effective training for analysts as well as those managing all means of collection. The training must allow analysts and collection managers the means by which to determine inadequacy of collection mechanisms and a means to make recommendations for improvement. *Leadership:* JRO-CBRND must work with the COCOM J2 and/or theater intelligence organizations to develop an effective CBRN education program for analysts as well as those managing all means of collection. The education process must provide analysts and collection managers with the tools they need to assess the efficacy of their analysis and collection efforts. *Personnel:* Personnel should not be assigned to intelligence analysis or collection activities vital to CBRN areas without requisite CBRN education and/or experience. *Facilities:* Training requirements should be analyzed and special training facilities developed/modified if required.

4. **Deficiency:** Joint intelligence and CBRN publications do not adequately address this issue.  
**Non-Materiel Solutions:** *Doctrine:* Joint intelligence and CBRN publications must be enhanced to adequately address this issue and to interface with each other so that roles and responsibilities are clearly delineated.
5. **Deficiency:** COCOM CBRND staff is not adequately staffed and organized to meet its intelligence-related responsibilities.  
**Non-Materiel Solutions:** *Organization:* COCOM CBRND staff should have a section dedicated to resolving CBRN intelligence issues. *Personnel:* COCOM CBRND should have adequate trained/experienced personnel assigned to man a section dedicated to resolving CBRN intelligence issues.
6. **Deficiency:** The J2 staff is not adequately trained/educated in CBRN issues.  
**Non-Materiel Solutions:** *Training:* Develop training that will enable the COCOM J2 staff to better understand their CBRN role and enhance their ability to obtain intelligence that is required to support the Shape function of strategic theater CBRND. *Leadership:* Develop an education program that will enable the COCOM J2 staff to better understand their CBRN role and enhance their ability to obtain intelligence that is required to support the Shape function of strategic theater CBRND.
7. **Deficiency:** CBRN staff officers are not adequately trained/educated in intelligence issues.  
**Non-Materiel Solutions:** *Doctrine:* Develop doctrine to provide guidance and outline interaction and exchange of information between J-2, the intelligence community, and other participating entities. *Training:* Develop training programs that allow CBRN staff officers to better support the CBRN intelligence process. *Leadership:* Develop education programs that allow CBRN staff officers to better understand the CBRN intelligence process and their roles and responsibilities.
8. **Deficiency:** Experimentation/red teaming does not provide feedback on intelligence indicators for this task.  
**Non-Materiel Solutions:** *Training:* Conduct small-scaled training sessions focused on communications and recognizing less obvious indicators of CBRN/TIM weapons storage. Incorporate the derived information into subsequent exercises that facilitate this and other areas of the task.
9. **Deficiency:** Joint Professional Military Education (JPME) does not adequately cover the fusion of intelligence/CBRN issues.  
**Non-Materiel Solutions:** *Leadership:* Integrate intelligence/CBRN fusion issues into JPME.

### 3.1.3.2 IMA Assessment Summary

N/A

**3.2 Task STSENS 2: Sense the operational deployment of CBRN/TIM weapons in theater****3.2.1 Functional Area Analysis****3.2.1.1 Definition**

To obtain information and data from all sources that determine when a military force or transnational organization is preparing to conduct or is conducting an operational deployment of CBRN/TIM weapons. Includes information on civil and military plans related to deployment, training conducted by military forces and civilians, and the overall CBRN/TIM defensive preparedness of military forces.

**3.2.1.2 Derivation**

*UJTL (ST 9.6, ST 2, ST 2.2.1).*

**3.2.1.2.1 Supported Task: SSENS 8****3.2.1.2.2 Lateral Task: STSHA 1****3.2.1.2.3 Supporting Task: OPSSENS 2****3.2.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Transnational organization
  - a. Negligible intelligence database. (C2.4.2)
  - b. Negligible theater intelligence access. (C2.4.2)
2. Nation-states
  - a. Marginal intelligence database. (C2.4.2)
  - b. Difficult theater intelligence access. (C2.4.2)

## **3.2.2 Functional Needs Analysis**

### **3.2.2.1 Capability and Deficiency Assessment Summary**

Table 3.2-1 discusses the only capability that currently exists to perform the task to the designated standards. There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The COCOM J-2 assists the commander of a combatant command by providing higher echelon, up to and including the NMJIC, and subordinate commands with a single, coordinated CBRN intelligence picture by fusing national and theater intelligence into all-source estimates and assessments. The COCOM J-2 is responsible for working with national/theater-level organizations to obtain intelligence that is required to support joint theater operations. Per joint intelligence doctrine, the J-2 is responsible for coordinating all intelligence-related CBRN functions pertaining to adversary employment of CBRN weapons with the appropriate CBRN staff element. But because of documented training, education, and experience issues, J2 personnel may not have a full grasp of what needs to be coordinated. As the COCOM commander's main source of expertise in addressing CBRN defense issues involving the warfighter, the COCOM CBRND staff must proactively engage the J2 to determine the adequacy of current and projected theater-level intelligence capabilities to sense the operational deployment of CBRN weapons in theater. To be proactive, the COCOM CBRND staff must be better prepared on intelligence/CBRND fusion issues. For the purposes of this analysis, current capabilities are listed and issues that need to be further assessed and clarified are provided for JRO-CBRND action.

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Near/mid-term experimentation results (as recommended in this JCIDS analysis) may lead to development of new capabilities. It is projected that improvements due to coordination/DOTLPF enhancements will dramatically improve the ability of the COCOM staff to articulate and assess "sense" requirements but the overall status will remain "yellow" due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. New organizational structures or other capabilities resulting from near/mid-term experimentation results (as recommended in this JCIDS analysis) may dramatically improve the ability of the COCOM staff to develop intelligence indicators for sensing the operational deployment of CBRN/TIM weapons in theater, but the overall status is projected to remain "yellow" due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

**Table 3.2-1. STSENS 2: Capability and Deficiency Assessment**

<b>Capability: Combatant Command J-2</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>
<b>Current Overall Capability<sup>1</sup></b>	Y <sup>2</sup>	Y <sup>3</sup>	G <sup>4</sup>	Y <sup>5</sup>	Y <sup>6</sup>
<b>Near/Mid-Term Overall Capability</b>	Y <sup>7</sup>	Y	G	Y	Y
<b>Far-Term Overall Capability<sup>8</sup></b>	Y <sup>9</sup>	Y	G	Y	Y

	<b>FAA Measure</b>	<b>Scale</b>
M1	Deploying CBRN/TIM weapons/units are detected and identified.	G – Yes, Y – Limited, R – No
M2	Intelligence on deploying CBRN/TIM weapons/units is accurate.	G – Yes, Y – Limited, R – No
M3	Deployment warning is provided to theater forces.	G – Yes, Y – Limited, R – No
M4	Strategic surprise does not occur.	G – Yes, Y – Limited, R – No
M5	There are indications (e.g., message traffic between potential suppliers and political leaders, indications of recent purchases of CBRN/TIM or precursors, production equipment in operation, etc.) of increased interest in CBRN/TIM weapons.	G – Yes, Y – Limited, R – No

<sup>1</sup> Joint intelligence and CBRN publications do not adequately address this issue. The COCOM CBRN staff is not adequately staffed and organized to meet its intelligence-related responsibilities. The J2 staff is not adequately trained/educated in CBRN issues. CBRN staff officers are not adequately trained/educated in intelligence issues. Experimentation does not provide feedback on intelligence indicators for this task. JPME does not adequately cover the fusion of intelligence/CBRN issues.

<sup>2</sup> The COCOM J-2 works with various national/theater-level organizations to detect and identify countries or transnational organizations deploying CBRN/TIM weapons/units/teams. Techniques and procedures to facilitate this process and to provide useful indicators may not be adequate.

<sup>3</sup> The COCOM J-2 works with various national/theater-level organizations to ensure accuracy of intelligence on countries or transnational organizations deploying CBRN/TIM weapons/units/teams. Techniques and procedures to facilitate this process and to ensure accuracy may not be adequate.

<sup>4</sup> Nothing precludes providing deployment warning to theater forces once the deployment is identified, detected, and confirmed.

<sup>5</sup> The COCOM J-2 works with various national/theater-level organizations to ensure that strategic surprise does not occur. Adequate resources and means may not be sufficiently applied to ensure countries or transnational organizations deploying CBRN/TIM weapons/units/teams are detected.

<sup>6</sup> The COCOM J-2 works with various national/theater-level organizations to determine indications of increased interest in CBRN/TIM weapons. Adequate resources and means may not be applied to ensure countries or transnational organizations showing increased interest are detected.

<sup>7</sup> Near and mid-term improvements for all measures will depend upon the emphasis placed upon, and efficacy of experimentation which will be designed to close knowledge gaps.

<sup>8</sup> DOTMLPF to support task should improve if effective experimentation closes knowledge gaps.

<sup>9</sup> Once knowledge gaps are closed, concepts may be refined and new capabilities will be proposed and refined as a result of experimentation.

### 3.2.3 Functional Solution Analysis

#### 3.2.3.1 DOTLPE Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** Techniques and procedures to facilitate detecting and identifying countries or transnational organizations deploying CBRN/TIM weapons/units/teams may not be adequate. **Non-Materiel Solutions:** *Doctrine:* JRO-CBRND must work with the COCOM J2 and/or theater intelligence organizations to develop effective techniques and procedures for detecting and identifying countries or transnational organizations deploying CBRN/TIM weapons/units/teams and to provide useful indicators. These indicators must include the means to determine agent types, nuclear weapon types and yields, TIMS being considered, means by which to release TIMS, delivery modes or systems, and unit designations and formations.
- 2. Deficiency:** Techniques and procedures to ensure accurate intelligence on countries or transnational organizations deploying CBRN/TIM weapons/units/teams may not be adequate. **Non-Materiel Solutions:** *Doctrine:* JRO-CBRND must work with the COCOM J2 and/or theater intelligence organizations to develop effective techniques and procedures to ensure accurate intelligence on countries or transnational organizations deploying CBRN/TIM weapons/units/teams and to develop metrics to measure accuracy.
- 3. Deficiency:** Adequate resources and means may not be sufficiently applied to ensure that a nation-state or transnational organization deploying CBRN/TIM weapons/units/teams is detected. **Non-Materiel Solutions:** *Organization:* The CBRN organization or staffing of the COCOM J2 as well as each theater intelligence organization must be analyzed from a CBRN standpoint to ensure that they can provide required CBRN intelligence concerning CBRN hazards. These hazards need to be detected, identified, and quantified for Shape to provide a clear understanding of the current and *predicted* CBRN situation to the commander. *Training:* Conduct a small-scaled exercise where “to identify resources needed to detect the operational deployment of CBRN/TIM weapons” is one of the primary objectives. In addition, JRO-CBRND must work with the COCOM J2 and/or theater intelligence organizations to develop effective training for analysts as well as those managing all means of collection. The training must allow analysts and collection managers the means by which to determine inadequacy of collection mechanisms and a means to make recommendations for improvement. *Leadership:* JRO-CBRND must work with the COCOM J2 and/or theater intelligence organizations to develop an effective CBRN education program for analysts as well as those managing all means of collection. The education process must provide analysts and collection managers with the tools they need to assess the efficacy of their analysis and collection efforts. *Personnel:* Personnel should not be assigned to intelligence analysis or collection activities vital to CBRN areas without requisite CBRN education and/or experience. *Facilities:* Training requirements should be analyzed and special training facilities developed/modified if required.

4. **Deficiency:** Joint intelligence and CBRN publications do not adequately address techniques and procedures that will facilitate sensing the operational deployment for CBRN/TIM weapons in theater.

**Non-Materiel Solutions:** *Doctrine:* Joint intelligence and CBRN publications must be enhanced to adequately address techniques and procedures and to interface with each other so that intelligence/CBRND roles and responsibilities are clearly delineated. Incorporate information attained from the exercise into the doctrine and joint intelligence and CBRN publications. *Training:* Conduct a small-scaled exercise where “to identify resources needed to detect the operational deployment of CBRN/TIM weapons” is one of the primary objectives.

5. **Deficiency:** COCOM CBRND staff is not adequately staffed and organized to meet its intelligence-related responsibilities.

**Non-Materiel Solutions:** *Organization:* COCOM CBRND staff should have a section dedicated to resolving CBRN intelligence issues. *Personnel:* COCOM CBRND should have adequate trained/experienced personnel assigned to man a section dedicated to resolving CBRN intelligence issues.

6. **Deficiency:** The J2 staff is not adequately trained/educated in CBRN issues.

**Non-Materiel Solutions:** *Training:* Develop training that will enable the COCOM J2 staff to better understand their CBRN role and enhance their ability to obtain intelligence that is required to support the Shape function of strategic theater CBRND. *Leadership:* Develop an education program that will enable the COCOM J2 staff to better understand their CBRN role and enhance their ability to obtain intelligence that is required to support the Shape function of strategic theater CBRND.

7. **Deficiency:** CBRN staff officers are not adequately trained/educated in intelligence issues.

**Non-Materiel Solutions:** *Training:* Develop training programs that allow CBRN staff officers to better support the CBRN intelligence process. These training programs would evolve from generalized, small-scaled training sessions to small-scaled, area-focused exercises. *Leadership:* Develop education programs that allow CBRN staff officers to better understand the CBRN intelligence process and their roles and responsibilities.

8. **Deficiency:** Experimentation/red teaming does not provide feedback on intelligence indicators for this task.

**Non-Materiel Solutions:** *Training:* JRO-CBRND must work with J2 and/or national intelligence organizations to integrate this task into both intelligence and CBRN experimentation campaign plans.

9. **Deficiency:** JPME does not adequately cover the fusion of intelligence/CBRN issues.

**Non-Materiel Solutions:** *Leadership:* Integrate intelligence/CBRN fusion issues into JPME.

### 3.2.3.2 IMA Assessment Summary

N/A

### **3.3 Task STSENS 3: Sense the employment of CBRN/TIM weapons in theater**

#### **3.3.1 Functional Area Analysis**

##### **3.3.1.1 Definition**

To obtain information and data from all sources that determine when a military force or transnational organization is preparing to or is employing CBRN/TIM weapons. Areas of interest include when the weapons will be employed, theater targets selected, weapons systems involved, locations of weapons systems, and forces/personnel involved in the employment. Extracts information from the medical, operational, intelligence, and environmental communities to identify potential biological warfare activities. Includes verification of first use.

##### **3.3.1.2 Derivation**

*UJTL (ST 9.6, ST 2, ST 2.2.1).*

##### **3.3.1.2.1 Supported Task: SSENS 11**

##### **3.3.1.2.2 Lateral Task: STSHA 1**

##### **3.3.1.2.3 Supporting Tasks: OPSSENS 3, OPSSENS 7**

##### **3.3.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Atmospheric. CBRN/TIM effects. (C1.3.3)

##### **Military**

1. Stressful mission. (C2.1)
2. No mission preparation. (C2.1.3)
3. Negligible personnel experience. (C2.2.4.5)
4. Conventional and terrorist threat form. (C2.9.2)

##### **Civil**

1. Limited foreign government support. (C3.1.2.3)

### **3.3.2 Functional Needs Analysis**

#### **3.3.2.1 Capability and Deficiency Assessment Summary**

Table 3.3-1 discusses the only capability that currently exists to perform the task to the designated standards. There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The COCOM J-2 assists the commander of a COCOM by providing higher echelon, up to and including the NMJIC, and subordinate commands with a single, coordinated CBRN intelligence picture by fusing national and theater intelligence into all-source estimates and assessments. The COCOM J-2 is responsible for working with national/theater-level organizations to obtain intelligence that is required to support joint theater operations. Per joint intelligence doctrine, the J-2 is responsible for coordinating all intelligence-related CBRN functions pertaining to adversary employment of CBRN weapons with the appropriate CBRN staff element. But because of documented training, education, and experience issues, J2 personnel may not have a full grasp of what needs to be coordinated. As the COCOM commander's main source of expertise in addressing CBRN defense issues involving the warfighter, the COCOM CBRND staff must proactively engage the J2 to determine the adequacy of current and projected theater-level intelligence capabilities to sense the employment of CBRN/TIM weapons in theater. To be proactive, the COCOM CBRND staff must be better prepared on intelligence/CBRND fusion issues. For the purposes of this analysis, current capabilities are listed and issues that need to be further assessed and clarified are provided for JRO-CBRND action.

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Near/mid-term experimentation results (as recommended in this JCIDS analysis) may lead to development of new capabilities. It is projected that improvements due to coordination/DOTLPF enhancements will dramatically improve the ability of the COCOM staff to articulate and assess Sense requirements, but the overall status will remain "yellow" due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. New organizational structures or other capabilities resulting from near/mid-term experimentation results (as recommended in this JCIDS analysis) may dramatically improve the ability of the COCOM staff to develop intelligence indicators for sensing the employment of CBRN/TIM weapons in theater, but the overall status is projected to remain "yellow" due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

**Table 3.3-1. STSENS 3: Capability and Deficiency Assessment**

<b>Capability: Combatant Command J-2</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>Y<sup>2</sup></b>	<b>Y<sup>3</sup></b>	<b>Y<sup>4</sup></b>	<b>Y<sup>5</sup></b>	<b>Y<sup>6</sup></b>
<b>Near/Mid-Term Overall Capability</b>	<b>Y<sup>7</sup></b>	<b>Y</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>
<b>Far-Term Overall Capability<sup>8</sup></b>	<b>Y<sup>9</sup></b>	<b>Y</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	CBRN attacks are detected and identified.	G – Yes, Y – Limited, R – No
M2	Reports on CBRN attacks are accurate.	G – Yes, Y – Limited, R – No
M3	Unambiguous attack warning is provided.	G – Yes, Y – Limited, R – No
M4	First use is verified.	G – Yes, Y – Limited, R – No
M5	Accurate attack assessments are provided.	G – Yes, Y – Limited, R – No

<sup>1</sup> Joint intelligence and CBRN publications do not adequately address the issue of sensing the terrorist use of CBRN weapons, the use of TIM as a weapon, or third-party situations where U.S. resources can not be brought to bear.

<sup>2</sup> The COCOM J-2 works with the COCOM J-3 and various national/theater-level organizations to detect and identify CBTN/TIM attacks. In the case of a nation-state conducting a CBRN attack against U.S. forces, the process is mature and effective. In the event of terrorist use of CBRN, it may be difficult or impossible to detect or identify the attack, and in the case of a biological attack or attacks involving TIM, it may be difficult to determine whether it is a natural disease outbreak or an accident. In the event of use not involving U.S. forces or allies, it may be difficult to gain required information. Techniques and procedures to facilitate this process when it involves terrorists or non-U.S. allies and to detect or identify attacks may not be adequate.

<sup>3</sup> Methods and procedures for accurately reporting CBRN attacks against U.S. forces are mature and effective. Methods and procedures for accurately reporting third-party, terrorist and TIM attacks may not be adequate.

<sup>4</sup> The COCOM J-2 works with the COCOM J-3 and various national/theater-level organizations to provide unambiguous CBRN/TIM attack warning. In the case of determining whether a nation-state has conducted a CBRN attack against U.S. Forces, the process is mature and effective. In the event of terrorist use of CBRN, it may be difficult or impossible to attribute the attack, and in the case of a biological attack or attacks involving TIM, it may be difficult to determine whether it is a natural disease outbreak or an accident. In the event of use not involving U.S. forces or allies, it may be difficult to gain required information. Techniques and procedures to facilitate this process when it involves terrorists or non-U.S. allies and to provide unambiguous warning may not be adequate.

<sup>5</sup> Methods and procedures for verifying first use of CBRN against U.S. forces are mature and effective. Methods and procedures for verifying first use in third-party, terrorist, and TIM attacks may not be adequate.

<sup>6</sup> Methods and procedures for providing accurate attack assessments when CBRN is used against U.S. forces are mature and effective. Methods and procedures providing accurate attack assessments in third-party, terrorist, and TIM attacks may not be adequate.

<sup>7</sup> Near/mid-term improvements for all measures will depend upon the emphasis placed upon, and efficacy of experimentation which will be designed to close knowledge gaps.

<sup>8</sup> As a result of focused experimentation, joint intelligence and CBRN publications will be able to adequately address the issue of sensing theater hazards in third-party situations where U.S. resources cannot be brought to bear.

<sup>9</sup> Once knowledge gaps are closed, concepts may be refined and new capabilities will be proposed and refined as a result of experimentation.

### 3.3.3 Functional Solution Analysis

#### 3.3.3.1 DOTLPE Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Techniques and procedures involving sensing of terrorist CBRN attacks may not be adequate.

**Non-Materiel Solutions:** *Doctrine:* Using the results of both experimentation and exercises, develop TTPs that will address all issues surrounding sensing the CBRN attacks of terrorists. Issues to be resolved include detecting and identifying the attacks, providing unambiguous warning of attacks or impending attacks, providing accurate reports and assessments and verification techniques and procedures. *Training:* Develop an experimentation/exercise campaign to address all issues surrounding the sensing of CBRN attacks of terrorists at the strategic theater level. Initial training should identify 2–3 essential, more general objectives that target personnel as a whole. Subsequent training/exercises should build upon initial objectives and encompass broader aspects of the task.

2. **Deficiency:** Techniques and procedures involving sensing of small biological attacks may not be adequate.

**Non-Materiel Solutions:** *Doctrine:* Using the results of both experimentation and exercises, develop TTPs that will address all issues surrounding sensing of small biological attacks. Issues to be resolved include detecting and identifying the attacks, providing unambiguous warning of attacks or impending attacks, providing accurate reports and assessments and verification techniques and procedures. *Training:* Develop an experimentation/exercise campaign to address all issues surrounding the sensing of biological attacks of terrorists at the strategic theater level. Initial training should identify 2-3 essential, more general objectives that target personnel as a whole. Subsequent training/exercises should build upon initial objectives and encompass broader aspects of the task.

3. **Deficiency:** Techniques and procedures involving sensing of TIM attacks may not be adequate.

**Non-Materiel Solutions:** *Doctrine:* Using the results of both experimentation and exercises, develop TTPs that will address all issues surrounding sensing of TIM attacks. Issues to be resolved include detecting and identifying the attacks, providing unambiguous warning of attacks or impending attacks, providing accurate reports and assessments and verification techniques and procedures. *Training:* Develop an experimentation/exercise campaign to address all issues surrounding the sensing of TIM attacks of terrorists at the strategic theater level. Initial training should identify 2-3 essential, more general objectives that target personnel as a whole. Subsequent training/exercises should build upon initial objectives and encompass broader aspects of the task.

4. **Deficiency:** Techniques and procedures involving sensing of third-party attacks may not be adequate.

**Non-Materiel Solutions:** *Doctrine:* Using the results of both experimentation and exercises, develop TTPs that will address all issues surrounding sensing third-party CBRN attacks. Issues to be resolved include detecting and identifying the attacks, providing unambiguous warning of attacks or impending attacks, providing accurate reports and assessments and verification techniques and procedures. *Training:* Develop an experimentation/exercise campaign to address all issues surrounding the sensing of third-party CBRN attacks at the strategic theater level.

5. **Deficiency:** Joint intelligence and CBRN publications do not adequately address the issue of sensing the terrorist use of CBRN weapons, the use of TIMs as a weapon, or third-party situations where U.S. resources can not be brought to bear.

**Non-Materiel Solutions:** *Doctrine:* Integrate all lessons learned and procedures into appropriate joint publications.

### 3.3.3.2 IMA Assessment Summary

N/A

### **3.4 Task STSENS 4: Sense theater CBRN/TIM hazards due to employment or ROTA of CBRN/TIM weapons or materials**

#### **3.4.1 Functional Area Analysis**

##### **3.4.1.1 Definition**

To obtain information and data from all sources that determine the location and source of theater CBRN/TIM hazards due to employment or release other than attack (ROTA) of CBRN/TIM weapons or materials. Areas of interest include detecting, identifying, and quantifying those CBRN/TIM hazards in all physical states (solid, liquid, gas). Enables the continued monitoring and identification of hazards in support of shaping, shielding, and sustaining.

##### **3.4.1.2 Derivation**

*UJTL (ST 9.6, ST 2, ST 2.2.1).*

##### **3.4.1.2.1 Supported Task: SSENS 12**

##### **3.4.1.2.2 Lateral Task: STSHA 1**

##### **3.4.1.2.3 Supporting Task: OPSSENS 4**

##### **3.4.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Atmospheric CBRN/TIM effects. (C1.3.3)
2. Nuclear radiation effects. (C1.3.3.1.2)

##### **Military**

1. Stressful mission. (C2.1)
2. No mission preparation. (C2.1.3)
3. Negligible personnel experience. (C2.2.4.5)

##### **Civil**

1. TIMs are present. (C3.3.7.5)

### **3.4.2 Functional Needs Analysis**

#### **3.4.2.1 Capability and Deficiency Assessment Summary**

Table 3.4-1 discusses the capabilities that currently exist to perform the task to the designated standards. These are the only capabilities that exists, and no other capabilities are projected that will accomplish this task.

##### **Current Capability and Deficiency**

The COCOM J-2 assists the commander of a COCOM by providing higher echelon, up to and including the NMJIC, and subordinate commands with a single, coordinated CBRN intelligence picture by fusing national and theater intelligence into all-source estimates and assessments. Similarly, the combatant command J-3 is where all the COCOM's planning, policies, intelligence, manpower, communications, and logistics functions are translated into action. This is the directorate that moves military forces and serves as the operational link between the component warfighting commanders and the combatant commander. The J-3 is responsible for synchronizing and monitoring theater-wide military operations and activities including reports of theater CBRN/TIM hazards due to employment or ROTA of CBRN/TIM weapons or materials. The COCOM staffs for intelligence and operations are able under most circumstances to effectively sense theater CBRN/TIM hazards due to employment or ROTA of CBRN/TIM weapons or materials. As the combatant commander's main source of expertise in addressing CBRN defense issues involving the warfighter, the COCOM CBRND staff must proactively engage the J-2 and J-3 to determine the adequacy of current and projected national- and theater-level operational and intelligence capabilities to sense when theater CBRN/TIM hazards due to employment or ROTA of CBRN/TIM weapons or materials are present. For the purposes of this analysis, current capabilities are listed and issues that need to be further assessed and clarified are provided for JRO-CBRND action. The overall current capability is "yellow."

##### **Projected Near/Mid-Term Capability and Deficiency**

No other capabilities are currently projected for the near/mid term. Near/mid-term experimentation results (as recommended in this JCIDS analysis) may lead to development of new capabilities. However, the overall capability remains "yellow."

##### **Projected Far-Term Capability and Deficiency**

No other capabilities are currently projected for the far-term future. New organizational structures or other capabilities resulting from near/mid-term experimentation results (as recommended in this JCIDS analysis) may continue to improve the ability to sense theater CBRN/TIM hazards due to employment or ROTA of CBRN/TIM weapons or materials. It is projected that improvements due to coordination/DOTMLPF enhancements will dramatically improve the ability of the COCOM to articulate and improve "sense" requirements resulting in a capability projection of "green."

**Table 3.4-1. STSENS 4: Capability and Deficiency Assessment**

Capability/Measure	M1	M2	M3
<b>Current</b>			
Combatant Command J-2	Y <sup>1</sup>	Y <sup>2</sup>	G <sup>3</sup>
Combatant Command J-3	Y <sup>4</sup>	Y <sup>5</sup>	G <sup>6</sup>
<b>Near/Mid</b>			
Combatant Command J-2	Y	Y	G
Combatant Command J-3	Y	Y	G
<b>Far</b>			
Combatant Command J-2	G <sup>7</sup>	G	G
Combatant Command J-3	G <sup>8</sup>	G	G
<b>Current Overall Capability</b>	Y	Y	G
<b>Near/Mid-Term Overall Capability</b>	Y	Y	G
<b>Far-Term Overall Capability</b>	G	G	G

	FAA Measure	Scale
M1	Hazards are detected and identified.	G – Yes, Y – Limited, R – No
M2	Reports on hazards are accurate.	G – Yes, Y – Limited, R – No
M3	Hazard warning is provided.	G – Yes, Y – Limited, R – No

<sup>1</sup> The J-2 works with the J-3 and various theater-level organizations to detect and identify CBRN/TIM hazards. In the case of a nation-state conducting a CBRN attack against U.S. forces, the process is mature and effective. While it may not be possible to attribute CBRN/TIM hazards as attacks, it will be possible to detect and identify hazards. In the event of use not involving U.S. forces or allies, it may be difficult to gain required information. Techniques and procedures to facilitate this process when it involves non-U.S. allies or countries that restrict information and access may not be adequate.

<sup>2</sup> Methods and procedures for accurately reporting hazards involving U.S. forces are mature and effective. Methods and procedures for accurately reporting hazards involving non-U.S. allies or countries that restrict information and access may not be adequate.

<sup>3</sup> Once a hazard or potential hazard is detected and identified, nothing precludes providing hazard warning to theater forces and to the National Military Command Center (NMCC).

<sup>4</sup> The J-3 is responsible for operations and command and control systems and ongoing current operations. The J-3 will coordinate all information, and in conjunction with the J-2, deconflict and assess the hazard reports and send out taskings theater-wide for further required detection, identification, or monitoring missions within the capabilities of operational forces. Coordination will be required with the NMCC for detection and identification outside of theater capabilities.

<sup>5</sup> Nothing precludes accurate reports within the operational capabilities of the combatant command. The J-3 must coordinate with the NMCC for information or requirements outside of theater capabilities.

<sup>6</sup> Once a hazard or potential hazard is detected and identified, nothing precludes providing hazard warning to theater forces and to the NMCC.

<sup>7</sup> New initiatives and better fusion between CBRND and J2 staffs as a result of focused experimentation will address and resolve the issue of sensing theater hazards in third-party situations where U.S. resources cannot be brought to bear. DOTMLPF enhancements will be available and integrated where applicable.

<sup>8</sup> The J3 will be able to effectively interface with the NMCC on coordination of issues outside of the theater as a result of focused experimentation.

### 3.4.3 Functional Solution Analysis

#### 3.4.3.1 DOTLPE Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** In the event of theater CBRN/TIM hazards not involving U.S. forces or allies, it may be difficult to detect or identify hazards and gain required information.  
**Non-Materiel Solutions:** *Doctrine:* Using the results of both experimentation and exercises, develop TTPs that will address all issues surrounding sensing theater CBRN/TIM hazards due to employment or ROTA of CBRN/TIM weapons or materials. Issues to be resolved include detecting and identifying hazards when they affect non-U.S. allies or countries that restrict information and access.
- 2. Deficiency:** In the event of theater CBRN/TIM hazards involving non-U.S. allies or countries that restrict information and access it may be difficult to gain accurate required information.  
**Non-Materiel Solutions:** *Doctrine:* Using the results of both experimentation and exercises, develop TTPs that will address all accuracy issues surrounding sensing theater CBRN/TIM hazards due to employment or ROTA of CBRN/TIM weapons or materials. Issues to be resolved include determining how to gain accurate information on hazards when they affect non-U.S. allies or countries that restrict information and access.
- 3. Deficiency:** Joint intelligence and CBRN publications do not adequately address the issue of sensing theater hazards in third-party situations where U.S. resources cannot be brought to bear.  
**Non-Materiel Solutions:** *Doctrine:* Integrate all information concerning actions to be taken when hazards affect non-U.S. allies or countries that restrict information and access and integrate lessons learned and procedures developed through experimentation into appropriate joint publications.
- 4. Deficiency:** Experimentation and training may not be conducted as frequently and extensively as required in order to identify capability gaps and required enhancements.  
**Non-Materiel Solutions:** *Training:* Conduct experimentation and training as required in order to identify capability gaps and required enhancements.

#### 3.4.3.2 IMA Assessment Summary

N/A

**3.5 Task STSENS 5: Monitor compliance of theater signatories to treaties that touch on CBRN/TIM matters (e.g., Chemical Weapons Convention) and states that are eliminating their WMD CBRN treaty signatories and elimination states for compliance**

**3.5.1 Functional Area Analysis**

**3.5.1.1 Definition**

To use COCOM resources to determine whether CBRN treaty signatories and those states voluntarily or involuntarily participating in CBRN elimination procedures are in compliance.

**3.5.1.2 Derivation**

*UJTL (ST 9.6, ST 2, ST 2.2.1, ST 8).*

**3.5.1.2.1 Supported Tasks: SSENS 1, SSENS 13**

**3.5.1.2.2 Lateral Task: STSHA 1**

**3.5.1.2.3 Supporting Task: OPSSENS 5**

**3.5.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. CBRN threat form. (C1.3.3.1-3)

**Military**

1. Cooperative nation
  - a. Partial preexisting arrangements. (C2.1.1.2)
  - b. Limited military commitments from other nations. (C2.1.1.7)
  - c. Limited host nation support. (C2.8.5)
2. Uncooperative nation
  - a. No preexisting arrangements. (C2.1.1.2)
  - b. Negligible military commitments from other nations. (C2.1.1.7)
  - c. No host nation support. (C2.8.5)

**Common Military Conditions**

1. Limited personnel expertise. (C2.2.4.5)

**Civil**

1. Cooperative nation
  - a. Limited foreign government support. (C3.1.2.3.)
2. Uncooperative nation
  - a. Negative foreign government support. (C3.1.2.3.)

**This task is analyzed in the WMD Interdiction and Elimination JCIDS Analysis.**

### **3.6 Task STSENS 6: Monitor theater scientific and technology developments for potential CBRN/TIM implications**

#### **3.6.1 Functional Area Analysis**

##### **3.6.1.1 Definition**

To use combatant command resources to gather information on theater scientific and technology developments, assess the information for applicability to CBRN/TIM weapons use, and distribute the information to theater forces and national-level agencies that require the information. Tracks theater developments in biology, chemistry, nuclear physics, and nanotechnologies that could affect the development or use of CBRN/TIM weapons. Fuses this information with other intelligence and operational and environmental data to provide guidance for planning.

##### **3.6.1.2 Derivation**

*UJTL (ST 9.6, ST 2.4.2.5).*

##### **3.6.1.2.1 Supported Tasks: SENSES 1, SENSES 14**

##### **3.6.1.2.2 Lateral Task: STSHA 1**

##### **3.6.1.2.3 Supporting Task: OPSSENS 6**

##### **3.6.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military.** N/A

**Civil**

1. Limited foreign government support. (C3.1.2.3)
2. Moderately opposed foreign public opinion. (C3.1.2.4)

#### **3.6.2 Functional Needs Analysis**

##### **3.6.2.1 Capability and Deficiency Assessment Summary**

Table 3.6-1 discusses the only capability that currently exists to perform the task to the designated standards. There is only one capability that exists, and no other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The COCOM J-2 assists the commander of a COCOM by providing higher echelon, up to and including the NMJIC, and subordinate commands with a single, coordinated CBRN intelligence picture by fusing national and theater intelligence into all-source estimates and assessments. The COCOM J-2 is responsible for working with national- and theater-level organizations to obtain intelligence that is required to support joint theater operations. Per joint intelligence doctrine, the J-2 is responsible for coordinating all intelligence-related CBRN functions pertaining to adversary employment of CBRN weapons with the appropriate CBRN staff element. But because of documented training, education, and experience issues, J2 personnel may not have a full grasp of what needs to be coordinated. As the COCOM commander's main source of expertise in addressing CBRN defense issues involving the warfighter, the COCOM CBRND staff must proactively engage the J2 to determine the adequacy of current and projected theater-level intelligence capabilities to monitor theater scientific and technology developments for potential CBRN/TIM implications. For the purposes of this analysis, current capabilities are listed, and issues that need to be further assessed and clarified are provided for JRO-CBRND action. There may not be adequate linkage between the implications of international scientific and technology developments for CBRN/TIM weapons and operational impacts. Joint intelligence and CBRN officers may not be fully aware of what is required or important. Joint intelligence and CBRN publications do not adequately address this issue. The overall current capability is "yellow."

**Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Near/mid-term experimentation results (as recommended in this JCIDS analysis) may lead to development of new capabilities. It is projected that improvements due to coordination/DOTMLPF enhancements will dramatically improve the ability of the DoD to monitor international scientific and technology developments for potential CBRN/TIM implications, but a capability projection of "yellow" is still made for the near/mid term due to anticipated coordination challenges with theater partners and cooperating countries.

**Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. New organizational structures or other capabilities and cooperative ventures with theater partners resulting from near/mid-term experimentation results (as recommended in this JCIDS analysis) should continue to improve the ability of the DoD to monitor international scientific and technology developments for potential CBRN/TIM implications resulting in a capability projection of "green."

**Table 3.6-1. STSENS 6: Capability and Deficiency Assessment**

<b>Capability: Combatant Command J-2</b>	<b>M1</b>	<b>M2</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>Y<sup>2</sup></b>	<b>Y<sup>3</sup></b>
<b>Near/Mid-Term Overall Capability<sup>4</sup></b>	<b>Y</b>	<b>Y</b>
<b>Far-Term Overall Capability</b>	<b>G</b>	<b>G</b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Strategic theater surprise due to science and technology developments does not occur.	G – Yes, Y – Limited, R – No
M2	Theater scientific and technology developments with applicability to CBRN/TIM weapons are detected and cataloged.	G – Yes, Y – Limited, R – No

<sup>1</sup> Joint intelligence and CBRN publications do not adequately address this issue.

<sup>2</sup> The J-2 works with various national/theater-level organizations to ensure that strategic surprise does not occur. There may not be adequate linkage between the implications of international scientific and technology developments for CBRN/TIM weapons and operational impacts.

<sup>3</sup> The J-2 works with various national/theater-level organizations to ensure that information relating to international scientific and technology developments for CBRN/TIM weapons are available if required. Joint intelligence and CBRN officers may not be fully aware of what is required or important.

<sup>4</sup> Joint intelligence and CBRN publications will be updated to adequately address this issue.

### 3.6.3 Functional Solution Analysis

#### 3.6.3.1 DOTLPE Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or there are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** There may not be adequate linkage between the implications of theater scientific and technology developments for CBRN/TIM weapons and operational impacts.  
**Non-Materiel Solutions:** *Doctrine:* Develop doctrine to provide guidance and outline interaction and exchange of information between J-2, the intelligence community, and other participating entities. *Training:* Develop an experimentation plan to determine the linkage between the implications of theater scientific and technology developments for CBRN/TIM weapons and operational impacts. Integrate lessons learned into TTPs and procedures that the J2 can coordinate with the intelligence community.
- 2. Deficiency:** Joint intelligence and CBRN officers may not be fully aware of what is required or important.  
**Non-Materiel Solutions:** *Doctrine:* Redefine the operational limitation of medics working as operational/intelligence personnel. *Organization:* Provide medical intelligence support or medical expertise to J-2 resources/offices. *Leadership:* Integrate TTPs developed through experimentation into leader education for both intelligence and CBRN staff officers. *Personnel:* Increase allocation of medical personnel to J-2 staff.
- 3. Deficiency:** Joint intelligence and CBRN publications do not adequately address this issue.  
**Non-Materiel Solutions:** *Doctrine:* Integrate TTPs developed through experimentation into both intelligence and CBRN joint publications.

#### 3.6.3.2 IMA Assessment Summary

N/A

### **3.7 Task STSENS 7: Develop TEPs for Sense-related issues**

#### **3.7.1 Functional Area Analysis**

##### **3.7.1.1 Definition**

To develop Theater Engagement Plans (TEPs) that will allow cooperation and the building of trust through a combination of Sense-related exercises, training, equipment exchange, and other cooperative efforts. Many nations that would normally support U.S. initiatives may feel threatened by hostile neighbors or nations that possess CBRN/TIM weapons. To ensure cooperation and interoperability, the combatant commander develops TEPs for Sense-related considerations and activities for assigned theater or designated countries. TEPs that include Sense-related considerations and activities for assigned theater or designated countries can help to mitigate reluctance to support the United States. If countries are provided with the means to predict and determine CBRN/TIM attacks or if they are assured of U.S. assistance, they will feel less threatened. The Chairman of the Joint Chiefs of Staff (CJCS), in conjunction with interagency partners, coordinates “Global Family of Engagement Plan” policy and guidelines to combatant commanders for Sense-related considerations.

##### **3.7.1.2 Derivation**

*UJTL (ST 9.6, ST 8.2.1, ST 8.1.2), CJCSM 3113.01a.*

##### **3.7.1.2.1 Supported Task: SSENS 15**

##### **3.7.1.2.2 Lateral Task: STSHA 9**

##### **3.7.1.2.3 Supporting Task: OPSSENS 8**

##### **3.7.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

##### **Military**

1. No preexisting arrangements. (C 2.1.1.2)
2. Limited personnel expertise. (C2.2.4.5)

##### **Civil**

1. Mixed support for political policies. (C3.1)
2. Limited foreign government support. (C3.1.2.3.)

### **3.7.2 Functional Needs Analysis**

#### **Capability and Deficiency Assessment Summary**

Table 3.7-1 discusses the only capability that currently exists to perform the task to the designated standards. There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The COCOM develops TEPs for restoration operation considerations and activities for assigned theater or designated countries. Nothing precludes the COCOM staff from establishing these TEPs now, but there is very little in the way of existing doctrine or TTPs to help guide them. A TEP is primarily a strategic planning document intended to link COCOM-planned regional engagement activities with national strategic objectives. TEPs are based on defense planning guidance. COCOM-planned and -supported operations and activities produce multiple benefits in readiness, modernization, and engagement. However, peacetime military engagement activities must be prioritized to ensure that efforts are focused on those that are of greatest importance without sacrificing warfighting capability. Because WMD represents the most significant threat to global security, it is an ideal candidate for theater engagement planning. TEPs identify the synchronization of these activities on a regional basis and illustrate the efficiencies gained from regional COCOM engagement activities that support national strategic objectives. No Sense-related experimentation or exercises have been conducted to provide feedback on efficacy of TEPs for specific countries. Leader education does not address this issue. The overall current assessment is “yellow.”

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Near/mid-term experimentation results (as recommended in this JCIDS analysis) may lead to development of new capabilities. It is projected that improvements due to coordination/DOTLPF enhancements will dramatically improve the ability of the COCOM staff to develop TEPs for Sense-related issues, but the overall status will remain “yellow” due to the inherent difficulty in initiating and developing new theater TEP programs.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. The overall status is likely to remain “yellow” due to the inherent difficulties posed by international relations.

**Table 3.7-1. STSENS 7: Capability and Deficiency Assessment**

<b>Capability: COCOM HQ</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>
<b>Current Overall Capability<sup>1</sup></b>	Y <sup>2</sup>	G <sup>3</sup>	R <sup>4</sup>
<b>Near/Mid-Term Overall Capability</b>	Y	G	R
<b>Far-Term Overall Capability<sup>5</sup></b>	Y	G	Y <sup>6</sup>

	<b>FAA Measure</b>	<b>Scale</b>
M1	“Sense” related TEPs are established for designated countries.	G – Yes, Y – Limited, R – No
M2	Existing TEPs are updated regularly.	G – Yes, Y – Limited, R – No
M3	Joint exercises/experimentation provide feedback on efficacy of TEPs for specific countries.	G – Yes, Y – Limited, R – No

<sup>1</sup> No doctrine has been developed. Leader education does not address this issue.

<sup>2</sup> Nothing precludes a COCOM staff from initiating theater engagement planning for sense-related considerations. No guidance has been provided, and no doctrine exists specifically addressing restoration operation integration into theater engagement planning.

<sup>3</sup> Nothing precludes meeting this standard once sense-related TEPs are established.

<sup>4</sup> No Sense-related exercises/experimentation have been conducted to provide feedback on efficacy of TEPs for specific countries.

<sup>5</sup> Doctrine will be developed. Leader education will begin to address this issue.

<sup>6</sup> Results of experimentation and feedback from insertion in training exercises will begin to provide valuable data on TEP-related issues.

### 3.7.3 Functional Solution Analysis

#### 3.7.3.1 DOTLPE Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** No guidance has been provided and no doctrine/TTPs exists specifically addressing restoration operation integration into theater engagement planning.  
**Non-Materiel Solutions:** *Doctrine:* Establish policies, TTPs, and guidelines that include practical ways to enhance sense-related consideration integration into theater engagement planning. *Training:* Conduct training to test, validate, and identify additional ways to enhance Sense-related consideration integration.
2. **Deficiency:** No Restoration Operation exercises/experimentation have been conducted to provide feedback on efficacy of TEPs for specific countries.  
**Non-Materiel Solutions:** *Training:* Develop exercises to include Sense-related considerations with TEP countries to determine efficacy of policy once established..
3. **Deficiency:** Leader education does not address this issue.  
**Non-Materiel Solutions:** *Leadership:* At the urging of the Joint Forces Staff College (JFSC), and as part of a Joint Requirements Office for Chemical, Biological, Radiological, and Nuclear Defense (JRO-CBRND) joint education initiative, a team began to investigate ways to develop CBRN defense initiatives as part of theater engagement planning. The subject matter experts at the JFSC felt that in the current global environment, CBRND was an ideal platform for military engagement, enhancing a common global defense capability against weapons of mass destruction. The team plans to present these JCIDS tasks to the JFSC as a foundation for the development of TEP education materials when they are finalized.

#### 3.7.3.2 IMA Assessment Summary

N/A

### **3.8 Task STSENS 8: Provide theater screening for endemic diseases and/or hazardous substances in the environment**

#### **3.8.1 Functional Area Analysis**

##### **3.8.1.1 Definition**

To use COCOM resources to provide theater screening for endemic diseases and/or hazardous substances in the environment. All theater capabilities are employed to ensure that endemic diseases and/or hazardous substances in the environment are detected, theater military forces are warned, and appropriate preventive action is taken.

##### **3.8.1.2 Derivation**

*UJTL (ST 4.2.2, ST 9.6).*

##### **3.8.1.2.1 Supported Task: SSENS 16**

##### **3.8.1.2.2 Lateral Task: STSHA 1**

##### **3.8.1.2.3 Supporting Task: OPSSENS 9**

##### **3.8.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Partial preexisting arrangements. (C2.1.1.2)

**Civil**

1. Limited foreign government support. (C3.1.2.3)
2. Moderately opposed foreign public opinion. (C3.1.2.4)

#### **3.8.2 Functional Needs Analysis**

##### **3.8.2.1 Capability and Deficiency Assessment Summary**

Table 3.8-1 discusses the only capability that exists to perform the task to the designated standard. Resources and DOTMLPF exist to support COCOM staff information and data collection, processing, and correlation from a variety of sources (national, international, military, civilian, etc.) to identify potential hazards and endemic diseases for evaluation and assessment of their probable impact and the necessary protective measures. The DoD Global Emerging Infections Surveillance and Response System (GEIS) and Armed Forces Medical Intelligence

Center (AFMIC) maintain active surveillance for infectious diseases that might affect military personnel, readiness, and operations and are resources for the COCOM staff. Dissemination of warnings to theater forces identifying these potential hazards and diseases and the associated protective measures are incorporated within existing doctrine. Deficiencies are related to the level of automation of information and data resources and their compatibility.

### **Current Capability and Deficiency**

Pathogens of military importance are identified. Outbreaks of new or mutated diseases assessed by the Centers for Disease Control (CDC) and/or the World Health Organization (WHO) are reviewed by AFMIC for inclusion. The GEIS also provides information on infectious diseases that pose a threat to personnel or reduce medical readiness. Other types of hazards are reviewed for their impact upon military forces, depending upon type and scope. For example, ITF-40 assesses a number of industrial chemicals for their potential impact. Information must be collected, processed, and correlated from a variety of sources (national, international, military, civilian, etc.) to identify potential hazards and endemic diseases for evaluation and assessment of their probable impact and the necessary protective measures.

Resources such as the CDC, WHO, the International Atomic Energy Agency (IAEA), AFMIC, GEIS, North Atlantic Treaty Organization (NATO), Food and Agriculture Organization (FAO), and others are identified as reliable sources for data and information about most areas of interest. The combination of in-theater and reachback resources provide the COCOM staff with information sources and data essential to the assessment process.

Diseases and hazards within an area of interest are not static. These change overtime. COCOM plan implementation processes incorporate requirements for ensuring currency of information and decision parameters. Adjustments are made as necessary. Identification of endemic diseases and hazards of military importance are disseminated and are accompanied with guidance on preventive measures. Changes to this information are disseminated throughout operations.

Adequate DOTLPP exists to conduct this task.

Not all potential hazards have been assessed for their military importance. For example, ITF-40 does not assess all the potential industrial chemicals possibly existing within an area of interest.

Much of the information and data must be manually collected, processed, correlated, evaluated, and assessed. Many resource systems are not integrated or are not automated. Information systems within DoD, theater, and other government agencies are frequently stovepiped, and the information must be manually transferred from one system to another. Additionally, data structures and fields are not always compatible between systems impacting application of data transfer utilities.

The largely manual nature of the current process is time consuming and the potential exists for exposure prior to receipt of warning.

The overall current capability is “yellow.”

**Projected Near/Mid-Term Capability and Deficiency**

There are no foreseeable changes in capability in the near/mid term.

**Projected Far-Term Capability and Deficiency**

There are no foreseeable changes in capability in the far term.

**Table 3.8-1. STSENS 8: Capability and Deficiency Assessment**

<b>Capability: COCOM Staff</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>Y<sup>2</sup></b>	<b>Y<sup>3</sup></b>	<b>Y<sup>4</sup></b>	<b>Y<sup>5</sup></b>
<b>Near/Mid-Term Overall Capability</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>
<b>Far-Term Overall Capability</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	All diseases/hazards are identified	G – Yes, Y – Limited, R – No
M2	Medical, operational, intelligence, and environmental data are correlated	G – Yes, Y – Limited, R – No
M3	Diseases/hazards are identified in time to warn forces and take appropriate preventive measures	G – Yes, Y – Limited, R – No
M4	Diseases/hazards are identified in time to treat forces.	G – Yes, Y – Limited, R – No

<sup>1</sup> Adequate DOTLPF exists to conduct this task.

<sup>2</sup> Limited. Pathogens of military importance are identified. Outbreaks of new or mutated diseases assessed by the CDC and/or WHO are reviewed by AFMIC for inclusion. The GEIS also provides information on infectious diseases that pose a threat to personnel or reduce medical readiness. Other types of hazards are reviewed for their impact upon military forces, depending upon type and scope. For example, ITF-40 assesses a number of industrial chemicals for their potential impact. However, ITF-40 does not assess all the potential industrial chemicals possibly existing within an area of interest. Information must be collected, processed, and correlated from a variety of sources (national, international, military, civilian, etc.) to identify potential hazards and endemic diseases for evaluation and assessment of their probable impact and the necessary protective measures.

<sup>3</sup> Limited. Resources such as the CDC, WHO, IAEA, AFMIC, GEIS, NATO, FAO, and others are identified as reliable sources for data and information about most areas of interest. However, much of the information and data must be collected, processed, correlated, evaluated, and assessed manually. The combination of in-theater and reachback resources provide the COCOM staff with information sources and data essential to the assessment process. Many resource systems are not integrated or are not automated. Information systems within DoD, theater, and other government agencies are frequently stovepiped, and the information must be manually transferred from one system to another. Additionally, data structures and fields are not always compatible between systems impacting application of data transfer utilities.

<sup>4</sup> Limited. Diseases and hazards within an area of interest are not static. These change over time. COCOM plan implementation processes incorporate requirements for ensuring currency of information and decision-making parameters. Adjustments are made as necessary. Identification of endemic diseases and hazards of military importance are disseminated and accompanied with guidance on preventive measures. Changes to this information are disseminated throughout operations. However, the largely manual nature of the current process is time-consuming, and the potential exists for exposure prior to receipt of warning.

<sup>5</sup> The ability to identify endemic diseases in time to treat forces will rely on access to in-theater intelligence of the populace. This will remain a difficult task under some conditions for the foreseeable future.

### 3.8.3 Functional Solution Analysis

#### 3.8.3.1 DOTLPE Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Not all potential hazards have been assessed for their military importance. For example, ITF-40 does not assess all the potential industrial chemicals possibly existing within an area of interest.

**Non-Materiel Solutions:** *Doctrine:* Redefine the operational limitation of medics working as operational/intelligence personnel. *Organization:* Provide medical intelligence support or medical expertise to J-2 resources/offices. *Leadership:* Develop leadership awareness of potential gap in existing information and potential sources for information and data. *Personnel:* Increase allocation of medical personnel to J-2 staff.

2. **Deficiency:** The largely manual nature of the current process is time-consuming, and the potential exists for exposure prior to receipt of warning.

**Non-Materiel Solutions:** *Leadership:* Develop leadership awareness of issues associated with information collection and processing and need for force preparedness and prior knowledge of hazards/diseases of military importance in area of interest.

#### 3.8.3.2 IMA Assessment Summary

### **3.9 Task STSENS 9: Develop theater environmental background data including climatology**

#### **3.9.1 Functional Area Analysis**

##### **3.9.1.1 Definition**

To use COCOM resources to obtain and assess theater environmental background data (including climatology) for potential CBRN/TIM implications. All theater capabilities are employed to obtain this information and to ensure that theater military forces have access to processed data.

##### **3.9.1.2 Derivation**

*UJTL (ST 9.6, ST 2.2.3).*

##### **3.9.1.2.1 Supported Task: SSENS 17**

##### **3.9.1.2.2 Lateral Task: STSHA 1**

##### **3.9.1.2.3 Supporting Task: OPSSENS 10**

##### **3.9.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

##### **Military**

1. Partial preexisting arrangements. (C 2.1.1.2)

##### **Civil**

1. Limited foreign government support. (C3.1.2.3)
2. Moderately opposed foreign public opinion. (C3.1.2.4)

#### **3.9.2 Functional Needs Analysis**

##### **3.9.2.1 Capability and Deficiency Assessment Summary**

Tables 3.9-1 discusses the capability that currently exists to perform the task to the designated standards within the theater. There is only one capability that exists, and no other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The combatant command J-3 is where all the COCOM's planning, policies, intelligence, manpower, communications, and logistics functions are translated into action. This is the directorate that moves military forces and serves as the operational link between the component warfighting commanders and the combatant commander. The J-3 is responsible for developing theater environmental background data, including climatology. The COCOM J-3 works with various theater DoD assets, as well as the CJCS, which can access national DoD assets that operate a military environmental service system to provide specialized theater meteorological, space, environmental, and oceanographic analysis and prediction services in support of military forces. Environmental background data are available or can be obtained for any area of the theater. Climatology data are available or can be obtained for any area of the theater. Total access is available through military command and control and communications systems. DOTLPF is adequate in most areas. CBRN considerations need to be integrated into environmental and climatology processes, TTPs and doctrine. The overall current capability is "green."

**Projected Near/Mid-Term Capability and Deficiency**

Capabilities will improve only as a result of improved CBRN experimentation and integration into exercises.

**Projected Far-Term Capability and Deficiency**

Capabilities will improve only as a result of improved CBRN experimentation and integration into exercises. This will ultimately result in effective enhancements to all DOTLPF.

**Table 3.9-1. STSENS: Capability and Deficiency Assessment**

<b>Capability: COCOM Staff</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>G<sup>2</sup></b>	<b>G<sup>3</sup></b>	<b>G<sup>4</sup></b>
<b>Near/Mid-Term Overall Capability</b>	<b>G</b>	<b>G</b>	<b>G</b>
<b>Far-Term Overall Capability<sup>5</sup></b>	<b>G</b>	<b>G</b>	<b>G</b>

	<b>FAA Measure</b>	<b>Elaboration</b>	<b>Scale</b>
M1	Environmental background data are available for essential theater areas.	Assesses if a means is available to gather environmental background data at any location. Does not take into account time/automation factors. If time/automation becomes a factor, a tactical-level materiel solution that speeds process may need to be considered.	G – Yes Y – Limited R – No
M2	Climatology data are available for essential theater areas.	Assesses if a means is available to gather climatology data at any location.	G – Yes Y – Limited R – No
M3	Available data can be accessed by theater forces with requirements.	Assesses ability of theater forces to access data once they are available. Ability to assess data for CBRN implications is not part of metric.	G – Yes Y – Limited R – No

<sup>1</sup> Theater CBRN considerations need to be integrated into environmental and climatology processes, TTPs, and doctrine.

<sup>2</sup> Environmental background data is available or can be obtained for any area of the theater.

<sup>3</sup> Climatology data is available or can be obtained for any area of the theater.

<sup>4</sup> Total access is available through military command and control and communications systems.

<sup>5</sup> Through the results of experimentation and other initiatives, theater CBRN considerations will be integrated into environmental and climatology processes, TTPs, and doctrine.

### **3.9.3 Functional Solution Analysis**

#### **3.9.3.1 DOTLPE Assessment Summary**

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** CBRN considerations need to be integrated into environmental and climatology processes, TTPs, and doctrine.

**Non-Materiel Solutions:** *Doctrine:* Integrate CBRN considerations into environmental and climatology processes, TTPs, and doctrine at the theater level.

## 4.0 Operational Sense

### 4.0.1 Introduction

The Operational (OP) level of war is where campaigns and major operations are planned, conducted, and sustained to accomplish strategic objectives within theaters or areas of operations. Activities at this level link tactics and strategy by establishing operational objectives needed to accomplish the strategic objectives, sequencing events to achieve the operational objectives, initiating actions, and applying resources to bring about and sustain these events. These activities imply a broader dimension of time or space than do tactics; they ensure the logistic and administrative support of tactical forces and provide the means by which tactical successes are exploited to achieve strategic objectives. Ten OP Sense (OPSENS) tasks were identified in the chemical, biological, radiological, and nuclear (CBRN) Functional Area Analysis (FAA), including a task for elimination operations. However, the detailed analysis of the elimination tasks has been deferred to the Joint Requirements Office for Chemical, Biological, Radiological, and Nuclear Defense (JRO-CBRND)–sponsored FAA/ Functional Needs Analysis (FNA) of the weapons of mass destruction (WMD) elimination and interdiction functional areas.

This chapter, detailing the OPSENS area, restates relevant information from the chemical, biological, radiological, and nuclear defense (CBRND) FAA, including a description of each of the 10 OPSENS tasks, derivation of the task, an indication of other linked tasks, and the pertinent conditions. The FNA section addresses the capability and deficiency analysis and a brief description of potential near-term changes. Once all the capabilities are considered, the assessment concludes with a separate, overarching look at the entire capability spectrum to identify remaining gaps and/or synergies. The Functional Solutions Analysis (FSA) section addresses possible solutions for the deficiencies identified in the FNA section. The non-materiel solutions address one or more of the six areas of DOTLPP: doctrine, organization, training, leadership, personnel, and facilities. Most of the OPSENS tasks involve required capabilities of major staffs or staff sections within the U.S. Department of Defense (DoD). In those areas where a DoD staff or agency needed to interact within the interagency, the task focused on DoD capabilities required to facilitate the interaction.

### 4.0.2 FNA Summary

Table 4.0-1 summarizes the overall current and projected capability to perform the OPSENS tasks identified in the CBRND FAA. The overall capability to conduct OPSENS tasks in the current time frame is assessed as “yellow.” The OP-level J-2 is responsible for working with theater-level organizations to obtain intelligence that is required to support joint OP-level operations. Per joint intelligence doctrine, the J-2 is responsible for coordinating all intelligence-related CBRN functions pertaining to adversary employment of CBRN weapons with the appropriate CBRN staff element, but because of documented training, education, and experience issues, J-2 personnel may not have a full grasp of what needs to be coordinated. As the OP-level commander’s main source of expertise in addressing CBRN defense issues involving the warfighter, the OP-level CBRND staff must proactively engage the J-2 to determine the adequacy of current and projected theater-level intelligence capabilities to sense the employment of CBRN/toxic industrial material (TIM) weapons in theater. To be proactive, the OP-level

CBRND staff must be better prepared on intelligence/CBRND fusion issues. For the purposes of this analysis, current capabilities are listed and issues that need to be further assessed and clarified are provided for JRO-CBRND action. While the J-2 and OP-level intelligence organizations have the responsibility to gather intelligence on CBRN threat-related issues, they do not have the requisite understanding of CBRN issues to fully address the requirements without assistance from the OP-level CBRND staff. It is projected that improvements due to coordination/ doctrine, organization, training, materiel, leadership and education, personnel, and facilities (DOTMLPF) enhancements will dramatically improve the ability of the OP-level staff to articulate and assess Sense requirements and the overall status will improve to “green.”

Table 4.0-1. Operational Sense Summary FNA Findings

OVERALL		●	●	●

**4.0.3 FSA Summary**

The paragraphs below summarize the assessment of all potential DOTMLPF solutions for the capability gaps identified in the FNA section.

**4.0.3.1 DOTMLPF**

The DOTMLPF solutions identified in this chapter include basic actions required to better prepare the appropriate staffs. No training or experimentation has taken place to enable the formulation of tactics, techniques, and procedures (TTPs) designed to facilitate the ability of intelligence personnel to assess CBRND Sense requirements. It is imperative that these exercises take place and lessons learned be integrated into doctrine, TTPs, and guidance. Other solutions include the development of leader education programs for both CBRND and intelligence staff officers and a detailed analysis of how the OP-level intelligence/CBRN community is organized and staffed to perform CBRN intelligence analysis and collection activities. In the case of deficiencies associated with service component–captured materiel exploitation units that are trained to find and exploit enemy equipment or supplies of CBRN intelligence value and potential, DOTMLPF solutions, TTPs, and doctrine across the services need to be assessed. Training/education on this task needs to be integrated into the intelligence tasks of all Service and joint schools and courses. In the case of deficiencies associated with collecting samples to verify CBRN weapon employment and potential DOTMLPF solutions, TTPs must be developed to guide the actions of non-Chemical commanders and units that may be required to collect samples.

**4.0.3.2 IMA**

There are no materiel requirements.

**4.1 Task OPSENS 1: Sense the storage locations of CBRN weapons or components in the JOA****4.1.1 Functional Area Analysis****4.1.1.1 Definition**

To obtain information and data from all sources that determine where a military force or transnational organization is storing CBRN/TIM weapons or components in the joint operations area (JOA). Areas of interest include storage locations, storage capacities, safety precautions, prevailing meteorological conditions at sites, types of weapons or components stored, and facility entrances.

**4.1.1.2 Derivation**

1. Negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)

## **4.1.2 Functional Needs Analysis**

### **4.1.2.1 Capability and Deficiency Assessment Summary**

Table 4.1-1 discusses the only capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The OP-level J-2 is responsible for working with theater-level and component command intelligence organizations to obtain intelligence that is required to support JOA operations. Per joint intelligence doctrine, the J-2 is responsible for coordinating all intelligence-related CBRN functions pertaining to adversary employment of CBRN weapons with the appropriate CBRN staff element. But because of documented training, education, and experience issues, J-2 personnel may not have a full grasp of what needs to be coordinated. As the OP-level commander's main source of expertise in addressing CBRN defense issues involving the warfighter, the OP-level CBRND staff must proactively engage the J-2 to determine the adequacy of current and projected theater-level intelligence capabilities to sense the storage locations of CBRN/TIM weapons or components. To be proactive, the OP-level CBRND staff must be better prepared on intelligence/CBRND fusion issues. For the purposes of this analysis, current capabilities are listed and issues that need to be further assessed and clarified are provided for JRO-CBRND action.

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Near/mid-term experimentation results (as recommended in this Joint Capabilities Integration and Development System [JCIDS] analysis) may lead to development of new capabilities. It is projected that improvements due to coordination/DOTLPF enhancements will dramatically improve the ability of the OP-level staff to sense the storage locations of CBRN/TIM weapons or components in the JOA, but the overall status will remain "yellow" due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. New organizational structures or other capabilities resulting from near/mid-term experimentation results (as recommended in this JCIDS analysis) may dramatically improve the ability of the OP-level staff to develop intelligence indicators for sensing the storage locations of CBRN/TIM weapons or components in the JOA, but the overall status is projected to remain "yellow" due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

**Table 4.1-1 OPSENS 1: Capability and Deficiency Assessment**

<b>Capability: Operational-Level Unit J-2</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>
<b>Current Overall Capability<sup>1</sup></b>	Y <sup>2</sup>	Y <sup>3</sup>	Y <sup>4</sup>
<b>Near/Mid-Term Overall Capability</b>	Y	Y	Y
<b>Far-Term Overall Capability<sup>5</sup></b>	Y	Y	Y

	<b>FAA Measure</b>	<b>Elaboration</b>	<b>Scale</b>
M1	Storage locations of CBRN weapons or components in the JOA are detected and identified.	Assesses techniques and procedures used by the OP-level J-2 to work with intelligence organizations to ensure adequate detection and identification.	G – Yes Y – Limited R – No
M2	Intelligence on storage locations of CBRN weapons or components is accurate.	Assesses techniques and procedures used by the OP-level J-2 to work with intelligence organizations to ensure accuracy of intelligence.	G – Yes Y – Limited R – N
M3	Operational surprise does not occur.	Assesses whether adequate resources and means are applied to obviate operational surprise.	G – Yes Y – Limited R – No

<sup>1</sup> Joint intelligence and CBRN publications do not adequately address this issue. In some cases, the OP-level CBRN staff is not adequately staffed and organized to meet its intelligence-related responsibilities. The OP-level J-2 staff is not adequately trained/educated in CBRN issues. CBRN staff officers are not adequately trained/educated in intelligence issues. Experimentation does not provide feedback on intelligence indicators for this task. JPME does not adequately cover the fusion of intelligence/CBRN issues.

<sup>2</sup> The OP-level J-2 works with various theater-level and component command intelligence organizations to determine where a nation-state or transnational organization is storing CBRN/TIM weapons or components. Techniques and procedures to facilitate this process and to provide useful indicators may not be adequate.

<sup>3</sup> The OP-level J-2 works with various theater-level and component command intelligence organizations to ensure accuracy of intelligence determining where a nation-state or transnational organization is storing CBRN/TIM weapons or components. Techniques and procedures to facilitate this process and to ensure accuracy may not be adequate.

<sup>4</sup> The OP-level J-2 works with various theater-level and component command intelligence organizations to ensure that operational surprise does not occur. Adequate resources and means may not be sufficiently applied in determining where a nation-state or transnational organization is storing CBRN/TIM weapons or components.

<sup>5</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

### 4.1.3 Functional Solution Analysis

#### 4.1.3.1 DOTLPE Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the Ideas for Materiel Approaches (IMA) section.

1. **Deficiency:** Techniques and procedures to facilitate detecting and identifying where a nation-state or transnational organization is storing CBRN/TIM weapons or components may not be adequate.

**Non-Materiel Solutions:** *Doctrine:* JRO-CBRND must work with the various potential OP-level J-2s and their typical alignment component command intelligence organizations to develop effective JOA techniques and procedures for detecting and identifying where a nation-state or transnational organization is storing CBRN/TIM weapons or components and to provide useful indicators. Each service organization that might form the foundation of a joint task force (JTF) has a different approach to both CBRN intelligence and its CBRN staffing. Indicators to be developed must include types of storage facilities, techniques for storage in unlikely locations, storage capacities, safety and security measures, transport and agent release techniques, and storage capacity. *Training:* Conduct small-scaled training sessions focused on recognizing less obvious indicators of CBRN/TIM weapons storage. Incorporate the derived information into subsequent exercises that facilitate this and other areas of the task.

2. **Deficiency:** Techniques and procedures to ensure accurate intelligence on where a nation-state or transnational organization is storing CBRN/TIM weapons or components may not be adequate.

**Non-Materiel Solutions:** *Doctrine:* JRO-CBRND must work with the various potential OP-level J-2s and their typical alignment component command intelligence organizations to develop effective techniques and procedures to ensure accurate theater intelligence on where a nation-state or transnational organization is storing CBRN/TIM weapons or components and to develop metrics to measure accuracy.

3. **Deficiency:** Adequate resources and means may not be sufficiently applied to ensure that storage of CBRN/TIM weapons or components is detected.

**Non-Materiel Solutions:** *Organization:* The CBRN organization or staffing of the various potential OP-level J-2s and their typical alignment component command intelligence organizations must be analyzed from a CBRN standpoint to ensure that they can provide required CBRN intelligence concerning CBRN hazards. These hazards need to be detected, identified, and quantified in order for Shape to provide a clear understanding of the current and *predicted* CBRN situation to the commander. *Training:* JRO-CBRND must work with the various potential OP-level J-2s and their typical alignment component command intelligence organizations to develop effective training for analysts as well as those managing all means of collection. The training must allow analysts and collection managers the means by which to determine inadequacy of collection mechanisms and a means to make recommendations for improvement. *Leadership:* JRO-CBRND must work with the various

potential OP-level J-2s and their typical alignment component command intelligence organizations to develop an effective CBRN education program for analysts as well as those managing all means of collection. The education process must provide analysts and collection managers with the tools they need to assess the efficacy of their analysis and collection efforts. *Personnel*: Personnel should not be assigned to intelligence analysis or collection activities vital to CBRN areas without requisite CBRN education and/or experience. *Facilities*: Analyze training requirements and develop/modify special training facilities if required.

4. **Deficiency**: Joint intelligence and CBRN publications do not adequately address this issue. **Non-Materiel Solutions**: *Doctrine*: Enhance joint intelligence and CBRN publications to adequately address this issue and to interface with each other so that roles and responsibilities are clearly delineated. Incorporate information attained from the exercise into the doctrine and joint intelligence and CBRN publications. *Training*: Conduct a small-scaled exercise where “to identify resources needed to detect the operational deployment of CBRN/TIM weapons” is one of the primary objectives.
5. **Deficiency**: Combatant command (COCOM) CBRND staff is not adequately staffed and organized to meet its intelligence-related responsibilities. **Non-Materiel Solutions**: *Organization*: Each JTF CBRND staff should have a section dedicated to resolving CBRN intelligence issues. *Personnel*: Each JTF CBRND should have adequate trained/experienced personnel assigned to man a section dedicated to resolving CBRN intelligence issues. Ensure that a diverse COCOM CBRND staff with personnel from different arenas and specialties is maintained. *Training*: Conduct small-scaled training sessions focused on intelligence-related responsibilities. Incorporate the derived information into subsequent exercises that facilitate this and other areas of the task. This approach would better identify staffing and organization issues that could be addressed in doctrine.
6. **Deficiency**: The J-2 staff is not adequately trained/educated in CBRN issues. **Non-Materiel Solutions**: *Training*: Develop training that will enable each JTF J-2 staff to better understand their CBRN role and enhance their ability to obtain intelligence that is required to support the Shape function of OP-level CBRND. *Leadership*: Develop an education program that will enable each JTF J-2 staff to better understand their CBRN role and enhance their ability to obtain intelligence that is required to support the Shape function of OP-level CBRND. *Personnel*: Ensure that a diverse J-2 staff with personnel from different arenas and specialties is maintained.
7. **Deficiency**: CBRN staff officers are not adequately trained/educated in intelligence issues. **Non-Materiel Solutions**: *Training*: Develop training programs that allow CBRN staff officers to better support the CBRN intelligence process. *Leadership*: Develop education programs that allow CBRN staff officers to better understand the CBRN intelligence process and their roles and responsibilities. *Personnel*: Ensure that a diverse J-2 staff with personnel from different arenas and specialties is maintained.

- 8. Deficiency:** Experimentation/red teaming does not provide feedback on intelligence indicators for this task.

**Non-Materiel Solutions:** *Training:* JRO-CBRND must work with both the intelligence and CBRN communities to integrate this task into both intelligence and CBRN experimentation campaign plans.

- 9. Deficiency:** Joint Professional Military Education (JPME) does not adequately cover the fusion of intelligence/CBRN issues.

**Non-Materiel Solutions:** *Leadership:* Integrate intelligence/CBRN fusion issues into JPME. Consider expanding JPME courses to include civilian courses.

#### **4.1.3.2 IMA Assessment Summary**

N/A

**4.2 Task OPSENS 2: Sense the operational deployment of CBRN weapons in the JOA****4.2.1 Functional Area Analysis****4.2.1.1 Definition**

To obtain information and data from all sources that determine when a military force or transnational organization is preparing to conduct or is conducting an operational deployment of CBRN/TIM weapons in the JOA. Includes information on civil and military plans related to deployment, training conducted by military forces and civilians, and the overall CBRN/TIM defensive preparedness of military forces.

**4.2.1.2 Derivation**

*UJTL (OP 7.5, ST 2.2.2.*

**4.2.1.2.1 Supported Task: STSENS 2****4.2.1.2.2 Lateral Tasks: OPSHA 1, OPSHA 2****4.2.1.2.3 Supporting Task: TASENS 15****4.2.1.3 Condition**

Perform this task under conditions of:

**Physical. NA****Military**

1. Transnational organization
  - a. Negligible intelligence database. (C2.4.2)
  - b. Negligible theater intelligence access. (C2.4.2)
2. Nation-states
  - a. Marginal intelligence database. (C2.4.2)
  - b. Difficult theater intelligence access. (C2.4.2)
3. Common Military Conditions
  - a. Conventional and terrorist threat form. (C2.9.2)

**Civil**

1. Negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)

## **4.2.2 Functional Needs Analysis**

### **4.2.2.1 Capability and Deficiency Assessment Summary**

Table 4.2-1 discusses the only capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The OP-level J-2 is responsible for working with theater-level and component command intelligence organizations to obtain intelligence that is required to support JOA operations. Per joint intelligence doctrine, the J-2 is responsible for coordinating all intelligence-related CBRN functions pertaining to adversary deployment of CBRN weapons with the appropriate CBRN staff element. But because of documented training, education, and experience issues, J-2 personnel may not have a full grasp of what needs to be coordinated. As the OP-level commander's main source of expertise in addressing CBRN defense issues involving the warfighter, the OP-level CBRND staff must proactively engage the J-2 to determine the adequacy of current and projected theater-level intelligence capabilities to sense the operational deployment of CBRN weapons in the JOA. To be proactive, the OP-level CBRND staff must be better prepared on intelligence/CBRND fusion issues. For the purposes of this analysis, current capabilities are listed and issues that need to be further assessed and clarified are provided for JRO-CBRND action.

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Near/mid-term experimentation results (as recommended in this JCIDS analysis) may lead to development of new capabilities. It is projected that improvements due to coordination/DOTLPF enhancements will dramatically improve the ability of the OP-level staff to sense the operational deployment of CBRN weapons in the JOA, but the overall status will remain "yellow" due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. New organizational structures or other capabilities resulting from near/mid-term experimentation results (as recommended in this JCIDS analysis) may dramatically improve the ability of the OP-level staff to develop intelligence indicators for sensing the storage locations of CBRN/TIM weapons or components in the JOA, but the overall status is projected to remain "yellow" due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

**Table 4.2-1. OPSENS 2: Capability and Deficiency Assessment**

<b>Capability: Operational-Level Unit J-2</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>
<b>Current Overall Capability<sup>1</sup></b>	Y <sup>2</sup>	Y <sup>3</sup>	G <sup>4</sup>	Y <sup>5</sup>
<b>Near/Mid-Term Overall Capability</b>	Y	Y	G	Y
<b>Far-Term Overall Capability<sup>6</sup></b>	Y <sup>7</sup>	Y	G	Y

	<b>FAA Measure</b>	<b>Elaboration</b>	<b>Scale</b>
M1	Deploying CBRN weapons/units in the JOA are detected and identified.	Assesses techniques and procedures used by the OP-level J-2 to work with the J-3 and various OP-level organizations to detect and identify deploying CBRN weapons/units.	G – Yes Y – Limited R – No
M2	Intelligence on deploying CBRN weapons/units is accurate.	Assesses techniques and procedures used by the OP-level J-2 to work with intelligence organizations to ensure accuracy of intelligence on deploying CBRN weapons/units.	G – Yes Y – Limited R – No
M3	Deployment warning is provided to JOA forces.	Assesses efficacy of warning capability once deployment is detected and identified.	G – Yes Y – Limited R – No
M4	Operational surprise does not occur.	Assesses whether adequate resources and means are applied to obviate operational surprise.	G – Yes Y – Limited R – No

<sup>1</sup> Joint intelligence and CBRN publications do not adequately address this issue. The OP-level CBRN staff is not adequately staffed and organized to meet its intelligence-related responsibilities. The J-2 staff is not adequately trained/educated in CBRN issues. CBRN staff officers are not adequately trained/educated in intelligence issues. Experimentation does not provide feedback on intelligence indicators for this task. JPME does not adequately cover the fusion of intelligence/CBRN issues.

<sup>2</sup> The OP-level J-2 works with various theater-level and component command intelligence organizations to detect and identify deploying CBRN weapons/units in the JOA. Techniques and procedures to facilitate this process and to provide useful indicators may not be adequate.

<sup>3</sup> The OP-level J-2 works with various theater-level and component command intelligence organizations to ensure accuracy of intelligence detecting and identifying deploying CBRN weapons/units in the JOA. Techniques and procedures to facilitate this process and to ensure accuracy may not be adequate.

<sup>4</sup> Nothing precludes providing warning of operational deployment of CBRN weapons in the JOA to JOA forces once the deploying units are detected and identified.

<sup>5</sup> The OP-level J-2 works with various theater-level and component command intelligence organizations to ensure that operational surprise does not occur. Adequate resources and means may not be sufficiently applied in detecting and identifying deploying CBRN weapons/units in the JOA.

<sup>6</sup> DOTLPF enhancements will be made possible as a result of experimentation designed to close intelligence fusion knowledge gaps.

<sup>7</sup> DOTLPF enhancements will be made possible as a result of experimentation designed to close intelligence fusion knowledge gaps.

### 4.2.3 Functional Solution Analysis

#### 4.2.3.1 DOTLPE Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Techniques and procedures to facilitate detecting and identifying the operational deployment of CBRN weapons in the JOA may not be adequate.  
**Non-Materiel Solutions:** *Doctrine:* JRO-CBRND must work with the various potential OP-level J-2s and their typical alignment component command intelligence organizations to develop effective JOA techniques and procedures for detecting and identifying the operational deployment of CBRN weapons in the JOA and to provide useful indicators. Each service organization that might form the foundation of a joint task force has a different approach to both CBRN intelligence and their CBRN staffing. Indicators to be developed must include the means to determine agent types, nuclear weapon types and yields, TIMS being considered, means by which to release TIMS, delivery modes or systems, and unit designations, locations, routes, and formations.
2. **Deficiency:** Techniques and procedures to ensure accurate intelligence on the operational deployment of CBRN weapons in the JOA may not be adequate.  
**Non-Materiel Solutions:** *Doctrine:* JRO-CBRND must work with the various potential OP-level J-2s and their typical alignment component command intelligence organizations to develop effective techniques and procedures to ensure accurate JOA intelligence on countries or transnational organizations deploying CBRN/TIM weapons/units/teams and to develop metrics to measure accuracy.
3. **Deficiency:** Adequate resources and means may not be sufficiently applied to ensure that a nation-state or transnational organization preparing to operationally deploy CBRN weapons in the JOA is detected.  
**Non-Materiel Solutions:** *Organization:* Analyze the CBRN organization or staffing of the various potential OP-level J-2s and their typical alignment component command intelligence organizations from a CBRN standpoint to ensure that they can provide required CBRN intelligence concerning CBRN hazards. These hazards need to be detected, identified, and quantified for Shape to provide a clear understanding of the current and *predicted* CBRN situation to the commander. *Training:* Conduct a small-scaled exercise where “to identify resources needed to detect the operational deployment of CBRN/TIM weapons” is one of the primary objectives. In addition, JRO-CBRND must work with the COCOM J2 and/or theater intelligence organizations to develop effective training for analysts as well as those managing all means of collection. The training must allow analysts and collection managers the means by which to determine inadequacy of collection mechanisms and a means to make recommendations for improvement. *Leadership:* JRO-CBRND must work with the various potential OP-level J-2s and their typical alignment component command intelligence organizations to develop an effective CBRN education program for analysts as well as those managing all means of collection. The education process must provide analysts and

collection managers with the tools they need to assess the efficacy of their analysis and collection efforts. *Personnel*: Personnel should not be assigned to intelligence analysis or collection activities vital to CBRN areas without requisite CBRN education and/or experience. *Facilities*: Analyze training requirements and developed/modify special training facilities if required.

4. **Deficiency**: Joint intelligence and CBRN publications do not adequately address this issue.  
**Non-Materiel Solutions**: *Doctrine*: Enhance joint intelligence and CBRN publications to adequately address this issue and to interface with each other so that roles and responsibilities are clearly delineated. Incorporate information attained from the exercise into the doctrine and joint intelligence and CBRN publications.
5. **Deficiency**: COCOM CBRND staff is not adequately staffed and organized to meet its intelligence-related responsibilities.  
**Non-Materiel Solutions**: *Organization*: Each OP-level CBRND staff should have a section dedicated to resolving CBRN intelligence issues. *Personnel*: Each OP-level CBRND staff should have adequate trained/experienced personnel assigned to man a section dedicated to resolving CBRN intelligence issues.
6. **Deficiency**: The J-2 staff is not adequately trained/educated in CBRN issues.  
**Non-Materiel Solutions**: *Training*: Develop training that will enable each JTF J-2 staff to better understand their CBRN role and enhance their ability to obtain intelligence that is required to support the Shape function of OP-level CBRND. *Leadership*: Develop an education program that will enable each JTF J-2 staff to better understand their CBRN role and enhance their ability to obtain intelligence that is required to support the Shape function of OP-level CBRND.
7. **Deficiency**: CBRN staff officers are not adequately trained/educated in intelligence issues.  
**Non-Materiel Solutions**: *Training*: Develop training programs that allow CBRN staff officers to better support the CBRN intelligence process. *Leadership*: Develop education programs that allow CBRN staff officers to better understand the CBRN intelligence process and their roles and responsibilities.
8. **Deficiency**: Experimentation/red teaming does not provide feedback on intelligence indicators for this task.  
**Non-Materiel Solutions**: *Training*: JRO-CBRND must work with both the intelligence and CBRN communities to integrate this task into both intelligence and CBRN experimentation campaign plans.
9. **Deficiency**: JPME does not adequately cover the fusion of intelligence/CBRN issues.  
**Non-Materiel Solutions**: *Leadership*: Integrate intelligence/CBRN fusion issues into JPME.

#### 4.2.3.2 IMA Assessment Summary

N/A

### **4.3 Task OPSENS 3: Sense the employment of CBRN weapons in the JOA**

#### **4.3.1 Functional Area Analysis**

##### **4.3.1.1 Definition**

To obtain information and data from all sources that determine when a military force or transnational organization is preparing to or is employing CBRN/TIM weapons in the JOA. Areas of interest include when the weapons will be employed, JOA targets selected, weapons systems involved, locations of weapons systems, and forces/personnel involved in the employment. Extracts information from the medical, operational, intelligence, and environmental communities to identify potential biological warfare activities. Includes intelligence assessment of industrial sites, storage and transport means for toxic industrial chemical (TIC) threats, hazards, and evidence of intentional or inadvertent release.

##### **4.3.1.2 Derivation**

*UJTL (OP 7.5, OP 2.2.2).*

##### **4.3.1.2.1 Supported Task: STSENS 3**

##### **4.3.1.2.2 Lateral Task: OPSHA 1**

##### **4.3.1.2.3 Supporting Tasks: TASENS 14, TASENS 16**

##### **4.3.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Atmospheric CBRN effects. (C1.3.3)

##### **Military**

1. Stressful mission. (C2.1)
2. No mission preparation. (C2.1.3)
3. Negligible personnel experience. (C2.2.4.5)
4. Conventional and terrorist threat form. (C2.9.2)

##### **Civil**

1. Limited foreign government support. (C3.1.2.3)

## **4.3.2 Functional Needs Analysis**

### **4.3.2.1 Capability and Deficiency Assessment Summary**

Table 4.3-1 discusses the only capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The OP-level J-2 is responsible for working with theater-level organizations to obtain intelligence that is required to support joint OP-level operations. Per joint intelligence doctrine, the J-2 is responsible for coordinating all intelligence-related CBRN functions pertaining to adversary employment of CBRN weapons with the appropriate CBRN staff element, but because of documented training, education, and experience issues, J2 personnel may not have a full grasp of what needs to be coordinated. As the OP-level commander's main source of expertise in addressing CBRND issues involving the warfight, the OP-level CBRND staff must proactively engage the J2 to determine the adequacy of current and projected theater-level intelligence capabilities to sense the employment of CBRN/TIM weapons in theater. To be proactive, the OP-level CBRND staff must be better prepared on intelligence/CBRND fusion issues. For the purposes of this analysis, current capabilities are listed and issues that need to be further assessed and clarified are provided for JRO-CBRND action.

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Near/mid-term experimentation results (as recommended in this JCIDS analysis) may lead to development of new capabilities. It is projected that improvements due to coordination/DOTLPF enhancements will dramatically improve the ability of the OP-level staff to sense the employment of CBRN weapons in the JOA, but the overall status will remain "yellow" due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. New organizational structures or other capabilities resulting from near/mid-term experimentation results (as recommended in this JCIDS analysis) may dramatically improve the ability of the OP-level staff to develop intelligence indicators for sensing the employment of CBRN weapons in the JOA, but the overall status is projected to remain "yellow" due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

**Table 4.3-1. OPSENS 3: Capability and Deficiency Assessment**

<b>Capability: Operational-Level Unit J-2</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>Y<sup>2</sup></b>	<b>Y<sup>3</sup></b>	<b>Y<sup>4</sup></b>	<b>Y<sup>5</sup></b>
<b>Near/Mid-Term Overall Capability</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>
<b>Far-Term Overall Capability<sup>6</sup></b>	<b>Y</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>

	<b>FAA Measure</b>	<b>Elaboration</b>	<b>Scale</b>
M1	CBRN/TIM attacks are detected and identified.	Assesses techniques and procedures used by the OP-level J-2 to work with the J-3 and also intelligence and OP-level organizations to detect and identify CBRN/TIM attacks	G – Yes Y – Limited R – No
M2	Reports on CBRN/TIM attacks are accurate.	Assesses techniques and procedures used by the OP-level J-2 to work with the J-3 and also intelligence and operational organizations to ensure accuracy of CBRN/TIM attack reports.	G – Yes Y – Limited R – No
M3	Unambiguous attack warning is provided.	Assesses techniques and procedures used by the OP-level J-2 to work with the J-3 and various theater-level organizations to provide unambiguous CBRN/TIM attack warning	G – Yes Y – Limited R – No
M4	Attack assessments are accurate.	Assesses techniques and procedures used by the OP-level J-2 to ensure accuracy of attack assessments	G – Yes Y – Limited R – No

<sup>1</sup> Joint intelligence and CBRN publications do not adequately address the issue of sensing the terrorist use of CBRN weapons, the use of TIM as a weapon, or third-party situations where U.S. resources can not be brought to bear.

<sup>2</sup> The OP-level J-2 works with the OP-level J-3 and various theater-level organizations to detect and identify CBRN/TIM attacks. In the case of a nation-state conducting a CBRN attack against U.S. forces, the process is mature and effective. In the event of terrorist use of CBRN, it may be difficult or impossible to detect or identify the attack, and in the case of a biological attack or attacks involving TIM, it may be difficult to determine whether it is a natural disease outbreak or an accident. In the event of use not involving U.S. forces or allies, it may be difficult to gain required information. Techniques and procedures to facilitate this process when it involves terrorists or non-U.S. allies and to detect or identify attacks may not be adequate.

<sup>3</sup> Methods and procedures for accurately reporting CBRN attacks against U.S. forces are mature and effective. Methods and procedures for accurately reporting third-party, terrorist, and TIM attacks may not be adequate.

<sup>4</sup> The OP-level J-2 works with the OP-level J-3 and various theater-level organizations to provide unambiguous CBRN/TIM attack warning. In the case of determining whether a nation-state has conducted a CBRN attack against U.S. forces, the process is mature and effective. In the event of terrorist use of CBRN, it may be difficult or impossible to attribute the attack, and in the case of a biological attack or attacks involving TIM, it may be difficult to determine whether it is a natural disease outbreak or an accident. In the event of use not involving U.S. forces or allies, it may be difficult to gain required information. Techniques and procedures to facilitate this process when it involves terrorists or non-U.S. allies and to provide unambiguous warning may not be adequate.

<sup>5</sup> Methods and procedures for providing accurate attack assessments when CBRN is used against U.S. forces are mature and effective. Methods and procedures providing accurate attack assessments in third-party, terrorist, and TIM attacks may not be adequate.

<sup>6</sup> Joint intelligence and CBRN publications will adequately address the issue of sensing the terrorist use of CBRN weapons, the use of TIM as a weapon, and third-party situations where U.S. resources cannot be brought to bear.

### 4.3.3 Functional Solution Analysis

#### 4.3.3.1 DOTLPE Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Techniques and procedures involving sensing of terrorist CBRN attacks may not be adequate.

**Non-Materiel Solutions:** *Doctrine:* Using the results of both experimentation and exercises, develop TTPs that address all issues surrounding sensing the CBRN attacks of terrorists. Issues to be resolved include detecting and identifying the attacks, providing unambiguous warning of attacks or impending attacks, providing accurate reports and assessments, and establishing verification techniques and procedures. *Training:* Develop an experimentation/exercise campaign to address all issues surrounding the sensing of CBRN attacks of terrorists at the operational level.

2. **Deficiency:** Techniques and procedures involving sensing of small biological attacks may not be adequate.

**Non-Materiel Solutions:** *Doctrine:* Using the results of both experimentation and exercises, develop TTPs that address all issues surrounding sensing of small biological attacks. Issues to be resolved include detecting and identifying the attacks, providing unambiguous warning of attacks or impending attacks, providing accurate reports and assessments, and establishing verification techniques and procedures. *Training:* Develop an experimentation/exercise campaign to address all issues surrounding the sensing of small biological attacks at the operational level.

3. **Deficiency:** Techniques and procedures involving sensing of TIM attacks may not be adequate.

**Non-Materiel Solutions:** *Doctrine:* Using the results of both experimentation and exercises, develop TTPs that address all issues surrounding sensing of TIM attacks. Issues to be resolved include detecting and identifying the attacks, providing unambiguous warning of attacks or impending attacks, providing accurate reports and assessments, and establishing verification techniques and procedures. *Training:* Develop an experimentation/exercise campaign to address all issues surrounding the sensing of TIM attacks at the operational level.

4. **Deficiency:** Techniques and procedures involving sensing of third-party attacks may not be adequate.

**Non-Materiel Solutions:** *Doctrine:* Using the results of both experimentation and exercises, develop TTPs that address all issues surrounding sensing third-party CBRN attacks. Issues to be resolved include detecting and identifying the attacks, providing unambiguous warning of attacks or impending attacks, providing accurate reports and assessments and verification techniques and procedures. *Training:* Develop an experimentation/exercise campaign to address all issues surrounding the sensing of third-party CBRN attacks at the operational level.

- 5. Deficiency:** Joint intelligence and CBRN publications do not adequately address the issue of sensing the terrorist use of CBRN weapons, the use of TIM as a weapon, or third-party situations where U.S. resources can not be brought to bear.

**Non-Materiel Solutions:** *Doctrine:* Integrate all lessons learned and procedures into appropriate joint publications.

**4.3.3.2 IMA Assessment Summary**

N/A

#### **4.4 Task OPSENS 4: Sense JOA CBRN hazards due to employment or ROTA of CBRN/TIM weapons or materials**

##### **4.4.1 Functional Area Analysis**

###### **4.4.1.1 Definition**

To obtain information and data from all sources that determine the location and source of JOA CBRN/TIM hazards due to employment or ROTA of CBRN/TIM weapons or materials. Areas of interest include detecting, identifying, and quantifying those CBRN/TIM hazards in all physical states (solid, liquid, gas located in the air, on the ground, or in water). Enables the continued monitoring and identification of hazards in support of shaping, shielding, and sustaining.

###### **4.4.1.2 Derivation**

*UJTL (OP 7.5, OP 2.2.2).*

###### **4.4.1.2.1 Supported Task: STSENS 4**

###### **4.4.1.2.2 Lateral Task: OPSHA 1**

###### **4.4.1.2.3 Supporting Tasks: TASENS 1, TASENS 2, TASENS 3, TASENS 4, TASENS 5, TASENS 6, TASENS 7, TASENS 8, TASENS 9, TASENS 10, TASENS 11, TASENS 12**

###### **4.4.1.3 Condition**

Perform this task under conditions of:

###### **Physical**

1. Atmospheric CBRN effects. (C1.3.3)

###### **Military**

1. Stressful mission. (C2.1)
2. No mission preparation. (C2.1.3)
3. Negligible personnel experience. (C2.2.4.5)

###### **Civil**

1. TIMs are present. (C3.3.7.5)

## **4.4.2 Functional Needs Analysis**

### **4.4.2.1 Capability and Deficiency Assessment Summary**

Table 4.4-1 discusses the capabilities that currently exist to perform the task to the designated standard. There are two capabilities that exist, and no other capabilities are projected that will accomplish this task.

#### **Current Capability and Deficiency**

The OP-level staffs for Intelligence and Operations are able under most circumstances to effectively sense theater CBRN/TIM hazards due to employment or ROTA of CBRN/TIM weapons or materials. The J-2 works with the J-3 and various OP-level organizations to detect and identify CBRN/TIM hazards. In the case of a nation-state conducting a CBRN attack against U.S. forces, the process is mature and effective. While it may not be possible to attribute CBRN/TIM hazards as attacks, it will be possible to detect and identify hazards. In the event of use not involving U.S. forces or allies, it may be difficult to gain required information. Techniques and procedures to facilitate this process when it involves non-U.S. allies or countries that restrict information and access may not be adequate. As the OP-level commander's main source of expertise in addressing CBRN defense issues involving the warfighter, the OP-level CBRND staff must proactively engage the J-2 and J-3 to determine the adequacy of current and projected JOA operational and intelligence capabilities to sense when JOA CBRN/TIM hazards due to employment or ROTA of CBRN/TIM weapons or materials are present. For the purposes of this analysis, current capabilities are listed and issues that need to be further assessed and clarified are provided for JRO-CBRND action.

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capabilities are currently projected for the near/mid term. Near/mid-term experimentation results (as recommended in this JCIDS analysis) may lead to development of new capabilities. It is projected that improvements due to coordination/DOTMLPF enhancements will dramatically improve the ability of the OP-level staff to articulate and improve Sense requirements. Continuing problems with information coordination and collection in the event of use not involving U.S. forces or allies will continue to result in a capability projection of "yellow."

#### **Projected Far-Term Capability and Deficiency**

No other capabilities are currently projected for the far-term future. New organizational structures or other capabilities resulting from near/mid-term experimentation results (as recommended in this JCIDS analysis) may continue to improve the ability to sense theater CBRN/TIM hazards due to employment or ROTA of CBRN/TIM weapons or materials. It is anticipated that problems associated with information coordination and collection in the event of use not involving U.S. forces or allies will be rectified as a result of experimentation and permit a capability projection of "green."

**Table 4.4-1. OPSENS 4: Capability and Deficiency Assessment**

Capability/Measure	M1	M2	M3
<b>Current</b>			
Operational-Level J-2	Y <sup>1</sup>	Y <sup>2</sup>	G <sup>3</sup>
Operational-Level J-3	Y <sup>4</sup>	Y <sup>5</sup>	G <sup>6</sup>
<b>Near/Mid</b>			
Operational-Level J-2	Y	Y	G
Operational-Level J-3	Y	Y	G
<b>Far</b>			
Operational-Level J-2	G <sup>7</sup>	G	G
Operational-Level J-3	G <sup>8</sup>	G	G
<b>Current Overall Capability</b>	Y	Y	G
<b>Near/Mid-Term Overall Capability</b>	Y	Y	G
<b>Far-Term Overall Capability</b>	G	G	G

	FAA Measure	Elaboration	Scale
M1	Hazards are detected and identified.	Assesses techniques and procedures used by the OP-level J-2/J-3 to work with various OP-level organizations to detect and identify CBRN/TIM hazards. Recognizes inherent current delay in sensing most biological attacks and concentrates on processing of technically available data when they become available.	G – Yes Y – Limited R – No
M2	Reports on hazards are accurate.	Assesses techniques and procedures used by the OP-level J-2/J-3 to work with intelligence and operational organizations to ensure accuracy of CBRN/TIM hazard reports. Recognizes inherent current difficulty in immediately sensing most biological attacks and concentrates on accuracy of data when it becomes available.	G – Yes Y – Limited R – No
M3	Hazard warning is provided.	Assesses efficacy of warning capability once hazard is detected and identified.	G – Yes Y – Limited R – No

<sup>1</sup> The J-2 works with the J-3 and various OP-level organizations to detect and identify CBRN/TIM hazards. In the case of a nation-state conducting a CBRN attack against U.S. forces, the process is mature and effective. While it may not be possible to attribute CBRN/TIM hazards as attacks, it will be possible to detect and identify hazards. In the event of use not involving U.S. forces or allies, it may be difficult to gain required information. Techniques and procedures to facilitate this process when it involves non-U.S. allies or countries that restrict information and access may not be adequate.

<sup>2</sup> Methods and procedures for accurately reporting hazards involving U.S. forces are mature and effective. Methods and procedures for accurately reporting hazards involving non-U.S. allies or countries that restrict information and access may not be adequate.

<sup>3</sup> Once a hazard or potential hazard is detected and identified, nothing precludes providing hazard warning to JOA forces and to the COCOM.

<sup>4</sup> The J-3 is responsible for operations and command and control systems and ongoing current operations. The J-3 will coordinate all information and, in conjunction with the J-2, deconflict and assess the hazard reports and send out taskings JOA-wide for further required detection, identification, or monitoring missions within the capabilities of operational forces. Coordination will be required with the COCOM for detection and identification outside of JOA capabilities.

<sup>5</sup> Nothing precludes accurate reports within the operational capabilities of the combatant command. The J-3 must coordinate with the COCOM for information or requirements outside of JOA capabilities.

<sup>6</sup> Once a hazard or potential hazard is detected and identified, nothing precludes providing hazard warning to JOA forces and to the COCOM.

<sup>7</sup> It is anticipated that problems associated with information coordination and collection in the event of use not involving U.S. forces or allies will be rectified as a result of experimentation and permit a capability projection of “green.”

<sup>8</sup> It is anticipated that problems associated with information coordination and collection in the event of use not involving U.S. forces or allies will be rectified as a result of experimentation and permit a capability projection of “green.”

### 4.4.3 Functional Solution Analysis

#### 4.4.3.1 DOTLPE Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** In the event of JOA CBRN/TIM hazards not involving U.S. forces or allies, it may be difficult to detect or identify hazards and gain required information.  
**Non-Materiel Solutions:** *Doctrine:* Using the results of both experimentation and exercises, develop TTPs that address all issues surrounding sensing theater CBRN/TIM hazards due to employment or ROTA of CBRN/TIM weapons or materials. Issues to be resolved include detecting and identifying hazards when they affect non-U.S. allies or countries that restrict information and access.
2. **Deficiency:** In the event of JOA CBRN/TIM hazards involving non-U.S. allies or countries that restrict information and access, it may be difficult to gain accurate required information.  
**Non-Materiel Solutions:** *Doctrine:* Using the results of both experimentation and exercises, develop TTPs that address all accuracy issues surrounding sensing theater CBRN/TIM hazards due to employment or ROTA of CBRN/TIM weapons or materials. Issues to be resolved include determining how to accurately gain information on hazards when they affect non-U.S. allies or countries that restrict information and access.
3. **Deficiency:** Joint intelligence and CBRN publications do not adequately address the issue of sensing JOA hazards in third-party situations where U.S. resources cannot be brought to bear.  
**Non-Materiel Solutions:** *Doctrine:* Integrate all information concerning actions to be taken when hazards affect non-U.S. allies or countries that restrict information and access and integrate lessons learned and procedures developed through experimentation into appropriate joint publications.
4. **Deficiency:** Experimentation and training may not be conducted as frequently and extensively as required to identify capability gaps and required enhancements.  
**Non-Materiel Solutions:** *Training:* Conduct experimentation and training as required to identify capability gaps and required enhancements.

#### 4.4.3.2 IMA Assessment Summary

N/A

**4.5 Task OPSENS 5: Monitor combatant command designated activities within the JOA for compliance with CBRN treaties or elimination requirements****4.5.1 Functional Area Analysis****4.5.1.1 Definition**

To use JTF resources to monitor COCOM-designated activities within the JOA for compliance with CBRN treaties or elimination requirements.

**4.5.1.2 Derivation**

*UJTL (OP 7.5, OP 5.7.7, OP 3.3.2).*

**4.5.1.2.1 Supported Task:** STSENS 5

**4.5.1.2.2 Lateral Task:** N/A

**4.5.1.2.3 Supporting Task:** N/A

**4.5.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Cooperative nation
  - a. Partial preexisting arrangements (C2.1.1.2)
  - b. Limited military commitments from other nations (C2.1.1.7)
  - b. Limited host nation support (C2.8.5)
2. Uncooperative nation
  - a. No preexisting arrangements (C2.1.1.2)
  - b. Negligible military commitments from other nations (C2.1.1.7)
  - c. No host nation support (C2.8.5)

**Common Military Conditions**

1. Limited personnel expertise. (C2.2.4.5)

**Civil**

1. Cooperative nation
  - a. Limited foreign government support. (C3.1.2.3)
2. Uncooperative nation

- a. Negative foreign government support. (C3.1.2.3)

**This task is analyzed in the WMD Interdiction and Elimination JCIDS Analysis.**

## **4.6 Task OPSENS 6: Collect enemy weapons systems and new technologies for exploitation of potential CBRN implications**

### **4.6.1 Functional Area Analysis**

#### **4.6.1.1 Definition**

To use JTF resources to exploit captured technical data on CBRN/TIM weapons and assess enemy capabilities, intent, and probable courses of action (COAs).

#### **4.6.1.2 Derivation**

*UJTL (OP 7.5, OP 2.3.1).*

##### **4.6.1.2.1 Supported Task: STSENS 6**

##### **4.6.1.2.2 Lateral Task: N/A**

##### **4.6.1.2.3 Supporting Task: N/A**

#### **4.6.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

#### **Military**

1. Stressful mission. (C2.1)
2. No mission preparation. (C2.1.3)
3. Negligible personnel experience. (C2.2.4.5)

**Civil.** N/A

### **4.6.2 Functional Needs Analysis**

#### **4.6.2.1 Capability and Deficiency Assessment Summary**

Table 4.6-1 discusses the capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

Each service component intelligence capability has captured material exploitation units that are trained to find and exploit enemy equipment or supplies of CBRN intelligence value. This task can be accomplished now with only minor deficiencies.

**Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Near/mid-term experimentation results (as recommended in this JCIDS analysis) may lead to development of new capabilities. It is projected that improvements due to coordination/doctrine, organization, training, materiel, leadership and education, personnel, and facilities (DOTMLPF) enhancements will continue to improve the ability of OP-level units to collect enemy weapons systems and new technologies for exploitation of potential CBRN implications

**Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. New organizational structures or other capabilities and cooperative ventures with theater partners resulting from near/mid-term experimentation results (as recommended in this JCIDS analysis) should continue to improve the ability of OP-level units to collect enemy weapons systems and new technologies for exploitation of potential CBRN implications.

Table 4.6-1. OPSENS 6: Capability and Deficiency Assessment

Capability: Service Component Intelligence Captured Material Exploitation Units	M1	M2	M3	M4	M5
Current Overall Capability <sup>1</sup>	G <sup>2</sup>	G <sup>3</sup>	G <sup>4</sup>	Y <sup>5</sup>	G <sup>6</sup>
Near/Mid-Term Overall Capability	G	G	G	Y	G
Far-Term Overall Capability	G <sup>7</sup>	G	G	G <sup>8</sup>	G

	FAA Measure	Scale
M1	Collected information and systems are processed in JOA.	G – Yes, Y – Limited, R – No
M2	Collected information and systems are processed within 24 hours.	G – Yes, Y – Limited, R – No
M3	Intelligence analysts are provided hard-copy formal report of information obtained in processing.	G – Yes, Y – Limited, R – No
M4	Procedures and checklists exist to help collect and evacuate enemy weapons systems and new technologies for exploitation of potential CBRN/TIM implications.	G – Yes, Y – Limited, R – No
M5	Intelligence analysts are provided voice or electronic mail report of information of significance.	G – Yes, Y – Limited, R – No

<sup>1</sup> CBRN specific training on exploitation is not integrated into all phases of service and joint intelligence training.

<sup>2</sup> Nothing precludes processing collected information in the JOA.

<sup>3</sup> Nothing precludes processing collected information within 24 hours.

<sup>4</sup> Nothing precludes providing hard-copy formal reports of information obtained in processing to intelligence analysts if required.

<sup>5</sup> While some procedures and checklists exist to help collect enemy weapons systems, all doctrine and TTPs in this area should be reviewed, updated, and consolidated into joint TTPs.

<sup>6</sup> Nothing precludes providing intelligence analysts with immediate reports of information of significance.

<sup>7</sup> CBRN specific training on exploitation will be integrated into all phases of service and joint intelligence training.

<sup>8</sup> Joint experimentation and consolidation of lessons learned will allow Joint TTPs to be developed for the collection of enemy weapons systems and new technologies for exploitation of potential CBRN implications.

### 4.6.3 Functional Solution Analysis

#### 4.6.3.1 DOTLPE Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

**1. Deficiency:** Doctrine and TTPs may not be adequate.

**Non-Materiel Solutions:** *Doctrine:* All doctrine and TTPs in this area should be reviewed, updated, and consolidated into joint TTPs. Incorporate information attained from the exercise into the doctrine and joint intelligence and CBRN publications. *Training:* Conduct training to test, validate, and identify gaps and inconsistencies in current doctrine and TTPs.

**2. Deficiency:** CBRN specific training on exploitation is not integrated into all phases of service and joint intelligence training.

**Non-Materiel Solutions:** *Doctrine:* Review Chairman of the Joint Chiefs of Staff Instruction (CJCSI) for Officer Professional Military Education (OPME)/JPME and ensure that CBRN-related intelligence learning areas are integrated appropriately. Review CBRN integration into intelligence tasks of all Service and joint schools and courses.

#### 4.6.3.2 IMA Assessment Summary

N/A

## **4.7 Task OPSENS 7: Collect data for determining employment of CBRN/TIM weapons in the JOA**

### **4.7.1 Functional Area Analysis**

#### **4.7.1.1 Definition**

To follow theater policy, standards, and procedures for determining employment of CBRN/TIM weapons. Includes sampling and procedures to be followed in verifying use of CBRN/TIM weapons in the air, on the ground, or in water.

#### **4.7.1.2 Derivation**

*UJTL OP 7.5.*

**4.7.1.2.1 Supported Task:** STSENS 3

**4.7.1.2.2 Lateral Task:** N/A

**4.7.1.2.3 Supporting Tasks:** TASENS 1, TASENS 2, TASENS 3, TASENS 4, TASENS 5, TASENS 6, TASENS 7, TASENS 8, TASENS 9, TASENS 10, TASENS 11, TASENS 12

#### **4.7.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Atmospheric CBRN effects. (C1.3.3)

##### **Military**

1. Stressful mission. (C2.1)
2. No mission preparation. (C2.1.3)
3. Negligible personnel experience. (C2.2.4.5)

**Civil.** N/A

### **4.7.2 Functional Needs Assessment**

#### **4.7.2.1 Capability and Deficiency Assessment Summary**

Table 4.7-1 discusses the only capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The J-3 manages the entire process of gathering data for determining employment of CBRN/TIM weapons in the JOA. The process is mature and has been employed in the field.

**Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Near/mid-term experimentation results (as recommended in this JCIDS analysis) may lead to development of new capabilities. It is projected that improvements due to coordination/DOTMLPF enhancements will result in improved doctrine and TTPs.

**Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. New organizational structures or other capabilities and cooperative ventures with theater partners resulting from near/mid-term experimentation results (as recommended in this JCIDS analysis) should continue to improve the ability of OP-level units to collect data for determining employment of CBRN/TIM weapons in the JOA through continuing improvements in TTPs.

**Table 4.7-1. OPSENS 7: Capability and Deficiency Assessment**

<b>Capability: Operational-Level Unit J-3</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>G<sup>2</sup></b>	<b>G<sup>3</sup></b>	<b>G<sup>4</sup></b>
<b>Near/Mid-Term Overall Capability</b>	<b>G</b>	<b>G</b>	<b>G</b>
<b>Far-Term Overall Capability<sup>5</sup></b>	<b>G</b>	<b>G</b>	<b>G</b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Samples are provided to lab to facilitate verification of CBRN/TIM weapon use.	G – Yes, Y – Limited, R – No
M2	Procedures and checklists are developed to facilitate the collection of data for determining employment of CBRN/TIM weapons in the JOA.	G – Yes, Y – Limited, R – No
M3	There are no faulty sample-handling or chain-of-custody errors.	G – Yes, Y – Limited, R – No

<sup>1</sup> There is little or no doctrine to help commanders understand their roles in verification of first use. TTPs have not been developed to help guide units not assigned this mission to accomplish sample collection if required.

<sup>2</sup> Nothing precludes providing samples to verification laboratories. The process is mature and refined.

<sup>3</sup> Internal procedures and checklists have been developed by units that have sample collection as an assigned mission.

<sup>4</sup> Chain of custody procedures are well-established for units that have sample collection as an assigned mission.

<sup>5</sup> Doctrine will be developed to help commanders understand their roles in verification of first use. TTPs will be developed to help guide units not assigned this mission to accomplish sample collection if required.

### 4.7.3 Functional Solution Analysis

#### 4.7.3.1 DOTLPE Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** There is little or no doctrine to help commanders understand their roles in verification of first use.  
**Non-Materiel Solutions:** *Doctrine:* Develop doctrine to help commanders and senior leaders at all levels to understand their roles in verification of first use. Incorporate information attained from the exercise into the doctrine and joint intelligence and CBRN publications.  
*Training:* Conduct training to test, validate, and identify gaps and inconsistencies in current doctrine and TTPs.
2. **Deficiency:** TTPs have not been developed to help guide units not assigned this mission to accomplish sample collection if required.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs have to help guide units not assigned this mission to accomplish sample collection if required. Developed techniques and field expedient techniques and equipment, if required, and describe for use.

#### 4.7.3.2 IMA Assessment Summary

N/A

## **4.8 Task OPSENS 8: Provide Sense country assistance teams to support TEP**

### **4.8.1 Functional Area Analysis**

#### **4.8.1.1 Definition**

To provide Sense country assistance teams to support the Theater Engagement Plan (TEP) that has been provided by the combatant commander. Many nations that would normally support U.S. initiatives may feel threatened by hostile neighbors or nations that possess CBRN/TIM weapons. The TEPs for Sense considerations are executed by special teams and units that demonstrate Sense capability or provide Sense-related training to selected countries.

#### **4.8.1.2 Derivation**

*UJTL (OP 7.5, OP 4.7.1), CJCSM 3113.01a.*

##### **4.8.1.2.1 Supported Task: STSENS 7**

##### **4.8.1.2.2 Lateral Task: OPSHA 9**

##### **4.8.1.2.3 Supporting Task: N/A**

#### **4.8.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

##### **Military**

1. No preexisting arrangements. (C2.1.1.2)
2. Limited personnel expertise. (C2.2.4.5)

##### **Civil**

1. Mixed support for political policies. (C3.1)
2. Limited foreign government support. (C3.1.2.3.)

### **4.8.2 Functional Needs Analysis**

#### **4.8.2.1 Capability and Deficiency Assessment Summary**

Table 4.8-1 discusses the only capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

Any JTF HQ has a team of operational planners and information command and control specialists. This team of experts has the skill to provide sense country assistance teams to support the TEP, but there are some deficiencies that negatively impact their ability to do so. The overall current capability is assessed as “green.”

**Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Near/mid-term experimentation results (as recommended in this JCIDS analysis) may lead to development of new capabilities. It is projected that improvements due to coordination/DOTMLPF enhancements will continue to improve the ability of the JTF to provide Sense country assistance teams to support TEPs. The overall capability will remain “green” in the near/mid term.

**Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. New organizational structures or other capabilities and cooperative ventures with theater partners resulting from near/mid-term experimentation results (as recommended in this JCIDS analysis) should continue to improve the ability of OP-level units to provide Sense country assistance teams to support TEPs. Specific doctrine will be developed. The linkage of restoration operations country assistance teams will be integrated into leader education. This task will be integrated as a standard part of training. Teams will be organized, equipped, trained, and educated. The overall capability will improve to “green” in the far-term.

**Table 4.8-1. OPSENS 8: Capability and Deficiency Assessment**

Capability: Operational-Level HQ	M1	M2	M3	M4
Current Overall Capability <sup>1</sup>	Y <sup>2</sup>	G <sup>3</sup>	G <sup>4</sup>	G <sup>5</sup>
Near/Mid-Term Overall Capability	Y	G	G	G
Far-Term Overall Capability <sup>6</sup>	G <sup>7</sup>	G	G	G

	FAA Measure	Scale
M1	Personnel from allied/friendly nations are enrolled in United States–provided military training.	G – Yes, Y – Limited, R – No
M2	Valid requests for Sense security assistance are met.	G – Yes, Y – Limited, R – No
M3	Quick response to requests for Sense security assistance.	G – Yes, Y – Limited, R – No
M4	Employ assistance team support to/from area of responsibility area of responsibility (AOR) nations (e.g., Cooperative Defense Initiative (CDI)).	G – Yes, Y – Limited, R – No

<sup>1</sup> No specific doctrine has been developed. The linkage of restoration operations restoration operation country assistance teams is not integrated into leader education. This task is not a standard part of training. Teams are not organized, equipped, trained, or educated.

<sup>2</sup> Nothing prevents personnel from allied/friendly nations from enrolling in United States–provided military training. There is currently no United States–provided military training on Sense-related topics.

<sup>3</sup> Once Sense country assistance teams are able to provide sense-related security assistance, nothing precludes valid requests from being met.

<sup>4</sup> Once Sense country assistance teams are able to provide sense-related security assistance, nothing precludes a quick response to requests.

<sup>5</sup> Nothing precludes assistance team support to/from AOR nations (e.g., CDI) from being employed once organized, equipped, trained, and educated in/on Sense-related issues.

<sup>6</sup> Specific doctrine will be developed. The linkage of restoration operations restoration operation country assistance teams will be integrated into leader education. This task will be integrated as a standard part of training. Teams will be organized, equipped, trained, and educated.

<sup>7</sup> United States–provided military training on Sense-related topics will be developed and be available for presentation to applicable nations.

### 4.8.3 Functional Solution Assessment

#### 4.8.3.1 DOTLPE Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** There are currently no United States–provided military TTPs or training on Sense-related topics.  
**Non-Materiel Solutions:** *Doctrine:* Develop Sense-related training for personnel from allied/friendly nations to enroll in. *Training:* Develop specific doctrine to guide and suggest Sense-related TEP opportunities.
- 2. Deficiency:** No specific doctrine has been developed.  
**Non-Materiel Solutions:** *Doctrine:* The Chairman of the Joint Chiefs of Staff (CJCS) has not developed an operational concept for Sense country assistance teams, and specific guidance (technical or procedural) on how to approach this task has not been provided. Develop TTPs, organizational structure, training, leadership education, and equipment for Sense country assistance teams to support TEPs.
- 3. Deficiency:** The linkage of Sense country assistance teams to TEP is not integrated into leader education.  
**Non-Materiel Solutions:** *Leadership:* Develop JPME classes for Sense country assistance teams to support TEPs.
- 4. Deficiency:** This task is not a standard part of training.  
**Non-Materiel Solutions:** *Training:* Develop training for Sense country assistance teams to support TEPs.
- 5. Deficiency:** Teams are not organized, equipped, trained, or educated.  
**Non-Materiel Solutions:** *Organization:* Develop organizational table of distribution and allowances (TDA) for Sense country assistance teams to support TEPs. *Training:* Develop training for Sense country assistance teams to support TEPs. *Leadership:* Develop leader education for Sense country assistance teams to support TEPs.

#### 4.8.3.2 IMA Assessment Summary

N/A

## **4.9 Task OPSENS 9: Provide JOA screening for endemic disease and/or hazardous substances in the environment**

### **4.9.1 Functional Area Analysis**

#### **4.9.1.1 Definition**

To use JTF resources to provide JOA screening for endemic diseases and/or hazardous substances in the environment. All JOA capabilities are employed to ensure that endemic diseases and/or hazardous substances in the environment are detected, JOA military forces are warned, and appropriate preventive action is taken.

#### **4.9.1.2 Derivation**

*UJTL (ST 4.2.2.4, OP 2.2.1, OP 7.5).*

##### **4.9.1.2.1 Supported Task: STSENS 8**

##### **4.9.1.2.2 Lateral Task: N/A**

##### **4.9.1.2.3 Supporting Task: N/A**

#### **4.9.1.3 Conditions**

Perform this task under the following conditions:

**Physical.** N/A

**Military**

1. Partial preexisting arrangements. (C2.1.1.2)

**Civil**

1. Limited foreign government support. (C3.1.2.3)
2. Moderately opposed foreign public opinion. (C3.1.2.4)

### **4.9.2 Functional Needs Analysis**

#### **4.9.2.1 Capability and Deficiency Assessment Summary**

Table 4.9-1 discusses the only capability that exists to perform the task to the designated standard, resident within the JTF staff.

**Current Capability and Deficiency**

Resources and DOTLPF exist to support JTF staff information and data collection, processing, and correlation from a variety of sources (national, international, military, civilian, etc.) to identify potential hazards and endemic diseases for evaluation and assessment of their probable impact and the necessary protective measures. The DoD Global Emerging Infections Surveillance and Response System (GEIS) and Armed Forces Medical Intelligence Center (AFMIC) maintain active surveillance for infectious diseases that might affect military personnel, readiness, and operations are resources for the JTF staff through reachback. COCOM resources and information are also available using reachback capabilities. Information and data within the JOA provided by coalition/partner forces, identified in JTF element reports, and developed by medical surveillance processes—to name a few—provide the JTF staff with critical indicators of potential and ongoing issues. Dissemination of warnings to JTF forces identifying these potential hazards and diseases, and the associated protective measures are incorporated within existing doctrine. Deficiencies are related to the level of automation of information and data resources, their compatibility, and supporting reachback capabilities.

**Projected Near/Mid-Term Capability and Deficiency**

There are no foreseeable changes in the near/mid term.

**Projected Far-Term Capability and Deficiency**

There are no foreseeable changes in the far term.

**Table 4.9-1. OPSENS 9: Capability and Deficiency Assessment**

<b>Capability: JTF Staff</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>Y<sup>2</sup></b>	<b>Y<sup>3</sup></b>	<b>Y<sup>4</sup></b>	<b>Y<sup>5</sup></b>
<b>Near/Mid-Term Overall Capability</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>
<b>Far-Term Overall Capability</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	All diseases/hazards are identified.	G – Yes, Y – Limited, R – No
M2	Medical, operational, intelligence, and environmental data are correlated.	G – Yes, Y – Limited, R – No
M3	Diseases/hazards are identified in time to warn forces and take appropriate preventive measures.	G – Yes, Y – Limited, R – No
M4	Diseases/hazards are identified in time to treat forces.	G – Yes, Y – Limited, R – No

<sup>1</sup> Adequate DOTLPF exists to conduct this task.

<sup>2</sup> Limited. Pathogens of military importance are identified. AFMIC and GEIS are resources for information on infectious diseases posing a threat to personnel or reduce medical readiness. Other types of hazards are reviewed for their impact upon military forces, depending upon type and scope. For example, ITF-40 assesses a number of industrial chemicals for their potential impact. However, ITF-40 does not assess all the potential industrial chemicals possibly existing within an area of interest. The COCOM is an informational and support resource for the JTF through reachback. Information must be collected, processed, and correlated from a variety of sources (e.g., coalition/ partner forces, JTF force reports, medical surveillance, etc.) to identify potential hazards and endemic diseases for evaluation and assessment of their probable impact and the necessary protective measures.

<sup>3</sup> Limited. Resources such as AFMIC, COCOM, GEIS, and others are identified as reliable sources for data and information about most areas of interest. Additionally, information observed and reported by coalition/partner forces and JTF elements is critical to identifying and assessing ongoing or potential issues. However, much of the information and data must be collected, processed, correlated, evaluated, and assessed manually. Reachback resources provide the JTF staff with information sources and data essential to the assessment process. However, automated reachback capabilities for expert advice, information gathering, and information transfer are not fully developed or available necessitating manual processes. Many resource systems are not integrated or are not automated. Information systems within DoD, Service, theater, other government agencies, and JTF elements are frequently stovepiped, and the information must be manually transferred from one system to another. Additionally, data structures and fields are not always compatible between systems impacting application of data transfer utilities.

<sup>4</sup> Limited. Diseases and hazards within an area of interest are not static. These change over time. JTF plan implementation processes incorporate requirements for ensuring currency of information and decisioning parameters. Adjustments are made as necessary. Identification of endemic diseases and hazards of military importance are disseminated and are accompanied with guidance on preventive measures. Changes to this information are disseminated throughout operations. However, the largely manual nature of the current process is time-consuming, and the potential exists for exposure prior to receipt of warning.

<sup>5</sup> Limited. Ability to identify disease in time to treat is dependent on type of disease and in-country/JOA intelligence. Some countries/areas may be reluctant to assist in identifying disease outbreaks due to quarantine and economic concerns.

### 4.9.3 Functional Solution Analysis

#### 4.9.3.1 DOTLPE Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** Not all potential hazards have been assessed for their military importance. For example, ITF-40 does not assess all the potential industrial chemicals possibly existing within an area of interest.  
**Non-Materiel Solutions:** *Leadership:* Ensure leadership awareness of potential gap in existing information and potential sources for information and data.
- 2. Deficiency:** Automated reachback capabilities for expert advice, information gathering, and information transfer are not fully developed or available necessitating manual processes.  
**Non-Materiel Solutions:** *Doctrine:* Emphasize application of automated reachback processes, enforce existing automated system/software standards, and identify resources—both subject matter experts (SMEs) and information/data sources—supporting JTF planning and operations; particularly expeditionary operations. *Organization:* Review existing and adjust as necessary potential SME and information/data resource organizational structures and responsibilities for support of JTF manual and automated reachback. *Training:* Develop training, institutional and unit level, on conduct and application of manual and automated reachback for SME and information/data interchange. *Leadership:* Ensure leadership emphasis upon reachback support (manual and automated) and JTF organic operational resourcing (e.g., data libraries, tools, etc.). *Personnel:* Identify and develop SME resources. *Facilities:* Develop infrastructure enhancements and capabilities supporting JTF automated reachback requirements.
- 3. Deficiency:** The largely manual nature of the current process is time-consuming, and the potential exists for exposure prior to receipt of warning.  
**Non-Materiel Solutions:** *Leadership:* Ensure leadership awareness of issues associated with information collection and processing and need for force preparedness and prior knowledge of hazards/diseases of military importance in area of interest.

## **4.10 Task OPSENS 10: Develop JOA environmental background data including climatology**

### **4.10.1 Functional Area Analysis**

#### **4.10.1.1 Definition**

To use JTF resources to obtain and assess JOA environmental background data (including climatology) for potential CBRN/TIM implications.

#### **4.10.1.2 Derivation**

*UJTL (OP 7.5, OP 2.2.3).*

##### **4.10.1.2.1 Supported Task: STSENS 9**

##### **4.10.1.2.2 Lateral Task: N/A**

##### **4.10.1.2.3 Supporting Task: N/A**

#### **4.10.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Partial preexisting arrangements. (C2.1.1.2)

### **4.10.2 Functional Needs Analysis**

#### **4.10.2.1 Capability and Deficiency Assessment Summary**

Table 4.10-1 discusses the capability that currently exists to perform the task to the designated standards within the theater. There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The OP-level/JTF J-3 works with various service component assets, as well as the COCOM J-3, which can access national DoD assets that operate a military environmental service system to provide specialized JOA meteorological, space, environmental, and oceanographic analysis and prediction services in support of military forces.

### **Projected Near/Mid-Term Capability and Deficiency**

Capabilities will improve only as a result of improved CBRN experimentation and integration into exercises.

### **Projected Far-Term Capability and Deficiency**

Capabilities will improve only as a result of improved CBRN experimentation and integration into exercises. This will ultimately result in effective enhancements to all DOTLPF. JOA CBRN considerations will be integrated into environmental and climatology processes, TTPs, and doctrine.

## 5.0 Tactical Sense

### 5.0.1 Introduction

At the tactical level of war, battles and engagements are planned and executed to accomplish military objectives assigned to tactical units or task forces. Activities at this level focus on the ordered arrangement and maneuver of combat elements in relation to each other and to the enemy to achieve combat objectives. Seventeen tactical sense tasks were identified in the chemical, biological, radiological, and nuclear (CBRN) Functional Area Analysis (FAA).

This chapter, detailing the Tactical Sense area, restates relevant information from the CBRND FAA, including a description of each of the 17 Tactical Sense tasks, derivation of the task, an indication of other linked tasks, and the pertinent conditions. The Functional Needs Analysis (FNA) section addresses the capability and deficiency analysis and provides brief descriptions of predicted near/mid-term and far-term changes. Once all the capabilities are considered, the assessment concludes with a separate, overarching look at the entire capability spectrum to identify remaining gaps and/or synergies. The Functional Solutions Analysis (FSA) section addresses possible solutions for the deficiencies identified in the FNA section. These are categorized into materiel and non-materiel solutions. The non-materiel solutions are addressed first and reflect one or more of the six areas of DOTLPF: doctrine, organization, training, leadership, personnel, and facilities. If there are no or only partial non-materiel solutions to the deficiencies, then materiel solutions are considered. These encompass broad approaches that are not system-specific. These potential materiel approaches are addressed and evaluated in the Ideas for Materiel Approach (IMAs) section. The IMAs can potentially mitigate or resolve in the near/mid- or far-term future.

Most of the Tactical Sense tasks involve detection of chemical, biological, and radiological hazards in the atmosphere, in water, and on surfaces, personnel, and military working animals (MWAs), specifically military working dogs (MWDs). The connectivity and interoperability of detectors (i.e., the ability of detectors to report findings and system status via fully interoperable and net-centric data links to current and programmed SHAPE systems) are key attributes that were not considered during this analysis. The closely related ability of detectors and detection systems to be remotely operated was also not considered. All programmed future Sense systems include these capabilities (interoperability, connectivity, and remote operation) when practical or required, while legacy systems and commercial off-the-shelf (COTS) items have limited or no capability in these areas. Only detection capabilities that are currently fielded by one or more units in the military or projected to be fielded by one or more military units in the future are considered in this assessment. For each task, capabilities are categorized according to the time period during which they are available or are projected to be available (e.g., a capability included under a “near/mid-term” heading is not currently available but is predicted to be available sometime during the near/mid-term future [i.e., FY2007–FY2011] and will remain available through the far-term future [FY2012–FY2020]). Availability of individual capabilities is not considered in task overall capability assessments. An overall capability for a task is determined by simply calculating the arithmetic mean of all relevant individual capabilities.

### 5.0.2 FNA Summary

The table below summarizes the overall current and projected capability to perform the Tactical (TA)-level Sense (SENS) tasks identified in the CBRND FAA. The overall capability to conduct TASENS tasks in the current time frame is assessed as “yellow.” In regards to chemical detection, there are key deficiencies in the U.S. Department of Defense’s (DoD’s) ability to detect low-level chemical hazards, toxic industrial chemicals (TICs) in general, and TICs and chemical warfare agents (CWAs) in water. DoD also lacks adequate capabilities to detect toxic industrial biologicals (TIBs) in general, biological warfare agents (BWAs) in time to warn, and biological hazards in water. Currently, radiological hazards cannot easily be detected without exposing the operator to potentially harmful radiation. Finally, DoD typically cannot quickly identify deployed and employed CBRN weapons and units on the battlefield.

It is projected that the overall capability will improve, but remain “yellow,” at the end of the FY2007–FY2011 program objective memorandum (POM) period as more advanced detectors are fielded. Near/mid-term future fielding of the Joint Chemical Agent Detector (JCAD), Joint Biological Agent Identification and Diagnostic System (JBAIDS), and Joint Service Lightweight Standoff Chemical Agent Detector (JSLSCAD), among others, is expected to mitigate major capability gaps in the detection of chemical hazards in the atmosphere and biological hazards in environmental samples. The projected overall status is not “green” since key deficiencies are likely to remain in areas including chemical aerosol detection, biological and chemical standoff detection, TIC and TIB detection, low-level chemical and biological detection, sample collection for future analysis, detector susceptibility to interference, authentic standoff radiological detection, radioisotope identification, and sensing tactical deployment and employment of CBRN weapons on the battlefield.

In the foreseeable far-term future (i.e., FY2012–FY2020), the overall capability will improve slightly over the near/mid-term future and thus will remain “yellow.” Far-term fielding of the Joint Chemical Biological Agent Water Monitor (JCBAWM), Joint Modular Chemical and Biological Detection System (JMCBDS), and Joint Biological Standoff Detection System (JBSDS), among others, is expected to mitigate major capability gaps in rapid detection of chemical and biological hazards in the atmosphere and in water. Key deficiencies are likely to remain in those areas discussed in the previous paragraph for the near/mid term.

**Table 5-01. Tactical Sense Summary FNA Findings**

### 5.0.3 Individual Capability Descriptions

The following text briefly describes the 27 chemical, 13 biological, and 15 radiological individual detection capabilities assessed in the FNA.

#### Individual Chemical Detection Capabilities

##### AN/KAS-1

The AN/KAS-1, a manual shipboard nerve agent standoff detector, detects vapors in the atmosphere, does not detect concentrations which can cause low-level (e.g., ocular) effects<sup>1</sup> and is susceptible to chemical interference (false positives and negatives). Its performance is highly dependent on the skill level of the operator.<sup>2</sup>

**APD2000**

The APD2000, an automatic point detector, detects vapors in the atmosphere and off-gassing from surfaces, personnel, and MWAs; does not detect concentrations which can cause low-level (e.g., ocular) effects; and is susceptible to chemical interference (false positives and negatives).<sup>3</sup>

**ARTEMIS**

The ARTEMIS, a far-term future automatic shipboard and fixed-site standoff detector, will detect vapors and aerosols in the atmosphere; will not detect concentrations which can cause low-level (e.g., ocular) effects; and will be susceptible to chemical interference (false positives and negatives).<sup>4</sup>

**Chemical Agent Monitor (CAM)/Improved Chemical Agent Monitor (ICAM)**

The CAM/ICAM, a point detector, detects vapors in the atmosphere and off-gassing from surfaces, personnel, and MWAs; does not detect concentrations which can cause low-level (e.g., ocular) effects; and is susceptible to chemical interference (false positives and negatives).<sup>5</sup>

**Chemical Ag0065nt Point Detector System (CAPDS) MK21 Mod I**

The CAPDS, a point detector, detects certain nerve agent vapors in the atmosphere; does not detect concentrations which can cause low-level (e.g., ocular) effects; and is susceptible to chemical interference (false positives and negatives).<sup>6</sup>

**Chemical Biological Mass Spectrometer (CBMS)**

The CBMS, an ion trap mass spectrometer, will detect all chemical and biological warfare agents. It will detect and identify chemical agents within 15 seconds and biological agents within 3–4 minutes. It is expected to be deployed on the Nuclear, Biological, Chemical Reconnaissance Vehicle (NBCRV) Stryker and Joint NBC Reconnaissance System (JNBCRS).<sup>7</sup>

**Gas Toxic Draeger Kit**

The Gas Toxic Draeger Kit, a manual TIC point detection kit, detects, identifies, and quantifies vapors.<sup>8</sup>

**HAPSITE Chemical Identification System**

The HAPSITE Chemical Identification System, a portable gas chromatography/mass spectrometer (GC/MS), provides laboratory-quality analysis for volatile organic chemicals (VOCs) in the atmosphere. With the Headspace Sampling System, it can also detect VOCs off-gassing from water, surfaces, personnel, and MWAs. It is battery-powered and weatherproof and weighs about 35 lbs. It requires some personnel training to operate.<sup>9</sup>

**HazMatID Chemical Identification System**

The HazMatID is a portable (23 lb.) Fourier transform infrared (FTIR) spectrometer that can be used for both quantitative and qualitative material analysis of solids, powders, pastes, and liquids. The system can identify nerve and blister warfare agents, TICs, forensic drugs, white powders, explosives, weapons of mass destruction (WMD) precursors, and common chemicals within 20 seconds of sample submission.<sup>10</sup>

**Improved Chemical Agent Point Detection System (IPDS)**

The IPDS, a fixed shipboard/shore-based point detector, detects certain nerve agent vapors, does not detect concentrations which can cause low-level (e.g., ocular) effects, and is susceptible to chemical interference (false positives and negatives).<sup>11</sup>

**Joint Chemical Agent Detector**

The JCAD, a near-future automatic point detector, detects vapors only (not aerosols), does not detect concentrations which can cause low-level (e.g., ocular) effects, and is susceptible to chemical interference (false positives and negatives). The JCAD will sense the atmosphere for chemical hazards. With the XM279 probe attached, it will detect vapors off-gassing from surfaces, personnel, MWAs, and remains.<sup>12</sup>

**Joint Chemical and Biological Agent Water Monitor<sup>13</sup>**

The JCBAWM, a near/mid-term future portable device, will detect, identify, and quantify chemical and biological agents in water. Its sensitivity will meet tri-service long-term consumption standards. As an objective, it will also detect, identify, and quantify all TICs, agricultural chemicals, and biological pathogens harmful to personnel.<sup>14</sup>

**Joint Chemical Surface Detector (JCSD)**

The JCSD, a near-future automatic standoff detector, will use UV laser technology to provide standoff, real-time detection and identification of chemical liquids deposited on the ground. The JCDS will be employed on the Interim Armored Vehicle–NBC Reconnaissance Variant (IAV–NBCRV), NBC Reconnaissance System (NBCRS Fox) and JNBCRS.<sup>15</sup>

**Joint Modular Chemical and Biological Detection System<sup>16</sup>**

The JMCBDS, a far-term, handheld, stationary and on-the-move point chemical and biological (CB) detector, identifier and quantifier, detects vapors (and aerosols as an objective) and is susceptible to chemical interference (false positives and negatives).<sup>17</sup> It will sense the atmosphere. It will sense chemical hazards off-gassing or resuspending from surfaces.

**Joint Service Lightweight Standoff Chemical Agent Detector**

The JSLSCAD, a near/mid-future automatic standoff detector, detects vapors only (not aerosols), does not detect concentrations which can cause low-level (e.g., ocular) effects, and is susceptible to chemical interference (false positives and negatives). It can operate while on the move.<sup>18</sup>

**M18A2 Kit**

The M18A2 Kit, a manual point detection kit, detects vapors in the atmosphere and off-gassing from surfaces, personnel, and liquids on surfaces, personnel, and MWAs and is susceptible to chemical interference (false positives and negatives). Vapor samples can also be collected in the sample tubes and then taken to a laboratory for analysis.<sup>19</sup>

**M8 Detection Paper**

M8 Paper, colorimetric chemical detection paper contained within a booklet, detects liquid (>0.02 mL) droplets on surfaces, personnel, and MWAs and is susceptible to chemical interference (false positives).<sup>20</sup>

**M9 Detection Paper**

M9 Paper, packaged as a single roll of expendable colorimetric chemical detection paper, detects liquid ( $>100\text{ }\mu\text{L}$ ) droplets on surfaces, personnel, and MWAs and is susceptible to chemical interference (false positives).<sup>21</sup>

**M21 Remote Sensing Chemical Agent Alarm (RSCAAL)**

The M21, an automatic standoff detector available on tripod or the M93A1 Fox, detects vapors only, does not detect concentrations which can cause low-level (e.g., ocular) effects, and is susceptible to chemical interference (false positives and negatives). Its performance is degraded under precipitation, fog, extreme turbulence, high humidity, and small temperature differentials at dusk, dawn, and periods with lots of cloud cover (P5, 8, 9, 10, 11). The M21 requires 15 minutes to set up.<sup>22</sup> It can be used to sense the atmosphere.

**M22 Automatic Chemical Agent Detector Alarm (ACADA)**

The M22 ACADA, a point detector, detects vapors in the atmosphere, does not detect concentrations which can cause low-level (e.g., ocular) effects, and is susceptible to chemical interference.<sup>23</sup> With the XM279 probe attached, it can detect vapors off-gassing from surfaces, personnel, MWAs, and remains.

**M256A1 Kit**

The M256A1 Kit, a manual point detection kit, detects vapors at levels below  $\text{EC}_{t50}$  in the atmosphere and off-gassing from surfaces, personnel, and MWAs and liquids at levels below  $\text{ED}_{50}$  on surfaces, personnel, and MWAs and is susceptible to chemical interference (false positives and negatives).<sup>24</sup>

**M272 Kit**

The M272 Kit, an Army portable, lightweight colorimetric kit, detects and identifies nerve, mustard, L, and AC in treated and untreated water sources. It is susceptible to chemical interference (false positives and negatives), it does not meet tri-service field drinking water standards, and some of its reagents are very harmful to the human body.<sup>25</sup>

**M8A1 Automatic Chemical Agent Alarm System**

The M8A1, a point detector, detects nerve agent vapors, does not detect concentrations which can cause low-level (e.g., ocular) effects, and is susceptible to chemical interference (false positives and negatives).<sup>26</sup>

**M90-D-1C**

The M90-D-1C, an automatic point detector, detects vapors only, does not detect concentrations which can cause low-level (e.g., ocular) effects, and is susceptible to chemical interference (false positives and negatives).<sup>27</sup>

**Mobile Mass Spectrometer MM-1**

The MM-1, a GC/MS equipped on the M93A1 Fox, detects 60 chemical compounds, including common CW agents and some common precursor and chemical degradation products. It can detect these compounds as vapors in the atmosphere or as liquids on the ground. It is better at

detecting liquids than vapors, requires baselining in clean air, is susceptible to chemical interference (false positives and negatives), and requires extensive personnel training.<sup>28</sup>

### **MultiRAE Plus**

The MultiRAE Plus, a portable, automatic five-gas modifiable point detector, detects vapors in the atmosphere. It can be configured to sample diffused or pumped gases and has a data-logging feature.<sup>29</sup>

### **Viking SpectraTrak**

The Viking SpectraTrak, a portable GC/MS, provides laboratory-quality analysis for 62,000 chemicals in the atmosphere and water and deposited on surfaces, personnel, and MWAs. It can operate in a continuous sampling mode or be used to analyze individual samples. It is not waterproof when operating, and it requires extensive personnel training to operate. It is current available to specialized units (e.g., technical escort units) only.<sup>30</sup>

## **Individual Biological Detection Capabilities**

### **Dry Filter Unit (DFU)**

The DFU, a stand-alone collector, can be used to collect internal and external ambient air particulate samples for subsequent analysis using handheld assays (HHA) and polymerase chain reaction (PCR) assays (e.g., Ruggedized Advanced Pathogen Identification Device [RAPID]). When combined with the aforementioned assays, a DFU enables detection of low concentrations of biological agents.<sup>31</sup>

### **DoD Biological Sampling Kit (BSK)**

The DoD BSK contains a panel of eight HHAs, a blue-capped tube containing a bottle of buffer solution and cotton tipped swabs, and a basic instruction card. It provides a presumptive identification for biological warfare agents in environmental samples.<sup>32</sup>

### **Enzyme-Linked Immunosorbent Assay (ELISA)**

ELISA is a laboratory method used to detect biological agents by detecting their antigens (Ag) or their corresponding antibodies (Ab) produced by the host. The sensitivity of ELISA is  $10^6$ – $10^7$  bacterial organisms/mL; 10–100 PFU/mL of Venezuelan Equine Encephalitis virus; 625 pg/mL of Staphylococcal Enterotoxin B (aerosol); and >5 ng/mL of ricin. ELISA typically requires 1–2 hours total in light of the processing, specimen and reagent application, and incubation times.<sup>33</sup>

### **Interim Biological Agent Detection System (IBADS)**

The IBADS, a Navy afloat point detector, monitors, collects, detects, and identifies airborne biological agents.<sup>34</sup>

### **Joint Biological Agent Identification and Diagnostic System**

JBAIDS is a near-future portable, reusable, and modifiable biological agent point detection and identification system for select environmental samples and clinical specimens (including swabs, sera, sputum, bodily exudates, feces, aerosol diluents, autopsy tissues, and soil). It could be used in mobile and fixed facilities, vehicles, aircraft, and ships. Block I JBAIDS will detect and identify all BWA pathogens at concentrations of 1000 CFU/mL and 10,000 PFU/mL (100

CFU/mL and 1,000 PFU/mL as an objective). Block II JBAIDS will detect and identify BWA toxins as well at concentrations of 1 µg/mL (1 pg/mL as an objective).<sup>35</sup> JBAIDS will require extensive personnel training to operate.

### **Handheld Assays with Sample Preparation Materials**

HHAs are simple, disposable, portable antibody-based devices that presumptively detect the presence of a particular biological agent in environmental samples. With various immunochromatography strips (e.g., Tetracore BioThreat Alert Test Strips, ANP Tech handheld assay, Environmental Technologies Group SMART Detection tickets, and near-future Battelle/Applied Biosystems PCR and antibody assays), all BWAs with possible exception of VHF can be detected if present at concentrations within detection limits. One vial of buffer solution and an instruction sheet are included with each handheld assay. Prepackaged sterile swabs, small sealable plastic bags, and a timer or wristwatch are not included and must be obtained separately.<sup>36</sup>

### **M31A2 Joint Biological Point Detection System (JBPDS)**

The JBPDS, a joint point detector, monitors, collects, stores, detects, and identifies airborne biological agents. It is compatible with multiple platforms (e.g., shipboard, portable, trailer-mounted, shelter version, STRYKER, and NBC Recon version) and is the first point detection capability for the Marines. It is anticipated to be used by the Air Force.<sup>37</sup>

### **Joint Biological Standoff Detection System<sup>38</sup>**

The JBSDS detects airborne biological clouds by shooting infrared (IR) + ultraviolet (UV) laser beams downrange to detect, track, and discriminate potential threats. The approach is based on LIDAR, which stands for Light Detecting and Ranging. The system will be compatible with multiple vehicle platforms. JBSDS will detect aerosol clouds consistent with a biological warfare (BW) release at ranges up to 5 km with a detection probability of 90% during normal night conditions and discriminate clouds with particles of biological origin from clouds with particles of nonbiological origin up to 1 km with a probability of 90% during normal night conditions and sufficient line of sight.<sup>39</sup>

### **Joint Chemical and Biological Agent Water Monitor**

The JCBAWM, a far-term future portable device, will detect, identify, and quantify chemical and biological agents in water. Its sensitivity will meet tri-service long-term consumption standards. As an objective, it will also detect, identify, and quantify all TICs, agricultural chemicals, and biological pathogens harmful to personnel.<sup>40</sup>

### **Joint Modular Chemical and Biological Detection System**

JMCBDS is a near-future handheld, stationary and on-the-move point CB detector, identifier, and quantifier (objective). It will be employable on many platforms (e.g., individuals, vehicles, aircraft, unmanned aerial vehicles [UAVs], and ships). It will detect all biological agents listed in the Joint Chiefs of Staff threat list, and it will identify and quantify detected agents as an objective.<sup>41</sup>

**M31 Biological Integrated Detection System (BIDS)**

The BIDS, a vehicle-portable biological point detector, is the Army's first biological detection capability. It monitors, collects, stores, detects, and identifies airborne biological agents.<sup>42</sup>

**Portal Shield**

Portal Shield is a network of a variable number of sensors for airborne biological agents mounted around the perimeter of a fixed site, commanded and controlled by a centralized post computer.<sup>43</sup>

**Ruggedized Advanced Pathogen Identification Device**

The RAPID, a portable, field-hardened, rapid thermocycler with concurrent fluorescence monitoring, detects and identifies biological agents in buffered samples through the use of real-time polymerase chain reaction (RT-PCR) technology. The sensitivity of RT-PCR is 15 fg–1 pg or 20–2 million plasmid copies for bacteria and 15 fg–1 pg or 100–1 million copies of the complementary deoxyribose nucleic acid (DNA) for viruses. RAPID can test up to 32 prepared test samples within 30 minutes.<sup>44</sup> JBAIDS will be based on RAPID technology.

**Individual Radiological Detection Capabilities****ADM-300**

The ADM-300, an Air Force portable radiation detection, identification, and computation (RADIAC) device, detects, identifies, and quantifies in real time alpha, beta, gamma, and x-radiation emitted from radiological materials in the atmosphere and on surfaces. It measures 0.1 µR/hour–10,000 R/hour for gamma radiation and 10 µR/hour–5 R/hour for beta radiation.<sup>45</sup>

**AN/PDQ-1 Multi-Function Radiation (MFR) Detector**

The AN/PDQ-1, a Navy portable RADIAC device, detects and identifies in real time beta and gamma radiation emitted from radiological materials in the atmosphere and on surfaces. It also quantifies the detected gamma, but not beta, radiation.<sup>46</sup>

**AN/PDR-27**

The AN/PDR-27, a Navy portable RADIAC device, detects and identifies in real time beta and gamma radiation emitted from radiological materials in the atmosphere and on surfaces. It also quantifies the detected gamma radiation 0–500 mR/hour.<sup>47</sup>

**AN/PDR-43**

The AN/PDR-43, a Navy portable RADIAC device, detects and identifies in real time beta and gamma radiation emitted from radiological materials in the atmosphere and on surfaces. It also quantifies the detected gamma, but not beta, radiation 0–500 R/hour.<sup>48</sup>

**AN/PDR-56**

The AN/PDR-56, a Navy and Marine Corps portable RADIAC device, detects and quantifies in real time alpha radiation emitted from radiological materials in the atmosphere and on surfaces. It measures 0–1,000,000 cpm.<sup>49</sup>

**AN/PDR-63**

The AN/PDR-63, a Marine Corps portable RADIAC device, detects, identifies, and quantifies in real time beta and gamma radiation emitted from radiological materials in the atmosphere and on surfaces. It measures 0–1 mrad/hour and 0–5000 rad/hour.<sup>50</sup>

**AN/PDR-65**

The AN/PDR-65, a Navy portable RADIAC device, detects and quantifies in real time gamma radiation emitted from radiological materials in the atmosphere and on surfaces. Its range is 0–10,000 R/hour.<sup>51</sup>

**AN/PDR-75**

The AN/PDR-75, an Army and Marine Corps dosimeter reader (CP-696/PRD-75), and its associated wristwatch-like dosimeter (DT-236/PDR-75) provide the capability to monitor and record the exposure of individual personnel to gamma and neutron radiation. It measures an individual dosimeter's total neutron and gamma dose 0–1000 cCy.<sup>52</sup>

**AN/PDR-77**

The AN/PDR-77, an Army portable RADIAC device, detects, identifies, and quantifies in real time alpha, beta, gamma, and x-radiation emitted from radiological materials in the atmosphere and on surfaces. It measures the count rate 1-999,000 cpm.<sup>53</sup>

**AN/UDR-13**

The AN/UDR-13, an Army portable RADIAC device, detects, identifies, and quantifies in real time gamma and neutron radiation emitted from radiological materials in the atmosphere and on surfaces. It measures the dose rate 0.1–999 cGy/hour and the total dose 0.1–999 cGy.<sup>54</sup>

**AN/VDR-2**

The AN/VDR-2, an Army and Marine Corps portable RADIAC device, measures and displays a gamma dose rate from background to 99.9 Gy/hour. Additionally, the AN/VDR-2 measures, stores, and displays accumulated dose from 0.01 µGy to 9.99 Gy.<sup>55</sup>

**Berkeley Nucleonics Corporation Surveillance & Measurement System 935**

The Berkeley Nucleonics Corporation Surveillance and Measurement (SAM) System 935 is a portable radioisotope identifier device. Its internal gamma detector enables multiple and concurrent radionuclide identification within one second. The device measures and displays the dose rate and dose in rem or sieverts. It has programmable audio and visual alarms. The published minimum detectable limit for the device is 0.5 µR/hour. An external gamma detector and internal neutron detector are optional.<sup>56</sup>

**CP-95/DT-60**

The CP-95, a Navy dosimeter reader and its associated dosimeter (DT-60), which is about the size of a quarter, provides the capability to monitor and record the exposure of individual personnel to gamma radiation. It measures an individual dosimeter's total gamma dose 10–600 Roentgens.<sup>57</sup>

**IM-93 and IM-143**

The IM-93 and IM-143 are Navy personal self-reading pocket dosimeters that indicate the total gamma radiation dose 0–600 Roentgens.<sup>58</sup> The IM-143 is also used by the Marine Corps.

**Siemens EPD<sup>®</sup> Mk2**

Siemens EPD<sup>®</sup> Mk2 is an electronic personal dosimeter that is sensitive to beta, gamma, and x-radiation. It provides a direct readout of deep/whole body and shallow/skin doses (0  $\mu$ Sv to >16 Sv, which is 0 mrem to >1600 rem) and dose rates (0  $\mu$ Sv to >4 Sv, which is 0 mrem/hour to >400 rem/hour). The dosimeter includes programmable deep/whole body and shallow/skin dose and dose rate alarms.<sup>59</sup>

**5.0.4 FSA Summary**

The paragraphs below summarize the assessment of all potential DOTMLPF (non-materiel and materiel) solutions for the capability gaps identified in the FNA section. The materiel approaches address both current and nondeveloped technologies for possible materiel solutions.

**5.0.4.1 DOTMLPF**

Non-materiel (DOTLPP) and materiel (M) solutions have been identified. Non-materiel solution assessments are guided by DOTLPP (doctrine, organization, training, leadership, personnel, and facilities) in accordance with CJCS 3170 and include solutions such as increasing training (T) on a detector due to its sophistication, increasing the number of reconnaissance personnel (P) required to perform a given task, or to determining the threshold contamination level for low-level health effects (D). If non-materiel solutions do not fully address a capability gap, then a materiel solution is sought. A materiel solution under the auspices of Sense may include a chemical detector with greater sensitivity, a standoff chemical detector with an extended range and higher degree of probability, a real-time biological detector, or an increased capability to detect TICs.

**5.0.4.2 IMA**

The Ideas for Materiel Approaches table below summarizes possible materiel approaches that address the remaining materiel requirements of the doctrine, organization, training, materiel, leadership and education, personnel, and facilities (DOTMLPF) assessment. These approaches are in various stages of development. Therefore, some are more readily applicable than others. Of the 18 IMAs, 12 are applicable to chemical detection, 10 are applicable to biological detection, and 6 are applicable to radiological detection.

**Table 5-02. Detection/SENSE Ideas for Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
<b>Mass spectrometry</b>  Sensing CWAs, TICs, BWAs, TIBs, (rad)  Agent physical state(s): gases, aerosols, liquids	Microanalytical approach that uses the difference in mass-to-charge ratios of chemical molecules or biomolecules to separate them from one another. It requires only a few nanograms of an analyte to obtain characteristic information on the analyte's structure and molecular weight. It requires that the sample be introduced in the gaseous phase, and this can be achieved by GC, high-performance liquid chromatography, ion chromatography, or capillary zone electrophoresis for chemical analytes or pyrolysis-gas chromatography-ion mobility spectrometer, Matrix-Assisted Laser Desorption Ionization–Time of Flight (MALDI-TOF), among others, for biological analytes. Theoretically, all known chemical warfare agents, TICs, bacteria, viruses, and toxins can be detected, identified, and quantified by MS, though it is not currently possible to achieve this in near-real time for detect-to-warn. <sup>60</sup> Mass spectrometry can also be used to help identify the chemical composition of detected and isolated radioactive materials.

<p><b>IR, UV, and microwave spectroscopy</b><sup>61</sup></p> <p>Sensing CWAs, TICs, BWAs, TIBs, and possibly rad</p> <p>Agent physical state(s): gases, aerosols, liquids</p>	<p>Based on the emission and absorption of IR, UV, and microwave radiation by chemicals and biomolecules of interest. Since characteristic vibrational wavelengths of most CW agents (and more specifically the phosphorus-oxygen bond on nerve agents, for example) occur in the IR region of the electromagnetic spectrum, IR spectroscopy is typically used for chemical detection. UV laser and laser-induced fluorescence (LIF) have been used to detect the presence of biological aerosols. Through IR and UV spectroscopy could be used for point detection, they are usually used for standoff detection. They can currently detect, identify, and quantify the line concentrations of chemicals and detect and discriminate between biological and nonbiological aerosols. Note that microwave spectroscopy is currently in the research and development phase.</p> <p>There are many variations of IR, UV, and microwave spectroscopy. Photoacoustic infrared spectroscopy (PIRS) is one such variation, which is presented as a separate IMA since it is frequently assessed separately in technical literature.<sup>62</sup></p> <p>In terms of radiological detection, the Canadian CBRN Research &amp; Technology Initiative (CRTI) is developing a standoff radiation detector. A laboratory prototype detector is capable of taking images of a scene and analyzing the images for ionizing radiation signatures. Alpha, beta, and gamma sources have been imaged under a variety of conditions. Alpha sources of only a few millicuries have been imaged at tens of meters with high signal-to-noise ratios.<sup>63</sup> The underlying technical approach for the detector has not been disclosed. The detector may be detecting fluorescence of air molecules that are being ionized by the radiation.</p>
--	---

<b>Ionization/ion mobility spectrometry (IMS)</b>  Sensing CWAs, TICs  Agent physical state(s): gases, vapors	<p>Based on small differences in the velocity of ions along a cylindrical tube across which a constant electric field is applied. An IMS detector typically operates by drawing air at atmospheric pressure into a reaction region, where the sample constituents are ionized. The sample must be in the vapor or gas phase (though theoretically liquid samples could first be volatilized). The ions travel through a charged drift tube, where they collide with a detector plate, thus producing a current that can be registered. A plot of the current versus time provides a characteristic ion mobility spectrum. The intensity of the spectrum peaks corresponds to the agent concentration. The response time ranges from several seconds to a few minutes.<sup>64</sup></p> <p>By adding an additional gate to the ion drift region, Fourier transform ion mobility spectrometry can be achieved, thus increasing sensitivity, specificity, and reducing false alarms. Discrimination between different organophosphate molecules may be possible; however, the approach still requires the agent be in the gaseous or vapor phase (no aerosols).<sup>65</sup></p>
<b>Photoacoustic infrared spectroscopy</b>  Sensing CWAs, TICs  Agent physical state(s): gases, liquids	<p>Like other infrared spectroscopy approaches, PIRS uses the selective absorption of IR radiation by chemical agent vapors and gases to identify and quantify the agent present. However, in contrast to traditional IR spectroscopy, PIRS typically uses a microphone to detect acoustic waves that result from absorption of IR radiation by a sample. It has been claimed that the gas-microphone method has been used for the characterization and analysis of solids and liquids in addition to gases. It is anticipated that a large number of chemical agents can be detected with this technology.<sup>66</sup></p>
<b>Chemiluminescence</b>  Sensing CWAs, TICs  Agent physical state(s): gases, liquids	<p>Based on quantitative measurement of the optical emission produced by a chemical reaction of the analyte and a reagent. Since chemiluminescence can take place in either the liquid or gas phase, it can be used for detecting chemicals in water. Phosphorus chemiluminescence detectors can be used to detect many chemical agents and are frequently coupled with gas chromatography.<sup>67</sup></p>

<p><b>Surface acoustic wave (SAW)</b></p> <p>Sensing CWAs, TICs, BWAs, TIBs</p> <p>Agent physical state(s): gases, aerosols</p>	<p>Based on piezoelectric materials (those that produce an electrical current when subjected to pressure or mechanical stress) coated with different absorbent polymers for chemical analytes or antibodies or complementary nucleic acid sequences for biological analytes. The chemical and biological analytes selectively absorb into or bind to the coated piezoelectric materials. Most SAW detectors incorporate an analytical preconcentrator (e.g., GC) to overcome absorption or binding limitations.<sup>68</sup> Sensitivities on the order of <math>10^5</math>–<math>10^6</math> cells have been reported for SAW biological detectors.</p> <p>Regarding SAW chemical detectors, the used absorbent polymers are susceptible to damage from certain highly reactive vapors (e.g., hydrofluoric acid). Furthermore, they are susceptible to interference from absorption of water and consequently must be calibrated to account for ambient relative humidity.</p>
<p><b>Colorimetric</b></p> <p>Sensing CWAs, TICs, BWAs, TIBs</p> <p>Agent physical state(s): gases, (aerosols), liquids</p>	<p>Based on a visible color change resulting from a chemical reaction that occurs when particular chemicals interact with various solutions and substrates. In regards to current chemical detection capabilities, the colorimetric approach is typically the fastest, cheapest, lightest, and easiest to use. Color-change detectors can detect nerve, blister, and blood agents with detection tubes, papers, or tickets that are coated with a particular substrate or reagent solutions. Responses range from immediate to several minutes. In addition, colorimetric approaches can detect VOCs, including carboxylic acids, alcohols, amines, ethers, thioethers, and thiols, generated by microorganisms (i.e., bacteria). Since each species of microorganism (e.g., bacteria) emits a distinct profile of enzymatic reaction products in the form of VOCs, biological detection and identification is possible for those microorganisms for which volatile metabolites are known. The ChemSensing Colorimetric Sensor uses this technological approach.<sup>69</sup></p> <p>Currently, some colorimetric systems have semiquantitative capabilities. Colorimetric detection tubes provide a semiquantitative indication of the amount of agent present. Results are dependent on the analyte being tested, its concentration, and the flow rate.</p>

<p><b>Raman spectroscopy</b></p> <p>Sensing CWAs, TICs, BWAs, TIBs</p> <p>Agent physical state(s): gases, aerosols, liquids</p>	<p>Based on the scattering of incident electromagnetic radiation by chemical species present in a (transparent) medium. Though similar in application to IR spectroscopy, the mechanism in Raman scattering differs from infrared absorption; for this reason, it is considered as a separate IMA. Current applications of Raman spectroscopy include nondestructive evaluation of CW agents in glass ampoules and bottles. Since surface-enhanced Raman spectroscopy (SERS) has been demonstrated for the detection of trace levels of CWAs and bacteria both in the vapor phase and in aqueous solution, an array of SERS sensors may be able to rapidly analyze ambient air and drinking water supplies. SERS requires no sample pretreatment and typically provides a response within 30 seconds. Another technique, resonance Raman spectroscopy using UV excitation, may be preferred over SERS in detecting biological agents in light of its more intense scattering and avoidance of background fluorescence.<sup>70</sup></p> <p>Raman Spectroscopy has been considered as a potential technological basis for standoff detection (specifically biological detection/identification).<sup>71</sup></p>
<p><b>Photoionization detection</b></p> <p>Sensing CWAs, TICs</p> <p>Agent physical state(s): gases</p>	<p>Based on the ionization of gaseous or vaporous chemicals through UV irradiation of a particular wavelength and detection of the ions. Specifically, a photoionization detector (PID) operates by passing an air sample between two charged metal electrodes in a vacuum region irradiated with UV radiation. A current, which corresponds to the concentration of the ionized molecular species, is produced as positively charged ions collect at the negative electrode. The specificity of the PID depends on the specificity of the excitation radiation wavelength that ionizes the molecule of interest. PIDs can be highly sensitive and quantitative when properly calibrated, though they have limited specificity and are highly subject to false positives in unknown or mixed environments.<sup>72</sup></p>
<p><b>Flame photometry</b></p> <p>Sensing CWAs, TICs, BWAs, TIBs</p> <p>Agent physical state(s): gases, aerosols</p>	<p>Based on the emission spectrum obtained through incineration of the sample in a hydrogen-oxygen flame. The emission spectrum allows for quantitative reading of the amount of a certain element in the sample. Sulfur and phosphorous flame photometry are often used to detect mustard and nerve agents, respectively. Since flame photometric detection requires separation technology for specificity, it is commonly coupled with gas chromatography.<sup>73</sup></p> <p>Though bacteria contain the same elements (e.g., Na, K, Ca, P, and S), the ratios of two atomic elements in two different bacteria are different. For this reason, flame photometry is predicted to be able to detect and identify bacterial species.<sup>74</sup></p>

<b>Electrochemistry</b>  Sensing CWAs, TICs  Agent physical state(s): gases, aerosols	Based on detection of the change of electrical potential due the absorption of a chemical into a solution or thin film. For example, the most common basis for an electrochemical gas sensor uses a conducting wire or filament that is coated with a reactive material that oxidizes rapidly when it encounters a CWA. Though electrochemical sensors are typically specific to a class of chemicals, arrays of different sensors may be able to provide coverage for multiple classes of agents and/or identify specific agents. The response time of electrochemical sensors is generally very fast (less than a minute, often seconds). Nevertheless, they are usually less sensitive than IMS and flame photometry approaches. <sup>75</sup>
<b>Immunoassay (antibody-based), including biochips</b>  Sensing BWAs, TIBs  Agent physical state(s): aerosols, liquids	Based on the highly specific binding of antigens (immunologically foreign substances) to their corresponding antibodies. The formation of an antigen-antibody complex can be monitored through different mechanisms: directly through interferometry, surface plasmon resonance, piezoelectric crystal microbalance, waveguide coupler, and electrical capacitance or indirectly through fluorescent evanescent biosensor surface, electrochemiluminescence, light-addressable potentiometric sensor immunoassay, and latex particle agglutination/light scattering. Antibodies (or analogous peptides or combinatorially derived molecules) specific for any bacteria, virus, or toxin can be made if the agent can be isolated and modeled. Detection, identification, and even quantification are possible through this technological approach. Technologies incorporating capillary electrophoresis can result in fast analysis times, potentially in near-real time. <sup>76</sup>
<b>Nucleic acid amplification/probing</b>  Sensing BWAs, TIBs  Agent physical state(s): aerosols, liquids	Based on the extreme selectivity of DNA and ribonucleic acid RNA recognition. This approach (and PCR in particular) utilizes nucleic acid probes that bind specifically to strands of complementary nucleic acids, in this case, from particular pathogens. These complementary nucleic acid segments are amplified and detected typically through luminescent tagging. The nucleic acid amplification approach is highly sensitive and specific. Detection, identification, and quantification of a pathogen of interest are possible. However, the approach cannot detect toxins (since they do not contain nucleic acids) and detection cannot be achieved in near-real time. <sup>77</sup>
<b>Tissue-based sensing</b>  Sensing BWAs, TIBs  Agent physical state(s): aerosols, liquids	Premised on the responsiveness of living cells and tissues to particular biological, chemical, or physical stimuli. A system may use primary or transformed cells from a variety of sources including neurons, immune cells, endothelial cells, fibroblasts, etc. For example, one system in the research and development stage uses B-cells engineered with recombinant antibodies that are complementary to antigens of specific bacteria and viruses. Detection is achieved through cellular bioluminescence, resulting from activation of a reporter molecule. Near-real-time (<3 min.) detection, identification, and quantification of pathogens (and possibly toxins as well) is feasible. <sup>78</sup>

<b>Multiple technologies (orthogonal)</b>	<p>The use of multiple, complementary technologies to broaden the number of agents detected and increase the reliability of the response. Examples include SAW/IMS, IMC/SAW/electrochemical/SCCell (S-CAD), GC/IMS, IMS/MS, nucleic acid/immunoassay technologies (e.g., PCR and immunological techniques), electrochemiluminescence/equilibrium immunoassay, and fluorescence correlation spectroscopy/PCR.</p>
<b>Gas-filled radiation detectors</b>  Sensing alpha, beta, gamma, and neutron radiation (possibly in the same unit)	<p>Based on detection of radiation-induced ionization of a gas contained within a defined gas chamber. When ionizing radiation enters a gas-filled detector, it may produce ions. These ions are detected as they collide with energized negative and positive electrodes within the chamber. All three main types of gas-filled radiation detectors (Geiger-Mueller detectors, proportional gas detectors, and ionization chambers) work through a variation of this mechanism.</p> <p>Geiger-Mueller detectors can respond to gamma and neutron radiation and, if equipped with a sufficiently thin chamber window, alpha and beta radiation as well. Proportional gas detectors can be used to distinguish between alpha and beta radiation. Finally, ionization chambers are typically used for gamma radiation measurements.</p>
<b>Scintillation Radiation Detectors</b>  Sensing alpha, beta, gamma, and neutron radiation (though not typically in a single unit)	<p>Based on detection of light that is emitted by particular inorganic crystals or organic compounds when exposed to ionizing radiation. Some of the scintillating materials include ZnS(Ag), anthracene, trans-stilbene, para-terphenyl, phenyl oxazole, NaI(Tl), CsI(Tl), bismuth germinate (<math>\text{Bi}_4\text{Ge}_3\text{O}_{12}</math>), and barium fluoride (<math>\text{BaF}_2</math>).</p> <p>Scintillation detectors can be used to detect alpha, beta, gamma, and neutron radiation depending on the scintillating material. Scintillation detectors for alpha radiation frequently use zinc sulfide activated with silver, ZnS(Ag), as the scintillating material. Scintillation detectors for beta and gamma radiation often incorporate organic and inorganic, e.g., NaI(Tl), scintillators, respectively. Some scintillation detectors, such as modern liquid scintillation units, can identify alpha, beta, gamma, or neutron-emitting radioisotopes in addition to detecting them.</p>

<b>Semiconductor Radiation Detectors</b>  Sensing alpha, beta, and gamma radiation (though not likely in a single unit)	<p>Based on detection of free electrons that are produced by certain semiconductors when they are exposed to ionizing radiation. The electrons are detected as they are collected at the electrodes by the applied voltage. The semiconductors that have been used for radiation detection include germanium, silicon, cadmium telluride (CdTe), and mercuric iodide (HgI<sub>2</sub>). Semiconductor neutron radiation detectors are currently in the research and development phase.</p> <p>Some germanium detectors can also identify gamma-emitting radioisotopes and they provide better energy resolution than the NaI(Tl) scintillation detector. Some silicon detectors have been used for alpha-emitting or beta-emitting radioisotope identification.</p>

**5.1 Task TASENS 1: Sense the atmosphere for chemical hazards****5.1.1 Functional Area Analysis****5.1.1.1 Definition**

To sense the atmosphere for the presence or absence of chemical hazards (encompasses chemical warfare agents and TICs) using sensors. Includes the functions of detection, identification, and quantification of the hazard. Also includes collection of samples for further analysis, along with early-warning surveillance of unforeseen hazard releases and monitoring of known hazard locations. Encompasses “detect to warn” and “detect to treat” situations. The evaluation encompasses all chemical hazards of military and medical importance.

**5.1.1.2 Derivation**

*UJTL TA 7, UJTL TA 7.1, Protection Joint Functional Concept.*

**5.1.1.2.1 Supported Tasks:** OPSSENS 1, OPSSENS 4, OPSSENS 7

**5.1.1.2.2 Lateral Task:** TASHA 16

**5.1.1.2.3 Supporting Task:** N/A

**5.1.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Mountainous, desert, jungle, and arctic terrain. (C1.1.1)
2. Significant urbanization. (C1.1.3.1)
3. Tropical, arctic, and arid climates. (C1.3.1)
4. Summer, winter seasons. (C1.3.1.1)
5. Stormy weather. (C1.3.1.3)
6. Hot, very cold air temperature. (C1.3.1.3.1)
7. High surface-wind velocity. (C1.3.1.3.3)
8. High/low relative humidity. (C1.3.1.3.5)
9. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6.1)
10. Heavy precipitation intensity. (C1.3.1.3.6.2)
11. Extreme turbulence and wind shear. (C1.3.1.3.8)
12. Negligible light. (C1.3.2.1)
13. Chemical effects. (C1.3.3.2).

**Military**

1. Stressful mission. (C2.1)
2. Location—ashore, afloat, airborne. (C2.1.4.1)

3. Minimal time available. (C2.1.5)
4. Low personnel capability. (C2.2.4)
5. Negligible personnel experience. (C2.2.4.5)
6. Ambiguous threat existence. (C2.9.3)

### Civil

1. Limited or negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)
3. High mission priority. (C3.1.3.2)
4. TICs present in the civilian sector. (C3.3.7.5).

## 5.1.2 Functional Needs Analysis

### 5.1.2.1 Capability and Deficiency Assessment Summary

Table 5.1-1 presents individual and overall current, near/mid-term, and far-term capabilities to perform the task to the designated standards. There are 16 current capabilities used to accomplish this task and five projected capabilities to be added in the future (three in the near/mid-term and two in the far-term). The individual capabilities include a range of point and standoff detectors with differing capabilities to meet the identified standards.

### Current Capabilities and Deficiencies

The overall current capability is assessed as “yellow.” Most current detectors detect the vapor of multiple CWAs and no or few TICs. Detection is usually achieved within two minutes and classification of the detected agent is typically provided. Though most detectors do not quantify the agent concentration, some provide relative hazard indications and more sensitive detectors (e.g., MS) provide absolute quantification capabilities. All but two current detectors are point detectors (AN/KAS-1 and M21 RSCAAL are standoff detectors). Though some point detectors can provide limited detect-to-warn capability, they are mainly used for detect-to-treat purposes.

There is no single capability that can perform the task to all of the designated standards. Mass spectrometers such as the Viking SpectraTrak and HAPSITE appear to be the best overall current capabilities, but they are costly, require substantial training to operate, and do not detect or identify in near-real time; consequently, they do not detect-to-warn and may be unable to identify-to-treat if high concentrations of fast-acting lethal agents are present. In addition, HAPSITE, like most current detectors, does not detect aerosols. The M8A1 ACAA and Viking Spectratrak are the only current detectors known to detect hazards in aerosol form. With few exceptions, current detectors do not detect CWAs at ECt50 ocular levels (IAW: Potential Military Chemical/ Biological Agents and Compounds. Also known as FM 3-11.9, MCRP 3-37.1B, NTRP 3-11.32, AFTTP(I) 3-2.55). No current detector detects VX vapor below immediately-dangerous-to-life-or-health (IDLH) levels, and most detectors detect soman (GD) and cyclosarin (GF) at twice IDLH levels. Other deficiencies include the lack of real-time CWA identification and TIC detection/identification capabilities, lack of agent quantification

capabilities, lack of a detector that also takes samples for future analysis, and detector susceptibility to chemical interference.<sup>1</sup>

### **Projected Near/Mid-Term Capabilities and Deficiencies**

The overall projected near/mid-term capability is assessed as “yellow.” In the near/mid-term future, the introduction of the JCAD, JSLSCAD, and integrated CBMS II will enhance the joint forces’ ability to rapidly (i.e., within 90 seconds) detect, quantify, and identify CWAs for both detect-to-warn and detect-to-treat purposes. JCAD and JSLSCAD will also improve the forces’ ability to determine cumulative doses of personnel exposed to CWAs and TICs. Nevertheless, MS units (including CBMS II) will likely be the only detectors able to detect all CWAs. MS units, gas toxic Draeger kits, JSLSCAD, and JCAD will be the main capabilities to detect TICs. They will detect many or all high-priority TICs.

The general inability to detect aerosols and agent concentrations at or below IDLH levels, the lack of a detector that also takes samples for future analysis, and detector susceptibility to chemical interference are likely to remain deficiencies in the near-future.

### **Projected Far-Term Capabilities and Deficiencies**

The overall projected far-term capability is assessed as “yellow.” In the far-term future, many fielded detectors will detect most, if not, all CWAs and some TICs. Most detectors will quantify and classify, if not identify, agents. MS units, gas toxic Draeger kits, JSLSCAD, and JCAD will likely remain the main capabilities to detect TICs. The introduction of ARTEMIS will increase the forces’ standoff detection capabilities. JMCBDS will provide an integrated chemical/biological detection, identification, and quantification capability and is expected to rapidly and reliably detect, identify, and quantify most CWAs and some TICs.

Many detectors will still not detect aerosols and agent concentrations that are expected to cause low-level effects. Furthermore, there will still be a lack of a detector that also takes samples for future analysis. The risk of chemical interference will remain, though it will be significantly mitigated through more precise sensors, orthogonal technologies, and more advanced algorithms.

---

	FAA Measure	Elaboration	Scale
M1	All of a potential adversary's weaponized CWAs can be detected using fielded technologies/equipment, regardless of agent physical properties, states, and concentrations?	Percentage of following 12 agents as described in FM 3-9 that are detected: Nerve agents (GA; GB; GD; GF; VX), vesicants (H/HD; HN-1,2,3; L; CX), cyanides (AC; CK), pulmonary agent (CG)	Percentages standardized to 0–10 scale

	FAA Measure	Elaboration	Scale
M2	All CWAs can be identified?	Ability to classify or identify detected CWAs.	10: Identify detected CWAs 7: Identify some detected CWAs; classify others 5: Classify detected CWAs 0: Neither identify nor classify detected CWAs
M3	All of a potential adversary's weaponized CWAs can be quantified using fielded technologies/ equipment?	Ability to provide snapshot concentration of detected CWAs.	10: Absolute quantification 5: Generic quantification 0: No quantification capability
M4	All TICs can be detected using fielded technologies/equipment?	Percentage of the 33 high-priority critical acutely toxic airborne TICs listed in <i>USACHPPM Report 47-EM-6154-03: ITF-40</i> . (FOUO) that are detected.	10: 100% 9: ≥90% 8: ≥80% 2: ≥20% 1: 1%–20% 0: 0%
M5	All TICs can be identified using fielded technologies/equipment?	Ability to classify or identify detected TICs.	10: Identify all detected TICs 7: Identify some detected TICs; classify others 5: Classify detected TICs 0: Neither classify nor identify detected TICs
M6	All TICs can be quantified using fielded technologies/equipment?	Ability to provide snapshot concentration of detected TICs.	10: Absolute quantification 5: Generic quantification 0: No quantification capability
M7	Time to detect chemical hazards?	Time period from CWA/TIC sampling to analysis output. Linear scale 1–10. Applies to point detectors only.	10: ≤12 sec 7: ≤30 sec 2: ≤60 sec 1: >60 sec
M8	Distance between chemical hazard and detector for accurate detection?	Linear scale 1–9. Applies to standoff detection only.	10: >9 km 9: ≤9 km 5: ≤5 km 2: ≤2 km 1: ≤1 km
M9	Chemical hazards are detected in time to warn forces and take appropriate protective measures?	Factors include time to detect chemical hazards (M7), distance between chemical hazard and detector for accurate detection (M8), as well as rate-of-action of those hazards.	10: Complete capability 5: Partial capability 0: No capability
M10	Chemical hazards are identified in time to treat forces?	Based on capability and time required to identify or classify hazards as well as rate-of-action of those hazards.	10: Complete capability 5: Partial capability 0: No capability

	FAA Measure	Elaboration	Scale
M11	Sampling collection procedures available for all of a potential adversary's weaponized chemical warfare agents and for all TICs using fielded technologies/equipment?	Refers to physical sampling for future analysis.	10: Complete capability 5: Partial capability 0: No capability
M12	Procedures maintain integrity of sample?	Refers to a physical sample for future analysis.	10: Complete capability 5: Partial capability 0: No capability
M13	Cumulative dose can be determined and presented using data from currently fielded sensors/equipment?	Assuming constant and defined breathing rates and lung retention efficiencies.	10: Complete capability (automatically calculated) 7: Moderate capability (monitoring capability + absolute quantification) 5: Minimal capability (absolute quantification) 0: Cumulative dose cannot be determined.
M14	There is effective DOTLPF in place to conduct task?	Refers to non-materiel elements associated with the execution of a task with the system.	10: DOTLPF exists and is adequate for the task to be performed with this system without limitations that cause significant impact upon operations. 5: Most critical aspects of DOTLPF for the task to be performed with this system are addressed. 0: DOTLPF is inadequate or does not exist for the task to be performed with this system.

<sup>1</sup> Limited—Detects only GA, GB, GD, GF, and VX. Does not detect concentrations which can cause low-level (e.g., ocular) effects; detects vapors only, and is susceptible to chemical interference (false positives and negatives).

<sup>2</sup> Does not identify or classify detected agents or TICs.

<sup>3</sup> Does not quantify amount of detected agents or TICs.

<sup>4</sup> No TICs detected.

<sup>5</sup> Does not identify or classify any TICs because it does not detect any TICs

<sup>6</sup> Does not quantify TIC concentrations because it does not detect any TICs.

<sup>7</sup> Based on operator skill and experience.

<sup>8</sup> 5 km range.

<sup>9</sup> Yes, as a standoff detector, it is assumed that range and response time are sufficient to detect-to-warn forces.

<sup>10</sup> Does not identify or classify agents or TICs.

<sup>11</sup> Sampling collection for future analysis capability does not exist with this technology/equipment.

<sup>12</sup> Cumulative dose cannot be determined and presented with data from this technology/equipment (no absolute quantification capability).

<sup>13</sup> There is effective DOTLPF in place to conduct task with this system.

<sup>14</sup> Limited—Detects only GA, GB, GD (0.1 mg/m<sup>3</sup> – IDLH level for GA/GB, 2X IDLH level for GD within 30 sec.); VX (0.04 mg/m<sup>3</sup> – 4X IDLH level within 30 sec.); HD (2 mg/m<sup>3</sup> – IDLH level within 15 sec.), and L (0.38 mg/m<sup>3</sup> within 15 sec.). According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), and <300 (L for eye) mg-min/m<sup>3</sup>. Does not detect concentrations which can cause low-level (e.g., ocular) effects; detects vapors only; and is susceptible to chemical interference (false positives and negatives).

<sup>15</sup> Identifies detected agents and TICs

<sup>16</sup> Detects pepper spray and mace (but these are not included in the *ITF-40* 33 high-priority critical acutely toxic airborne toxic industrial chemicals.)

<sup>17</sup> Detects in less than 30 seconds.

<sup>18</sup> Point detector, so no standoff distance.

<sup>19</sup> Can detect within 30 seconds and thus provides some detect-to-warn capability.

<sup>20</sup> Identifies hazards within 30 seconds.

<sup>21</sup> Commercial off-the-shelf detector. Unknown if sufficient DOTLPF in place.

<sup>22</sup> Limited—Detects only GA, GB, GD, GF, VX, HD, and L ( $0.1 \text{ mg/m}^3$  – IDLH level for GA/GB, 2X IDLH for GD/GF; 10X IDLH for VX; 1/20 IDLH for HD). According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), and <300 (L for eye)  $\text{mg-min/m}^3$ . Does not detect concentrations which can cause low-level (e.g., ocular) effects; detects vapors only; and is susceptible to chemical interference (false positives and negatives).

<sup>23</sup> Classifies agents as being nerve or blister agents.

<sup>24</sup> Provides relative hazard indication (relative quantification).

<sup>25</sup> Detects hazards in less than 1 minute. Note: Requires up to 8 hours to warm up after 30 days storage

<sup>26</sup> Detects within 1 minute and thus provides some detect-to-warn capability.

<sup>27</sup> Classifies agents within 1 minute.

<sup>28</sup> Detects GB, GD, and VX only ( $0.3 \text{ mg/m}^3$  – 3X IDLH for GB, 6X for GD, and 30X IDLH for VX, within 2 minutes). According to FM 3-11.9, incapacitating doses are 75 (GB for resting person), 75–300 (GD), and 50 (VX)  $\text{mg-min/m}^3$ . Does not detect concentrations which can cause low-level (e.g., ocular) effects; detects vapors only; and is susceptible to chemical interference (false positives and negatives).

<sup>29</sup> Detects hazards within 2 minutes.

<sup>30</sup> Detects within 2 minutes and thus provides some detect-to-warn capability.

<sup>31</sup> Detects AC ( $2.4 \text{ mg/m}^3$  – 1/25 IDLH level) and CG ( $0.08 \text{ mg/m}^3$ ) vapors only. According to FM 3-11.9, the incapacitating dose for CG is  $1,600 \text{ mg-min/m}^3$ .

<sup>32</sup> Provides absolute quantification capability for all detected agents and TICs.

<sup>33</sup> Limited—Detects CO, ethylene oxide, HCN, HCl, HF,  $\text{NO}_2$ , and CG.

<sup>34</sup> Detects in <1 minute to 10 minutes (depending on compound and concentration).

<sup>35</sup> Varies in detection time so detect-to-warn capability varies as well.

<sup>36</sup> Possibly identifies detected hazards in time to treat but depends on compound and concentration.

<sup>37</sup> Cumulative dose can be roughly estimated, but it cannot be precisely determined since this technology/equipment does not have a monitoring capability.

<sup>38</sup> Presumably detects all 12 CWA of interest (claims low ppb to ppt detection limits; 1 ppb =  $0.01 \text{ mg/m}^3$  for VX – IDLH level;  $0.006$ – $0.007 \text{ mg/m}^3$  for G-agents –  $\sim 1/10$  IDLH levels;  $0.007 \text{ mg/m}^3$  for HD – 1/285 IDLH level). According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), <300 (L for eye), 7,000 (CK), and 1,6000 (CG)  $\text{mg-min/m}^3$ . Detects vapors only.

<sup>39</sup> Identifies detected agents and TICs (through mass spectrometry).

<sup>40</sup> Provides absolute quantification capability for all detected agents and TICs (specifically provides composition intensities, e.g., ppm).

<sup>41</sup> Presumably detects most TICs in ITF-40. Detects vapors only.

<sup>42</sup> Detects within 10 minutes.

<sup>43</sup> Does not provide any detect-to-warn capability.

<sup>44</sup> Hazards are not identified in time to treat, especially if lethal fast-acting agents at high concentrations are involved.

<sup>45</sup> Limited—Detects only GA, GB, GD, GF, VX ( $0.1 \text{ mg/m}^3$  – IDLH for GA/GB, 2X IDLH for GD/GF, 10X IDLH for VX, within 60 sec.); and HD ( $10 \text{ mg/m}^3$  – 5X IDLH level, within 60 sec.). According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), and 50 (VX)  $\text{mg-min/m}^3$ . Does not detect concentrations which can cause low-level (e.g., ocular) effects; detects vapors only; and is susceptible to chemical interference (false positives and negatives).

<sup>46</sup> Detects hazards in less than 1 minute.

<sup>47</sup> Detects GA, GB, GD, GF, VX ( $0.1 \text{ mg/m}^3$  – IDLH level for GA/GB, 2X IDLH for GD/GF, 10X IDLH for VX within 4 min. for GB and VX), HD ( $0.5 \text{ mg/m}^3$  –  $\frac{1}{4}$  IDLH within 3 min.), L, CX, AC, and CK. According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), and 50 (VX)  $\text{mg-min/m}^3$ . Detects vapors only and is susceptible to chemical interference (false positives and negatives).

<sup>48</sup> Classifies G and V agents as nerve agents; identifies HD, L, AC, and CG.

<sup>49</sup> Detects TICs AC and CG.

<sup>50</sup> Identifies detected TICs.

<sup>51</sup> May require up to 10 minutes to classify or identify, which is generally inadequate for identify-to-treat.

<sup>52</sup> Vapor samples can be taken and saved for future analysis.

<sup>53</sup> Sample integrity is maintained.

<sup>54</sup> Detects only GA, GB, GD (90 mg/m<sup>3</sup>), HD (4500 mg/m<sup>3</sup>), and L (500 mg/m<sup>3</sup>). According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), and <300 (L for eye) mg-min/m<sup>3</sup>. Degraded performance: (P 8, 9) Can be obstructed by snow and rain; (M3) Must be stationary during operation. Does not detect concentrations which can cause low-level (e.g., ocular) effects, detects vapors only; and is susceptible to chemical interference (false positives and negatives)

<sup>55</sup> Detects within 1 minute. Degraded performance: (P5,8,9,10,11) Under precipitation, fog, extreme turbulence, high humidity, and small temperature differentials at dusk, dawn, and periods with lots of cloud cover; (M3) Minimum time available (15 min. setup time)

<sup>56</sup> 5 km range. Degraded performance: (P5,8,9,10,11) Under precipitation, fog, extreme turbulence, high humidity, and small temperature differentials at dusk, dawn, and periods with lots of cloud cover; (M3) Minimum time available (15 min. setup time)

<sup>57</sup> Limited—Detects only GA, GB, GD, GF (0.1 mg/m<sup>3</sup> – IDLH level for GA/GB, 2X IDLH for GD/GF within 30 sec.); VX (0.04 mg/m<sup>3</sup> – 4X IDLH level within 90 sec.); HD, and L (10 mg/m<sup>3</sup> – 5X IDLH level for HD, unknown L). According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), and <300 (L for eye) mg-min/m<sup>3</sup>. Does not detect concentrations which can cause low-level (e.g., ocular) effects; detects vapors only; and is susceptible to chemical interference (false positives and negatives).

<sup>58</sup> Classifies detected G and V agents as nerve agents; identifies detected H and L agents.

<sup>59</sup> Relative hazard level provided through three different sensitivity levels.

<sup>60</sup> Provides some detect-to-warn capability since it detects hazards within 2 minutes and its M42 alarm unit can be placed up to 400 m from the M88 detector unit.

<sup>61</sup> Classifies or identifies agents within 30 seconds.

<sup>62</sup> Detects GA, GB, GD, GF (0.005 mg/m<sup>3</sup> – 1/20 IDLH for GA/GB, 1/10 IDLH for GD/GF), VX (0.02 mg/m<sup>3</sup> – 2X IDLH level), HD (2mg/m<sup>3</sup> – IDLH level), HN, L (9 mg/m<sup>3</sup>), CX (3 mg/m<sup>3</sup>), AC (9 mg/m<sup>3</sup> – below IDLH), CK (8 mg/m<sup>3</sup>), and CX (3 mg/m<sup>3</sup>) in vapor form and is susceptible to chemical interference. According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), <300 (L for eye), 7,000 (CK), and 1,6000 (CG) mg-min/m<sup>3</sup>.

<sup>63</sup> Classifies G and V agents as nerve agents; identifies blood and blister agents.

<sup>64</sup> Detects TICs AC and CK.

<sup>65</sup> Detects within 15 minutes.

<sup>66</sup> Hazards are identified in time to treat when M8 paper is used for liquid detection. Hazards are not identified in time to treat when ampoules are used for vapor detection (delayed response; 15-20 minutes).

<sup>67</sup> Detects only GA, GB, GD (0.1–0.2 mg/m<sup>3</sup>: 1 – 4X IDLH level), and VX (0.4 mg/m<sup>3</sup> – 40X IDLH level). According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), and 50 (VX) mg-min/m<sup>3</sup>. Detects vapors and inhalable aerosols; does not detect concentrations which can cause low-level (e.g., ocular) effects, and is susceptible to chemical interference (false positives and negatives).

<sup>68</sup> Provides some detect-to-warn capability since it detects hazards within 2 minutes and its M42 alarm unit can be placed up to 400 m from the M43A1 detector unit.

<sup>69</sup> Detects GA, GB, GD, and VX (claims 0.02 mg/m<sup>3</sup> – 1/5 IDLH level for GA/GB, 2/5 IDLH level for GD, 2X IDLH level for VX; test data 0.01 mg/m<sup>3</sup> for GA and GB); HD (claims 0.05 mg/m<sup>3</sup>; test data 0.033 mg/m<sup>3</sup>), L (0.05 mg/m<sup>3</sup>); and AC (1.0 mg/m<sup>3</sup> – 1/60 IDLH level). (GF, H, HN, CX, CG, and CK can be programmed into the detector). According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), <300 (L for eye), 7,000 (CK), and 1,6000 (CG) mg-min/m<sup>3</sup>. Does not detect concentrations which can cause low-level (e.g., ocular) effects; detects vapors only; and is susceptible to chemical interference (false positives and negatives).

<sup>70</sup> Classifies agents as nerve, blister, blood and choking agents.

<sup>71</sup> Indicates low, medium, and high concentrations.

<sup>72</sup> Detects AC only (CI, CG, and CK can be programmed into the detector).

<sup>73</sup> Classifies hazards within 2 minutes.

<sup>74</sup> Detects 20–30 CWAs, precursors, and degradation products (including all 12 CWAs) in vapor (62 mg/m<sup>3</sup> for GB – 620X IDLH; 46 mg/m<sup>3</sup> for CK; 115 mg/m<sup>3</sup> for CG) and liquid form, and is susceptible to chemical interference (false positives and negatives). According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), <300 (L for eye), 7,000 (CK), and 1,6000 (CG) mg-min/m<sup>3</sup>.

<sup>75</sup> Provides relative intensities (concentrations) of detected agents and TICs.

<sup>76</sup> Detects phosphene, hydrogen cyanide, cyanogen chloride, phosphorus trichloride, and phosphorus oxychloride.

- 
- <sup>77</sup> Detects within 45 seconds.
- <sup>78</sup> Detects within 45 seconds and thus provides some detect-to-warn capability.
- <sup>79</sup> Identifies hazards within 45 seconds.
- <sup>80</sup> Liquid and vapor samples can be taken.
- <sup>81</sup> Presumably only CG detected (though can add AC detection capability); detects vapors only.
- <sup>82</sup> Presumably CG and 59 other toxic chemicals are classified as VOCs; if AC detection capability is included, then AC is identified.
- <sup>83</sup> Presumably the total concentration in ppm of CG + 59 other toxic chemicals given; however, if AC detection capability is included, AC concentration is quantified.
- <sup>84</sup> Presumably detects acrolein, acrylonitrile, allyl alcohol, ammonia, arsine, carbon monoxide, chlorine, dimethylamine, ethylene oxide, formaldehyde, methylamine, phosgene, propylene oxide, sulfur dioxide, sulfur trioxide + 2 more of following as modular detection/identification/quantification capabilities: carbon monoxide, hydrogen sulfide, sulfur dioxide, chlorine, ammonia, nitric oxide, nitrogen dioxide, hydrogen chloride, and phosphine.
- <sup>85</sup> Classifies some TICs within the VOC category; the two modular slots allows for identification of two of the following: carbon monoxide, hydrogen sulfide, sulfur dioxide, chlorine, ammonia, nitric oxide, nitrogen dioxide, hydrogen chloride, and phosphine.
- <sup>86</sup> Presumably the total concentration in ppm of 15 TICs plus individual concentrations for of two of the following: carbon monoxide, hydrogen sulfide, sulfur dioxide, chlorine, ammonia, nitric oxide, nitrogen dioxide, hydrogen chloride, and phosphine.
- <sup>87</sup> Classifies agents and TICs within 1 minute.
- <sup>88</sup> Cumulative dose can be determined and presented since the monitor collects and records up to 20,000 data points with time and date.
- <sup>89</sup> Presumably detects all 12 agents of interest; detects all states (claims 5 ppb detection limit for air preconcentrator = 0.05 mg/m<sup>3</sup> for VX – 5X IDLH level, 0.030–0.035 mg/m<sup>3</sup> for G-agents: 1/3–2/3 IDLH levels, 0.035 mg/m<sup>3</sup> for HD – 1/57 IDLH level). According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), <300 (L for eye), 7,000 (CK), and 1,6000 (CG) mg-min/m<sup>3</sup>. Degraded performance: (P5, 9, 10) Not waterproof when operating; (M5) Negligible personnel experience.
- <sup>90</sup> Identifies sampled agents and TICs (through mass spectrometry).
- <sup>91</sup> Presumably detects all TICs in ITF-40; detects all states.
- <sup>92</sup> Since system has continuous sampling capability, cumulative dose can likely be calculated.
- <sup>93</sup> Presumably will detect all CWAs (0.4 mg/m<sup>2</sup> surface for nerve, blister, blood, and choking agents).
- <sup>94</sup> All detected CWAs will be identified.
- <sup>95</sup> Will detect and identify within 15 seconds.
- <sup>96</sup> Will be point detector, so no standoff distance.
- <sup>97</sup> Will detect within 15 seconds and thus provide some detect-to-warn capability.
- <sup>98</sup> Will identify within 15 seconds, which provides complete capability.
- <sup>99</sup> Liquid and vapor samples will be able to be taken.
- <sup>100</sup> Sample integrity will be maintained.
- <sup>101</sup> Future system(s). Thus, DOTLPF is also future and cannot be evaluated.
- <sup>102</sup> Will detect only GA, GB, GD, GF, and VX (0.1 mg/m<sup>3</sup> - IDLH level for GA/GB, 2X IDLH level for GD/GF, 10X IDLH for VX, within 30 sec.); HD, HN3, and L (2.0 mg/m<sup>3</sup> – IDLH level – within 120 sec.), AC (22 mg/m<sup>3</sup> – below IDLH level, within 60 sec.), CK (20 mg/m<sup>3</sup> within 60 sec.), and CG vapors only, and will not detect concentrations which can cause low-level (e.g., ocular) effects. According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), <300 (L for eye), 7,000 (CK), and 1,6000 (CG) mg-min/m<sup>3</sup>.
- <sup>103</sup> Will classify agents as nerve, blister, blood, and choking agents.
- <sup>104</sup> Will provide absolute quantification capability for all detected agents and TICs.
- <sup>105</sup> Will detect Cl, HBr, HCl, AC, HF, HS, and CG as an objective.
- <sup>106</sup> Will detect hazards within 1 minute.
- <sup>107</sup> Will detect within 1 minute and thus will provide some detect-to-warn capability.
- <sup>108</sup> Will classify hazards within 1 minute.
- <sup>109</sup> Will monitor exposure and automatically calculate cumulative dose.
-

- <sup>110</sup> Will detect GA, GB, GD, GF (135 mg/m<sup>2</sup>; 114 mg/m<sup>2</sup> as an objective); VX (135 mg/m<sup>2</sup>; 2.88 mg/m<sup>2</sup> as an objective); HD, HN3, L (3,300 mg/m<sup>2</sup>; 1,170 mg/m<sup>2</sup> as an objective); AC (6,600 mg/m<sup>2</sup>), and CK (6,000 mg/m<sup>2</sup>). According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), <300 (L for eye), 7,000 (CK), and 1,6000 (CG) mg-min/m<sup>3</sup>. Will not detect concentrations which can cause low-level (e.g., ocular) effects and will detect vapors only.
- <sup>111</sup> Will classify detected agents and TICs as a threshold requirement; will identify detected agents and TICs as an objective requirement.
- <sup>112</sup> Will provide absolute quantification capability for all detected agents and TICs as an objective.
- <sup>113</sup> Yes, all 98 TICs listed in Table 3: Hazard Ranking Index in ERDEC-SP-061: ITF-40 (objective).
- <sup>114</sup> Will detect hazards within 90 seconds.
- <sup>115</sup> Will have 5 km range as threshold requirement, 40 km range as objective requirement.
- <sup>116</sup> Yes, as a future standoff detector, assumed that its range and response time will be sufficient to detect-to-warn forces.
- <sup>117</sup> Will classify or identify hazards within 90 seconds.
- <sup>118</sup> The cumulative dose may be estimable since the technology/equipment will provide agent concentration. Unknown if it will have monitoring capability.
- <sup>119</sup> Will detect all 12 CWAs of interest in vapor and aerosol forms. Will not detect concentrations which can cause low-level (e.g., ocular) effects.
- <sup>120</sup> Will detect hazards within 2 minutes.
- <sup>121</sup> Will have 20 km range for CWAs. Unknown for TICs.
- <sup>122</sup> This technology/equipment will not have sampling collection for future analysis capability.
- <sup>123</sup> Will detect only GA, GB, GD, GF (0.1 mg/m<sup>3</sup> – IDLH level for GA/GB, 2X IDLH level for GD/GF within 30 sec.); VX (0.04 mg/m<sup>3</sup> – 4X IDLH level within 90 sec.); HD, HN3, L (2.0 mg/m<sup>3</sup> – IDLH level within 120 sec.); AC (22 mg/m<sup>3</sup> – below IDLH level within 60 sec.); CK (20 mg/m<sup>3</sup> within 60 sec.); and CG in vapor and aerosol forms, and will not detect concentrations which can cause low-level (e.g., ocular) effects. According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), <300 (L for eye), 7,000 (CK), and 1,6000 (CG) mg-min/m<sup>3</sup>.
- <sup>124</sup> Will detect ammonia, arsine, chlorine, diborane, fluorine, hydrogen bromide, hydrogen cyanide, hydrogen fluoride, nitric acid, phosgene, phosphorus trichloride, sulphur dioxide, and sulphuric acid.
- <sup>125</sup> Will identify all detected TICs as an objective.
- <sup>126</sup> Will detect within 2 minutes and thus will provide some detect-to-warn capability.
- <sup>127</sup> Will classify or identify CWAs and TICs within 2 minutes.

### 5.1.3 Functional Solution Analysis

#### 5.1.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, that deficiency is then reassessed in the IMAs section.

1. **Deficiency:** Lack of real-time or near real-time TIC detection and identification capabilities.  
**Non-Materiel Solutions:** *Training (partial):* Increase training of personnel on indicators of TIC releases.
2. **Deficiency:** General inability to detect (liquid, solid, or dusty) aerosols.  
**Non-Materiel Solutions:** None
3. **Deficiency:** General inability to detect nerve agents (i.e., VX and, to a lesser extent, GD and GF) at or below IDLH levels.  
**Non-Materiel Solutions:** *Training (partial):* Increase training of personnel on portable mass spectrometers (e.g., Viking SpectraTrak and HAPSITE).
4. **Deficiency:** Susceptibility to chemical interference.  
**Non-Materiel Solutions:** *Training (partial):* Increase training of personnel on portable mass spectrometers (e.g., Viking SpectraTrak and HAPSITE).
5. **Deficiency:** Lack of real-time or near-real-time CWA identification capabilities.  
**Non-Materiel Solutions:** None
6. **Deficiency:** Lack of agent quantification capabilities.  
**Non-Materiel Solutions:** *Training (partial):* Increase training of personnel on portable mass spectrometers (e.g., Viking SpectraTrak and HAPSITE).
7. **Deficiency:** Lack of reliable standoff (or remote) detection capability for CWAs and TICs.  
**Non-Materiel Solutions:** None
8. **Deficiency:** Lack of detectors that also take and maintain physical samples for future analysis capability.  
**Non-Materiel Solutions:** None

#### 5.1.3.2 IMA Assessment Summary

Table 5.1-2 identifies 11 ideas for materiel approaches that, if developed, may reduce or eliminate the deficiencies associated with detecting chemical hazards in the atmosphere. Advances in orthogonal technologies may be able to address all identified deficiencies.

Table 5.1-2. TASENS 1: IMA Assessment

TASENS 1: Sense the atmosphere for chemical hazards <sup>1</sup>											
Identified Gap	Idea for Materiel Approach (IMA)										
	Mass Spectrometry <sup>2</sup>	Infrared, Ultraviolet, and Microwave Spectroscopy <sup>3</sup>	Ion Mobility Spectrometry <sup>4</sup>	Photoacoustic Infrared Spectroscopy	Chemiluminescence Detection <sup>5</sup>	Surface Acoustic Wave Technology <sup>6</sup>	Multiple, Complementary Technologies (Orthogonal) <sup>7</sup>	Raman Spectroscopy	Photo-ionization Technology	Flame Photometry <sup>8</sup>	Electrochemical (Chemiresistor) Sensor Technology
Lack of real-time or near real-time TIC detection and identification capabilities. <sup>9</sup>		X	X		X <sup>10</sup>	X	X	X			
General inability to detect (liquid, solid, or dusty) aerosols. <sup>11</sup>	X <sup>12</sup>	X				X	X <sup>13</sup>	X		X	X
General inability to detect nerve agents (i.e., VX and, to a lesser extent, GD and GF) at or below IDLH levels.	X <sup>14</sup>	X					X	X		X

<sup>2</sup> Includes GC/MS, liquid chromatograph/mass spec (LC/MS), matrix-assisted laser desorption ionization with time-of-flight mass spectrometry.  
<sup>3</sup> Examples include CO<sub>2</sub> long-wave infrared (LWIR), Differential Scattering/Differential Absorption of Light (DISC)/Differential Absorption LIDAR (DIAL), CO<sub>2</sub> conv Mid-Wave Infrared (MWIR) DISC/DIAL, solid-state (SS) conv MWIR DISC/DIAL, FTIR, Hyperspectral LWIR, Passive MWIR, SS conv LWIR DISC/DIAL, SS conv Short-Wave Infrared (SWIR) – LWIR, SS conv UV-LW IR, Active LWIR Polarization, Active MWIR Polarization, Passive LWIR Polarization, Filtered Forward-Looking Infrared (FLIR), UV LIF/FTIR, and Microwave (GHz and THz) Spectroscopy.

<sup>4</sup> May be coupled with GC; External Second Gate, Fourier Transform Ion Mobility Spectrometry approach can improve sensitivity and selectivity.

<sup>5</sup> For example, Phosphorus Chemiluminescence Detection (PCD)

<sup>6</sup> May be coupled with GC.

<sup>7</sup> Examples include SAW/IMS, IMC/SAW/Electrochemical/SCCell (S-CAD), GC/IMS.

<sup>8</sup> May be coupled with GC or reversed-phase liquid chromatography (RPLC).

<sup>9</sup> Increasing the number of TICs identified by JCAD and/or JMCBDS is a potential solution.

<sup>10</sup> Classifies, but generally does not identify, agents

<sup>11</sup> Distributing more Viking SpectraTraks is a potential solution.

<sup>12</sup> Aerosol Mass Spectrometry (e.g., aerosol time-of-flight spectrometry (ATOFMS))

<sup>13</sup> MS and IMS.

<sup>14</sup> Distributing more Viking SpectraTraks and HAPSITEs is a potential solution.

<sup>15</sup> JCAD and/or JMCBDS are expected to eliminate deficiency.

<sup>16</sup> Distributing more Viking SpectraTraks and HAPSITEs is a potential solution.

<sup>17</sup> In conjunction with robotics for MS, IMS, PIRS, chemiluminescence detection, SAW Technology, photoionization technology, flame photometry, and electrochemical sensor technology IMAs.

<sup>18</sup> All IMAs could be designed to eliminate this capability gap. Part of the sample would be diverted for storage.

## 5.2 Task TASENS 2: Sense the atmosphere for biological hazards

### 5.2.1 Functional Area Analysis

#### 5.2.1.1 Definition

To sense the atmosphere for the presence or absence of biological hazards (encompasses biological warfare agents and TIB material) using sensors. Includes the functions of detection, identification, and quantification of the hazard. Also includes collection of samples for further analysis, along with early-warning surveillance of unforeseen agent releases and monitoring of known hazard locations. Encompasses both “detect to warn” and “detect to treat” situations to enable appropriate protective measures. The evaluation encompasses all biological warfare hazards of military and medical importance.

#### 5.2.1.2 Derivation

*UJTL TA 7, UJTL TA 7.1, Protection Joint Functional Concept.*

**5.2.1.2.1 Supported Tasks:** OPSENS 1, OPSENS 4, OPSENS 7

**5.2.1.2.2 Lateral Task:** TASHA 16

**5.2.1.2.3 Supporting Task:** N/A

#### 5.2.1.3 Condition

Perform this task under conditions of:

##### **Physical**

1. Mountainous, desert, jungle, and arctic terrain. (C1.1.1)
2. Significant urbanization. (C1.1.3.1)
3. Tropical, arctic, and arid climates. (C1.3.1)
4. Summer, winter seasons. (C1.3.1.1)
5. Stormy weather. (C1.3.1.3)
6. Hot, very cold air temperature. (C1.3.1.3.1)
7. High surface-wind velocity. (C1.3.1.3.3)
8. High relative humidity. (C1.3.1.3.5)
9. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6.1)
10. Heavy precipitation intensity. (C1.3.1.3.6.2)
11. Extreme turbulence and wind shear. (C1.3.1.3.8)
12. Negligible light. (C1.3.2.1)
13. Biological effects. (C1.3.3.3)

##### **Military**

1. Stressful mission (C2.1)

2. Location—ashore, afloat, airborne (C2.1.4.1)
3. Minimal time available. (C2.1.5)
4. Low personnel capability. (C2.2.4)
5. Negligible personnel experience. (C2.2.4.5)
6. Ambiguous threat existence. (C2.9.3)

### Civil

1. Limited or negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)
3. High mission priority. (C3.1.3.2)
4. High health risk. (C3.3.1.5)
5. Significant refugee care responsibility. (C3.3.2.3)
6. Toxic industrial biological material present in the civilian sector. (C3.3.7.5)

## 5.2.2 Functional Needs Analysis

### 5.2.2.1 Capability and Deficiency Assessment Summary

Table 5.2-1 presents individual and overall current, near/mid-term, and far-term capabilities to perform the task to the designated standards. There are seven current capabilities used to accomplish this task and four projected capabilities to be added in the future (three in the near/mid-term and one in the far-term). The individual capabilities include a range of point and standoff detectors with differing capabilities to meet the identified standards.

### Current Capabilities and Deficiencies

The overall current capability is assessed as “yellow.” Many, if not most, BWAs can be presumptively detected and identified by collecting and concentrating aerosols through the use of a dry filter unit, followed by manual sample preparation and the following laboratory and field-deployable analytical techniques: immunochromatographic HHAs, which are part of the BSK; ELISA; and RT-PCR, as used by RAPID. Of the 25 BWAs described in the *Medical Management of Biological Casualties*, a complete set of HHAs can detect and identify all agents with the possible exception of the viral hemorrhagic fever agents; however, the BSK contains eight different HHAs and thus detects only eight BWAs per kit. The eight agents in the kit may be assembled to reflect the threat.<sup>1</sup> A comprehensive set of ELISAs, which are laboratory-based, can ostensibly detect and identify all 25 BWAs (as well as any TIB), assuming that an antigen or antibody has been isolated for each agent. RAPID, like all PCR-based technologies, can, with the appropriate reagents, detect and identify all BWA and TIB pathogens, but none of the toxins (since the toxins, unless contaminated with the source organisms, do not provide any genetic material). HHAs and RAPID can generically quantify detected agents (HHAs only through the aide of a reader), whereas some varieties of ELISAs provide absolute quantification capabilities.

The automated systems M31 BIDS, IBADS, JBPDS, and Portal Shield use immunochromatographic assays for detection and thus have capabilities similar to those of the HHAs. They detect and identify between four and ten BWAs, depending on the system, typically

within 15 minutes. Like HHAs, ELISAs, and the RAPID, they can identify-to-treat, but cannot provide a response quickly enough for detect-to-warn. Three systems—the M31E1 BIDS, JBPDS, and Portal Shield—take and maintain physical samples for further analysis (These samples must currently be taken to off-site laboratories to validate the detection analysis).

There is no single, automated, current capability to detect all BWAs. Furthermore, all current automated detectors do quantify agents, and thus, cumulative dose estimates cannot be determined. In addition, they do not detect any TIBs.

Overall current task deficiencies include the lack of real-time BWA detection and identification capabilities, agent quantification capabilities, and field analysis verification capabilities, as well as the lack of TIB detection capabilities and standoff detection capabilities for biological aerosols.

### **Projected Near/Mid-Term Capabilities and Deficiencies**

The overall projected near/mid-term capability is assessed as “yellow.” Near/mid-term capability CBMS II integrated into the NBCRS Stryker and JNBCRS will be required to detect all BWAs in BIDS P3I list at 15 agent-containing particles per liter of air (ACPLA) within 3 minutes (Block I) and all BWAs in the ITF6A list (1990) at 25 ACPLA within 4 minutes. JBAIDS Block I will detect 11 BWA pathogens (as a threshold requirement), whereas Block II will detect the same 11 BWA pathogens plus the four toxins of interest (as a threshold requirement). Unlike current capabilities, JBAIDS will also quantify agent concentrations in the analyzed sample, which may allow for crude estimates of cumulative doses. Analysis output following sample preparation requires 25–40 minutes. The JBSDS will provide a standoff detection capability for potentially hazardous biological aerosols. It will not identify agents, nor will it absolutely or relatively quantify concentrations.

Of the overall current task deficiencies, the lack of field analysis verification capabilities, TIB detection capabilities and discriminatory standoff detection capabilities for biological agents are likely to remain deficiencies in the near/mid term.

### **Projected Far-Term Capabilities and Deficiencies**

The overall projected far-term capability is assessed as “yellow.” The JMCBDS will detect all BWA in the JCS list, but no TIBs. It will identify and quantify all detected agents as an objective. Though it will be a point detector, its quick (<1-minute) response time may enable it to provide some detect-to-warn capability. Like JBAIDS, the JMCBDS will enable crude estimations of cumulative doses if it quantifies detected agents.

Of the overall current task deficiencies, the lack of field analysis verification capabilities, TIB detection capabilities and discriminatory standoff detection capabilities for biological agents are likely to remain deficiencies in the far term.

---

<sup>1</sup> The collection of surface samples to use in HHA results in a sample for further analysis. Coolers/temperature-controlled equipment to hold and maintain the sample needs to be available if the sample is not immediately evacuated.

	FAA Measure	Elaboration	Scale
M1	All of a potential adversary's weaponized BWAs can be detected using fielded technologies/equipment, regardless of agent physical properties, states, and concentrations?	Number of the 25 biological agents described in the <i>Medical Management of Biological Casualties</i> that are detected. Fourteen of the 25 agents are as follow: Anthrax ( <i>Bacillus anthracis</i> ); Brucellosis ( <i>Brucellae</i> ); Glanders ( <i>Burkholderia mallei</i> ); Melioidosis ( <i>Burkholderia pseudomallei</i> ); Q Fever ( <i>Coxiella burnetii</i> ); Plague ( <i>Yersinia pestis</i> ); Tularemia ( <i>Francisella tularensis</i> ); Botulinum toxin; Ricin; SEB; T-2 Mycotoxins; Smallpox (variola major and minor); Viral Equine Encephalitis (e.g., VEE, WEE, and EEE); and Ebola and Marburg hemorrhagic fever viruses. Linear 2–10	10: All 25 BWAs detected 8: ≥20 BWAs detected 6: ≥15 BWAs detected 4: ≥10 BWAs detected 2: ≥5 BWAs detected 1: ≥1 BWA detected 0: No BWAs detected
M2	All of a potential adversary's weaponized BWAs can be identified using fielded technologies/equipment?	Ability to identify or classify (e.g., as bacteria, toxin, or virus) detected BWAs.	10: Identify detected BWAs 7: Identify some detected BWAs; classify others 5: Classify detected BWAs 3: Some detected BWAs are classified or identified 0: Neither identify nor classify detected BWAs

	FAA Measure	Elaboration	Scale
M3	All of a potential adversary's weaponized BWAs can be quantified using fielded technologies/equipment?	Ability to provide snapshot concentration of detected BWAs.	10: Absolute quantification 5: Generic quantification 0: No quantification capability
M4	All TIB material can be detected using fielded technologies/equipment?	Toxic industrial biological material includes medical waste, raw sewage, and vaccine-related biologics. Pathogens and toxins within TIB material are what are generally detected.	10: All pathogens and toxins within TIB material, including medical waste, raw sewage, and vaccine-related biologics can be detected 5: All TIB pathogens or toxins within one or more categories (i.e., medical waste, raw sewage and vaccine-related biologics) can be detected 3: Some TIB pathogens and toxins within one category (i.e., medical waste, raw sewage and vaccine-related biologics) can be detected 0: No TIB pathogens and toxins can be detected
M5	All TIB material can be identified using fielded technologies/equipment?	Ability to identify or classify (e.g., as bacteria, toxin, or virus) detected TIB material.	10: All pathogens and toxins within TIB material can be identified 7: Identify some TIB pathogens and toxins; classify others 5: Classify detected TIB pathogens and toxins 3: Some detected TIB pathogens and toxins are classified or identified 0: Neither classify nor identify detected TICs
M6	All TIB material can be quantified using fielded technologies/equipment?	Ability to provide snapshot concentration of detected TIBs.	10: Absolute quantification 5: Generic quantification 0: No quantification capability
M7	Time to detect biological hazards?	Time period from BWA/TIB sampling to analysis output (after sample preparation, and if attack time is known). Linear scale 2–9. Applies to point detectors only.	10: ≤1 minute 9: ≤4 minutes 8: ≤7 minutes 7: ≤10 minutes 4: ≤40 minutes 2: ≤60 minutes 1: >60 minutes

	FAA Measure	Elaboration	Scale
M8	Distance between biological hazard and detector for accurate detection?	Linear scale 1–9. Applies to standoff detection only.	10: $\geq 9$ km 9: $\geq 9$ km 5: $\leq 5$ km 2: $\leq 2$ km 1: $\leq 1$ km
M9	Biological hazards are detected in time to warn forces and take appropriate protective measures?	Dependent upon time to detect biological hazards (M7), distance between biological hazard and detector for accurate detection (M8), as well as rate-of-action of those hazards.	10: Complete capability 5: Partial capability 0: No capability
M10	Biological hazards are identified in time to treat forces?	Based on capability and time required to identify or classify hazards, as well as rate-of-action of those hazards. Of all considered BWAs, ricin may require the most rapid response. Immunoglobulin therapy must be administered within 1 hour of ricin exposure to be effective.	10: Complete capability (<1 hour) 5: Partial capability 0: No capability
M11	Sampling collection procedures available for all of a potential adversary's weaponized BWAs and for all TIB material using fielded technologies/equipment?	Refers to physical sampling for future analysis.	10: Complete capability 5: Partial capability 0: No capability
M12	Procedures maintain integrity of sample?	Refers to a physical sample for future analysis.	10: Complete capability 5: Partial capability 0: No capability
M13	Time to validate the presence of biological hazards in the atmosphere?	Refers to confirmatory identification.	10: Rapidly—validation performed expeditiously by particular technology/equipment. 5: Moderately delayed—mobile analysis tools can validate onsite. 0: Delayed—offsite laboratory analysis required for validation.
M14	Cumulative dose can be determined and presented using data from currently fielded sensors/equipment?	If an absolute quantification capability is provided, then it is possible that the cumulative dose can be estimated (thus a minimal capability). If a monitoring capability is provided, then a more accurate cumulative dose can be calculated (moderate capability). If the cumulative dose is automatically calculated, then a complete capability is provided.	10: Complete capability 7: Moderate capability 5: Minimal capability 0: Cumulative dose cannot be determined

	FAA Measure	Elaboration	Scale
M15	There is effective DOTLPP in place to conduct task?	Refers to non-materiel elements associated with the execution of the task with the system.	10: DOTLPP exists and is adequate for the task to be performed with this system without limitations that cause significant impact upon operations 5: Most critical aspects of DOTLPP for the task to be performed with this system are addressed 0: DOTLPP is inadequate or does not exist for the task to be performed with this system

<sup>1</sup> Current and near-future HHAs detect all BWAs with the possible exception of the viral hemorrhagic fevers; however, the BSK contains eight different HHAs and thus detects eight BWAs. The HHA sensitivity is  $10^5$ – $10^6$  CFU/mL (*B. anthracis*) and 50–1200 ng/mL (*Botulinum* toxin A and *Botulinum* toxin F, respectively). Degraded performance: (C6) Toxic Industrial Biological Material present in civilian sector. Susceptible to interference (false positives and negatives due to matrix effects, among others); (M3) Minimal time available. Requires sample preparation prior to applying sample to assay.

<sup>2</sup> All detected BWAs are identified. In light of how biological detection works, detected BWAs are also identified.

<sup>3</sup> Does not absolutely quantify agent. However, may provide relative indication of quantity, but only through the use of a reader. Soldiers will not likely have the reader.

<sup>4</sup> According to specifications, does not detect any TIBs.

<sup>5</sup> Detects and identifies within 15 minutes following sample preparation.

<sup>6</sup> Point detector.

<sup>7</sup> Since concept of operations involves testing once every 1–8 hours (mission dependent), there is only a minimal capability to identify-to-treat exposed personnel.

<sup>8</sup> Collects physical sample for future analysis.

<sup>9</sup> Maintains physical sample integrity.

<sup>10</sup> Requires samples to be confirmed off site in laboratory.

<sup>11</sup> Does not provide absolute quantification capability, so cumulative dose cannot be determined.

<sup>12</sup> There is effective DOTLPP in place to conduct task, at least for bacillus bacteria (specifically anthrax). Procedures for other agents are probably similar.

<sup>13</sup> Ostensibly all BWAs can be detected by ELISA. ELISA's sensitivity is  $10^5$ – $10^6$  CFU/mL (*B. anthracis*); 10–100 PFU/mL of Venezuelan Equine Encephalitis virus; and 625 pg/mL of Staphylococcal Enterotoxin B (aerosol) and greater than 5 ng/mL of ricin.

<sup>14</sup> Some varieties of ELISA can absolutely quantify the antigen or antibody concentration.

<sup>15</sup> Theoretically, any agent (i.e., antigen or antibody) for which an ELISA has been designed can be detected through this method; however, only one particular pathogen or toxin antigen or antibody can be tested per ELISA model.

<sup>16</sup> A particular TIB pathogen or toxin is identified if it is detected, since ELISA is highly specific and detects a particular agent.

<sup>17</sup> Typically requires 1–2 hours (following sample collection and preparation) for detection, identification, and if applicable, quantification, primarily because of incubation time.

<sup>18</sup> Since concepts of operations involves collecting the filter for testing once every 1–8 hours (mission dependent), identify-to-treat capability is minimal.

<sup>19</sup> RAPID may be able to detect all pathogens; PCR does not detect toxins, though the toxic material may be contaminated with source genetic material. (In this assessment, it is assumed that this is not the case). Standard PCR has a sensitivity of 10–100 CFU/mL bacteria (*B. anthracis*); and 15 fg–1 pg or 100–1 million copies of the complementary DNA for viruses.

<sup>20</sup> RAPID, through RT-PCR, may provide generic quantification.

<sup>21</sup> Theoretically, any TIB pathogen can be detected with appropriate reagents; toxins cannot be detected unless contaminated with source genetic material.

<sup>22</sup> All detected TIBs are identified.

<sup>23</sup> Detects and identifies within 30 minutes following sample preparation, but sample preparation requires several hours.

<sup>24</sup> Detects four to eight agents detected (including anthrax, plague, botox, and SEB). The required sensitivity of the BIDS is 25 ACPLA (NDI model) and 15 ACPLA (P3I model).

- 
- <sup>25</sup> Does not provide absolute or generic (snapshot) quantification capability.
- <sup>26</sup> Detects and identifies within 15 minutes.
- <sup>27</sup> Refers to M13E1 BIDS model only.
- <sup>28</sup> There is effective DOTLPF in place to conduct task with this system.
- <sup>29</sup> Detects four agents.
- <sup>30</sup> Provides generic quantification capability with the use of a reader.
- <sup>31</sup> Detects 10 agents including: anthrax, smallpox, plague, tularemia, botox, SEB, and viral hemorrhagic fevers Ebola/Marburg. The required sensitivity of the JBPDS is 1 ACPLA, though this capability has not likely been achieved.
- <sup>32</sup> Collects 4–5 mL sample for future analysis.
- <sup>33</sup> Detects 8–10 agents.
- <sup>34</sup> Detects within 25 minutes.
- <sup>35</sup> Networked point detectors.
- <sup>36</sup> Block I will detect all BW agents in BIDS P31 list at 15 ACPLA in 3 minutes. Block II will identify BW agents in ITF6A list (1990) at 25 ACPLA in 4 minutes.
- <sup>37</sup> At the very least, Block II will identify detected BWAs.
- <sup>38</sup> Will detect within 3–4 minutes.
- <sup>39</sup> Will be a point detector.
- <sup>40</sup> May detect within 3 minutes, but this is the threshold for detect-to-warn capability according to James Harper presentation of *Rapid Identification of Biological Pathogens with the CANARY System*. It is concluded that it will not have any detect-to-warn capability.
- <sup>41</sup> Will require samples to be confirmed off site in laboratory
- <sup>42</sup> Future system(s). Thus, DOTLPF is also future and cannot be evaluated.
- <sup>43</sup> Block I will detect Anthrax; Brucella; Ebola VHF virus; Marburg VHF virus; Viral Encephalitis viruses (VEE/WWW/EEE); Glanders; Meliodosis; Plague; Q Fever; Smallpox; and Tularemia (and Typhus) as a threshold requirement; and Crimean-Congo hemorrhagic virus; Dengue fever; Hantaviruses; and Rift Valley fever virus (and Cholera, Cryptosporidium; E. coli; Influenza; Salmonella; and Shigella) as an objective; Block II will add toxins Botulinum, microcystins, ricin, SEB, and T-2 Mycotoxins.
- <sup>44</sup> Will identify all detected agents.
- <sup>45</sup> Will quantify the concentration in the sample.
- <sup>46</sup> Will not detect any TIBs.
- <sup>47</sup> Will detect and identify within 40 minutes (25-minute objective) for Blocks I and II following sample preparation.
- <sup>48</sup> Will provide physical sample collection capability for future analysis.
- <sup>49</sup> Will maintain integrity of physical sample.
- <sup>50</sup> Cumulative dose will be able to be estimated from data (minimal capability).
- <sup>51</sup> Will detect aerosol clouds consistent with a BW release above naturally occurring backgrounds at ranges up to 5 km (15 km [O]) of at least 10,000 ACPLA (5,000 [O]) with a detection probability of 90% (95%[O]) in near-real time during normal night conditions and sufficient line of sight. [T].
- <sup>52</sup> Will detect aerosol clouds and discriminate clouds with particles of biological origin from clouds with particles of nonbiological origin at average cloud concentrations of 3,000 (1,000 [O]) ACPLA up to 1 km (3 km [O]) with a probability of 90% (95% [O]) in near-real time during normal night conditions and sufficient line of sight [T].
- <sup>53</sup> Will not provide generic (snapshot) quantification capability.
- <sup>54</sup> Will provide real-time detection of aerosol clouds consistent with a BW release and real-time discrimination of clouds with particles of biological origin from clouds with particles of nonbiological origin.
- <sup>55</sup> Will be a standoff detector with considerable range and real-time detection capability.
- <sup>56</sup> Will not collect physical sample.
- <sup>57</sup> Will detect all agents in JCS threat list. Will detect 1 ACPLA or as low as reasonably achievable (ALARA).
- <sup>58</sup> Will identify all detected agents as an objective.
- <sup>59</sup> Will provide absolute quantification capability as an objective.
- <sup>60</sup> Will not detect any TIBs.
- <sup>61</sup> Will detect within 1 minute.
-

<sup>62</sup> Though a point detector may provide partial detect-to-warn capability since detection time is 1 minute, which is less than 3-minute threshold for detect-to-warn capability according to James Harper presentation of *Rapid Identification of Biological Pathogens with the CANARY System*.

<sup>63</sup> Since it will have absolute quantification and monitoring capability, JMCBDS will provide moderate cumulative dose determination capability.

### 5.2.3 Functional Solution Analysis

#### 5.2.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, that deficiency is then reassessed in the IMAs section.

1. **Deficiency:** Lack of real-time or near-real-time BWA detection and identification capabilities.  
**Non-Materiel Solutions:** None
2. **Deficiency:** Lack of standoff detection/identification (not just bio/nonbio discrimination) capability for biological agents.  
**Non-Materiel Solutions:** None
3. **Deficiency:** Validation of findings requires laboratory testing.  
**Non-Materiel Solutions:** *Doctrine:* Modify doctrine to permit validation by a reliable on-site detection/identification capability (e.g., portable PCR), if appropriate, as confirmatory detection/identification is ultimately dependent upon doctrine, not materiel capabilities.
4. **Deficiency:** Lack of TIB detection capability.  
**Non-Materiel Solutions:** None
5. **Deficiency:** Lack of agent quantification capabilities.  
**Non-Materiel Solutions:** None
6. **Deficiency:** Lack of physical sampling capability for future analysis.  
**Non-Materiel Solutions:** None

#### 5.2.3.2 IMA Assessment Summary

Table 5.2-2 identifies nine ideas for materiel approaches that, if developed, may reduce or eliminate the deficiencies associated with detecting biological hazards in the atmosphere. Advances in mass spectrometry, immunoassays, tissue-based detection, or orthogonal technologies may be able to address all identified deficiencies.

Table 5.2-2. TASENS 2: IMA Assessment

TASENS 2: Sense the atmosphere for biological hazards <sup>1</sup>										
Identified Gap	Idea for Materiel Approach (IMA)	Mass Spectrometry <sup>2</sup>	Immunoassay (Antibody-Based) <sup>3</sup>	Genetic (Nucleic Acid-Based) <sup>4</sup>	Tissue-Based	Flame Photometry <sup>5</sup>	Colorimetric <sup>6</sup>	Multiple, Complementary Technologies (Orthogonal) <sup>7</sup>	Raman Spectroscopy	Infrared (IR), Ultraviolet (UV) , and Microwave Spectroscopy <sup>8</sup>
Lack of real-time or near real-time BWA detection and identification capabilities. <sup>9</sup>		X <sup>10</sup>	X		X		X	X	X	X
Lack of standoff (or remote) detection/identification (not just bio/nonbio discrimination) capability for biological agents. <sup>11</sup>		X	X	X	X	X		X	X	X
Lack of TIB-detection capability.		X	X	X	X	X	X	X	X	X
Lack of agent-quantification capabilities. <sup>12</sup>		X	X	X	X	X	X	X		
Lack of physical-sampling capability for future analysis. <sup>13</sup>		X	X	X	X	X	X	X	X	X

<sup>6</sup> ChemSensing Colorimetric Sensor.

<sup>7</sup> Includes nucleic acid/immunoassay technologies (e.g., PCR and immunological techniques), electrochemiluminescence/equilibrium immunoassay, Fluorescence correlation spectroscopy/PCR.

<sup>8</sup> CO<sub>2</sub> long-wave IR (LWIR) Differential Scattering/Differential Absorption of Light (DISC)/Differential Absorption LIDAR (DIAL), CO<sub>2</sub> conv mid-wave IR (MWIR) DISC/DIAL, solid-state (SS) conv MWIR DISC/DIAL, FTIR, Hyperspectral LWIR, Passive MWIR, SS conv LWIR DISC/DIAL, SS conv short-wave IR (SWIR) – LWIR, SS conv UV-LW IR, Active LWIR Polarization, Active MWIR Polarization, Passive LWIR Polarization, Filtered Forward-Looking Infrared (FLIR), UV LIF/FTIR.

<sup>9</sup> JMCBDS is expected to provide rapid BWA detection capability (i.e., within 1 minute)

<sup>10</sup> A time-of-flight mass spectrometer being developed by Johns Hopkins' Applied Physics Laboratory can, within minutes, identify biological agent aerosols, though in less detail than slower mass spectrometry-based detectors. Brown, Kathryn. "Up in the Air." *Science*. 305: 27. August 2004. pp. 1228–29.

<sup>11</sup> In conjunction with UAV for MS, Immunoassay, Genetic, Tissue-Based, and Flame Photometry IMAs.

<sup>12</sup> JBAIDS and JMCBDS are expected to quantify agent and thus eliminate capability gap.

<sup>13</sup> All IMAs could be designed to eliminate this capability gap. The collection equipment would be better maintained as an independent capability. The solution could involve a module connected to the detector that notifies the operator to take samples or triggers an automated process to begin sampling.

### 5.3 Task TASENS 3: Sense the atmosphere for radiological hazards

#### 5.3.1 Functional Area Analysis

##### 5.3.1.1 Definition

To sense the atmosphere for the presence or absence of radiation hazards and toxic industrial radiological (TIR) material using sensors. Includes the functions of detection, identification, and quantification of the hazard. Also includes collection of samples for further analysis, along with early-warning surveillance of unforeseen hazard releases and monitoring of known hazard locations. Encompasses both “detect to warn” and “detect to treat” situations to enable appropriate protective measures.

##### 5.3.1.2 Derivation

*UJTL TA 7, UJTL TA 7.1, Protection Joint Functional Concept.*

**5.3.1.2.1 Supported Tasks:** OPSSENS 1, OPSSENS 4, OPSSENS 7

**5.3.1.2.2 Lateral Task:** TASHA 16

**5.3.1.2.3 Supporting Task:** N/A

##### 5.3.1.3 Condition

Perform this task under conditions of:

##### **Physical**

1. Mountainous, desert, jungle, and arctic terrain. (C1.1.1)
2. Significant urbanization. (C1.1.3.1)
3. Tropical, arctic, and arid climates. (C1.3.1)
4. Summer, winter seasons. (C1.3.1.1)
5. Stormy weather. (C1.3.1.3)
6. Hot, very cold air temperature. (C1.3.1.3.1)
7. High surface-wind velocity. (C1.3.1.3.3)
8. High relative humidity. (C1.3.1.3.5)
9. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6.1)
10. Heavy precipitation intensity. (C1.3.1.3.6.2)
11. Extreme turbulence and wind shear. (C1.3.1.3.8)
12. Negligible light. (C1.3.2.1)
13. Strong nuclear atmosphere weapons effects. (C1.3.3)
14. Moderate nuclear radiation effects. (C1.3.3.1.2)

##### **Military**

1. Stressful mission. (C2.1)

2. Location—ashore, afloat, airborne. (C2.1.4.1)
3. Minimal time available. (C2.1.5)
4. Low personnel capability. (C2.2.4)
5. Negligible personnel experience. (C2.2.4.5)
6. Ambiguous threat existence. (C2.9.3)

## Civil

1. Limited or negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)
3. High mission priority. (C3.1.3.2)
4. TIMs present in the civilian sector. (C3.3.7.5)

### 5.3.2 Functional Needs Analysis

#### 5.3.2.1 Capability and Deficiency Assessment Summary

Table 5.3-1 presents individual and overall current, near/mid-term, and far-term capabilities to perform the task to the designated standards. There are 15 current capabilities used to accomplish this task. The capabilities include a range of portable RADIAC devices and dosimeters.

#### Current Capabilities and Deficiencies

The overall current capability is assessed as “yellow.” Most current RADIACs detect and identify beta radiation and detect, identify, and quantify gamma radiation. All RADIACs perform their functions in real time (though the level of confidence increases with increased sampling time) and thus provide a complete detect-to-warn capability. Many also automatically calculate the cumulative dose. Dosimeters generally measure the total dose from gamma radiation exposure. Most are not self-indicating and need to be placed within a reader to retrieve the dose information. Many currently fielded dosimeters were designed for fallout operations and are incapable of supporting operations in lower-level radiation environments.

There is no single capability that can perform the task to all of the designated standards. ADM-300 detects most forms of radiation (alpha, beta, gamma, and x-ray), but it, like all RADIACs, detects, identifies, and quantifies only the radiation, not the radioisotope. Furthermore, the ADM-300, like all RADIACs and dosimeters, must be exposed to radiation to detect it. Overall task deficiencies include the lack of radioisotope identification capabilities, reliable alpha detection capabilities, monitors that can detect all types of radiation, and detectors that take sample for future analysis and the complete lack of true standoff detection capabilities.

#### Projected Near/Mid-Term Capabilities and Deficiencies

No changes in capability are projected in the near/mid term for this task, so the overall projected near/mid-term capability will remain “yellow.”

### **Projected Far-Term Capabilities and Deficiencies**

No changes in capability are projected in the far-term for this task, so the overall projected far-term capability will remain “yellow.”

**Table 5.3-1. TASENS 3: Capability and Deficiency Assessment**

	FAA Measure	Elaboration	Scale
M1	All radiological hazards (including TIR material) can be detected using fielded technologies/equipment?	<p>Number of radiation types (i.e., alpha, beta, gamma, neutron, and x-ray) detected. Note: Fielded technologies/equipment detect radiological hazards by detecting the radiation emitted from these hazards.</p> <p>TIR material includes depleted uranium (DU), a common battlefield hazard resulting from certain types of ammunition and damaged armor.</p>	<p>10: All five types  8: Four types  6: Three type  4: Two types  2: Single type  0: No radiological hazards detected</p>
M2	All radiological hazards (including TIR material) can be identified using fielded technologies/ equipment?	Ability to identify type of radiation detected or the radioisotope emitting the radiation. Note: Fielded technologies/equipment that identify radioisotope also identify the type(s) of radiation detected.	<p>10: Identifies radioisotope emitting radiation  5: Identifies type of radiation detected  0: No identification capability</p>
M3	All radiological hazards (including TIR material) can be quantified using fielded technologies/ equipment?	Ability to quantify activity of radiological material (i.e., Cu or Bq), or the exposure (i.e., Roentgen or Coulomb/kg) or dose rate (rad, rem, Gy, or Sv) from emitted radiation.	<p>10: Absolute quantification  5: Generic quantification (or absolute quantification of one radiation type and no quantification of another type)  0: No quantification capability</p>

	<b>FAA Measure</b>	<b>Elaboration</b>	<b>Scale</b>
M4	Time to detect radiological hazard?	Time period from exposure to radiation to analysis output.	10: Near real time 0: Not near real time
M5	Distance between radiological hazard and detector for accurate detection?	Since fielded technologies/equipment detect the radiation emitted from radiological hazards, the distance depends on range of emitted radiation. All field technologies/equipment must be exposed to emitted radiation to detect the radiological hazard. If a radiological detector did not need to be exposed to radiation emitted from a radiological hazard to detect that hazard, then it would exhibit true standoff capability.	10: Exposure to emitted radiation not required to detect hazard 0: Exposure to emitted radiation required to detect hazard
M6	Radiological hazards are detected in time to warn forces and take appropriate protective measures?	Dosimetry is a key protection measure used to ensure personnel do not exceed the command dose level. Complete capability requires automated dosimeters capable of alarming when dose rates and total doses are reached that are well below traditional nuclear warfare levels.	10: Complete capability (alarming personal dosimeter with digital readout, dose rate alarm, and total dose alarm suitable for both occupational exposure use [meets OSHA requirements for tracking low-level exposures] and nuclear warfare operations [fully EMP hardened]) 5: Partial capability (Personal dosimeter with ability for wearer to read in the field, suitable for nuclear warfare operations and with range of 0.1–1000 cGy and display scales ranging cGys to 100s of cGy) 0: No capability
M7	Radiological hazards are identified in time to treat forces?	A complete capability requires both near real-time identification of the emitted radiation type(s) and radioisotope. Identification of the emitted radiation type(s) enables appropriate medical response to radiation exposure and identification of the radioisotope determines to appropriate medical course of action to radiological material internalization.	10: Complete capability (near real-time identification of radioisotope and emitted radiation type[s]) 5: Partial capability (Delayed identification of emitted radiation type[s]) 0: No capability (no identification capability)
M8	Cumulative dose can be determined and presented using data from currently fielded sensors/equipment?	If an absolute quantification capability is provided, then it is possible that the cumulative dose can be estimated (thus a minimal capability). If a monitoring capability is provided, then a more accurate cumulative dose can be calculated (moderate capability). If the cumulative dose is automatically calculated, then a complete capability is provided.	10: Complete capability 7: Moderate capability 5: Minimal capability 0: Cumulative dose cannot be determined.
M9	There is effective DOTLPF in place to conduct task?	Refers to non-materiel elements associated with the execution of a task with the system.	10: DOTLPF exists and is adequate for the task to be performed with this system without limitations that cause significant impact upon operations 5: Most critical aspects of DOTLPF for the task to be performed with this system are addressed 0: DOTLPF is inadequate or does not exist for the task to be performed with this system

- 
- <sup>1</sup> Detects most radiation types (alpha, beta, gamma, and x-ray) emitted from radiological materials.
  - <sup>2</sup> Identifies type of radiation, but not radioisotope.
  - <sup>3</sup> Absolutely quantifies radiation level.
  - <sup>4</sup> Real-time detection. Level of confidence increases with increased sampling time and radiation levels.
  - <sup>5</sup> Requires exposure to emitted radiation to detect hazard.
  - <sup>6</sup> Not a dosimeter.
  - <sup>7</sup> Provides partial identify-to-treat capability since immediately identifies detected radiation type, but not the radioisotope.
  - <sup>8</sup> Automatically calculates cumulative dose since system capable of dose and dose rate alarms across entire measurement range; also predictive algorithm provides estimate of time in field before alarm; unknown whether cumulative dose is directly output.
  - <sup>9</sup> There is effective DOTLPF in place to conduct task with this system.
  - <sup>10</sup> In combination with OA-9449/PDQ probe. The MFR alone detects gamma radiation; with the probe, it measures gamma radiation and detects beta radiation.
  - <sup>11</sup> Detects beta/gamma radiation emitted from radiological materials.
  - <sup>12</sup> Absolutely quantifies gamma radiation level; detects, but does not quantify, beta radiation.
  - <sup>13</sup> Absolutely quantifies radiation level and provides monitoring capability and thus provides moderate capability to determine cumulative dose.
  - <sup>14</sup> Detects alpha radiation emitted from radiological materials (particularly plutonium).
  - <sup>15</sup> Detects only one type of radiation, so identification capability is not applicable.
  - <sup>16</sup> Detects gamma radiation emitted from radiological materials (particularly plutonium).
  - <sup>17</sup> System automatically calculates cumulative dose.
  - <sup>18</sup> The DT-236 dosimeter records the total dose to gamma and neutron radiation. The CP-696 reader is required to retrieve the dose information.
  - <sup>19</sup> Does not differentiate between dose received from gamma radiation and dose received from neutron radiation.
  - <sup>20</sup> Absolutely quantifies total gamma and neutron dose absorbed by dosimeter.
  - <sup>21</sup> Dose can be viewed only when dosimeter is placed within reader; therefore, radiation exposure cannot be detected in near real time.
  - <sup>22</sup> Dosimeter must be exposed to radiation to warn of radiation hazard.
  - <sup>23</sup> Dosimeter, but can't be read by wearer in the field.
  - <sup>24</sup> Through reader, displays total dose to penetrating (i.e., gamma and neutron) radiation, which allows for partial identify-to-treat capability.
  - <sup>25</sup> Dosimeter records total cumulative dose to gamma and neutron radiation.
  - <sup>26</sup> Detects alpha, beta, gamma, and x-radiation emitted from radiological materials.
  - <sup>27</sup> Detects gamma/neutron radiation emitted from radiological materials.
  - <sup>28</sup> Partial capability. Dosimeter measures the gamma/neutron dose rate from 0.1–999 cGy/hour and the total dose from 0.1–999 cGy.
  - <sup>29</sup> Detects gamma radiation and with optional neutron detector, neutron radiation as well.
  - <sup>30</sup> Identifies the radioisotope.
  - <sup>31</sup> Complete capability.
  - <sup>32</sup> Provides complete identify-to-treat capability since immediately identifies radioisotope.
  - <sup>33</sup> Dosimeter indicates total dose to gamma radiation only.
  - <sup>34</sup> Absolutely quantifies total gamma radiation dose absorbed by dosimeter.
  - <sup>35</sup> Provides partial identify-to-treat capability. As dosimeter detects only gamma radiation, an indication of a significant dose could suggest and help treat acute radiation syndrome, e.g.
  - <sup>36</sup> Dosimeter records cumulative dose to gamma radiation.
  - <sup>37</sup> As a self-indicating pocket dosimeter, possibly allows for near-real-time detection of gamma radiation; however, dose rate must be high for increase in dose to be noticeable during a short period.

### 5.3.3 Functional Solution Analysis

#### 5.3.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, that deficiency is then reassessed in the IMAs section.

1. **Deficiency:** Lack of reliable alpha-detection capabilities.  
**Non-Materiel Solutions:** *Training (partial):* Increase training of personnel on ADM-300, AN/PDR-56 and AN/PDR-77.
2. **Deficiency:** Lack of monitors that can detect most or all types of radiation.  
**Non-Materiel Solutions:** *Training (partial):* Increase training of personnel on ADM-300.
3. **Deficiency:** Lack of true standoff detection capability.<sup>1</sup>  
**Non-Materiel Solutions:** None
4. **Deficiency:** Lack of radioisotope-identification capabilities.  
**Non-Materiel Solutions:** None
5. **Deficiency:** Lack of self-indicating, alarming person dosimeters with low-to-high level detection capability.  
**Non-Materiel Solutions:** None

#### 5.3.3.2 IMA Assessment Summary

Table 5.3-2 identifies four ideas for materiel approaches that, if developed, may reduce or eliminate the deficiencies associated with detecting radiological hazards in the atmosphere. Advances in scintillation or semiconductor radiation detection technologies may be able to address all identified deficiencies.

---

<sup>1</sup> Current detectors must be exposed to radiation to detect the presence of a radiological source. This fact means that the users of handheld radiation detectors may also be exposed to radiation. CRTI is currently developing a standoff radiological detection capability. [http://www.crti.drdc-rddc.gc.ca/projects/crti\\_0203rd\\_e.html](http://www.crti.drdc-rddc.gc.ca/projects/crti_0203rd_e.html)

Table 5.3-2. TASENS 3: IMA Assessment

TASENS 3: Sense the atmosphere for radiological hazards <sup>1</sup>				
Identified Gaps	Ideas for Material Approaches (IMA)			
	Gas-Filled Radiation Detectors <sup>2</sup>	Scintillation Radiation Detectors <sup>3</sup>	Semiconductor Radiation Detectors <sup>4</sup>	Infrared, Ultraviolet, and Microwave Spectroscopy
Lack of reliable alpha detection capabilities. <sup>5</sup>	X	X	X	
Lack of monitors that can detect all types of radiation. <sup>6</sup>	X	X	X	
Lack of true standoff (or remote) detection capability. <sup>7</sup>	X	X	X	X <sup>8</sup>
Lack of radioisotope identification capabilities. <sup>9</sup>		X	X	
Lack of self-indicating, alarming person dosimeters with low-to-high level detection capability.		X	X	

<sup>1</sup> <http://hps.org/publicinformation/ate/q534.html>

<sup>2</sup> Includes Geiger-Mueller detectors, proportional gas detectors, and ionization chambers

<sup>3</sup> Includes ZnS(Ag), anthracene, trans-stilbene, para-terphenyl, phenyl oxazole, NaI(Tl), CsI(Tl), bismuth germinate (Bi<sub>4</sub>Ge<sub>3</sub>O<sub>12</sub>), barium fluoride (BaF<sub>2</sub>)-based detectors

<sup>4</sup> Includes germanium, silicon, cadmium telluride (CdTe), and mercuric iodide (HgI<sub>2</sub>)-based detectors

<sup>5</sup> Distributing more ADM-300 and AN/PDR-77 is a potential solution.

<sup>6</sup> Distributing more ADM-300 is a potential solution.

<sup>7</sup> In conjunction with robotics or UAVs for gas-filled detector, scintillation detector, and semiconductor detector IMAs.

<sup>8</sup> CRTI is developing a standoff radiation detector that may be technically based on electromagnetic spectroscopy of surrounding air molecules being ionized by the radiation.

[http://www.crti.drdc-rddc.gc.ca/projects/crti\\_0203rd\\_e.html](http://www.crti.drdc-rddc.gc.ca/projects/crti_0203rd_e.html)

<sup>9</sup> Distributing gamma and/or alpha scintillation detectors with radioisotope identification capabilities is a potential solution.

## 5.4 Task TASENS 4: Sense surfaces for chemical hazards

### 5.4.1 Functional Area Analysis

#### 5.4.1.1 Definition

To sense the presence or absence of chemical hazards (encompasses chemical warfare agents and TICs) on surfaces. Includes the functions of detection, identification, and quantification of the hazard. Also includes the requirement to determine the extent and physical properties of contamination, monitoring of known hazard locations, and collection of samples for further analysis. Encompasses both “detect to warn” and “detect to treat” situations to enable appropriate protective measures.

#### 5.4.1.2 Derivation

*UJTL TA 7, UJTL TA 7.1, Protection Joint Functional Concept.*

**5.4.1.2.1 Supported Tasks:** OPSSENS 1, OPSSENS 4, OPSSENS 7

**5.4.1.2.2 Lateral Task:** N/A

**5.4.1.2.3 Supporting Task:** N/A

#### 5.4.1.3 Condition

Perform this task under conditions of:

##### **Physical**

1. Mountainous, desert, jungle, and arctic terrain. (C1.1.1)
2. Significant urbanization. (C1.1.3.1)
3. High sea state. (C1.2.1.3)
4. Tropical, arctic, and arid climates. (C1.3.1)
5. Summer, winter seasons. (C1.3.1.1)
6. Stormy weather. (C1.3.1.3)
7. Hot, very cold air temperature. (C1.3.1.3.1)
8. High surface-wind velocity. (C1.3.1.3.3)
9. High relative humidity. (C1.3.1.3.5)
10. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6.1)
11. Heavy precipitation intensity. (C1.3.1.3.6.2)
12. Extreme turbulence and wind shear. (C1.3.1.3.8)
13. Negligible light. (C1.3.2.1)
14. Chemical effects. (C1.3.3.2)

##### **Military**

1. Stressful mission. (C2.1)

2. Location—ashore, afloat, airborne. (C2.1.4.1)
3. Minimal time available. (C2.1.5)
4. Low personnel capability. (C2.2.4)
5. Negligible personnel experience. (C2.2.4.5)
6. Ambiguous threat existence. (C2.9.3)

### Civil

1. Limited or negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)
3. Low mission priority. (C3.1.3.2)
4. TICs present in the civilian sector. (C3.3.7.5)

## 5.4.2 Functional Needs Analysis

### 5.4.2.1 Capability and Deficiency Assessment Summary

Table 5.4-1 presents individual and overall current, near/mid-term, and far-term capabilities to perform the task to the designated standards. There are 10 current capabilities used to accomplish this task and four projected capabilities to be added in the future (three in the near/mid-term and one in the far-term). The individual capabilities include a range of point detectors and a future standoff detector with differing capabilities to meet the identified standards (Note: The ratings may be based on vendor-provided claims).

### Current Capabilities and Deficiencies

The overall current capability is assessed as “yellow.” Most current detectors do not directly detect chemical agents on surfaces but rather detect vapors off-gassing from the deposited agent. The APD2000, CAM/ICAM, HAPSITE with the headspace sampling system, and M22 ACADA with XM279 probe all work through this method. Consequently, these detectors’ capabilities for sensing chemical agents on surfaces are generally equivalent to their capabilities for sensing chemical agents in the atmosphere, assuming that the agent is sufficiently volatile for a detectable amount of chemical vapor to accumulate above the contaminated surface.

M8 and M9 papers are the primary current capabilities for directly detecting liquid chemical warfare agents (i.e., nerve and blister agents) deposited on surfaces. M8 paper indicates exposure to liquid agent by changing its color from tan to yellow, red, and green for G-agents, H-agents and Lewisite, and V-agents, respectively. M9 paper does not classify or identify detected agents, but turns pink, red, reddish-brown, or red-purple when exposed to liquid G-agents, H-agents, V-agents, and Lewisite. The HazMatID is another capability that can identify sampled CWA (and TIC) liquids (and solids, powders, and pastes) on surfaces. Though the system can identify samples within 20 seconds, the samples must be manually fed into the device.

There is no single detection device/instrument that is capable of performing all TASENS 4 tasks. Mass spectrometers Viking SpectraTrak and HAPSITE are sophisticated capabilities, but they do not detect or identify in near-real time; consequently, they do not detect to warn and may be

unable to identify to treat high concentrations of fast-acting lethal agents. Current overall task deficiencies include the general inability to detect deposited low-volatility agents, dusty agents, and off-gassing nerve agents (i.e., VX and, to a lesser extent, GD and GF) at or below IDLH levels; lack of real-time CWA identification and TIC detection/identification capabilities; lack of agent quantification capabilities; lack of a detector that also takes samples for future analysis; lack of standoff (or remote) detection capability for CWAs and TICs on surfaces; inability to detect adsorbed and absorbed chemical agents; and detector susceptibility to chemical interference.<sup>1</sup>

### **Projected Near/Mid-Term Capabilities and Deficiencies**

The overall projected near/mid-term capability is assessed as “yellow.” In the near/mid-term future, more detectors will quantify and classify, if not identify, agents. Nevertheless, MS units and the JCSD will likely be the only detectors able to detect all CWAs. MS units Viking Spectratrak and HAPSITE will remain the main capabilities to detect TICs. They will detect many or all high-priority TICs.

The general inability to detect deposited low-volatility agents, dusty agents, and off-gassing nerve agents (i.e., VX and, to a lesser extent, GD and GF) at or below IDLH levels; lack of real-time CWA identification and TIC detection/identification capabilities; lack of agent quantification capabilities; lack of a detector that also takes samples for future analysis; inability to detect adsorbed and absorbed chemical agents; lack of standoff (or remote) detection capability for CWAs and TICs on surfaces; and detector susceptibility to chemical interference are likely to remain deficiencies in the near-future.

### **Projected Far-Term Capabilities and Deficiencies**

The overall projected far-term capability is assessed as “yellow.” In the far-term future, most fielded detectors will detect most, if not, all CWAs and some TICs. Most detectors will quantify and classify, if not identify, agents. MS units will likely remain the main capabilities to detect TICs. Many detectors will still not detect deposited low-volatility agents, dusty agents, and off-gassing nerve agents at or below IDLH levels. Furthermore, there will still be a lack of a detector that also takes samples for future analysis, a lack of standoff (or remote) detection capability for CWAs and TICs on surfaces, and an inability to detect adsorbed and absorbed chemical agents. Chemical interference will remain an issue.

---

<sup>1</sup> Refer to the JRO *Operational Impact Assessment of Non-Traditional Agents* report, July 2003 (S/NF) for information on nontraditional agent detection.

	FAA Measure	Elaboration	Scale
M1	All of a potential adversary's weaponized CWAs can be detected using fielded technologies/ equipment, regardless of agent physical properties, states, and concentrations?	Percentage of following 12 agents as described in FM 3-9 that are detected: nerve agents (GA; GB; GD; GF; VX), vesicants (H/HD; HN-1,2,3; L; CX), cyanides (AC; CK), pulmonary agent (CG)	Percentages standardized to 0–10 scale
M2	All CWAs can be identified?	Ability to classify or identify detected CWAs.	10: Identify detected CWAs 7: Identify some detected CWAs; classify others 5: Classify detected CWAs 0: Neither identify nor classify detected CWAs
M3	All of a potential adversary's weaponized CWAs can be quantified using fielded technologies/equipment?	Ability to provide snapshot concentration of detected CWAs.	10: Absolute quantification 5: Generic quantification 0: No quantification capability

	FAA Measure	Elaboration	Scale
M4	All TICs can be detected using fielded technologies/equipment?	Percentage of the 33 high-priority critical acutely toxic airborne TICs listed in <i>USACHPPM Report 47-EM-6154-03: ITF-40</i> . (FOUO) that are detected.	10: 100% 9: $\geq 90\%$ 8: $\geq 80\%$ 2: $\geq 20\%$ 1: 1%–20% 0: 0%
M5	All TICs can be identified using fielded technologies/equipment?	Ability to classify or identify detected TICs.	10: Identify all detected TICs 7: Identify some detected TICs; classify others 5: Classify detected TICs 0: Neither classify nor identify detected TICs
M6	All TICs can be quantified using fielded technologies/equipment?	Ability to provide snapshot concentration of detected TICs.	10: Absolute quantification 5: Generic quantification 0: No quantification capability
M7	Time to detect chemical hazards?	Time period from CWA/TIC sampling to analysis output. Linear scale 1–10.	10: $\leq 12$ sec 7: $\leq 30$ sec 2: $\leq 60$ sec 1: $> 60$ sec
M8	Distance between chemical hazard and detector for accurate detection?	Linear scale 1–9. Applies to standoff detection only.	10: $\geq 9$ km 9: $\leq 9$ km 5: $\leq 5$ km 2: $\leq 2$ km 1: $\leq 1$ km
M9	Chemical hazards are detected in time to warn forces and take appropriate protective measures?	This measure is not relevant to this task.	N/A
M10	Chemical hazards are identified in time to treat forces?	Based on capability and time required to identify or classify hazards, as well as rate-of-action of those hazards.	10: Complete capability 5: Partial capability 0: No capability
M11	Sampling collection procedures available for all of a potential adversary's weaponized CWAs and for all TICs using fielded technologies/ equipment?	Refers to physical sampling for future analysis.	10: Complete capability 5: Partial capability 0: No capability
M12	Procedures maintain integrity of sample?	Refers to a physical sample for future analysis.	10: Complete capability 5: Partial capability 0: No capability
M13	Cumulative dose can be determined and presented using data from currently fielded sensors/equipment?	This measure is not relevant to this task.	N/A

	FAA Measure	Elaboration	Scale
M14	There is effective DOTLPF in place to conduct task?	Refers to non-materiel elements associated with the execution of a task with the system.	10: DOTLPF exists and is adequate for the task to be performed with this system without limitations that cause significant impact upon operations 5: Most critical aspects of DOTLPF for the task to be performed with this system are addressed 0: DOTLPF is inadequate or does not exist for the task to be performed with this system

<sup>1</sup> Limited—Detects only GA, GB, GD (0.1 mg/m<sup>3</sup> – IDLH level for GA/GB, 2X IDLH level for GD within 30 sec.); VX (0.04 mg/m<sup>3</sup> – 4X IDLH level within 30 sec.); HD (2 mg/m<sup>3</sup> – IDLH level within 15 sec.), and L (0.38 mg/m<sup>3</sup> within 15 sec.). According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), and <300 (L for eye) mg-min/m<sup>3</sup>. Does not detect concentrations which can cause low-level (e.g., ocular) effects; detects vapors only; and is susceptible to chemical interference (false positives and negatives).

<sup>2</sup> Identifies detected agents and TICs.

<sup>3</sup> Does not quantify amount of detected agents or TICs.

<sup>4</sup> Detects pepper spray and mace (but these are not included in the ITF-40 33 high-priority critical acutely toxic airborne TICs.)

<sup>5</sup> Does not quantify TIC concentrations because it does not detect any TICs.

<sup>6</sup> Detects in less than 30 seconds.

<sup>7</sup> Point detector, so no standoff distance.

<sup>8</sup> Not relevant to this task (N/A).

<sup>9</sup> Identifies hazards within 30 seconds.

<sup>10</sup> Sampling collection for future analysis capability does not exist with this technology/equipment.

<sup>11</sup> COTS detector. Unknown if sufficient DOTLPF in place.

<sup>12</sup> Limited—Detects only GA, GB, GD, GF, VX, HD, and L (0.1 mg/m<sup>3</sup> – IDLH level for GA/GB, 2X IDLH for GD/GF; 10X IDLH for VX; 1/20 IDLH for HD). According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), and <300 (L for eye) mg-min/m<sup>3</sup>. Does not detect concentrations which can cause low-level (e.g., ocular) effects; detects vapors only; and is susceptible to chemical interference (false positives and negatives).

<sup>13</sup> Classifies agents as being nerve or blister agents.

<sup>14</sup> Provides relative hazard indication (relative quantification).

<sup>15</sup> No TICs detected.

<sup>16</sup> Does not identify or classify any TICs because it does not detect any TICs.

<sup>17</sup> Detects hazards in less than 1 minute. Note: Requires up to 8 hours to warm up after 30 days storage.

<sup>18</sup> Classifies agents within 1 minute.

<sup>19</sup> There is effective DOTLPF in place to conduct task with this system.

<sup>20</sup> Presumably detects all 12 CWAs of interest considering that it claims that it can detect nerve and blister agents; plus 25,000 unique ATR chemical spectra are available to be programmed into the system. Detects solids, powders, pastes, and liquids only.

<sup>21</sup> Identifies detected agents and TICs (through IR spectrometry).

<sup>22</sup> Presumably detects most TICs in ITF-40. Detects solids, powders, pastes, and liquids only.

<sup>23</sup> Detects and identifies within 20 seconds of sample submission.

<sup>24</sup> Detects and identifies within 20 seconds of sample submission, but samples must be manually fed into system.

<sup>25</sup> Headspace sampling system.

<sup>26</sup> Presumably detects all 12 CWAs of interest (claims low ppb to ppt detection limits; 1 ppb = 0.01 mg/m<sup>3</sup> for VX – IDLH level; 0.006–0.007 mg/m<sup>3</sup> for G-agents – ~1/10 IDLH levels; 0.007 mg/m<sup>3</sup> for HD – 1/285 IDLH level). According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), <300 (L for eye), 7,000 (CK), and 1,6000 (CG) mg-min/m<sup>3</sup>. Detects vapors only.

- 
- <sup>27</sup> Identifies detected agents and TICs (through MS).
- <sup>28</sup> Provides absolute quantification capability for all detected agents and TICs (specifically provides composition intensities, e.g., ppm).
- <sup>29</sup> Presumably detects most TICs in ITF-40. Detects vapors only.
- <sup>30</sup> Detects within 10 minutes.
- <sup>31</sup> Hazards are not identified in time to treat, especially if lethal fast-acting agents at high concentrations are involved.
- <sup>32</sup> Detects GA, GB, GD, GF, VX, HD, HN and L liquid (>0.02 mL) droplets.
- <sup>33</sup> Classifies as G-, H- (and L), and V-agents.
- <sup>34</sup> Classifies agents within 30 seconds.
- <sup>35</sup> Detects GA, GB, GD, GF, VX, HD, HN and L liquid (>100 µL) droplets.
- <sup>36</sup> Does not identify or classify detected agents or TICs.
- <sup>37</sup> Detects within 20 seconds.
- <sup>38</sup> Does not identify or classify agents or TICs.
- <sup>39</sup> Assuming probe does not affect system performance.
- <sup>40</sup> Limited—Detects only GA, GB, GD, GF (0.1 mg/m<sup>3</sup> – IDLH level for GA/GB, 2X IDLH for GD/GF within 30 sec.); VX (0.04 mg/m<sup>3</sup> – 4X IDLH level within 90 sec.); HD, and L (10 mg/m<sup>3</sup> – 5X IDLH level for HD, unknown L). According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), and <300 (L for eye) mg-min/m<sup>3</sup>. Does not detect concentrations which can cause low-level (e.g., ocular) effects; detects vapors only; and is susceptible to chemical interference (false positives and negatives).
- <sup>41</sup> Classifies detected G and V agents as nerve agents; identifies detected H and L agents.
- <sup>42</sup> Relative hazard level provided through three different sensitivity levels.
- <sup>43</sup> Classifies or identifies agents within 30 seconds.
- <sup>44</sup> M8 paper is also included in the kit.
- <sup>45</sup> Detects GA, GB, GD, GF (0.005 mg/m<sup>3</sup> – 1/20 IDLH for GA/GB, 1/10 IDLH for GD/GF), VX (0.02 mg/m<sup>3</sup> – 2X IDLH level), HD (2mg/m<sup>3</sup> – IDLH level), HN, L (9 mg/m<sup>3</sup>), CX (3 mg/m<sup>3</sup>), AC (9 mg/m<sup>3</sup> – below IDLH), CK (8 mg/m<sup>3</sup>), and CX (3 mg/m<sup>3</sup>) in vapor form and is susceptible to chemical interference. According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), <300 (L for eye), and 7,000 (CK) mg-min/m<sup>3</sup>.
- <sup>46</sup> Classifies G and V agents as nerve agents; identifies blood and blister agents.
- <sup>47</sup> Detects TICs AC and CK.
- <sup>48</sup> Identifies detected TICs.
- <sup>49</sup> Detects within 15 minutes.
- <sup>50</sup> Hazards are identified in time to treat when M8 paper is used for liquid detection. Hazards are not identified in time to treat when ampoules are used for vapor detection (delayed response; 15–20 minutes).
- <sup>51</sup> Detects 20–30 CWAs, precursors, and degradation products (including all 12 CWAs) in vapor (62 mg/m<sup>3</sup> for GB – 620X IDLH; 46 mg/m<sup>3</sup> for CK; 115 mg/m<sup>3</sup> for CG) and liquid form, and is susceptible to chemical interference (false positives and negatives). According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), <300 (L for eye), 7,000 (CK), and 1,6000 (CG) mg-min/m<sup>3</sup>.
- <sup>52</sup> Provides relative intensities (concentrations) of detected agents and TICs.
- <sup>53</sup> Detects phosgene, hydrogen cyanide, cyanogen chloride, phosphorus trichloride, and phosphorus oxychloride.
- <sup>54</sup> Detects within 45 seconds.
- <sup>55</sup> Identifies hazards within 45 seconds.
- <sup>56</sup> A physical sample can be taken, but not through the MM-1. The M93A1 Fox has a protective glove attached to the body by which an occupant can safely collect physical samples.
- <sup>57</sup> Sample integrity is maintained.
- <sup>58</sup> Presumably detects all 12 agents of interest; detects all states (claims 5 ppb detection limit for air preconcentrator = 0.05 mg/m<sup>3</sup> for VX – 5X IDLH level, 0.030–0.035 mg/m<sup>3</sup> for G-agents: 1/3–2/3 IDLH levels, 0.035 mg/m<sup>3</sup> for HD – 1/57 IDLH level). According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), <300 (L for eye), 7,000 (CK), and 1,6000 (CG) mg-min/m<sup>3</sup>. Degraded performance: (P5, 9, 10) Not waterproof when operating; (M5) Negligible personnel experience.
-

- 
- <sup>59</sup> Identifies sampled agents and TICs (through MS).
- <sup>60</sup> Presumably detects all TICs in ITF-40; detects all states.
- <sup>61</sup> Presumably will detect all CWAs (0.4 mg/m<sup>2</sup> surface for nerve, blister, blood, and choking agents).
- <sup>62</sup> All detected CWAs will be identified.
- <sup>63</sup> Will detect and identify within 15 seconds.
- <sup>64</sup> Will be point detector, so no standoff distance.
- <sup>65</sup> Will identify within 15 seconds, which provides complete capability.
- <sup>66</sup> Liquid and vapor samples will be able to be taken.
- <sup>67</sup> Sample integrity will be maintained.
- <sup>68</sup> Future system(s). Thus, DOTLPF is also future and cannot be evaluated.
- <sup>69</sup> Will detect only GA, GB, GD, GF, and VX (0.1 mg/m<sup>3</sup> – IDLH level for GA/GB, 2X IDLH level for GD/GF, 10X IDLH for VX, within 30 sec.); HD, HN3, and L (2.0 mg/m<sup>3</sup> – IDLH level, within 120 sec.), AC (22 mg/m<sup>3</sup> – below IDLH level, within 60 sec.), CK (20 mg/m<sup>3</sup> within 60 sec.), and CG vapors only, and will not detect concentrations which can cause low-level (e.g., ocular) effects. According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), <300 (L for eye), and 7,000 (CK) mg-min/m<sup>3</sup>.
- <sup>70</sup> Will classify agents as nerve, blister, blood, and choking agents.
- <sup>71</sup> Will provide absolute quantification capability for all detected agents and TICs.
- <sup>72</sup> Will detect Cl, HBr, HCl, AC, HF, HS, and CG as an objective.
- <sup>73</sup> Will detect hazards within 1 minute.
- <sup>74</sup> Will be point detector, so no standoff distance.
- <sup>75</sup> Will classify hazards within 1 minute.
- <sup>76</sup> This technology/equipment will not have sampling collection for future analysis capability.
- <sup>77</sup> Future system(s). Thus, DOTLPF is also future and cannot be evaluated.
- <sup>78</sup> Will detect all 12 CWAs: GA, GB, GD, GF, VX, H/HD, HN-1,2,3, L, CX, AC, CK, and CG.
- <sup>79</sup> All detected agents will be identified.
- <sup>80</sup> Unknown—to detect TIMs, which include TICs.
- <sup>81</sup> Will detect chemical hazards in real time.
- <sup>82</sup> Though technically a standoff detector, the standoff distance will be minimal.
- <sup>83</sup> Will identify chemical hazards in real time; therefore adequate for identify-to-treat.
- <sup>84</sup> This technology/equipment will not have sampling collection for future analysis capability.
- <sup>85</sup> Will detect only GA, GB, GD, GF (0.1 mg/m<sup>3</sup> – IDLH level for GA/GB, 2X IDLH level for GD/GF within 30 sec.); VX (0.04 mg/m<sup>3</sup> – 4X IDLH level within 90 sec.); HD, HN3, L (2.0 mg/m<sup>3</sup> – IDLH level within 120 sec.); AC (22 mg/m<sup>3</sup> – below IDLH level within 60 sec.); CK (20 mg/m<sup>3</sup> within 60 sec.); and CG in vapor and aerosol forms, and will not detect concentrations which can cause low-level (e.g., ocular) effects. According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), <300 (L for eye), 7,000 (CK), and 1,6000 (CG) mg-min/m<sup>3</sup>.
- <sup>86</sup> Will detect ammonia, arsine, chlorine, diborane, fluorine, hydrogen bromide, hydrogen cyanide, hydrogen fluoride, nitric acid, phosgene, phosphorus trichloride, sulphur dioxide, and sulphuric acid.
- <sup>87</sup> Will identify all detected TICs as an objective.
- <sup>88</sup> Will detect hazards within 2 minutes.
- <sup>89</sup> Will classify or identify CWAs and TICs within 2 minutes.
-

### 5.4.3 Functional Solution Analysis

#### 5.4.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, that deficiency is then reassessed in the IMAs section.

1. **Deficiency:** Lack of real-time or near-real-time TIC detection and identification capabilities.  
**Non-Materiel Solutions:** *Training (partial):* Increase training of personnel on TIC recognizable effects on surfaces.
2. **Deficiency:** General inability to detect deposited low-volatility agents and dusty agents.  
**Non-Materiel Solutions:** None
3. **Deficiency:** General inability to detect off-gassing nerve agents (i.e., VX and, to a lesser extent, GD and GF) at or below IDLH levels.  
**Non-Materiel Solutions:** *Training (partial):* Increase training of personnel on portable mass spectrometers (e.g., Viking SpectraTrak and HAPSITE).
4. **Deficiency:** Susceptibility to chemical interference.  
**Non-Materiel Solutions:** *Training (partial):* Increase training of personnel on portable mass spectrometers (e.g., Viking SpectraTrak and HAPSITE).
5. **Deficiency:** Lack of real-time or near-real-time CWA identification capabilities.  
**Non-Materiel Solutions:** None
6. **Deficiency:** Lack of agent quantification capabilities.  
**Non-Materiel Solutions:** *Training (partial):* Increase training of personnel on portable mass spectrometers (e.g., Viking SpectraTrak and HAPSITE).
7. **Deficiency:** Lack of standoff (or remote) detection capability for CWAs and TICs on surfaces.  
**Non-Materiel Solutions:** None
8. **Deficiency:** Inability to detect absorbed and adsorbed chemical agents.  
**Non-Materiel Solutions:** None
9. **Deficiency:** Lack of detector that also takes physical samples for future analysis capability.  
**Non-Materiel Solutions:** None

#### 5.4.3.2 IMA Assessment Summary

Table 5.4-2 identifies 12 ideas for materiel approaches that, if developed, may reduce or eliminate the deficiencies associated with detecting chemical hazards in the atmosphere. Advances in orthogonal technologies may be able to address all identified deficiencies.

Table 5.4-2: TASENS 4. IMA Assessment

[http://proceedings.ndia.org/dod\\_cb/Tuesday\\_PM/Zarzycki.pdf](http://proceedings.ndia.org/dod_cb/Tuesday_PM/Zarzycki.pdf)

<sup>2</sup> GC/MS, LC/MS.

<sup>3</sup> Examples include Thermal Infrared Spectroscopy, FTIR, long-wave IR (LWIR) Differential Scattering/Differential Absorption of Light (DISC)/Differential Absorption LIDAR (DIAL), LWIR Polarization, mid-wave IR (MWIR) DISC/DIAL, MWIR Polarization, Near-IR Scattering, NIR Laser-Induced Breakdown Spectroscopy (LIBS) UV Fluorescence, Multiband Brillouin Scattering, LWIR FTIR, LWIR Filtered Forward-Looking Infrared (FLIR), and Microwave (GHz and THz) spectroscopy.

<sup>4</sup> May be coupled with GC; External Second Gate, Fourier Transform Ion Mobility Spectrometry approach can improve sensitivity and selectivity.

<sup>5</sup> For example, PCD.

<sup>6</sup> May be coupled with GC.

<sup>7</sup> Examples include SAW/IMS.

<sup>8</sup> NIR Raman, Visible Light (VIS) Surface-Enhanced Raman, VIS Raman, UV Raman, Multiband Resonance-Enhanced Raman, Multiband Surface-Enhanced Raman.

<sup>9</sup> Increasing the number of TICs identified by JCAD and/or JMCBDS is a potential solution.

<sup>10</sup> Classifies, but generally does not identify, agents

<sup>11</sup> Distributing more HAPSITES and Viking Spectratraks is a potential solution.

<sup>12</sup> MS and IMS.

<sup>13</sup> JCAD and JMCBDS are expected to quantify agent and thus eliminate capability gap.

<sup>14</sup> Distributing more HAPSITES and Viking Spectratraks is a potential solution.

<sup>15</sup> In conjunction with robotics for MS, IMS, PIRS, Chemiluminescence Detection, SAW Technology, photoionization technology, Flame Photometry, and Electrochemical Sensor Technology IMAs. JCSD is expected to provide standoff detection capability for CWAs on the ground.

<sup>16</sup> All IMAs could be designed to eliminate this capability gap. The collection equipment would be better maintained as an independent capability. The solution could involve a module connected to the detector that notifies the operator to take samples or triggers an automated process to begin sampling.

## 5.5 Task TASENS 5: Sense surfaces for biological hazards

### 5.5.1 Functional Area Analysis

#### 5.5.1.1 Definition

To sense the presence or absence of biological hazards (encompasses biological warfare agents and TIB material) on surfaces. Includes the functions of detection, identification, and quantification of the hazard. Also includes the requirement to determine the extent and physical properties of contamination, monitoring of known hazard locations, and collection of samples for further analysis. Encompasses both “detect to warn” and “detect to treat” situations to enable appropriate protective measures.

#### 5.5.1.2 Derivation

*UJTL TA 7, UJTL TA 7.1, Protection Joint Functional Concept.*

**5.5.1.2.1 Supported Tasks:** OPSSENS 1, OPSSENS 4, OPSSENS 7

**5.5.1.2.2 Lateral Task:** N/A

**5.5.1.2.3 Supporting Task:** N/A

#### 5.5.1.3 Condition

Perform this task under conditions of:

##### **Physical**

1. Mountainous, desert, jungle, and arctic terrain. (C1.1.1)
2. Significant urbanization. (C1.1.3.1)
3. High sea state. (C1.2.1.3)
4. Tropical, arctic, and arid climates. (C1.3.1)
5. Summer, winter seasons. (C1.3.1.1)
6. Stormy weather. (C1.3.1.3)
7. Hot, very cold air temperature. (C1.3.1.3.1)
8. High surface-wind velocity. (C1.3.1.3.3)
9. High relative humidity. (C1.3.1.3.5)
10. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6.1)
11. Heavy precipitation intensity. (C1.3.1.3.6.2)
12. Extreme turbulence and wind shear. (C1.3.1.3.8)
13. Negligible light. (C1.3.2.1)
14. Biological effects. (C1.3.3.3)

##### **Military**

1. Stressful mission. (C2.1)

2. Location—ashore, afloat, airborne. (C2.1.4.1)
3. Minimal time available. (C2.1.5)
4. Low personnel capability. (C2.2.4)
5. Negligible personnel experience. (C2.2.4.5)
6. Ambiguous threat existence. (C2.9.3)

## Civil

1. Limited or negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)
3. High mission priority. (C3.1.3.2)
4. High health risk. (C3.3.1.5)
5. Significant refugee care responsibility. (C3.3.2.3)
6. Toxic Industrial Biological Material present in the civilian sector. (C3.3.7.5)

## 5.5.2 Functional Needs Analysis

### 5.5.2.1 Capability and Deficiency Assessment Summary

Table 5.5-1 presents individual and overall current, near/mid-term, and far-term capabilities to perform the task to the designated standards. There are three current capabilities used to accomplish this task and one projected capability to be added in the future (JBAIDS in the near/mid term). The individual capabilities differ in their abilities to meet the identified standards.

### Overall Capability and Deficiency Summary

The overall current capability is assessed as “yellow.” Many, if not most, BWAs can be presumptively detected and identified by collecting surface samples through physical sampling, followed by manual sample preparation and the following laboratory and field-deployable analytical techniques: immunochromatographic HHAs, which are part of the BSK; ELISA; and RT-PCR, as used by the RAPID. Of the 25 BWAs described in the *Medical Management of Biological Casualties*, a complete set of HHAs can detect and identify all agents with the possible exception of the viral hemorrhagic fever agents; however, the BSK contains eight different HHAs and thus detects only eight BWAs per kit. The eight agents in the kit may be assembled to reflect the threat.<sup>1</sup> A comprehensive set of ELISAs, which are laboratory-based, can ostensibly detect and identify all 25 BWAs (as well as any TIB), assuming that an antigen or antibody has been isolated for each agent. RAPID, like all PCR-based technologies, can, with the appropriate reagents, detect and identify all BWA and TIB pathogens, but none of the toxins (since the toxins, unless contaminated with the source organisms, do not provide any genetic material). HHAs and RAPID can generically quantify detected agents (HHAs only through the aide of a reader), whereas some varieties of ELISAs provide absolute quantification capabilities.

Overall current task deficiencies include the lack of integrated sample collection, detection, identification, and quantification capability for BWAs on surfaces; real-time or near-real-time detection, identification, and quantification capability for sampled BWAs; standoff detection

capability for BWAs on surfaces; field analysis verification capabilities; and TIB detection capabilities.

### **Projected Near/Mid-Term Capabilities and Deficiencies**

The overall projected near/mid-term capability is assessed as “yellow.” Near/Mid-term capability JBAIDS Block I will detect 11 BWA pathogens (as a threshold requirement), whereas Block II will detect the same 11 BWA pathogens plus the four toxins of interest (as a threshold requirement). JBAIDS will also quantify agent concentrations in the analyzed sample. It will require 25–40 minutes for analysis output following sample preparation and will thus provide a complete identify-to-treat capability. All of the overall current task deficiencies are likely to remain deficiencies in the near/mid term.

### **Projected Far-Term Capabilities and Deficiencies**

No changes in capability are projected in the far term for this task, so the overall projected far-term capability will remain “yellow.”

---

<sup>1</sup> The collection of surface samples to use in HHA results in a sample for further analysis. Coolers/temperature-controlled equipment to hold and maintain the sample needs to be available if the sample is not immediately evacuated.

	<b>FAA Measure</b>	<b>Elaboration</b>	<b>Scale</b>
M1	All of a potential adversary's weaponized BWAs can be detected using fielded technologies/equipment, regardless of agent physical properties, states, and concentrations?	Number of the 25 biological agents described in the <i>Medical Management of Biological Casualties</i> that are detected. Fourteen of the twenty-five agents are as follows: Anthrax ( <i>Bacillus Anthracis</i> ); Brucellosis ( <i>Brucellae</i> ); Glanders ( <i>Burkholderia mallei</i> ); Melioidosis ( <i>Burkholderia pseudomallei</i> ); Q Fever ( <i>Coxiella burnetii</i> ); Plague ( <i>Yersinia pestis</i> ); Tularemia ( <i>Francisella tularensis</i> ); Botulinum toxin; Ricin; SEB; T-2 Mycotoxins; Smallpox (variola major and minor); Viral Equine Encephalities (e.g., VEE, WEE, and EEE); and Ebola and Marburg hemorrhagic fever viruses. Linear 2–10.	10: All 25 BWAs detected 8: ≥20 BWAs detected 6: ≥15 BWAs detected 4: ≥10 BWAs detected 2: ≥5 BWAs detected 1: ≥1 BWA detected 0: No BWAs detected
M2	All of a potential adversary's weaponized BWAs can be identified using fielded technologies/equipment?	Ability to identify or classify (e.g., as bacteria, toxin, or virus) detected BWAs.	10: Identify detected BWAs 7: Identify some detected BWAs; classify others 5: Classify detected BWAs 3: Some detected BWAs are classified or identified 0: Neither identify nor classify detected BWAs
M3	All of a potential adversary's weaponized BWAs can be quantified using fielded technologies/equipment?	Ability to provide snapshot concentration of detected BWAs.	10: Absolute quantification 5: Generic quantification 0: No quantification capability

	FAA Measure	Elaboration	Scale
M4	All TIB material can be detected using fielded technologies/equipment?	TIB material includes medical waste, raw sewage, and vaccine-related biologics. Pathogens and toxins within TIB material are what are generally detected.	10: All pathogens and toxins within TIB material, including medical waste, raw sewage, and vaccine-related biologics can be detected 5: All TIB pathogens or toxins within one or more categories (i.e., medical waste, raw sewage and vaccine-related biologics) can be detected 3: Some TIB pathogens and toxins within one category (i.e., medical waste, raw sewage and vaccine-related biologics) can be detected 0: No TIB pathogens and toxins can be detected
M5	All TIB material can be identified using fielded technologies/equipment?	Ability to identify or classify (e.g., as bacteria, toxin, or virus) detected TIB material.	10: All pathogens and toxins within TIB material can be identified 7: Identify some TIB pathogens and toxins; classify others 5: Classify detected TIB pathogens and toxins 3: Some detected TIB pathogens and toxins can be classified or identified 0: Neither classify nor identify detected TIBs
M6	All TIB material can be quantified using fielded technologies/equipment?	Ability to provide snapshot concentration of detected TIBs.	10: Absolute quantification 5: Generic quantification 0: No quantification capability
M7	Time to detect biological hazards?	Time period from BWA/TIB sampling to analysis output. Linear scale 2–7. Applies to point detectors only.	10: $\leq 1$ minute 9: $\leq 4$ minutes 8: $\leq 7$ minutes 7: $\leq 10$ minutes 4: $\leq 40$ minutes 2: $\leq 60$ minutes 1: $> 60$ minutes
M8	Distance between biological hazard and detector for accurate detection?	Linear scale 1–9. Applies to standoff detection only.	10: $\geq 9$ km 9: $\geq 9$ km 5: $\leq 5$ km 2: $\leq 2$ km 1: $\leq 1$ km

	FAA Measure	Elaboration	Scale
M9	Biological hazards are detected in time to warn forces and take appropriate protective measures?	This measure is not relevant to this task.	N/A
M10	Biological hazards are identified in time to treat forces?	Based on capability and time required to identify or classify hazards, as well as rate-of-action of those hazards. Of all considered BWAs, ricin may require the most rapid response. Immunoglobulin therapy must be administered within 1 hour of ricin exposure to be effective.	10: Complete capability (<1 hour) 5: Partial capability 0: No capability
M11	Sampling collection procedures available for all of a potential adversary's weaponized BWAs and for all TIB material using fielded technologies/equipment?	Refers to physical sampling for future analysis.	10: Complete capability 5: Partial capability 0: No capability
M12	Procedures maintain integrity of sample?	Refers to a physical sample for future analysis.	10: Complete capability 5: Partial capability 0: No capability
M13	Time to validate the presence of biological hazards in the atmosphere?	Refers to confirmatory identification.	10: Rapidly—validation performed expeditiously by particular technology/equipment 5: Moderately delayed—mobile analysis tools can validate on site 0: Delayed—off-site laboratory analysis required for validation
M14	Cumulative dose can be determined and presented using data from currently fielded sensors/equipment?	This measure is not relevant to this task.	N/A
M15	There is effective DOTLPF in place to conduct task?	Refers to non-materiel elements associated with the execution of the task with the system.	10: DOTLPF exists and is adequate for the task to be performed with this system without limitations that cause significant impact upon operations 5: Most critical aspects of DOTLPF for the task to be performed with this system are addressed. 0: DOTLPF is inadequate or does not exist for the task to be performed with this system.

<sup>1</sup> Current and near-future HHAs detect all BWAs with the possible exception of the viral hemorrhagic fevers; however, the BSK contains eight different HHAs and thus detects eight BWAs. The HHA sensitivity is  $10^5$ – $10^6$  CFU/mL (*B. anthracis*) and 50–1200 ng/mL (*Botulinum* toxin A and *Botulinum* toxin F, respectively). Degraded performance: (C6)

TIB Material present in civilian sector. Susceptible to interference (false positives and negatives due to matrix effects, among others); (M3) Minimal time available. Requires sample preparation prior to applying sample to assay.

<sup>2</sup> All detected BWAs are identified.

<sup>3</sup> Does not absolutely quantify agent. May provide relative indication of quantity, but only through the use of a reader. Soldiers will not likely have the reader.

<sup>4</sup> According to specifications, does not detect any TIBs.

<sup>5</sup> Detects within 15 minutes.

<sup>6</sup> Point detector.

<sup>7</sup> Not relevant to this task (N/A).

<sup>8</sup> Immediately identifies all detected hazards (detection requires up to 15 minutes) and thus provides complete identify-to-treat capability.

<sup>9</sup> Provides physical sample collection capability for future analysis.

<sup>10</sup> Maintains integrity of sample.

<sup>11</sup> Requires samples to be confirmed off site in laboratory.

<sup>12</sup> Does not provide absolute quantification capability, so cumulative dose cannot be determined.

<sup>13</sup> There is effective DOTLPF in place to conduct task, at least for bacillus bacteria (specifically anthrax). Procedures for other agents are probably similar.

<sup>14</sup> Ostensibly all BWAs can be detected by ELISA. ELISA's sensitivity is  $10^5$ – $10^6$  CFU/mL (*B. anthracis*); 10–100 PFU/mL of Venezuelan Equine Encephalitis virus; and 625 pg/mL of Staphylococcal Enterotoxin B (aerosol) and greater than 5 ng/mL of ricin.

<sup>15</sup> Some varieties of ELISA can absolutely quantify the antigen or antibody concentration.

<sup>16</sup> Theoretically, any agent (i.e., antigen or antibody) for which an ELISA has been designed can be detected through this method; however, only one particular pathogen or toxin antigen or antibody can be tested per ELISA model.

<sup>17</sup> A particular TIB pathogen or toxin is identified if it is detected, since ELISA is highly specific and detects a particular agent.

<sup>18</sup> Typically requires 1–2 hours (following sample collection and preparation) for detection, identification, and if applicable, quantification, primarily because of incubation time.

<sup>19</sup> Not designed for sample collection for future analysis.

<sup>20</sup> RAPID may be able to detect all pathogens; PCR does not detect toxins, though the toxic material may be contaminated with source genetic material (In this assessment, it is assumed that this is not the case). Standard PCR has a sensitivity of 10–100 CFU/mL bacteria (*B. anthracis*); and 15 fg–1 pg or 100–1 million copies of the complementary DNA for viruses.

<sup>21</sup> RAPID, through RT-PCR, may provide generic quantification.

<sup>22</sup> Theoretically, any TIB pathogen can be detected with appropriate reagents; toxins cannot be detected unless contaminated with source genetic material.

<sup>23</sup> All detected TIBs are identified.

<sup>24</sup> Detects and identifies within 30 minutes following sample preparation, but sample preparation requires several hours.

<sup>25</sup> Block I will detect Anthrax; Brucella; Ebola VHF virus; Marburg VHF virus; Viral Encephalitis viruses (VEE/WW/EEE); Glanders; Melioidosis; Plague; Q Fever; Smallpox; and Tularemia [and Typhus] as a threshold requirement; and Crimean-Congo hemorrhagic virus; Dengue fever; Hantaviruses; and Rift Valley Fever Virus [and Cholera, Cryptosporidium; E. coli; Influenza; Salmonella; and Shigella] as an objective; Block II will add toxins Botulinum, microcystins, ricin, SEB, and T-2 Mycotoxins.

<sup>26</sup> Will identify all detected agents.

<sup>27</sup> Will quantify the concentration in the sample.

<sup>28</sup> Will not detect any TIBs.

<sup>29</sup> Will detect and identify within 40 minutes (25-minute objective) for Blocks I and II following sample preparation.

<sup>30</sup> Will be a point detector.

<sup>31</sup> Will immediately identify all detected hazards (detection will require 25–40 minutes) and thus will provide complete identify-to-treat capability.

<sup>32</sup> Will provide physical sample collection capability for future analysis.

<sup>33</sup> Will maintain integrity of physical sample.

<sup>34</sup> Will require samples to be confirmed off site at laboratory.

<sup>35</sup> Cumulative dose will be able to be estimated from data (minimal capability).

<sup>36</sup> Future system(s). Thus, DOTLPF is also future and cannot be evaluated.

### 5.5.3 Functional Solution Analysis

#### 5.5.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, that deficiency is then reassessed in the IMAs section.

1. **Deficiency:** Lack of integrated sample collection, detection, identification, and quantification capability for BWAs on surfaces.

**Non-Materiel Solutions:** None

2. **Deficiency:** Lack of real-time or near-real-time detection, identification, and quantification capability for sampled BWAs.

**Non-Materiel Solutions:** None

3. **Deficiency:** Lack of standoff detection capability for BWAs on surfaces.

**Non-Materiel Solutions:** None

4. **Deficiency:** Lack of unit/team-level field validation/confirmation of positive identifications as laboratory confirmation is required.

**Non-Materiel Solutions:** *Doctrine:* Modify doctrine to permit validation by a reliable on-site detection/identification capability (e.g., portable PCR) as confirmatory detection/identification is ultimately dependent upon doctrine, not materiel capabilities.

5. **Deficiency:** Lack of TIB detection capability.

**Non-Materiel Solutions:** None

6. **Deficiency:** Lack of detector that also takes samples for future analysis capability.

**Non-Materiel Solutions:** None

#### 5.5.3.2 IMA Assessment Summary

Table 5.5-2 identifies nine ideas for materiel approaches that, if developed, may reduce or eliminate the deficiencies associated with detecting biological hazards on surfaces. Advances in MS, immunoassays; flame photometry; tissue-based detection; Raman, IR, UV, or microwave spectroscopy; or orthogonal technologies may be able to address all identified deficiencies.

Table 5.5-2. TASENS 5: DOTMLPF Assessment

TASENS 5: Sense surfaces for biological hazards <sup>1</sup>									
Identified Gaps	Ideas for Material Approaches (IMA)								
	Mass Spectrometry <sup>2</sup>	Immunoassay (Antibody-Based) <sup>3</sup>	Genetic (Nucleic Acid-Based) <sup>4</sup>	Tissue-Based	Flame Photometry <sup>5</sup>	Colorimetric <sup>6</sup>	Orthogonal <sup>7</sup> Technologies	Raman Spectroscopy <sup>8</sup>	IR, UV, and Microwave Spectroscopy <sup>9</sup>
Lack of integrated sample collection, detection, identification, and quantification capability for BWAs on surfaces. <sup>10</sup>	X	X	X	X	X	X	X	X	X
Lack of real-time or near-real time detection, identification, and quantification capability for sampled BWAs. <sup>11</sup>	X	X		X	X	X	X	X	X
Lack of standoff (or remote) detection/identification capability for BWAs on surfaces. <sup>12</sup>	X	X	X	X	X		X	X	X
Lack of TIB detection capability.	X	X	X	X	X	X	X	X	X
Lack of detector that also takes samples for future analysis. <sup>13</sup>	X	X	X	X	X	X	X	X	X

<sup>6</sup> ChemSensing Colorimetric Sensor

<sup>7</sup> Includes nucleic acid/immunoassay technologies (e.g., PCR and immunological techniques), electrochemiluminescence/equilibrium immunoassay, Fluorescence correlation spectroscopy/PCR

<sup>8</sup> NIR Raman, Visible Light (VIS) Surface-Enhanced Raman, VIS Raman, UV Raman, Multiband Resonance-Enhanced Raman, Multiband Surface-Enhanced Raman.

<sup>9</sup> NIR Raman, Visible Light (VIS) Surface-Enhanced Raman, VIS Raman, UV Raman, Multiband Resonance-Enhanced Raman, Multiband Surface-Enhanced Raman.

<sup>9</sup> Thermoluminescence/FTIR, long-wave IR (LWIR) Differential Scattering/Differential Absorption of Light (DISC)/Differential Absorption LIDAR (DIAL), LWIR Polarization, mid-wave IR (MWIR) DISC/DIAL, MWIR Polarization, Near-Infrared (NIR) Laser-Induced Breakdown Spectroscopy (LIBS) UV Fluorescence, Multiband Brillouin Scattering.

<sup>10</sup> Sample collection, independent of the detector, is one of the main, if not the main, problem. Quantification cannot be achieved without efficient, standardized sample collection and preparation (if needed). JBAIDS is expected to detect, identify, and quantify all BWAs on surfaces, and thus eliminate capability gap.

<sup>11</sup> Reducing the sample preparation and response times for JBAIDS is a potential solution.

<sup>12</sup> In conjunction with robotics for Mass Spectrometry, Immunoassay, Genetic, Tissue-Based, and Flame Photometry IMAs.

<sup>13</sup> All IMAs could be designed to eliminate this capability gap. The collection equipment would be better maintained as an independent capability. The solution could involve a module connected to the detector that notifies the operator to take samples or triggers an automated process to begin sampling.

## 5.6 Task TASENS 6: Sense surfaces for radiological hazards

### 5.6.1 Functional Area Analysis

#### 5.6.1.1 Definition

To sense the presence or absence of radiation hazards on surfaces. Includes the functions of detection, identification, and quantification of the radiological hazard. Also includes the requirement to determine the extent and physical properties of contamination, monitoring of known agent locations, and collection of samples for further analysis. Encompasses both “detect to warn” and “detect to treat” situations to enable appropriate protective measures.

#### 5.6.1.2 Derivation

*UJTL TA 7, UJTL TA 7.1, Protection Joint Functional Concept.*

##### 5.6.1.2.1 Supported Tasks: OPSSENS 1, OPSSENS 4, OPSSENS 7

##### 5.6.1.2.2 Lateral Task: N/A

##### 5.6.1.2.3 Supporting Task: N/A

#### 5.6.1.3 Condition

Perform this task under conditions of:

##### **Physical**

1. Mountainous, desert, jungle, and arctic terrain. (C1.1.1)
2. Significant urbanization. (C1.1.3.1)
3. High sea state. (C1.2.1.3)
4. Tropical, arctic, and arid climates. (C1.3.1)
5. Summer, winter seasons. (C1.3.1.1)
6. Stormy weather. (C1.3.1.3)
7. Hot, very cold air temperature. (C1.3.1.3.1)
8. High surface-wind velocity. (C1.3.1.3.3)
9. High relative humidity. (C1.3.1.3.5)
10. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6.1)
11. Heavy precipitation intensity. (C1.3.1.3.6.2)
12. Extreme turbulence and wind shear. (C1.3.1.3.8)
13. Negligible light. (C1.3.2.1)
14. Strong nuclear atmosphere weapons effects. (C1.3.3)
15. Moderate nuclear radiation effects. (C1.3.3.1.2)

##### **Military**

1. Stressful mission. (C2.1)

2. Location—ashore, afloat, airborne. (C2.1.4.1)
3. Minimal time available. (C2.1.5)
4. Low personnel capability. (C2.2.4)
5. Negligible personnel experience. (C2.2.4.5)
6. Ambiguous threat existence. (C2.9.3)

### Civil

1. Limited or negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)
3. High mission priority. (C3.1.3.2)
4. Toxic industrial radiological materials present in the civilian sector. (C3.3.7.5)

## 5.6.2 Functional Needs Analysis

### 5.6.2.1 Capability and Deficiency Assessment Summary

Table 5.6-1 presents individual and overall current, near/mid-term, and far-term capabilities to perform the task to the designated standards. There are 11 current capabilities used to accomplish this task. The capabilities include a range of portable RADIAC devices.

### Current Capabilities and Deficiencies

The overall current capability is assessed as “yellow.” Most current RADIACS detect and identify beta radiation and detect, identify, and quantify gamma radiation. All RADIACs perform their functions in real time (though the level of confidence increases with increased sampling time) and thus provide a complete detect-to-warn capability. Many also automatically calculate the cumulative dose.

There is no single capability that can perform the task to all of the designated standards. ADM-300 detects most forms of radiation (alpha, beta, gamma and x-ray), but like all RADIACs, it detects, identifies, and quantifies only the radiation, not the radioisotope. Furthermore, like all RADIACs, the ADM-300 must be exposed to radiation to detect it. Current overall task deficiencies include the lack of radioisotope identification capabilities, reliable alpha detection capabilities, monitors that can detect all radiation types, detectors that take samples for future analysis<sup>1</sup>, and the complete lack of true standoff detection capabilities.

### Projected Near/Mid-Term Capabilities and Deficiencies

No changes in capability are projected in the near/mid term for this task, so the overall projected near/mid-term capability will remain “yellow.”

---

<sup>1</sup> Only the M34A1 sampling kit, which is not a detector, is capable of collecting and maintaining a radiological sample.

### **Projected Far-Term Capabilities and Deficiencies**

No changes in capability are projected in the far term for this task, so the overall projected far-term capability will remain “yellow.”

Table 5.6-1. TASENS 6: Capability and Deficiency Assessment

System/Measure	M1	M2	M3	M4	M5	M6	M7	M8	M9

	FAA Measure	Elaboration	Scale
M1	All radiological hazards (including TIR material) can be detected using fielded technologies/equipment?	Number of radiation types (i.e., alpha, beta, gamma, neutron, and x-ray) detected. Note: Fielded technologies/equipment detect radiological hazards by detecting the radiation emitted from these hazards.  TIR material includes DU, a common battlefield hazard resulting from certain types of ammunition and damaged armor.	10: All five types 8: Four types 6: Three types 4: Two types 2: Single type 0: No radiological hazards detected
M2	All radiological hazards (including TIR material) can be identified using fielded technologies/equipment?	Ability to identify type of radiation detected or the radioisotope emitting the radiation. Note: Fielded technologies/equipment that identify radioisotope also identify the type(s) of radiation detected.	10: Identifies radioisotope emitting radiation 5: Identifies type of radiation detected 0: No identification capability
M3	All radiological hazards (including TIR material) can be quantified using fielded technologies/equipment?	Ability to quantify activity of radiological material (i.e., Cu or Bq), or the exposure (i.e., Roentgen or Coulomb/kg) or dose rate (rad, rem, Gy, or Sv) from emitted radiation.	10: Absolute quantification 5: Generic quantification (or absolute quantification of one radiation type and no quantification of another type) 0: No quantification capability

	FAA Measure	Elaboration	Scale
M4	Time to detect radiological hazard?	Time period from exposure to radiation to analysis output.	10: Near real time 0: Not near real time
M5	Distance between radiological hazard and detector for accurate detection?	Since fielded technologies/equipment detect the radiation emitted from radiological hazards, the distance depends on range of emitted radiation. All field technologies/equipment must be exposed to emitted radiation to detect the radiological hazard. If a radiological detector did not need to be exposed to radiation emitted from a radiological hazard to detect that hazard, then it would exhibit true standoff capability.	10: Exposure to emitted radiation not required to detect hazard. 0: Exposure to emitted radiation required to detect hazard.
M6	Radiological hazards are detected in time to warn forces and take appropriate protective measures?	Since appropriate protective measures depend on the radiation type(s) being emitted, complete capability requires real-time or near-real-time detection of emitted radiation and identification of that radiation by type.	10: Complete capability (real-time or near-real-time detection and identification of radiation type[s]) 5: Partial capability (delayed detection of the radiation without identification capability) 0: No capability
M7	Radiological hazards are identified in time to treat forces?	A complete capability requires both near real-time identification of the emitted radiation type(s) and radioisotope. Identification of the emitted radiation type(s) enables appropriate medical response to radiation exposure and identification of the radioisotope determines to appropriate medical course of action to radiological material internalization.	10: Complete capability (near-real-time identification of radioisotope and emitted radiation type[s]) 5: Partial capability (Delayed identification of emitted radiation type[s]) 0: No capability (no identification capability)
M8	Cumulative dose can be determined and presented using data from currently fielded sensors/equipment?	If an absolute quantification capability is provided, then it is possible that the cumulative dose can be estimated (thus a minimal capability). If a monitoring capability is provided, then a more accurate cumulative dose can be calculated (moderate capability). If the cumulative dose is automatically calculated, then a complete capability is provided.	10: Complete capability 7: Moderate capability 5: Minimal capability 0: Cumulative dose cannot be determined
M9	There is effective DOTLPF in place to conduct task?	Refers to non-materiel elements associated with the execution of a task with the system.	10: DOTLPF exists and is adequate for the task to be performed with this system without limitations that cause significant impact upon operations 5: Most critical aspects of DOTLPF for the task to be performed with this system are addressed 0: DOTLPF is inadequate or does not exist for the task to be performed with this system

<sup>1</sup> Detects most radiation types (alpha, beta, gamma, and x-ray) emitted from radiological materials.

<sup>2</sup> Identifies type of radiation, but not radioisotope.

<sup>3</sup> Absolutely quantifies radiation level.

<sup>4</sup> Real-time detection. Level of confidence increases with increased sampling time and radiation levels.

- <sup>5</sup> Requires exposure to emitted radiation to detect hazard.
- <sup>6</sup> Provides complete detect-to-warn capability since detects and identifies radiation in real time.
- <sup>7</sup> Provides partial identify-to-treat capability since immediately identifies detected radiation type, but not the radioisotope.
- <sup>8</sup> Automatically calculate cumulative dose since system capable of dose and dose rate alarms across entire measurement range; also predictive algorithm provides estimate of time in field before alarm; unknown whether cumulative dose is directly output.
- <sup>9</sup> There is effective DOTLPF in place to conduct task with this system.
- <sup>10</sup> In combination with OA-9449/PDQ probe. The MFR alone detects gamma radiation; with the probe, it measures gamma radiation and detects beta radiation.
- <sup>11</sup> Detects beta/gamma radiation emitted from radiological materials.
- <sup>12</sup> Absolutely quantifies gamma radiation level; detects, but does not quantify, beta radiation.
- <sup>13</sup> Absolutely quantifies radiation level and provides monitoring capability, thus provides moderate capability to determine cumulative dose.
- <sup>14</sup> Detects alpha radiation emitted from radiological materials (particularly plutonium).
- <sup>15</sup> Detects only one type of radiation, so identification capability is not applicable.
- <sup>16</sup> Provides complete detect-to-warn capability since detects one radiation type in real time.
- <sup>17</sup> Detects gamma radiation emitted from radiological materials (particularly plutonium).
- <sup>18</sup> System automatically calculates cumulative dose.
- <sup>19</sup> Detects alpha, beta, gamma, and x-radiation emitted from radiological materials.
- <sup>20</sup> Detects gamma/neutron radiation emitted from radiological materials.
- <sup>21</sup> Detects gamma radiation and with optional neutron detector, neutron radiation as well.
- <sup>22</sup> Identifies the radioisotope.
- <sup>23</sup> Provides complete identify-to-treat capability since immediately identifies radioisotope.

### 5.6.3 Functional Solution Analysis

#### 5.6.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, that deficiency is then reassessed in the IMAs section.

1. **Deficiency:** Lack of reliable alpha detection capabilities.  
**Non-Materiel Solutions:** *Training (partial):* Increase training of personnel on ADM-300, AN/PDR-56, and AN/PDR-77.
2. **Deficiency:** Lack of monitors that can detect all types of radiation.  
**Non-Materiel Solutions:** *Training (partial):* Increase training of personnel on ADM-300.
3. **Deficiency:** Lack of true standoff detection capability.<sup>1</sup>  
**Non-Materiel Solutions:** None
4. **Deficiency:** Lack of radioisotope identification capabilities.  
**Non-Materiel Solutions:** None
5. **Deficiency:** Lack of detector that can also take samples for future analysis capability.<sup>2</sup>  
**Non-Materiel Solutions:** None

#### 5.6.3.2 IMA Assessment Summary

Table 5.6-2 identifies four ideas for materiel approaches that, if developed, may reduce or eliminate the deficiencies associated with detecting radiological hazards in the atmosphere. Advances in scintillation or semiconductor radiation detection technologies may be able to address all identified deficiencies.

---

<sup>1</sup> Current detectors must be exposed to radiation to detect the presence of a radiological source, so users of handheld radiation detectors may also be exposed to radiation. CRTI is currently developing a standoff radiological detection capability.

[http://www.crti.drdc-rddc.gc.ca/projects/crti\\_0203rd\\_e.html](http://www.crti.drdc-rddc.gc.ca/projects/crti_0203rd_e.html)

<sup>2</sup> Only the M34A1 sampling kit, which is not a detector, is capable of collecting and maintaining a radiological sample.

Table 5.6-2. TASENS 6: IMA Assessment

TASENS 6: Sense surfaces for radiological hazards <sup>1</sup>					
<div> <div>Identified Gaps</div> <div>Ideas for Material Approaches (IMA)</div> </div>	Gas-Filled Radiation Detectors <sup>2</sup>	Scintillation Radiation Detectors <sup>3</sup>	Semiconductor Radiation Detectors <sup>4</sup>	IR, UV, and Microwave Spectroscopy

	Lack of monitors that can detect all types of radiation. <sup>6</sup>	X	X	X	
	Lack of true standoff (or remote) detection capability. <sup>7</sup>	X	X	X	X <sup>8</sup>
	Lack of radioisotope identification capabilities. <sup>9</sup>		X	X	
	Lack of detector that collects contamination for low-level detection and future analysis. <sup>10</sup>	X	X	X	

<sup>1</sup> <http://hps.org/publicinformation/ate/q534.html>

<sup>2</sup> Includes Geiger-Mueller detectors, proportional gas detectors, and ionization chambers.

<sup>3</sup> Includes ZnS(Ag), anthracene, trans-stilbene, para-terphenyl, phenyl oxazole, NaI(Tl), CsI(Tl), bismuth germinate (Bi<sub>4</sub>Ge<sub>3</sub>O<sub>12</sub>), barium fluoride (BaF<sub>2</sub>)-based detectors

<sup>4</sup> Includes germanium, silicon, cadmium telluride (CdTe), and mercuric iodide (HgI<sub>2</sub>)-based detectors.

<sup>5</sup> Distributing more ADM-300 and AN/PDR-77 is a potential solution.

<sup>6</sup> Distributing more ADM-300 is a potential solution.

<sup>7</sup> In conjunction with robotics for gas-filled detector, scintillation detector, and semiconductor detector IMAs.

<sup>8</sup> CRTI is developing a standoff radiation detector that may be technically based on electromagnetic spectroscopy of surrounding air molecules being ionized by the radiation.

<sup>9</sup> [http://www.crti.drdc-rddc.gc.ca/projects/crti\\_0203rd\\_e.html](http://www.crti.drdc-rddc.gc.ca/projects/crti_0203rd_e.html)

<sup>10</sup> Distributing gamma and/or alpha scintillation detectors with radioisotope identification capabilities is a potential solution.

<sup>10</sup> All point detection IMAs could be designed to eliminate this capability gap. The collection equipment would be better maintained as an independent capability. The solution could involve a module connected to the detector that notifies the operator to take samples or triggers an automated process to begin sampling.

## **5.7 Task TASENS 7: Sense water for chemical hazards**

### **5.7.1 Functional Area Analysis**

#### **5.7.1.1 Definition**

To sense the presence or absence of chemical hazards (encompasses CWAs and TICs) in water (potable and nonpotable). Includes the functions of detection, identification, and quantification of the hazard. Also includes collection of samples for further analysis, along with early-warning surveillance of unforeseen agent releases and monitoring of known hazard locations, as well as the requirement to determine the extent and physical properties of contamination. Encompasses both “detect to warn” and “detect to treat” situations to enable appropriate protective measures. The evaluation encompasses all chemical hazards of military and medical importance. Must occur in situ to assist with raw water site selection and identification of soldier contact hazards, in-line post reverse osmosis water purification unit (ROWPU) and permanent water distribution systems, and on-demand to spot-check potable water distribution sites and shower points.

#### **5.7.1.2 Derivation**

*UJTL TA 7, UJTL TA 7.1, Protection Joint Functional Concept.*

**5.7.1.2.1 Supported Tasks:** OPSENS 1, OPSENS 4, OPSENS 7

**5.7.1.2.2 Lateral Task:** TASHA 14

**5.7.1.2.3 Supporting Task:** N/A

#### **5.7.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Inaccessible subsurface water. (C1.1.2.3)
2. High sea state. (C1.2.1.3)
3. High shipping presence. (C1.2.6)
4. Summer, winter seasons. (C1.3.1.1)
5. Stormy weather. (C1.3.1.3)
6. Hot, very cold air temperature. (C1.3.1.3.1)
7. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6.1)
8. Heavy precipitation intensity. (C1.3.1.3.6.2)
9. Negligible light. (C1.3.2.1)
10. Chemical effects. (C1.3.3.2)

##### **Military**

1. Stressful mission. (C2.1)

2. Location—ashore, afloat, airborne. (C2.1.4.1)
3. Minimal time available. (C2.1.5)
4. Low personnel capability. (C2.2.4),
5. Negligible personnel experience. (C2.2.4.5)
6. Ambiguous threat existence. (C2.9.3)

### Civil

1. Limited or negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)
3. High mission priority. (C3.1.3.2)
4. Toxic Industrial Chemicals present in the civilian sector. (C3.3.7.5).

## 5.7.2 Functional Needs Analysis

### 5.7.2.1 Capability and Deficiency Assessment Summary

Table 5.7-1 presents individual and overall current, near/mid-term, and far-term capabilities to perform the task to the designated standards. There are four current capabilities used to accomplish this task and two projected capabilities to be added in the future (one each in the near/mid term and the far term). The capabilities include colorimetric kits and mass spectrometers with differing capabilities to meet the identified standards.

### Current Capabilities and Deficiencies

The overall current capability is assessed as “yellow.” The M272 Kit, the primary current capability for detecting chemical hazards in water, detects the G-agents, VX, HD, Lewisite, and hydrogen cyanide (AC) and classifies/identifies a detected agent as a nerve agent, HD, Lewisite, or AC. The more sophisticated capabilities are MS-based and include the HAPSITE with headspace sampling system, MM-1 integrated into the M93A1 Fox, and Viking Spectratrak. The MSs detect all CWAs, identify detected agents, and typically quantify agent concentrations as composition intensities. The HAPSITE and Viking Spectratrak also detect, identify, and quantify most, if not all, TICs of interest.<sup>1</sup>

There is no single capability that can perform the task to all of the designated standards. MS Viking SpectraTrak is a sophisticated current capability, but it does not detect or identify in near-real time; consequently, it may be unable to identify-to-treat fast-acting lethal agents in potable water that has since been ingested. Current overall task deficiencies include the general inability to detect down to hazard levels which meet tri-service drinking standards; general lack of detection, identification, and quantification capabilities for TICs in water; and complete lack of real-time detection, identification, and quantification capabilities for CWAs and TICs in water.

---

<sup>1</sup> Refer to the JRO *Operational Impact Assessment of Non-Traditional Agents* report, July 2003 (S/NF) for information on nontraditional agent detection.

Furthermore, there is no current detector that also takes a chemical sample from water for future analysis.<sup>2</sup>

### **Projected Near/Mid-Term Capabilities and Deficiencies**

The overall projected near/mid-term capability is assessed as “yellow.” In the near/mid-term future, the CBMS II will be deployed on the NBCRV Stryker and/or JNBCRS. It will detect, identify, and quantify chemical hazards in sampled water three times faster than the MM-1 on the M93A1 Fox. Nevertheless, the NBCRV Stryker and JNBCRS, like the M93A1 Fox, will be reconnaissance vehicles, and therefore, though they will be able to test potable water for chemical hazards, they will not likely be regularly employed for this purpose.

All current deficiencies will likely remain in the near/mid-term future. The NBCRV Stryker and/or JNBCRS (regardless of the inclusion of the CBMS II) are expected to be capable of taking and maintaining a physical sample for future analysis; however, there will still be no modular detection system that is capable of performing this task.

### **Projected Far-Term Capabilities and Deficiencies**

The overall projected far-term capability is assessed as “green.” In the far-term future, the JCBAWM is expected to be fielded. It will be a significant improvement over the M292 Kit. Presumably it will detect, identify, and measure the concentration of all CWAs and TICs of interest (specifically, all agents listed in Defense Intelligence Agency [DIA] document “Threat Environment Projection: Chemical and Biological Warfare 2000–2025” as an objective). Unlike the M292 Kit, it will meet the tri-service long-term consumption standards (and as an objective, detect concentrations 20% lower than those established in the standards). However, its analysis time of 10 minutes will be similar to those of MS units and may be insufficient for identifying-to-treat agents that were present in recently ingested water. It is unknown whether the JCBAWM will be able to take and maintain a physical sample for future analysis.

In the far-term future, there will remain a complete lack of real-time detection, identification, and quantification capabilities for CWAs and TICs in water. Depending on the JCBAWM capabilities, the lack of a detector that can also take and maintain a physical sample for future analysis may remain a deficiency.

---

<sup>2</sup> The M34A1 sampling kit, which is not a detector, and the M93A1 Fox, regardless of the inclusion of the MM-1, are capable of collecting and maintaining a chemical sample.

<sup>1</sup> Headspace sampling system

<sup>2</sup> Presumably detects all 12 CWA of interest by detecting vapors off-gassing from water (average detection limit: ~5 µg/L).

<sup>3</sup> Identifies detected agents and TICs (through MS).

<sup>4</sup> Provides absolute quantification capability for all detected agents and TICs (specifically provides composition intensities, e.g., ppm).

<sup>5</sup> Presumably detects most TICs in ITF-40. Detects vapors off-gassing from water.

<sup>6</sup> Detects within 10 minutes.

<sup>7</sup> Not relevant to this task (N/A).

<sup>8</sup> Hazards are not identified in time to treat, especially if lethal fast-acting agents at high concentrations are involved.

<sup>9</sup> Sampling collection for future analysis capability does not exist with this technology/equipment.

<sup>10</sup> COTS detector. Unknown if sufficient DOTLPF in place.

<sup>11</sup> Detects GA, GB, GD, GF and VX (0.02 mg/L ORD requirement); HD and L (2.0 mg/L ORD requirement); and AC (20.0 mg/L ORD requirement). Does not meet tri-service field drinking water consumption standards, which are the aforementioned detection limit requirements.

<sup>12</sup> Identifies/classifies as nerve agent, AC, HD, or Lewisite.

<sup>13</sup> Does not quantify amount of detected agents or TICs.

<sup>14</sup> Detects and identifies HCN (AC) only.

<sup>15</sup> Each agent class test (blister, blood, and nerve) takes about 6–7 minutes. All tests can be completed in 20 minutes.

<sup>16</sup> There is effective DOTLPF in place to conduct task with this system.

<sup>17</sup> Detects 20–30 CWAs, precursors, and degradation products (including all 12 CWAs) in liquid form through use of 120°C probe that vaporizes liquid. Vapor detection limits: 62 mg/m<sup>3</sup> for GB – 620X IDLH; 46 mg/m<sup>3</sup> for CK; 115 mg/m<sup>3</sup> for CG. According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), <300 (L for eye), 7,000 (CK), and 1,6000 (CG) mg-min/m<sup>3</sup>. It is susceptible to chemical interference (false positives and negatives).

<sup>18</sup> Provides relative intensities (concentrations) of detected agents and TICs.

<sup>19</sup> Detects phosgene, hydrogen cyanide, cyanogen chloride, phosphorus trichloride, and phosphorus oxychloride.

<sup>20</sup> Detects within 45 seconds.

<sup>21</sup> Identifies hazards within 45 seconds.

<sup>22</sup> A physical sample can be taken, but not through the MM-1. The M93A1 Fox has a protective glove attached to the body by which an occupant can safely collect physical samples.

<sup>23</sup> Sample integrity is maintained.

<sup>24</sup> Presumably detects all 12 agents of interest (5 µg/L detection limit); detects all states. Degraded performance: (P5, 9, 10) Not waterproof when operating; (M5) Negligible personnel experience.

<sup>25</sup> Identifies sampled agents and TICs (through mass spectrometry).

<sup>26</sup> Presumably detects all TICs in ITF-40; detects all states.

<sup>27</sup> Presumably will detect all CWAs.

<sup>28</sup> All detected CWAs will be identified.

<sup>29</sup> Will detect and identify within 15 seconds.

<sup>30</sup> Will identify within 15 seconds, which provides complete capability.

<sup>31</sup> Liquid and vapor samples will be able to be taken.

<sup>32</sup> Sample integrity will be maintained.

<sup>33</sup> Future system(s). Thus, DOTLPF is also future and cannot be evaluated.

<sup>34</sup> Will detect all agents listed in DIA document “Threat Environment Projection: Chemical and Biological Warfare 2000–2025” (objective). Will meet tri-service long-term consumption standards (objective is to detect 20% lower than tri-service consumption standards).

<sup>35</sup> Will identify detected CWAs and TICs.

<sup>36</sup> Will absolutely quantify hazard (concentration).

<sup>37</sup> Will detect all TICs of interest as an objective.

<sup>38</sup> Will detect within 10 minutes.

<sup>39</sup> Hazards will not be identified in time to treat, especially if lethal fast-acting agents at high concentrations are involved.

### 5.7.3 Functional Solution Analysis

#### 5.7.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, that deficiency is then reassessed in the IMAs section.

1. **Deficiency:** Lack of detection, identification, and quantification capability for TICs in water.  
**Non-Materiel Solutions:** *Training (partial):* Increase training of personnel on Viking SpectraTraks and HAPSITEs with Headspace Sampling System.
2. **Deficiency:** Lack of detectors that meet tri-service drinking standards.  
**Non-Materiel Solutions:** *Training (partial):* Increase training of personnel on Viking SpectraTraks and HAPSITEs with Headspace Sampling System.
3. **Deficiency:** Lack of real-time or near-real time detection, identification, and quantification capability for CWAs and TICs in water.  
**Non-Materiel Solutions:** None
4. **Deficiency:** Lack of detector that can also take samples for future analysis capability.  
**Non-Materiel Solutions:** None

#### 5.7.3.2 IMA Assessment Summary

Table 5.7-2 identifies eight ideas for materiel approaches that, if developed, may reduce or eliminate the deficiencies associated with detecting chemical hazards in water. Advances in MS, electromagnetic spectroscopy, Raman spectroscopy, PIRS, or orthogonal technologies may be able to address all identified deficiencies.

Table 5.7-2. TASENS 7: IMA Assessment

<b>TASENS 7: Sense water for chemical hazards</b>								
<div> <div>Identified Gaps</div> <div>Ideas for Materiel Approaches (IMA)</div> </div>	Mass Spectrometry <sup>1</sup>	IR, UV, and Microwave Spectroscopy <sup>2</sup>	Photoacoustic Infrared Spectroscopy	Chemiluminescence Detection <sup>3</sup>	SAW Technology	Colorimetric	Multiple, Complementary Technologies (Orthogonal) <sup>4</sup>	Raman Spectroscopy <sup>5</sup>
General lack of detection, identification, and quantification capability for TICs in water. <sup>6</sup>	X	X	X	X	X	X	X	X
General lack of detectors that meet tri-service drinking standards. <sup>7</sup>	X	X	X	X	X		X	X

<sup>1</sup> Includes GC/MS, LC/MS.<sup>2</sup> Examples include CO<sub>2</sub> long-wave IR (LWIR) Differential Scattering/Differential Absorption of Light (DISC)/Differential Absorption LIDAR (DIAL), CO<sub>2</sub> conv mid-wave IR (MWIR) DISC/DIAL, solid-state (SS) conv MWIR DISC/DIAL, FTIR, Hyperspectral LWIR, Passive MWIR, SS conv LWIR DISC/DIAL, SS conv short-wave IR (SWIR) – LWIR, SS conv UV-LW IR, Active LWIR Polarization, Active MWIR Polarization, Passive LWIR Polarization, Filtered Forward-Looking IR (FLIR), UV Laser-Induced Fluorescence (LIF)/FTIR, and Microwave (GHz and THz) Spectroscopy.<sup>3</sup> Can take place in either solution or vapor phase and thus can be used for detecting chemicals in water.<sup>4</sup> Examples include SAW/IMS.<sup>5</sup> Chemical agent detection by surface-enhanced Raman spectroscopy. <http://bookstore.spie.org/index.cfm?fuseaction=DetailPaper&ProductId=511940&coden><sup>6</sup> Distributing more Viking SpectraTraks and HAPSITES with Headspace Sampling System is a potential solution. JCBAWM is expected to eliminate capability gap.<sup>7</sup> Distributing more Viking SpectraTraks is a potential solution. JCBAWM is expected to eliminate capability gap.<sup>8</sup> Reducing the response time of JCBAWM, Viking SpectraTrak, and/or HAPSITE with Headspace Sampling System is a potential solution.<sup>9</sup> Photoionization/KitToF MS; “Automated, Real-Time Screening of CWs in Water by Photoionization/KitToF MS.” Jack Syage, Syagen Technology, Inc<sup>10</sup> All IMAs could be designed to eliminate this capability gap. The collection equipment would be better maintained as an independent capability. The solution could involve a module connected to the detector that notifies the operator to take samples or triggers an automated process to begin sampling.

## **5.8 Task TASENS 8: Sense water for biological hazards**

### **5.8.1 Functional Area Analysis**

#### **5.8.1.1 Definition**

To sense the presence or absence of biological hazards (includes BWAs and TIB material) in water (potable and nonpotable). Includes the functions of detection, identification, and quantification of the hazard. Also includes collection of samples for further analysis, along with early-warning surveillance of unforeseen hazard releases and monitoring of known hazard locations, as well as the requirement to determine the extent and physical properties of contamination. Encompasses both “detect to warn” and “detect to treat” situations to enable appropriate protective measures. Must occur in situ to assist with raw water site selection and identification of soldier contact hazards, in-line post ROWPU and permanent water distribution systems, and on-demand to spot-check potable water distribution sites and shower points.

#### **5.8.1.2 Derivation**

*UJTL TA 7, UJTL TA 7.1, Protection Joint Functional Concept.*

**5.8.1.2.1 Supported Tasks:** OPSENS 1, OPSENS 4, OPSENS 7

**5.8.1.2.2 Lateral Task:** TASHA 14

**5.8.1.2.3 Supporting Task:** N/A

#### **5.8.1.3 Conditions**

Perform this task under conditions of:

##### **Physical**

1. Inaccessible subsurface water. (C1.1.2.3)
2. High sea state. (C1.2.1.3)
3. High shipping presence. (C1.2.6)
4. Summer, winter seasons. (C1.3.1.1)
5. Stormy weather. (C1.3.1.3)
6. Hot, very cold air temperature. (C1.3.1.3.1)
7. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6.1)
8. Heavy precipitation intensity. (C1.3.1.3.6.2)
9. Negligible light. (C1.3.2.1)
10. Biological effects. (C1.3.3.3)

##### **Military**

1. Stressful mission. (C2.1)
2. Location—ashore, afloat, airborne. (C2.1.4.1)

3. Minimal time available. (C2.1.5)
4. Low personnel capability. (C2.2.4),
5. Negligible personnel experience. (C2.2.4.5)
6. Deployment movement and maneuver—includes logistical requirements such as lift, supply, and transportation. (C2.5)
7. Ambiguous threat existence. (C2.9.3)

### Civil

1. Limited or negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)
3. High mission priority. (C3.1.3.2)
4. High health risk. (C3.3.1.5)
5. Significant refugee care responsibility. (C3.3.2.3)
6. TIB material present in the civilian sector. (C3.3.7.5)

## 5.8.2 Functional Needs Analysis

### 5.8.2.1 Capability and Deficiency Assessment Summary

Table 5.8-1 presents individual and overall current, near/mid-term, and far-term capabilities to perform the task to the designated standards. There are three current capabilities used to accomplish this task and two projected capabilities to be added in the future (JBAIDS in the near/mid term and JCBAWM in the far term). The individual capabilities differ in their abilities to meet the identified standards.

### Overall Capability and Deficiency Summary

The overall current capability is assessed as “yellow.” Many, if not most, BWAs can be presumptively detected and identified by collecting water samples through physical sampling, followed by manual sample preparation and the following laboratory and field-deployable analytical techniques: immunochromatographic HHAs, which are part of the BSK; ELISA; and RT-PCR, as used by the RAPID. Of the 25 BWAs described in the *Medical Management of Biological Casualties*, a complete set of HHAs can detect and identify all agents with the possible exception of the viral hemorrhagic fever agents; however, the BSK contains eight different HHAs and thus detects only eight BWAs per kit. The eight agents in the kit may be assembled to reflect the threat.<sup>1</sup> A comprehensive set of ELISAs, which are laboratory-based, can ostensibly detect and identify all 25 BWAs (as well as any TIB), assuming that an antigen or antibody has been isolated for each agent. Like all PCR-based technologies, RAPID can, with the appropriate reagents, detect and identify all BWA and TIB pathogens but none of the toxins (since the toxins, unless contaminated with the source organisms, do not provide any genetic material). HHAs and RAPID can generically quantify detected agents (HHAs only through the aide of a reader), whereas some varieties of ELISAs provide absolute quantification capabilities.

Overall current task deficiencies include the lack of integrated sample collection, detection, identification, and quantification capability for BWAs in water; real-time or near-real-time

detection, identification, and quantification capability for sampled BWAs; field analysis verification capabilities; a detector that also takes samples for future analysis<sup>2</sup>; and TIB detection capabilities.

### **Projected Near/Mid-Term Capabilities and Deficiencies**

The overall projected near/mid-term capability is assessed as “yellow.” Near/mid-term capability JBAIDS Block I will detect 11 BWA pathogens (as a threshold requirement), whereas Block II will detect the same 11 BWA pathogens plus the four toxins of interest (as a threshold requirement). JBAIDS will also quantify agent concentrations in the analyzed sample. It will require 25–40 minutes for analysis output following sample preparation, and will thus provide a complete identify-to-treat capability.

All of the overall current task deficiencies are likely to remain deficiencies in the near/mid term.

### **Projected Far-Term Capabilities and Deficiencies**

The overall projected far-term capability is assessed as “yellow.” As an objective, far-term capability JCBAWM will detect, identify, and absolutely quantify all BWAs of interest (presumably, since requirement is all agents listed in DIA document “Threat Environment Projection: Chemical and Biological Warfare 2000–2025”) as well as TIBs of interest within 10 minutes. It will thus provide a complete identify-to-treat capability.

The lack of real-time or near-real-time detection, identification, and quantification capability for sampled BWAs; field analysis verification capabilities; and a detector that also takes samples for future analysis are likely to remain deficiencies in the far term.

---

<sup>1</sup> The collection of surface samples to use in HHA results in a sample for further analysis.

Coolers/temperature-controlled equipment to hold and maintain the sample needs to be available if the sample is not immediately evacuated.

<sup>2</sup> The M34A1 sampling kit, which is not a detector, is capable of collecting and maintaining a biological sample.

**Table 5.8-1. TASENS 8: Capability and Deficiency Assessment**

	FAA Measure	Elaboration	Scale
M1	All of a potential adversary's weaponized BWAs can be detected using fielded technologies/equipment, regardless of agent physical properties, states, and concentrations?	Number of the 25 biological agents described in the <i>Medical Management of Biological Casualties</i> that are detected. Fourteen of the 25 agents are as follows: Anthrax ( <i>Bacillus Anthracis</i> ); Brucellosis ( <i>Brucellae</i> ); Glanders ( <i>Burkholderia mallei</i> ); Meliodosis ( <i>Burkholderia pseudomallei</i> ); Q Fever ( <i>Coxiella burnetii</i> ); Plague ( <i>Yersinia pestis</i> ); Tularemia ( <i>Francisella tularensis</i> ); Botulinum toxin; Ricin; SEB; T-2 Mycotoxins; Smallpox (variola major and minor); Viral Equine Encephalities (e.g., VEE, WEE, and EEE); and Ebola and Marburg hemorrhagic fever viruses. Linear 2–10.	10: All 25 BWAs detected 8: ≥20 BWAs detected 6: ≥15 BWAs detected 4: ≥10 BWAs detected 2: ≥5 BWAs detected 1: ≥1 BWA detected 0: No BWAs detected
M2	All of a potential adversary's weaponized BWAs can be identified using fielded technologies/equipment?	Ability to identify or classify (e.g., as bacteria, toxin, or virus) detected BWAs.	10: Identify detected BWAs 7: Identify some detected BWAs; classify others 5: Classify detected BWAs 3: Some detected BWAs are classified or identified 0: Neither identify nor classify detected BWAs
M3	All of a potential adversary's weaponized BWAs can be quantified using fielded technologies/equipment?	Ability to provide snapshot concentration of detected BWAs.	10: Absolute quantification 5: Generic quantification 0: No quantification capability

	FAA Measure	Elaboration	Scale
M4	All TIB material can be detected using fielded technologies/equipment?	TIB material includes medical waste, raw sewage, and vaccine-related biologics. Pathogens and toxins within TIB material are what are generally detected.	10: All pathogens and toxins within TIB material, including medical waste, raw sewage, and vaccine-related biologics can be detected 5: All TIB pathogens or toxins within one or more categories (i.e., medical waste, raw sewage and vaccine-related biologics) can be detected 3: Some TIB pathogens and toxins within one category (i.e., medical waste, raw sewage and vaccine-related biologics) can be detected 0: No TIB pathogens and toxins can be detected
M5	All TIB material can be identified using fielded technologies/equipment?	Ability to identify or classify (e.g., as bacteria, toxin, or virus) detected TIB material.	10: All pathogens and toxins within TIB material can be identified 7: Identify some TIB pathogens and toxins; classify others 5: Classify detected TIB pathogens and toxins 3: Some detected TIB pathogens and toxins can be classified or identified 0: Neither classify nor identify detected TICs
M6	All TIB material can be quantified using fielded technologies/equipment?	Ability to provide snapshot concentration of detected TIBs.	10: Absolute quantification 5: Generic quantification 0: No quantification capability
M7	Time to detect biological hazards?	Time period from BWA/TIB sampling to analysis output. Linear scale 2–7. Applies to point detectors only.	10: ≤1 minute 9: ≤4 minutes 8: ≤7 minutes 7: ≤10 minutes 4: ≤40 minutes 2: ≤60 minutes 1: >60 minutes
M8	Distance between biological hazard and detector for accurate detection?	This measure is not relevant to this task.	N/A
M9	Biological hazards are detected in time to warn forces and take appropriate protective measures?	This measure is not relevant to this task.	N/A

	FAA Measure	Elaboration	Scale
M10	Biological hazards are identified in time to treat forces?	Based on capability and time required to identify or classify hazards, as well as rate-of-action of those hazards. Of all considered BWAs, ricin may require the most rapid response. Immunoglobulin therapy must be administered within 1 hour of ricin exposure to be effective.	10: Complete capability (<1 hour) 5: Partial capability 0: No capability
M11	Sampling collection procedures available for all of a potential adversary's weaponized biological warfare agents and for all TIB material using fielded technologies/equipment?	Refers to physical sampling for future analysis.	10: Complete capability 5: Partial capability 0: No capability
M12	Procedures maintain integrity of sample?	Refers to a physical sample for future analysis.	10: Complete capability 5: Partial capability 0: No capability
M13	Time to validate the presence of biological hazards in sample?	Refers to confirmatory identification.	10: Rapidly—validation performed expeditiously by particular technology/equipment 5: Moderately delayed—mobile analysis tools can validate on site 0: Delayed—off-site laboratory analysis required for validation
M14	Cumulative dose can be determined and presented using data from currently fielded sensors/equipment?	This measure is not relevant to this task.	N/A
M15	There is effective DOTLPF in place to conduct task?	Refers to non-materiel elements associated with the execution of the task with the system.	10: DOTLPF exists and is adequate for the task to be performed with this system without limitations that cause significant impact upon operations 5: Most critical aspects of DOTLPF for the task to be performed with this system are addressed 0: DOTLPF is inadequate or does not exist for the task to be performed with this system

<sup>1</sup> Current and near-future HHAs detect all BWAs with the possible exception of the viral hemorrhagic fevers; however, the BSK contains eight different HHAs and thus detects eight BWAs. The HHA sensitivity is  $10^5$ – $10^6$  CFU/mL (*B. anthracis*) and 50–1200 ng/mL (*Botulinum* toxin A and *Botulinum* toxin F, respectively). Degraded performance: (C6) TIB material present in civilian sector. Susceptible to interference (false positives and negatives due to matrix effects, among others); (M3) Minimal time available. Requires sample preparation prior to applying sample to assay.

<sup>2</sup> All detected BWAs are identified.

<sup>3</sup> Does not absolutely quantify agent. However, may provide relative indication of quantity, but only through the use of a reader. Soldiers will not likely have the reader.

<sup>4</sup> According to specifications, does not detect any TIBs.

<sup>5</sup> Detects within 15 minutes.

<sup>6</sup> Not relevant to this task (N/A).

<sup>7</sup> Immediately identifies all detected hazards (detection requires up to 15 minutes) and thus provides complete identify-to-treat capability.

<sup>8</sup> Does not collect a sample for future analysis.

<sup>9</sup> Requires samples to be confirmed off site in laboratory.

<sup>10</sup> There is effective DOTLPF in place to conduct task, at least for bacillus bacteria (specifically anthrax). Procedures for other agents are probably similar.

<sup>11</sup> Ostensibly all BWAs can be detected by ELISA. ELISA's sensitivity is  $10^5$ – $10^6$  CFU/mL (*B. anthracis*); 10–100 PFU/mL of Venezuelan Equine Encephalitis virus; and 625 pg/mL of Staphylococcal Enterotoxin B (aerosol) and greater than 5 ng/mL of ricin.

<sup>12</sup> Some varieties of ELISA can absolutely quantify the antigen or antibody concentration.

<sup>13</sup> Theoretically, any agent (i.e., antigen or antibody) for which an ELISA has been designed can be detected through this method; however, only one particular pathogen or toxin antigen or antibody can be tested per ELISA model.

<sup>14</sup> A particular TIB pathogen or toxin is identified if it is detected, since ELISA is highly specific and detects a particular agent.

<sup>15</sup> Typically requires 1–2 hours (following sample collection and preparation) for detection, identification, and if applicable, quantification, primarily because of incubation time.

<sup>16</sup> Not designed for sample collection for future analysis.

<sup>17</sup> RAPID may be able to detect all pathogens; PCR does not detect toxins, though the toxic material may be contaminated with source genetic material (In this assessment, it is assumed that this is not the case). Standard PCR has a sensitivity of 10–100 CFU/mL bacteria (*B. anthracis*); and 15 fg–1 pg or 100–1 million copies of the complementary DNA for viruses.

<sup>18</sup> RAPID, through RT-PCR, may provide generic quantification.

<sup>19</sup> Theoretically, any TIB pathogen can be detected with appropriate reagents; toxins cannot be detected unless contaminated with source genetic material.

<sup>20</sup> All detected TIBs are identified.

<sup>21</sup> Detects and identifies within 30 minutes following sample preparation, but requires several hours for sample preparation.

<sup>22</sup> Block I will detect Anthrax; Brucella; Ebola VHF virus; Marburg VHF virus; Viral Encephalitis viruses (VEE/WWW/EEE); Glanders; Meliodosis; Plague; Q Fever; Smallpox; and Tularemia (and Typhus) as a threshold requirement; and Crimean-Congo hemorrhagic virus; Dengue fever; Hantaviruses; and Rift Valley Fever Virus (and Cholera, Cryptosporidium; E. coli; Influenza; Salmonella; and Shigella) as an objective; Block II will add toxins Botulinum, microcystins, ricin, SEB, and T-2 Mycotoxins.

<sup>23</sup> Will identify all detected agents.

<sup>24</sup> Will quantify the concentration in the sample.

<sup>25</sup> Will not detect any TIBs.

<sup>26</sup> Will detect and identify within 40 minutes (25-minute objective) for Blocks I and II following sample preparation.

<sup>27</sup> Will immediately identify all detected hazards (detection will require 25–40 minutes) and thus will provide complete identify-to-treat capability.

<sup>28</sup> Will provide physical sample collection capability for future analysis.

<sup>29</sup> Will maintain integrity of physical sample.

<sup>30</sup> Will require samples to be confirmed off site at laboratory.

<sup>31</sup> Future system(s). Thus, DOTLPF is also future and cannot be evaluated.

<sup>32</sup> Will detect all agents listed in DIA document "Threat Environment Projection: Chemical and Biological Warfare 2000–2025" (objective).

<sup>33</sup> Will identify detected BWAs and TIBs.

<sup>34</sup> Will absolutely quantify hazard.

<sup>35</sup> Will detect all TIBs of interest as an objective.

<sup>36</sup> Will detect within 10 minutes.

<sup>37</sup> Will immediately identify all detected hazards (detection will require up to 10 minutes) and thus will provide complete identify-to-treat capability.

### 5.8.3 Functional Solution Analysis

#### 5.8.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, that deficiency is then reassessed in the IMAs section.

1. **Deficiency:** Lack of TIB detection capability.  
**Non-Materiel Solutions:** None
2. **Deficiency:** Lack of real-time or near-real time detection, identification, and quantification capability for BWAs in water.  
**Non-Materiel Solutions:** None
3. **Deficiency:** Lack of integrated sample collection, detection, identification, and quantification capability for BWAs in water.  
**Non-Materiel Solutions:** None
4. **Deficiency:** Lack of detector that can also take samples for future analysis capability.  
**Non-Materiel Solutions:** None
5. **Deficiency:** Validation of findings requires laboratory testing.  
**Non-Materiel Solutions:** *Doctrine:* Modify doctrine to permit validation by a reliable on-site detection/identification capability (e.g., portable PCR) as confirmatory detection/identification is ultimately dependent upon doctrine, not materiel capabilities.  
*Training (partial):* Train personnel in analytical techniques to ensure accuracy.

#### 5.8.3.2 IMA Assessment Summary

Table 5.8-2 identifies seven ideas for materiel approaches that, if developed, may reduce or eliminate the deficiencies associated with detecting biological hazards in water. Advances in MS, electromagnetic spectroscopy, Raman spectroscopy, or orthogonal technologies may be able to address all identified deficiencies.

Table 5.8-2. TASENS 8: IMA Assessment

TASENS 8: Sense water for biological hazards							
Identified Gaps	Ideas for Materiel Approaches (IMA)						
	Mass Spectrometry <sup>1</sup>	IR, UV, and Microwave Spectroscopy	Immunoassay (Antibody-Based) <sup>2</sup>	Genetic (Nucleic Acid-Based) <sup>3</sup>	Tissue-Based	Orthogonal <sup>4</sup> (Immunoassay/ Nucleic Acid-Based)	Raman Spectroscopy
Lack of real-time or near-real-time detection, identification, and quantification capability for sampled BWAs. <sup>5</sup>	X <sup>6</sup>	X			X <sup>7</sup>	X	X
Lack of current detection, identification, and quantification capability for TIBs in water. <sup>8</sup>	X	X	X	X		X	X
Lack of integrated sample collection, detection, identification, and quantification capability for BWAs in water.	X	X	X	X	X	X	X
Lack of detector that also takes samples for future analysis capability.	X	X	X	X	X	X	X

<sup>1</sup> Includes GC/MS, LC/MS.<sup>2</sup> Includes Immunological/SAW technology<sup>3</sup> Includes PCR and RT-PCR amplification, DNA microchip technology, SAW technology<sup>4</sup> Includes nucleic acid/immunoassay technologies (e.g., PCR and immunological techniques), electrochemiluminescence/equilibrium immunoassay, Fluorescence correlation spectroscopy/PCR.<sup>5</sup> Reducing the sample preparation (if applicable) and response time of JCBAWM and JBAIDS is a potential solution.<sup>6</sup> Possibly through rapid separation processes (e.g., capillary zone electrophoresis).<sup>7</sup> Near real-time detection, identification, and quantification of pathogens (and possibly toxins as well) is feasible. NATIBO, *Biological Detection System Technologies Technology and Industrial Base Study*, February 2001, pp. 4-12 to 4-13; Harper, James, "Automated CANARY Testbed for Fast Bioaerosol Identification," MIT Lincoln Laboratory, Presented at 2004 Biological-Chemical Detection Symposium, Washington, D.C.<sup>8</sup> JCBAWM is expected to detect, identify, and quantify all TIBs in water and thus eliminate capability gap.

## **5.9 Task TASENS 9: Sense water for radiological hazards**

### **5.9.1 Functional Area Analysis**

#### **5.9.1.1 Definition**

To sense the presence of radiological hazards in water (potable and nonpotable). Includes the functions of detection, identification, and quantification of the hazard. Also includes collection of samples for further analysis, along with early-warning surveillance of unforeseen radiological releases and monitoring of known radiological locations, as well as the requirement to determine the extent and physical properties of radiological contamination. Encompasses both “detect to warn” and “detect to treat” situations to enable appropriate protective measures. Must occur in-situ to assist with raw water site selection and identification of soldier contact hazards, in-line post ROWPU and permanent water distribution systems, and on-demand to spot-check potable water distribution sites and shower points.

#### **5.9.1.2 Derivation**

*UJTL TA 7, UJTL TA 7.1, Protection Joint Functional Concept.*

**5.9.1.2.1 Supported Tasks:** OPSENS 1, OPSENS 4, OPSENS 7

**5.9.1.2.2 Lateral Task:** TASHA 14

**5.9.1.2.3 Supporting Task:** N/A

#### **5.9.1.3 Conditions**

Perform this task under conditions of:

##### **Physical**

1. Inaccessible subsurface water. (C1.1.2.3)
2. High sea state. (C1.2.1.3)
3. High shipping presence. (C1.2.6)
4. Summer, winter seasons. (C1.3.1.1)
5. Stormy weather. (C1.3.1.3)
6. Hot, very cold air temperature. (C1.3.1.3.1)
7. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6.1)
8. Heavy precipitation intensity. (C1.3.1.3.6.2)
9. Negligible light. (C1.3.2.1)
10. Moderate nuclear radiation hazards. (C1.3.3.1.2)

##### **Military**

1. Stressful mission. (C2.1)
2. Location—ashore, afloat, airborne. (C2.1.4.1)

3. Minimal time available. (C2.1.5)
4. Low personnel capability. (C2.2.4),
5. Negligible personnel experience. (C2.2.4.5)
6. Ambiguous threat existence. (C2.9.3)

### Civil

1. Limited or negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)
3. High mission priority. (C3.1.3.2)
4. TIR materials present in the civilian sector. (C3.3.7.5)

## 5.9.2 Functional Needs Analysis

### 5.9.2.1 Capability and Deficiency Assessment Summary

Table 5.9-1 presents individual and overall current, near/mid-term, and far-term capabilities to perform the task to the designated standards. There are 10 current capabilities used to accomplish this task. The capabilities include a range of portable RADIAC devices and dosimeters.

### Current Capabilities and Deficiencies

The overall current capability is assessed as “yellow.” Most current RADIACs detect and identify beta radiation and detect, identify, and quantify gamma radiation. All RADIACS perform their functions in real time (though the level of confidence increases with increased sampling time) and thus provide a complete detect-to-warn capability. Many also automatically calculate the cumulative dose.

There is no single capability that can perform the task to all of the designated standards. RADIACs detect and quantify only the radiation, not the isotope. Furthermore, all RADIACs and dosimeters must be exposed to radiation to detect it. Current overall task deficiencies include the lack of detection capability for low-level radiological contamination in water, detection capability for alpha-emitting contaminants in water<sup>1</sup>, radioisotope identification capabilities, monitors that can detect all radiation types, and detectors that take samples for future analysis<sup>2</sup>.

### Projected Near/Mid-Term Capabilities and Deficiencies

No changes in capability are projected in the near/mid term for this task, so the overall projected near/mid-term capability will remain “yellow.”

---

<sup>1</sup> Water shields alpha radiation, and thus only alpha-emitting contaminants at the water surface are likely to be detected.

<sup>2</sup> Only the M34A1 sampling kit, which is not a detector, is capable of collecting and maintaining a radiological sample.

### **Projected Far-Term Capabilities and Deficiencies**

No changes in capability are projected in the far term for this task, so the overall projected far-term capability will remain “yellow.”

Table 5.9-1. TASENS 9: Capability and Deficiency Assessment

System/Measure	M1	M2	M3	M4	M5	M6	M7	M8	M9

	FAA Measure	Elaboration	Scale
M1	All radiological hazards (including TIR material) can be detected using fielded technologies/equipment?	Number of radiation types (i.e., alpha, beta, gamma, neutron, and x-radiation) detected. Note: Fielded technologies/equipment detect radiological hazards by detecting the radiation emitted from these hazards.  TIR material includes DU, a common battlefield hazard resulting from certain types of ammunition and damaged armor.	10: All five types 8: Four types 6: Three types 4: Two types 2: Single type 0: No radiological hazards detected
M2	All radiological hazards (including TIR material) can be identified using fielded technologies/equipment?	Ability to identify type of radiation detected or the radioisotope emitting the radiation. Note: Fielded technologies/equipment that identify radioisotope also identify the type(s) of radiation detected.	10: Identifies radioisotope emitting radiation 5: Identifies type of radiation detected 0: No identification capability
M3	All radiological hazards (including TIR material) can be quantified using fielded technologies/equipment?	Ability to quantify activity of radiological material (i.e., Cu or Bq), or the exposure (i.e., Roentgen or Coulomb/kg) or dose rate (rad, rem, Gy, or Sv) from emitted radiation.	10: Absolute quantification 5: Generic quantification (or absolute quantification of one radiation type and no quantification of another type) 0: No quantification capability
M4	Time to detect radiological hazard?	Time period from exposure to radiation to analysis output.	10: Near-real time 0: Not near-real time

	FAA Measure	Elaboration	Scale
M5	Distance between radiological hazard and detector for accurate detection?	This measure is not relevant to this task.	N/A
M6	Radiological hazards are detected in time to warn forces and take appropriate protective measures?	This measure is not relevant to this task.	N/A
M7	Radiological hazards are identified in time to treat forces?	A complete capability requires both near-real-time identification of the emitted radiation type(s) and radioisotope. Identification of the emitted radiation type(s) enables appropriate medical response to radiation exposure and identification of the radioisotope determines to appropriate medical course of action to radiological material internalization.	10: Complete capability (near-real-time identification of radioisotope and emitted radiation type[s]) 5: Partial capability (near-real-time identification of emitted radiation type[s]) 0: No capability (no identification capability)
M8	Cumulative dose can be determined and presented using data from currently fielded sensors/equipment?	This measure is not relevant to this task.	N/A
M9	There is effective DOTLPF in place to conduct task?	Refers to non-materiel elements associated with the execution of a task with the system.	10: DOTLPF exists and is adequate for the task to be performed with this system without limitations that cause significant impact upon operations 5: Most critical aspects of DOTLPF for the task to be performed with this system are addressed 0: DOTLPF is inadequate or does not exist for the task to be performed with this system

<sup>1</sup> Detects most radiation types (alpha, beta, gamma, and x-radiation) emitted from radiological materials.

<sup>2</sup> Identifies type of radiation, but not radioisotope.

<sup>3</sup> Absolutely quantifies radiation level.

<sup>4</sup> Real-time detection. Level of confidence increases with increased sampling time and radiation levels.

<sup>5</sup> Requires exposure to emitted radiation to detect hazard.

<sup>6</sup> Provides complete detect-to-warn capability since detects and identifies radiation in real time.

<sup>7</sup> Provides partial identify-to-treat capability since immediately identifies detected radiation type, but not the radioisotope.

<sup>8</sup> Automatically calculate cumulative dose since system capable of dose and dose rate alarms across entire measurement range; also predictive algorithm provides estimate of time in field before alarm; unknown whether cumulative dose is directly outputted.

<sup>9</sup> There is effective DOTLPF in place to conduct task with this system.

<sup>10</sup> In combination with OA-9449/PDQ probe. The MFR alone detects gamma radiation; with the probe, it measures gamma radiation and detects beta radiation.

<sup>11</sup> Detects beta/gamma radiation emitted from radiological materials.

<sup>12</sup> Absolutely quantifies gamma radiation level; detects, but does not quantify, beta radiation.

<sup>13</sup> Absolutely quantifies radiation level and provides monitoring capability, thus provides moderate capability to determine cumulative dose.

<sup>14</sup> Detects alpha radiation emitted from radiological materials (particularly plutonium).

- <sup>15</sup> Detects only one type of radiation, so identification capability is not applicable.
- <sup>16</sup> Provides complete detect-to-warn capability since detects one radiation type in real time.
- <sup>17</sup> Detects gamma radiation emitted from radiological materials (particularly plutonium).
- <sup>18</sup> System automatically calculates cumulative dose.
- <sup>19</sup> Detects alpha, beta, gamma, and x-radiation emitted from radiological materials.
- <sup>20</sup> Detects gamma/neutron radiation emitted from radiological materials.

### 5.9.3 Functional Solution Analysis

#### 5.9.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, that deficiency is then reassessed in the IMAs section.

1. **Deficiency:** Lack of detection capability for low-level radiological contamination in water.  
**Non-Materiel Solutions:** None
2. **Deficiency:** Lack of monitors that can detect most or all types of radiation.  
**Non-Materiel Solutions:** *Training (partial):* Increase training of personnel on ADM-300.
3. **Deficiency:** Lack of detection capability for alpha-emitting contaminants in water.<sup>1</sup>  
**Non-Materiel Solutions:** None
4. **Deficiency:** Lack of radioisotope identification capabilities.  
**Non-Materiel Solutions:** None
5. **Deficiency:** Lack of detector that can also take samples for future analysis capability.<sup>2</sup>  
**Non-Materiel Solutions:** None

#### 5.9.3.2 IMA Assessment Summary

Table 5.9-2 identifies three ideas for materiel approaches that, if developed, may reduce or eliminate the deficiencies associated with detecting radiological hazards in water. Advances in scintillation or semiconductor radiation detection technologies may be able to address all identified deficiencies.

---

<sup>1</sup> Water shields alpha radiation, and thus only alpha-emitting contaminants at the water surface are likely to be detected.

<sup>2</sup> Only the M34A1 sampling kit, which is not a detector, is capable of collecting and maintaining a radiological sample.

Table 5.9-2. TASENS 9: IMA Assessment

TASENS 9: Sense water for radiological hazards <sup>1</sup>				
<div><div>Identified Gaps</div><div>Ideas for Material Approaches (IMA)</div></div>	Gas-Filled Detectors <sup>2</sup>	Scintillation Radiation Detectors <sup>3</sup>	Semiconductor Radiation Detectors <sup>4</sup>	
	Lack of detection capability for low-level radiological contamination in water.	X	X	X
	Lack of detection capability for alpha-emitting contaminants in water. <sup>5</sup>	X	X	X
	Lack of monitors that can detect all types of radiation. <sup>6</sup>	X	X	X
	Lack of radioisotope identification capabilities. <sup>7</sup>		X	X
	Lack of detector that also takes samples for future analysis. <sup>8</sup>	X	X	X

<sup>1</sup> <http://hps.org/publicinformation/ate/q534.html>

<sup>2</sup> Includes Geiger-Mueller detectors, proportional gas detectors, and ionization chambers.

<sup>3</sup> Includes ZnS(Ag), anthracene, trans-stilbene, para-terphenyl, phenyl oxazole, NaI(Tl), CsI(Tl), bismuth germinate (Bi<sub>4</sub>Ge<sub>3</sub>O<sub>12</sub>), barium fluoride (BaF<sub>2</sub>)-based detectors.

<sup>4</sup> Includes germanium, silicon, cadmium telluride (CdTe), and mercuric iodide (HgI<sub>2</sub>)-based detectors.

<sup>5</sup> Distributing more ADM-300 and AN/PDR-77 is a potential solution.

<sup>6</sup> Distributing more ADM-300 is a potential solution.

<sup>7</sup> Distributing gamma and/or alpha scintillation detectors with radioisotope identification capabilities is a potential solution.

<sup>8</sup> All point detection IMAs could be designed to eliminate this capability gap. The collection equipment would be better maintained as an independent capability. The solution could involve a module connected to the detector that notifies the operator to take samples or triggers an automated process to begin sampling.

**5.10 Task TASENS 10: Sense the presence of chemical hazards on humans, MWAs and remains****5.10.1 Functional Area Analysis****5.10.1.1 Definition**

To sense the presence or absence of chemical hazards (includes CWAs and TICs) on humans, MWAs, and remains. Includes the external detection of contamination prior to the manifestation of symptoms. Diagnosis of internal exposure is not part of this task as it is addressed in a separate Sustain task. Includes the functions of detection, identification, and quantification of the hazard. Also includes the requirement to determine the extent and physical properties of contamination, monitoring of known hazard locations, and collection of samples for further analysis. Encompasses “detect to warn” and “detect to treat” situations. The evaluation encompasses all chemical hazards of military and medical importance.

**5.10.1.2 Derivation**

*UJTL TA 7, UJTL TA 7.1, Protection Joint Functional Concept.*

**5.10.1.2.1 Supported Tasks:** OPSENS 1, OPSENS 4, OPSENS 7**5.10.1.2.2 Lateral Tasks:** TASHA 11, TASHA 13**5.10.1.2.3 Supporting Task:** N/A**5.10.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Tropical, arctic, and arid climates. (C1.3.1)
2. Summer, winter seasons. (C1.3.1.1)
3. Stormy weather. (C1.3.1.3)
4. Hot, very cold air temperature. (C1.3.1.3.1)
5. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6.1)
6. Heavy precipitation intensity. (C1.3.1.3.6.2)
7. Negligible light. (C1.3.2.1)
8. Chemical effects. (C1.3.3.2)

**Military**

1. Stressful mission. (C2.1)
2. Location—ashore, afloat, airborne. (C2.1.4.1)
3. Minimal time available. (C2.1.5)
4. Low personnel capability. (C2.2.4)

5. Poor personnel morale. (C2.2.4.4)
6. Negligible personnel experience. (C2.2.4.5)
7. Poor multinational integration. (C2.3.1.2)
8. Limited or no host nation support. (C2.8.5)
9. Ambiguous threat existence. (C2.9.3)

## Civil

- High mission priority. (C3.1.3.2)
- Negligible language translators. (C3.2.1.2)
- Significant refugee care responsibility. (C3.3.2.3)
- TICs present in the civilian sector. (C3.3.7.5)

## 5.10.2 Functional Needs Analysis

### 5.10.2.1 Capability and Deficiency Assessment Summary

Table 5.10-1 presents individual and overall current, near/mid-term, and far-term capabilities to perform the task to the designated standards. There are eight current capabilities used to accomplish this task and two projected capabilities to be added in the future (one each in the near/mid term and one in the far term). The individual capabilities include a range of colorimetric paper and kits, IMS detectors, and MSs with differing capabilities to meet the identified standards.

### Current Capabilities and Deficiencies

The overall current capability is assessed as “yellow.” Most current detectors do not directly detect chemical agents on personnel and MWAs, but rather detect vapors off-gassing from the deposited agent. The APD2000, CAM/ICAM, HAPSITE with the headspace sampling system, and M22 ACADA with XM279 probe all work through this method. Consequently, these detectors’ capabilities for sensing chemical agents on surfaces are generally equivalent to their capabilities for sensing chemical agents in the atmosphere, assuming that the agent is sufficiently volatile for a detectable amount of chemical vapor to accumulate above the contaminated personnel or MWA.

M8 and M9 papers are the primary current capabilities for directly detecting liquid chemical warfare agents (i.e., nerve and blister agents) deposited on personnel. M8 paper indicates exposure to liquid agent by changing its color from tan to yellow, red, and green for G-agents, H-agents and Lewisite, and V-agents, respectively. M9 paper does not classify or identify detected agents, but turns pink, red, reddish-brown, or red-purple when exposed to liquid G-agents, H-agents, V-agents, and Lewisite.

There is no single capability that can perform the task to all of the designated standards. MSs Viking SpectraTrak and HAPSITE are sophisticated current capabilities, but they do not detect or identify in near-real time; consequently, they may be unable to identify-to-treat high concentrations of fast-acting lethal agents. Current overall task deficiencies include the general

inability to detect deposited low-volatility agents, dusty agents, and off-gassing nerve agents (i.e., VX and, to a lesser extent, GD and GF) at or below IDLH levels; lack of real-time CWA identification and TIC detection/identification capabilities; lack of agent quantification capabilities; lack of a detector that also takes samples for future analysis; and detector susceptibility to chemical interference.<sup>1</sup>

### **Projected Near/Mid-Term Capabilities and Deficiencies**

The overall projected near/mid-term capability is assessed as “yellow.” In the near/mid-term future, more detectors will quantify and classify, if not identify, agents. Nevertheless, MS units and the JCSD will likely be the only detectors able to detect all CWAs. MS units Viking Spectratrak and HAPSITE will remain the main capabilities to detect TICs. They will detect many or all high-priority TICs.

The general inability to detect deposited low-volatility agents, dusty agents, and off-gassing nerve agents (i.e., VX and, to a lesser extent, GD and GF) at or below IDLH levels; lack of real-time CWA identification and TIC detection/identification capabilities; lack of agent quantification capabilities; lack of a detector that also takes samples for future analysis; and detector susceptibility to chemical interference are likely to remain deficiencies in the near-future.

### **Projected Far-Term Capabilities and Deficiencies**

The overall projected far-term capability is assessed as “yellow.” In the far-term future, many fielded detectors will detect most, if not, all CWAs and some TICs. Many detectors will quantify and classify, if not identify, agents. MS units will likely remain the main capabilities to detect TICs. Many detectors will still not detect deposited low-volatility agents, dusty agents, and off-gassing nerve agents at or below IDLH levels. Furthermore, there will still be a lack of a detector that also takes samples for future analysis. Chemical interference will remain an issue.

---

<sup>1</sup> Refer to the JRO *Operational Impact Assessment of Non-Traditional Agents* report, July 2003 (S/NF) for information on nontraditional agent detection.

	FAA Measure	Elaboration	Scale
M1	All of a potential adversary's weaponized CWAs can be detected using fielded technologies/equipment, regardless of agent physical properties, states, and concentrations?	Percentage of following 12 agents as described in FM 3-9 that are detected: nerve agents (GA; GB; GD; GF; VX), vesicants (H/HD; HN-1,2,3; L; CX), cyanides (AC; CK), pulmonary agent (CG)	Percentages standardized to 0–10 scale
M2	All CWAs can be identified?	Ability to classify or identify detected CWAs.	10: Identify detected CWAs 7: Identify some detected CWAs; classify others 5: Classify detected CWAs 0: Neither identify nor classify detected CWAs
M3	All of a potential adversary's weaponized CWAs can be quantified using fielded technologies/equipment?	Ability to provide snapshot concentration of detected CWAs.	10: Absolute quantification 5: Generic quantification 0: No quantification capability

	FAA Measure	Elaboration	Scale
M4	All TICs can be detected using fielded technologies/equipment?	Considering only TICs listed in <i>USACHPPM Report 47-EM-6154-03: ITF-40</i> . (FOUO)	10: All TICs listed in ITF-40 9: $\geq 90\%$ of 33 high-priority critical acutely toxic airborne TICs according to ITF-40 8: $\geq 80\%$ of 33 high-priority critical acutely toxic airborne TICs according to ITF-40 2: $\geq 20\%$ of 33 high-priority critical acutely toxic airborne TICs according to ITF-40 1: 1%–20% of 33 high-priority critical acutely toxic airborne TICs according to ITF-40 0: None of 33 high-priority critical acutely toxic airborne TICs according to ITF-40
M5	All TICs can be identified using fielded technologies/equipment?	Ability to classify or identify detected TICs.	10: Identify all detected TICs 7: Identify some detected TICs; classify others 5: Classify detected TICs 0: Neither classify nor identify detected TICs
M6	All TICs can be quantified using fielded technologies/equipment?	Ability to provide snapshot concentration of detected TICs.	10: Absolute quantification 5: Generic quantification 0: No quantification capability
M7	Time to detect chemical hazards?	Time period from CWA/TIC sampling to analysis output. Linear scale 1–10.	10: $\leq 12$ sec 7: $\leq 30$ sec 2: $\leq 60$ sec 1: $> 60$ sec
M8	Distance between chemical hazard and detector for accurate detection?	This measure is not relevant to this task.	N/A
M9	Chemical hazards are detected in time to warn forces and take appropriate protective measures?	This measure is not relevant to this task.	N/A
M10	Chemical hazards are identified in time to treat forces?	Based on capability and time required to identify or classify hazards, as well as rate-of-action of those hazards.	10: Complete capability 5: Partial capability 0: No capability
M11	Sampling collection procedures available for all of a potential adversary's weaponized CWAs and for all TICs using fielded technologies/equipment?	Refers to physical sampling for future analysis.	10: Complete capability 5: Partial capability 0: No capability
M12	Procedures maintain integrity of sample?	Refers to a physical sample for future analysis.	10: Complete capability 5: Partial capability 0: No capability

	FAA Measure	Elaboration	Scale
M13	There is effective DOTLPF in place to conduct task?	Refers to non-materiel elements associated with the execution of a task with the system.	10: DOTLPF exists and is adequate for the task to be performed with this system without limitations that cause significant impact upon operations 5: Most critical aspects of DOTLPF for the task to be performed with this system are addressed 0: DOTLPF is inadequate or does not exist for the task to be performed with this system

<sup>1</sup> Limited—Detects only GA, GB, GD (0.1 mg/m<sup>3</sup> – IDLH level for GA/GB, 2X IDLH level for GD within 30 sec.); VX (0.04 mg/m<sup>3</sup> – 4X IDLH level within 30 sec.); HD (2 mg/m<sup>3</sup> – IDLH level within 15 sec.), and L (0.38 mg/m<sup>3</sup> within 15 sec.). According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), and <300 (L for eye) mg-min/m<sup>3</sup>. Does not detect concentrations which can cause low-level (e.g., ocular) effects; detects vapors only; and is susceptible to chemical interference (false positives and negatives).

<sup>2</sup> Identifies detected agents and TICs.

<sup>3</sup> Does not quantify amount of detected agents or TICs.

<sup>4</sup> Detects pepper spray and mace (but these are not included in the *ITF-40* 33 high-priority critical acutely toxic airborne toxic industrial chemicals.)

<sup>5</sup> Does not quantify TIC concentrations because it does not detect any TICs.

<sup>6</sup> Detects in less than 30 seconds.

<sup>7</sup> Not relevant to this task (N/A).

<sup>8</sup> Identifies hazards within 30 seconds.

<sup>9</sup> Sampling collection for future analysis capability does not exist with this technology/equipment.

<sup>10</sup> COTS detector. Unknown if sufficient DOTLPF in place.

<sup>11</sup> Limited—Detects only GA, GB, GD, GF, VX, HD, and L (0.1 mg/m<sup>3</sup> – IDLH level for GA/GB, 2X IDLH for GD/GF; 10X IDLH for VX; 1/20 IDLH for HD). According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), and <300 (L for eye) mg-min/m<sup>3</sup>. Does not detect concentrations which can cause low-level (e.g., ocular) effects; detects vapors only; and is susceptible to chemical interference (false positives and negatives).

<sup>12</sup> Classifies agents as being nerve or blister agents.

<sup>13</sup> Provides relative hazard indication (relative quantification).

<sup>14</sup> No TICs detected.

<sup>15</sup> Does not identify or classify any TICs because it does not detect any TICs

<sup>16</sup> Detects hazards in less than 1 minute. Note: Requires up to 8 hours to warm up after 30 days storage.

<sup>17</sup> Classifies agents within one minute.

<sup>18</sup> There is effective DOTLPF in place to conduct task with this system.

<sup>19</sup> Headspace sampling system.

<sup>20</sup> Presumably detects all 12 CWA of interest (claims low ppb to ppt detection limits; 1 ppb = 0.01 mg/m<sup>3</sup> for VX – IDLH level; 0.006–0.007 mg/m<sup>3</sup> for G-agents – ~1/10 IDLH levels; 0.007 mg/m<sup>3</sup> for HD – 1/285 IDLH level). According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), <300 (L for eye), 7,000 (CK), and 1,6000 (CG) mg-min/m<sup>3</sup>. Detects vapors only.

<sup>21</sup> Identifies detected agents and TICs (through MS).

<sup>22</sup> Provides absolute quantification capability for all detected agents and TICs (specifically provides composition intensities, e.g., ppm).

<sup>23</sup> Presumably detects most TICs in ITF-40. Detects vapors only.

<sup>24</sup> Detects within 10 minutes.

<sup>25</sup> Hazards are not identified in time to treat, especially if lethal fast-acting agents at high concentrations are involved.

<sup>26</sup> Detects GA, GB, GD, GF, VX, HD, HN and L liquid (>0.02 mL) droplets.

<sup>27</sup> Classifies as G-, H- (and L), and V- agents.

<sup>28</sup> Classifies agents within 30 seconds.

<sup>29</sup> Detects GA, GB, GD, GF, VX, HD, HN and L liquid (>100 µL) droplets.

<sup>30</sup> Does not identify or classify detected agents or TICs.

<sup>31</sup> Detects within 20 seconds.

<sup>32</sup> Does not identify or classify agents or TICs.

<sup>33</sup> Assuming probe does not affect system performance.

<sup>34</sup> Limited—Detects only GA, GB, GD, GF (0.1 mg/m<sup>3</sup> – IDLH level for GA/GB, 2X IDLH for GD/GF within 30 sec.); VX (0.04 mg/m<sup>3</sup> – 4X IDLH level within 90 sec.); HD, and L (10 mg/m<sup>3</sup> – 5X IDLH level for HD, unknown L). According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), and <300 (L for eye) mg-min/m<sup>3</sup>. Does not detect concentrations which can cause low-level (e.g., ocular) effects; detects vapors only; and is susceptible to chemical interference (false positives and negatives).

<sup>35</sup> Classifies detected G and V agents as nerve agents; identifies detected H and L agents.

<sup>36</sup> Relative hazard level provided through three different sensitivity levels.

<sup>37</sup> Classifies or identifies agents within 30 seconds.

<sup>38</sup> Detects GA, GB, GD, GF (0.005 mg/m<sup>3</sup> – 1/20 IDLH for GA/GB, 1/10 IDLH for GD/GF), VX (0.02 mg/m<sup>3</sup> – 2X IDLH level), HD (2mg/m<sup>3</sup> – IDLH level), HN, L (9 mg/m<sup>3</sup>), CX (3 mg/m<sup>3</sup>), AC (9 mg/m<sup>3</sup> – below IDLH), and CK (8 mg/m<sup>3</sup>) in vapor form and is susceptible to chemical interference. According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), <300 (L for eye), and 7,000 (CK) mg-min/m<sup>3</sup>.

<sup>39</sup> Classifies G and V agents as nerve agents; identifies blood and blister agents.

<sup>40</sup> Detects TICs AC and CK.

<sup>41</sup> Identifies detected TICs.

<sup>42</sup> Detects within 15 minutes.

<sup>43</sup> Hazards are identified in time to treat when M8 paper is used for liquid detection. Hazards are not identified in time to treat when ampoules are used for vapor detection (delayed response; 15–20 minutes).

<sup>44</sup> Presumably detects all 12 agents of interest; detects all states (claims 5 ppb detection limit for air preconcentrator = 0.05 mg/m<sup>3</sup> for VX – 5X IDLH level, 0.030–0.035 mg/m<sup>3</sup> for G-agents: 1/3–2/3 IDLH levels, 0.035 mg/m<sup>3</sup> for HD – 1/57 IDLH level). According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), <300 (L for eye), 7,000 (CK), and 1,6000 (CG) mg-min/m<sup>3</sup>. Degraded performance: (P5, 9, 10) Not waterproof when operating; (M5) Negligible personnel experience

<sup>45</sup> Identifies sampled agents and TICs (through mass spectrometry)

<sup>46</sup> Presumably detects all TICs in ITF-40; detects all states.

<sup>47</sup> Will detect only GA, GB, GD, GF, and VX (0.1 mg/m<sup>3</sup> – IDLH level for GA/GB, 2X IDLH level for GD/GF, 10X IDLH for VX, within 30 sec.); HD, HN3, and L (2.0 mg/m<sup>3</sup> – IDLH level – within 120 sec.), AC (22 mg/m<sup>3</sup> – below IDLH level, within 60 sec.), CK (20 mg/m<sup>3</sup> within 60 sec.), and CG vapors only, and will not detect concentrations which can cause low-level (e.g., ocular) effects. According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), <300 (L for eye), 7,000 (CK), and 1,6000 (CG) mg-min/m<sup>3</sup>.

<sup>48</sup> Will classify agents as nerve, blister, blood, and choking agents.

<sup>49</sup> Will provide absolute quantification capability for all detected agents and TICs.

<sup>50</sup> Will detect Cl, HBr, HCl, AC, HF, HS, and CG as an objective.

<sup>51</sup> Will detect hazards within 1 minute.

<sup>52</sup> Will classify hazards within 1 minute.

<sup>53</sup> This technology/equipment will not have sampling collection for future analysis capability.

<sup>54</sup> Future system(s). Thus, DOTLPF is also future and cannot be evaluated.

<sup>55</sup> Will detect only GA, GB, GD, GF (0.1 mg/m<sup>3</sup> – IDLH level for GA/GB, 2X IDLH level for GD/GF within 30 sec.); VX (0.04 mg/m<sup>3</sup> – 4X IDLH level within 90 sec.); HD, HN3, L (2.0 mg/m<sup>3</sup> – IDLH level within 120 sec.); AC (22 mg/m<sup>3</sup> – below IDLH level within 60 sec.); CK (20 mg/m<sup>3</sup> within 60 sec.); and CG in vapor and aerosol forms, and will not detect concentrations which can cause low-level (e.g., ocular) effects. According to FM 3-11.9, incapacitating doses are 300 (GA for resting person), 75 (GB for resting person), 75–300 (GD), 50 (VX), 150 (inhaled HD), <300 (L for eye), 7,000 (CK), and 1,6000 (CG) mg-min/m<sup>3</sup>.

<sup>56</sup> Will detect ammonia, arsine, chlorine, diborane, fluorine, hydrogen bromide, hydrogen cyanide, hydrogen fluoride, nitric acid, phosgene, phosphorus trichloride, sulphur dioxide, and sulphuric acid.

- <sup>57</sup> Will identify all detected TICs as an objective.
- <sup>58</sup> Will detect hazards within 2 minutes.
- <sup>59</sup> Will classify or identify CWAs and TICs within 2 minutes.

### 5.10.3 Functional Solution Analysis

#### 5.10.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, that deficiency is then reassessed in the IMAs section.

1. **Deficiency:** Lack of real-time or near-real-time TIC detection and identification capabilities.  
**Non-Materiel Solutions:** None
2. **Deficiency:** General inability to detect deposited low-volatility agents and dusty agents.  
**Non-Materiel Solutions:** None
3. **Deficiency:** General inability to detect low-volatility CWAs (e.g., VX and, to a lesser extent, HD) at or below IDLH levels.  
**Non-Materiel Solutions:** *Training (partial):* Increase training of personnel on portable MS units (e.g., Viking SpectraTrak and HAPSITE).
4. **Deficiency:** Susceptibility to chemical interference.  
**Non-Materiel Solutions:** *Training (partial):* Increase training of personnel on portable MS units (e.g., Viking SpectraTrak and HAPSITE).
5. **Deficiency:** Lack of real-time or near-real-time CWA identification capabilities.  
**Non-Materiel Solutions:** None
6. **Deficiency:** Lack of agent quantification capabilities.  
**Non-Materiel Solutions:** *Training (partial):* Increase training of personnel on portable MS units (e.g., Viking SpectraTrak and HAPSITE).
7. **Deficiency:** Lack of detector that also takes physical samples for future analysis capability.  
**Non-Materiel Solutions:** None

#### 5.10.3.2 IMA Assessment Summary

Table 5.10-2 identifies 12 ideas for materiel approaches that, if developed, may reduce or eliminate the deficiencies associated with detecting chemical hazards in the atmosphere. Advances in orthogonal technologies may be able to address all identified deficiencies.

National Academy Press. 2000. <http://books.nap.edu/books/0309068754/html/>; Kosal, Margaret E. "The Basics of Chemical and Biological Detectors." 24 November 2003. <http://cns.miiis.edu/pubs/week/031124.htm>; Detection and Measurement of Chemical Agents, <http://books.nap.edu/html/terrorism/ch4.html>; Conventional analytical methods for chemical warfare agents, <http://www.iupac.org/publications/pac/2002/pdf/7412x2281.pdf>; National Institute of Justice. *Guide for the Selection of Chemical Agent and Toxic Industrial Material Detection Equipment for Emergency First Responders*. 2000. <http://www.ojp.usdoj.gov/nij/pubs-sum/184449.htm>

<sup>2</sup> Includes GC/MS, LC/MS, Matrix-Assisted Laser Desorption Ionization with Time-of-Flight Mass Spectrometry (MALDI-TOF MS)

<sup>3</sup> Examples include Thermal Infrared Spectroscopy, FTIR, long-wave IR (LWIR) Differential Scattering/Differential Absorption of Light (DISC)/Differential Absorption LIDAR (DIAL), LWIR Polarization, mid-wave IR (MWIR) DISC/DIAL, MWIR Polarization, Near-IR Scattering, NIR Laser-Induced Breakdown Spectroscopy (LIBS) UV Fluorescence, Multiband Brillouin Scattering, LWIR FTIR, LWIR Filtered Forward-Looking IR (FLIR), and Microwave (GHz and THz) Spectroscopy.

<sup>4</sup> May be coupled with GC; External Second Gate, Fourier Transform Ion Mobility Spectrometry approach can improve sensitivity and selectivity.

<sup>5</sup> For example, PCD.

<sup>6</sup> May be coupled with GC.

<sup>7</sup> Examples include SAW/IMS, IMC/SAW/Electrochemical/SCCell (S-CAD).

<sup>8</sup> May be coupled with GC or reversed-phase liquid chromatography (RPLC).

<sup>9</sup> Increasing the number of TICs identified by JCAD and/or JMCBDS is a potential solution.

<sup>10</sup> Classifies, but generally does not identify, agents.

<sup>11</sup> Distributing more HAPSITES and Viking Spectratraks is a potential solution.

<sup>12</sup> MS and IMS.

<sup>13</sup> Distributing more HAPSITES and Viking Spectratraks is a potential solution. JCAD and/or JMCBDS are expected to eliminate capability gap.

<sup>14</sup> All IMAs could be designed to eliminate this capability gap. The collection equipment would be better maintained as an independent capability. The solution could involve a module connected to the detector that notifies the operator to take samples or triggers an automated process to begin sampling.

## **5.11 Task TASENS 11: Sense the presence of biological hazards on humans, MWAs, and remains**

### **5.11.1 Functional Area Analysis**

#### **5.11.1.1 Definition**

To sense the presence or absence of biological hazards (includes biological warfare agents and TIB material) on humans, MWAs, and remains. Includes external detection of contamination prior to the manifestation of symptoms. Diagnosis of internal exposure is not part of this task as it is addressed in a separate Sustain task. Includes the functions of detection, identification, and quantification of the hazard. Also includes the requirement to determine the extent and physical properties of contamination, monitoring of known hazard locations, and collection of samples for further analysis. Encompasses “detect to warn” and “detect to treat” situations. The evaluation encompasses all biological hazards of military and medical importance.

#### **5.11.1.2 Derivation**

*UJTL TA 7, UJTL TA 7.1, Protection Joint Functional Concept.*

##### **5.11.1.2.1 Supported Tasks:** OPSENS 1, OPSENS 4, OPSENS 7

##### **5.11.1.2.2 Lateral Task:** N/A

##### **5.11.1.2.3 Supporting Task:** N/A

#### **5.11.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Tropical, arctic, and arid climates. (C1.3.1)
2. Summer, winter seasons. (C1.3.1.1)
3. Stormy weather. (C1.3.1.3)
4. Hot, very cold air temperature. (C1.3.1.3.1)
5. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6.1)
6. Heavy precipitation intensity. (C1.3.1.3.6.2)
7. Negligible light. (C1.3.2.1)
8. Biological effects. (C1.3.3.3)

##### **Military**

1. Stressful mission. (C2.1)
2. Location—ashore, afloat, airborne. (C2.1.4.1)
3. Minimal time available. (C2.1.5)
4. Low personnel capability. (C2.2.4)

5. Poor personnel morale. (C2.2.4.4)
6. Negligible personnel experience. (C2.2.4.5)
7. Poor multinational integration. (C2.3.1.2)
8. Deployment movement and maneuver—includes logistical requirements such as lift, supply, and transportation. (C2.5)
9. Limited or no host nation support. (C2.8.5)
10. Ambiguous threat existence. (C2.9.3)

### Civil

1. High mission priority. (C3.1.3.2)
2. Negligible language translators. (C3.2.1.2)
3. High health risk. (C3.3.1.5)
4. Significant refugee care responsibility. (C3.3.2.3)
5. TIB materials present in the civilian sector. (C3.3.7.5)

## 5.11.2 Functional Needs Analysis

### 5.11.2.1 Capability and Deficiency Assessment Summary

Table 5.11-1 presents individual and overall current, near/mid-term, and far-term capabilities to perform the task to the designated standards. There are three current capabilities used to accomplish this task and one projected capabilities to be added in the future (JBAIDS in the near/mid term). The individual capabilities differ in their abilities to meet the identified standards.

### Overall Capability and Deficiency Summary

The overall current capability is assessed as “yellow.” Many, if not most, BWAs can be presumptively detected and identified by collecting samples from personnel, MWAs, and remains through physical sampling, followed by manual sample preparation and the following laboratory and field-deployable analytical techniques: immunochromatographic HHAs, which are part of the BSK; ELISA; and RT-PCR, as used by RAPID. Of the 25 BWAs described in the *Medical Management of Biological Casualties*, a complete set of HHAs can detect and identify all agents with the possible exception of the viral hemorrhagic fever agents; however, the BSK contains eight different HHAs and thus detects only eight BWAs per kit. The eight agents in the kit may be assembled to reflect the threat.<sup>1</sup> A comprehensive set of ELISAs, which are laboratory-based, can ostensibly detect and identify all 25 BWAs (as well as any TIB), assuming that an antigen or antibody has been isolated for each agent. Like all PCR-based technologies, RAPID can, with the appropriate reagents, detect and identify all BWA and TIB pathogens, but none of the toxins (since the toxins, unless contaminated with the source organisms, do not provide any genetic material). HHAs and RAPID can generically quantify detected agents

---

<sup>1</sup> The collection of surface samples to use in HHA results in a sample for further analysis. Coolers/temperature-controlled equipment to hold and maintain the sample needs to be available if the sample is not immediately evacuated.

(HHAs only through the aide of a reader), whereas some varieties of ELISAs provide absolute quantification capabilities.

Overall current task deficiencies include the lack of integrated sample collection, detection, identification, and quantification capability for BWAs on personnel, MWAs, and remains; real-time or near-real-time detection, identification, and quantification capability for sampled BWAs; field analysis verification capabilities; as well as TIB detection capabilities.

### **Projected Near/Mid-Term Capabilities and Deficiencies**

The overall projected near/mid-term capability is assessed as “yellow.” Near/mid-term capability JBAIDS Block I will detect 11 BWA pathogens (as a threshold requirement), whereas Block II will detect the same 11 BWA pathogens plus the four toxins of interest (as a threshold requirement). JBAIDS will also quantify agent concentrations in the analyzed sample. It will require 25–40 minutes for analysis output following sample preparation, and will thus provide a complete identify-to-treat capability.

All of the overall current task deficiencies are likely to remain deficiencies in the near/mid term.

### **Projected Far-Term Capabilities and Deficiencies**

No changes in capability are projected in the far term for this task, so the overall projected far-term capability will remain “yellow.”

	FAA Measure	Elaboration	Scale
M1	All of a potential adversary's weaponized BWAs can be detected using fielded technologies/equipment, regardless of agent physical properties, states, and concentrations?	Number of the 25 biological agents described in the <i>Medical Management of Biological Casualties</i> that are detected. Fourteen of the 25 agents are as follows: Anthrax ( <i>Bacillus Anthracis</i> ); Brucellosis ( <i>Brucellae</i> ); Glanders ( <i>Burkholderia mallei</i> ); Melioidosis ( <i>Burkholderia pseudomallei</i> ); Q Fever ( <i>Coxiella burnetii</i> ); Plague ( <i>Yersinia pestis</i> ); Tularemia ( <i>Francisella tularensis</i> ); Botulinum toxin; Ricin; SEB; T-2 Mycotoxins; Smallpox (variola major and minor); Viral Equine Encephalities (e.g., VEE, WEE, and EEE); and Ebola and Marburg hemorrhagic fever viruses. Linear from 2–10.	10: All 25 BWAs detected 8: ≥20 BWAs detected 6: ≥15 BWAs detected 4: ≥10 BWAs detected 2: ≥5 BWAs detected 1: ≥1 BWA detected 0: No BWAs detected
M2	All of a potential adversary's weaponized BWAs can be identified using fielded technologies/equipment?	Ability to identify or classify (e.g., as bacteria, toxin, or virus) detected BWAs.	10: Identify detected BWAs 7: Identify some detected BWAs; classify others 5: Classify detected BWAs 3: Some detected BWAs are classified or identified 0: Neither identify nor classify detected BWAs
M3	All of a potential adversary's weaponized BWAs can be quantified using fielded technologies/ equipment?	Ability to provide snapshot concentration of detected BWAs.	10: Absolute quantification 5: Generic quantification 0: No quantification capability

	FAA Measure	Elaboration	Scale
M4	All TIB material can be detected using fielded technologies/equipment?	TIB material includes medical waste, raw sewage, and vaccine-related biologics. Pathogens and toxins within TIB material are what are generally detected.	10: All pathogens and toxins within TIB material, including medical waste, raw sewage, and vaccine-related biologics can be detected 5: All TIB pathogens or toxins within one or more categories (i.e., medical waste, raw sewage and vaccine-related biologics) can be detected 3: Some TIB pathogens and toxins within one category (i.e., medical waste, raw sewage and vaccine-related biologics) can be detected 0: No TIB pathogens and toxins can be detected
M5	All TIB material can be identified using fielded technologies/equipment?	Ability to identify or classify (e.g., as bacteria, toxin, or virus) detected TIB material.	10: All pathogens and toxins within TIB material can be identified 7: Identify some TIB pathogens and toxins; classify others 5: Classify detected TIB pathogens and toxins 3: Some detected TIB pathogens and toxins can be classified or identified 0: Neither classify nor identify detected TICs
M6	All TIB material can be quantified using fielded technologies/equipment?	Ability to provide snapshot concentration of detected TIBs.	10: Absolute quantification 5: Generic quantification 0: No quantification capability
M7	Time to detect biological hazards?	Time period from BWA/TIB sampling to analysis output. Linear scale 2–9. Applies to point detectors only.	10: ≤1 minute 9: ≤4 minutes 8: ≤7 minutes 7: ≤10 minutes 4: ≤40 minutes 2: ≤60 minutes 1: >60 minutes
M8	Distance between biological hazard and detector for accurate detection?	This measure is not relevant to this task.	N/A
M9	Biological hazards are detected in time to warn forces and take appropriate protective measures?	This measure is not relevant to this task.	N/A

	FAA Measure	Elaboration	Scale
M10	Biological hazards are identified in time to treat forces?	Based on capability and time required to identify or classify hazards, as well as rate-of-action of those hazards. Of all considered BWAs, ricin may require the most rapid response. Immunoglobulin therapy must be administered within 1 hour of ricin exposure to be effective.	10: Complete capability (<1 hour) 5: Partial capability 0: No capability
M11	Sampling collection procedures available for all of a potential adversary's weaponized BWAs and for all TIB material using fielded technologies/ equipment?	Refers to physical sampling for future analysis.	10: Complete capability 5: Partial capability 0: No capability
M12	Procedures maintain integrity of sample?	Refers to a physical sample for future analysis.	10: Complete capability 5: Partial capability 0: No capability
M13	Time to validate the presence of biological hazards in the atmosphere?	Refers to confirmatory identification.	10: Rapidly—validation performed expeditiously by particular technology/equipment 5: Moderately delayed—mobile analysis tools can validate onsite 0: Delayed—off-site laboratory analysis required for validation
M14	There is effective DOTLPF in place to conduct task?	Refers to non-materiel elements associated with the execution of the task with the system.	10: DOTLPF exists and is adequate for the task to be performed with this system without limitations that cause significant impact upon operations 5: Most critical aspects of DOTLPF for the task to be performed with this system are addressed 0: DOTLPF is inadequate or does not exist for the task to be performed with this system

<sup>1</sup> Current and near-future HHAs detect all BWAs with the possible exception of the viral hemorrhagic fevers. The HHA sensitivity is  $10^5$ – $10^6$  CFU/mL (*B. anthracis*) and 50–1200 ng/mL (Botulinum toxin A and Botulinum toxin F, respectively). Degraded performance: (C6) TIB material present in civilian sector. Susceptible to interference (false positives and negatives); (M3) Minimal time available. Requires sample preparation prior to applying sample to assay.

<sup>2</sup> All detected BWAs are identified.

<sup>3</sup> Does not absolutely quantify agent. However, may provide relative indication of quantity, but only through the use of a reader. Soldiers will not likely have the reader.

<sup>4</sup> According to specifications, does not detect any TIBs.

<sup>5</sup> Detects within 15 minutes.

<sup>6</sup> Not relevant to this task (N/A).

<sup>7</sup> Immediately identifies all detected hazards (detection requires up to 15 minutes) and thus provides complete identify-to-treat capability.

<sup>8</sup> Does not collect a sample for future analysis.

<sup>9</sup> Requires samples to be confirmed off site in laboratory.

<sup>10</sup> There is effective DOTLPF in place to conduct task, at least for bacillus bacteria (specifically anthrax). Procedures for other agents are probably similar.

- 
- <sup>11</sup> Ostensibly all BWAs can be detected by ELISA. ELISA's sensitivity is  $10^5$ – $10^6$  CFU/mL (*B. anthracis*); 10–100 PFU/mL of Venezuelan Equine Encephalitis virus; and 625 pg/mL of Staphylococcal Enterotoxin B (aerosol) and greater than 5 ng/mL of ricin.
- <sup>12</sup> Some varieties of ELISA can absolutely quantify the antigen or antibody concentration.
- <sup>13</sup> Theoretically, any agent (i.e., antigen or antibody) for which an ELISA has been designed can be detected through this method; however, only one particular pathogen or toxin antigen or antibody can be tested per ELISA model.
- <sup>14</sup> A particular TIB pathogen or toxin is identified if it is detected, since ELISA is highly specific and detects a particular agent.
- <sup>15</sup> Typically requires 1–2 hours (following sample collection and preparation) for detection, identification, and if applicable, quantification, primarily because of incubation time.
- <sup>16</sup> Not designed for sample collection for future analysis.
- <sup>17</sup> RAPID may be able to detect all pathogens; PCR does not detect toxins, though the toxic material may be contaminated with source genetic material (In this assessment, it is assumed that this is not the case). Standard PCR has a sensitivity of 10–100 CFU/mL bacteria (*B. anthracis*); and 15 fg–1 pg or 100–1 million copies of the complementary DNA for viruses.
- <sup>18</sup> RAPID, through RT-PCR, may provide generic quantification.
- <sup>19</sup> Theoretically, any TIB pathogen can be detected with appropriate reagents; toxins cannot be detected unless contaminated with source genetic material.
- <sup>20</sup> All detected TIBs are identified.
- <sup>21</sup> Detects and identifies within 30 minutes following sample preparation, but sample preparation requires several hours.
- <sup>22</sup> Block I will detect Anthrax; Brucella; Ebola VHF virus; Marburg VHF virus; Viral Encephalitis viruses (VEE/WW/EEE); Glanders; Meliodosis; Plague; Q Fever; Smallpox; and Tularemia (and Typhus) as a threshold requirement; and Crimean-Congo hemorrhagic virus; Dengue fever; Hantaviruses; and Rift Valley Fever Virus (and Cholera, Cryptosporidium; E. coli; Influenza; Salmonella; and Shigella) as an objective; Block II will add toxins Botulinum, microcystins, ricin, SEB, and T-2 Mycotoxins.
- <sup>23</sup> Will identify all detected agents.
- <sup>24</sup> Will quantify the concentration in the sample.
- <sup>25</sup> Will not detect any TIBs.
- <sup>26</sup> Will detect and identify within 40 minutes (25-minute objective) for Blocks I and II following sample preparation.
- <sup>27</sup> Will immediately identify all detected hazards (detection will require 25–40 minutes) and thus will provide complete identify-to-treat capability.
- <sup>28</sup> Will provide physical sample collection capability for future analysis.
- <sup>29</sup> Will maintain integrity of physical sample.
- <sup>30</sup> Will require samples to be confirmed off site at laboratory.
- <sup>31</sup> Future system(s). Thus, DOTLPF is also future and cannot be evaluated.

### 5.11.3 Functional Solution Analysis

#### 5.11.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, that deficiency is then reassessed in the IMAs section.

1. **Deficiency:** Lack of integrated detection, identification, and quantification capability for BWAs on personnel and MWAs.  
**Non-Materiel Solutions:** None
2. **Deficiency:** Lack of real-time or near-real-time detection, identification, and quantification capability for BWAs on personnel and MWAs.  
**Non-Materiel Solutions:** None
3. **Deficiency:** Validation of findings requires laboratory testing.  
**Non-Materiel Solutions:** *Doctrine:* Modify doctrine to permit validation by a reliable on-site detection/identification capability (e.g., portable PCR) as confirmatory detection/identification is ultimately dependent upon doctrine, not materiel capabilities.  
*Training (partial):* Train personnel in analytical techniques to ensure accuracy.
4. **Deficiency:** Lack of TIB detection capability.  
**Non-Materiel Solutions:** None
5. **Deficiency:** Lack of detector that also takes samples for future analysis capability.  
**Non-Materiel Solutions:** None

#### 5.11.3.2 IMA Assessment Summary

Table 5.11-2 identifies nine ideas for materiel approaches that, if developed, may reduce or eliminate the deficiencies associated with detecting biological hazards on personnel and MWAs. Advances in MS; immunoassays; flame photometry; tissue-based detection; Raman, IR, UV, or microwave spectroscopy; or orthogonal technologies may be able to address all identified deficiencies.

Table 5.11-2. TASENS 11: IMA Assessment

TASENS 11: Sense personnel and MWAs for biological hazards <sup>1</sup>									
Identified Gaps	Ideas for Material Approaches (IMA)								
	Mass Spectrometry <sup>2</sup>	Immunoassay (Antibody-Based) <sup>3</sup>	Genetic (Nucleic Acid-Based) <sup>4</sup>	Tissue-Based	Flame Photometry <sup>5</sup>	Orthogonal <sup>6</sup> (Immunoassay/Nucleic Acid-Based)	Colorimetric <sup>7</sup>	Raman Spectroscopy <sup>8</sup>	IR, UV, and Microwave Spectroscopy <sup>9</sup>
Lack of integrated detection, identification, and quantification capability for BWAs on personnel and MWAs. <sup>10</sup>	X	X	X	X	X	X	X	X	X
Lack of real-time or near-real-time detection, identification, and quantification capability for BWAs on personnel and MWAs. <sup>11</sup>	X	X		X	X	X	X	X	X
Lack of TIB detection capability.	X	X	X	X	X	X	X	X	X
Lack of detector that also takes samples for future analysis capability. <sup>12</sup>	X	X	X	X	X	X	X	X	X

<sup>1</sup> McKone, Thomas E., Beverly M. Huey, et al. (eds.) *Strategies to Protect the Health of Deployed U.S. Forces: Detecting, Characterizing and Documenting Exposures*. National Academy Press. 2000. <http://books.nap.edu/books/0309068754/html/>; Kosal, Margaret E. "The Basics of Chemical and Biological Detectors." 24 November 2003. <http://cns.miiis.edu/pubs/week/031124.htm>; Detection and Measurement of Biological Agents. <http://books.nap.edu/html/terrorism/ch6.html>; National Institute of Justice. *An Introduction to Biological Agent Detection Equipment for Emergency First Responders*. 2001. <http://www.ojp.usdoj.gov/nij/pubs-sum/190747.htm>

<sup>2</sup> Includes GC/MS, LC/MS, Gas Chromatography-Ion Trap Tandem Mass Spec (GC-MS-MS), Matrix-Assisted Laser Desorption Ionization (MALDI) MS.

<sup>3</sup> Includes SAW technology.

<sup>4</sup> Includes PCR and RT-PCR amplification, DNA microchip technology, SAW technology.

<sup>5</sup> Philippe, Adam, Damien Descroix and Jean-Pierre Chiaroni. "Flame Photometry for Biological Detection." Proceedings from the 6<sup>th</sup> CBW Protection Symposium. 1998.

<sup>6</sup> Includes nucleic acid/immunoassay technologies (e.g., PCR and immunological techniques), electrochemiluminescence/equilibrium immunoassay, Fluorescence correlation spectroscopy/PCR.

<sup>7</sup> ChemSensing Colorimetric Sensor.

<sup>8</sup> NIR Raman, Visible Light (VIS) Surface-Enhanced Raman, VIS Raman, UV Raman, Multiband Resonance-Enhanced Raman, Multiband Surface-Enhanced Raman.

<sup>9</sup> Thermoluminescence/FTIR, long-wave IR Differential Scattering/Differential Absorption of Light (DISC)/Differential Absorption LIDAR (DIAL), LWIR Polarization, mid-wave IR (MWIR) DISC/DIAL, MWIR Polarization, near-IR (NIR) Laser-Induced Breakdown Spectroscopy (LIBS) UV Fluorescence, Multiband Brillouin Scattering.

<sup>10</sup> Sample collection, independent of the detector, is one of the main, if not the main, problem. Quantification cannot be achieved without efficient, standardized sample collection and preparation (if needed). JBAIDS is expected to detect, identify, and quantify all BWAs on personnel and MWAs, and thus eliminate capability gap.

<sup>11</sup> Reducing the sample preparation and response times for JBAIDS is a potential solution.

<sup>12</sup> All IMAs could be designed to eliminate this capability gap. The collection equipment would be better maintained as an independent capability. The solution could involve a module connected to the detector that notifies the operator to take samples or triggers an automated process to begin sampling.

## **5.12 Task TASENS 12: Sense the presence of radiological hazards on humans, MWAs, and remains**

### **5.12.1 Functional Area Analysis**

#### **5.12.1.1 Definition**

To sense the presence or absence of radiological substances on humans, MWAs, and remains. Includes external detection of contamination prior to the manifestation of symptoms. Diagnosis of internal exposure is not part of this task as it is addressed in a separate Sustain task. Includes the functions of detection, identification, and quantification of the substance. Also includes the requirement to determine the extent and physical properties of contamination, monitoring of known radiological locations, and collection of samples for further analysis. Encompasses “detect to warn” and “detect to treat” situations.

5. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6.1)
6. Heavy precipitation intensity. (C1.3.1.3.6.2)
7. Negligible light. (C1.3.2.1)
8. Strong nuclear atmosphere weapons effects. (C1.3.3)
9. Moderate nuclear radiation effects. (C1.3.3.1.2)

##### **Military**

1. Stressful mission. (C2.1)
2. Location—ashore, afloat, airborne. (C2.1.4.1)
3. Minimal time available. (C2.1.5)
4. Low personnel capability. (C2.2.4)

5. Poor personnel morale. (C2.2.4.4)
6. Negligible personnel experience. (C2.2.4.5)
7. Poor multinational integration. (C2.3.1.2)
8. Deployment movement and maneuver—includes logistical requirements such as lift, supply, and transportation. (C2.5)
9. Limited or no host nation support. (C2.8.5)
10. Ambiguous threat existence. (C2.9.3)

### Civil

1. High mission priority. (C3.1.3.2)
2. Negligible language translators. (C3.2.1.2)
3. Significant refugee care responsibility. (C3.3.2.3)
4. TIR materials present in the civilian sector. (C3.3.7.5)

## 5.12.2 Functional Needs Analysis

### 5.12.2.1 Capability and Deficiency Assessment Summary

Table 5.12-1 presents individual and overall current, near/mid-term, and far-term capabilities to perform the task to the designated standards. There are 13 current capabilities used to accomplish this task. The capabilities include a range of portable RADIAC devices and dosimeters.

### Current Capabilities and Deficiencies

The overall current capability is assessed as “yellow.” Most current RADIACS detect and identify beta radiation and detect, identify, and quantify gamma radiation. All RADIACs perform their functions in real time (though the level of confidence increases with increased sampling time) and thus provide a complete detect-to-warn capability. Many also automatically calculate the cumulative dose. Dosimeters generally measure the total dose from gamma radiation exposure. Most are not self-indicating and need to be placed within a reader to retrieve the dose information.

There is no single capability that can perform the task to all of the designated standards. ADM 300 detects alpha, beta, gamma, and x-radiation, but like all RADIACs, it detects, identifies, and quantifies only the radiation, not the radioisotope. Furthermore, like all RADIACs and dosimeters, the ADM-300, must be exposed to radiation to detect it. Overall task deficiencies include the lack of radioisotope identification capabilities, reliable alpha detection capabilities, monitors that can detect all types of radiation, and detectors that take sample for future analysis.

### Projected Near/Mid-Term Capabilities and Deficiencies

No changes in capability are projected in the near/mid term for this task, so the overall projected near/mid-term capability will remain “yellow.”

### **Projected Far-Term Capabilities and Deficiencies**

No changes in capability are projected in the far term for this task, so the overall projected far-term capability will remain “yellow.”

**Table 5.12-1. TASENS 12: Capability and Deficiency Assessment**

	FAA Measure	Elaboration	Scale
M1	All radiological hazards (including TIR material) can be detected using fielded technologies/equipment?	<p>Number of radiation types (i.e., alpha, beta, gamma, neutron, and x-radiation) detected. Note: Fielded technologies/equipment detect radiological hazards by detecting the radiation emitted from these hazards.</p> <p>TIR material includes DU, a common battlefield hazard resulting from certain types of ammunition and damaged armor.</p>	<p>10: All five types  8: Four types  6: Three types  4: Two types  2: Single type  0: No radiological hazards detected</p>
M2	All radiological hazards (including TIR material) can be identified using fielded technologies/ equipment?	Ability to identify type of radiation detected or the radioisotope emitting the radiation. Note: Fielded technologies/equipment that identify radioisotope also identify the type(s) of radiation detected.	<p>10: Identifies radioisotope emitting radiation  5: Identifies type of radiation detected  0: No identification capability</p>

	FAA Measure	Elaboration	Scale
M3	All radiological hazards (including TIR material) can be quantified using fielded technologies/ equipment?	Ability to quantify activity of radiological material (i.e., Cu or Bq), or the exposure (i.e., Roentgen or Coulomb/kg) or dose rate (rad, rem, Gy, or Sv) from emitted radiation.	10: Absolute quantification 5: Generic quantification (or absolute quantification of one radiation type and no quantification of another type) 0: No quantification capability
M4	Time to detect radiological hazard?	Time period from exposure to radiation to analysis output.	10: Near real time 0: Not near-real time
M5	Distance between radiological hazard and detector for accurate detection?	This measure is not relevant to this task.	N/A
M6	Radiological hazards are detected in time to warn forces and take appropriate protective measures?	This measure is not relevant to this task.	N/A
M7	Radiological hazards are identified in time to treat forces?	A complete capability requires both near-real-time identification of the emitted radiation type(s) and radioisotope. Identification of the emitted radiation type(s) enables appropriate medical response to radiation exposure and identification of the radioisotope determines to appropriate medical course of action to radiological material internalization.	10: Complete capability (near-real-time identification of radioisotope and emitted radiation type[s]) 5: Partial capability (Delayed identification of emitted radiation type[s]) 0: No capability (no identification capability)
M8	There is effective DOTLPF in place to conduct task?	Refers to non-materiel elements associated with the execution of a task with the system.	10: DOTLPF exists and is adequate for the task to be performed with this system without limitations that cause significant impact upon operation 5: Most critical aspects of DOTLPF for the task to be performed with this system are addressed 0: DOTLPF is inadequate or does not exist for the task to be performed with this system

<sup>1</sup> Detects alpha, beta, gamma, and x-radiation emitted from radiological materials.

<sup>2</sup> Identifies type of radiation, but not radioisotope.

<sup>3</sup> Absolutely quantifies radiation level.

<sup>4</sup> Real-time detection. Level of confidence increases with increased sampling time and radiation levels.

<sup>5</sup> Not relevant to this task (N/A)

<sup>6</sup> Provides partial identify-to-treat capability since immediately identifies detected radiation type, but not the radioisotope.

<sup>7</sup> There is effective DOTLPF in place to conduct task with this system.

<sup>8</sup> In combination with OA-9449/PDQ probe. The MFR alone detects gamma radiation; with the probe, it measures gamma radiation and detects beta radiation.

<sup>9</sup> Detects beta/gamma radiation emitted from radiological materials.

- <sup>10</sup> Absolutely quantifies gamma radiation level; detects, but does not quantify, beta radiation.
- <sup>11</sup> Detects alpha radiation emitted from radiological materials (particularly plutonium).
- <sup>12</sup> Detects only one type of radiation, so identification capability is not applicable.
- <sup>13</sup> Detects gamma radiation emitted from radiological materials (particularly plutonium).
- <sup>14</sup> The DT-236 dosimeter records the total dose to gamma and neutron radiation. The CP-696 reader is required to retrieve the dose information.
- <sup>15</sup> Does not differentiate between dose received from gamma radiation and dose received from neutron radiation.
- <sup>16</sup> Absolutely quantifies total gamma and neutron dose absorbed by dosimeter.
- <sup>17</sup> Dose can be viewed only when dosimeter is placed within reader; therefore, radiation exposure cannot be detected in near-real time.
- <sup>18</sup> Through reader, displays total dose to penetrating (i.e., gamma and neutron) radiation, which allows for partial identify-to-treat capability.
- <sup>19</sup> Detects alpha, beta, gamma, and x-radiation emitted from radiological materials.
- <sup>20</sup> Detects gamma/neutron radiation emitted from radiological materials.
- <sup>21</sup> Dosimeter indicates total dose to gamma radiation only.
- <sup>22</sup> Absolutely quantifies total gamma radiation dose absorbed by dosimeter.
- <sup>23</sup> Provides partial identify-to-treat capability. As dosimeter only detects gamma radiation, an indication of a significant dose could suggest and help treat acute radiation syndrome, e.g.
- <sup>24</sup> As a self-indicating pocket dosimeter, possibly allows for near-real-time detection of gamma radiation; however, dose rate must be high for increase in dose to be noticeable during a short period.

### 5.12.3 Functional Solution Analysis

#### 5.12.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, that deficiency is then reassessed in the IMAs section.

1. **Deficiency:** Lack of reliable alpha-detection capabilities.  
**Non-Materiel Solutions:** *Training (partial):* Increase training of personnel on ADM-300, AN/PDR-56, and AN/PDR-77.
2. **Deficiency:** Lack of monitors that can detect most or all types of radiation.  
**Non-Materiel Solutions:** *Training (partial):* Increase training of personnel on ADM-300.
3. **Deficiency:** Lack of radioisotope identification capabilities.  
**Non-Materiel Solutions:** None
4. **Deficiency:** Lack of detector that can also take samples for future analysis capability.  
**Non-Materiel Solutions:** None

#### 5.12.3.2 IMA Assessment Summary

Table 5.12-2 identifies three ideas for materiel approaches that, if developed, may reduce or eliminate the deficiencies associated with detecting radiological hazards in the atmosphere. Advances in scintillation or semiconductor radiation detection technologies may be able to address all identified deficiencies.

Table 5.12-2. TASENS 12: IMA Assessment

Identified Gaps	Ideas for Material Approaches (IMA)		
	Gas-filled Radiation Detectors <sup>1</sup>	Scintillation Radiation Detectors <sup>2</sup>	Semiconductor Radiation Detectors <sup>3</sup>
Lack of reliable alpha-detection capabilities. <sup>4</sup>	X	X	X
Lack of monitors that can detect all types of radiation. <sup>5</sup>	X	X	X
Lack of radioisotope identification capabilities. <sup>6</sup>		X	X
Lack of detector that collects contamination for low-level detection and future analysis. <sup>7</sup>	X	X	X

<sup>1</sup> Includes Geiger-Mueller detectors, proportional gas detectors, and ionization chambers

<sup>2</sup> Includes ZnS(Ag), anthracene, trans-stilbene, para-terphenyl, phenyl oxazole, NaI(Tl), CsI(Tl), bismuth germanate (Bi<sub>4</sub>Ge<sub>3</sub>O<sub>12</sub>), barium fluoride (BaF<sub>2</sub>)-based detectors.

<sup>3</sup> Includes germanium, silicon, cadmium telluride (CdTe), and mercuric iodide (HgI<sub>2</sub>)-based detectors.

<sup>4</sup> Distributing more ADM-300 and AN/PDR-77 is a potential solution.

<sup>5</sup> Distributing more ADM-300 is a potential solution.

<sup>6</sup> Distributing gamma and/or alpha scintillation detectors with radioisotope identification capabilities is a potential solution.

<sup>7</sup> All point-detection IMAs could be designed to eliminate this capability gap. The collection equipment would be better maintained as an independent capability. The solution could involve a module connected to the detector that notifies the operator to take samples or triggers an automated process to begin sampling.

**5.13 Task TASENS 13: Mark CBR contaminated air, surfaces, and water****5.13.1 Functional Area Analysis****5.13.1.1 Definition**

To mark contaminated air, surfaces, and water includes exterior and interior atmospheres, food, terrain, personnel, equipment, facilities, supplies, and bodies of water. Objective is to identify hazards to allies while providing no advantage to enemy forces. Marking methods could include visual, audible, and electronic indicators depending on the requirement.

**5.13.1.2 Derivation**

*UJTL TA 7, UJTL TA 7.1, Protection Joint Functional Concept.*

**5.13.1.2.1 Supported Task:** N/A

**5.13.1.2.2 Lateral Task:** TASHA 24

**5.13.1.2.3 Supporting Task:** N/A

**5.13.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Mountainous, desert, jungle, and arctic terrain. (C1.1.1)
2. Significant urbanization. (C1.1.3.1)
3. High sea state. (C1.2.1.3)
4. Stormy weather. (C1.3.1.3)
5. High surface-wind velocity. (C1.3.1.3.3)
6. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6.1)
7. Heavy precipitation intensity. (C1.3.1.3.6.2)
8. Extreme turbulence and wind shear. (C1.3.1.3.8)
9. Very low visibility. (C1.3.2)
10. Negligible light. (C1.3.2.1)
11. Dense obscuration. (C1.3.2.2)
12. Severely degraded radio frequency spectrum. (C1.3.5)

**Military**

1. Minimal time available. (C2.1.5)
2. Some or no interoperability. (C2.2.6)
3. Highly restricted information exchange. (C2.3.1.8)
4. Extreme threat. (C2.9.1)

**Civil**

1. Aggressively opposed foreign public opinion. (C3.1.2.4)
2. High mission priority. (C3.1.3.2)
3. TIMs present in the civilian sector. (C3.3.7.5)

**5.13.2 Functional Needs Analysis****5.13.2.1 Capability and Deficiency Assessment Summary**

Table 5.13-1 discusses the individual capability of the current M274 NBC Marking Kit to perform the task to the designated standards. No near-future capabilities have been identified for this task.

**Current Capability and Deficiency**

The overall current capability is assessed as “green.” Under ideal conditions, the M274 NBC Marking Kit is able to perform the task to all of the designated standards. However, its performance may be degraded under low light or if surrounded by obscurants since it does not provide any audible or electronic indicators of contamination. Consequently, overall task deficiencies include the lack of audible or electronic indicators of contamination. These deficiencies are likely to remain in the near future.

**Projected Near/Mid-Term Capability and Deficiency**

No changes in capability are projected in the near/mid term for this task, so the overall projected near/mid-term capability will remain “green.”

**Projected Far-Term Capability and Deficiency**

No changes in capability are projected in the far term for this task, so the overall projected far-term capability will remain “green.”

**Table 5.13-1. TASENS 13: Capability and Deficiency Assessment**

System/Measure	M1	M2	M3	M4
<b>Current – Near/Mid - Far</b>				
M274 NBC Marking Set	10 <sup>1</sup>	5 <sup>2</sup>	5 <sup>3</sup>	10 <sup>4</sup>
<b>Current Overall Capability</b>	10	5	5	10
<b>Near/Mid-Term Overall Capability</b>	10	5	5	10
<b>Far-Term Overall Capability</b>	10	5	5	10

	FAA Measure	Scale
M1	Markings are standardized among coalition forces?	10: Complete capability 5: Partial capability 0: No capability
M2	Markings facilitate effective contamination avoidance?	10: Complete capability 5: Partial capability 0: No capability
M3	Markings are monitored and changed in near-real time to reflect changes in hazards?	10: Complete capability 5: Partial capability 0: No capability
M4	There is effective DOTLPF in place to conduct task?	10: DOTLPF exists and is adequate for the task to be performed with this system without limitations that cause significant impact upon operations 5: Most critical aspects of DOTLPF for the task to be performed with this system are addressed 0: DOTLPF is inadequate or does not exist for the task to be performed with this system

<sup>1</sup> Markings are standardized among US and NATO forces.<sup>2</sup> M274 markings may not be visible under low light or if surrounded by obscurants.<sup>3</sup> Markings are unlikely to be monitored and changed in near-real time. Markings would likely be monitored and changed as time permits.<sup>4</sup> There is effective DOTLPF in place to conduct task with this system.

**5.13.3 Functional Solution Analysis****5.13.3.1 DOTLPF Assessment Summary**

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, that deficiency is then reassessed in the IMAs section.

- 1. Deficiency:** Lack of audible and electromagnetic indicators of contamination.

**Non-Materiel Solutions:** None

**5.13.3.2 IMA Assessment Summary**

The materiel solution to a lack of audible and electromagnetic indicators of contamination involves developing beacons that audibly and/or electronically notifies forces of contamination. This technology would be especially valuable in contaminated urban environments and on contaminated airfields.

## **5.14 Task TASENS 14: Observe the indigenous population for indicators of CBRN/TIM attack**

### **5.14.1 Functional Area Analysis**

#### **5.14.1.1 Definition**

To collect data from indigenous population that may indicate potential CBRN/TIM attack. Indigenous population includes individuals, animals, and plants. Includes indicators such as human illness and environmental abnormalities such as an unexplained absence or elevated illness of wildlife or plants. Methods include observations as well as data obtained from local sources or organizations.

#### **5.14.1.2 Derivation**

*UJTL (TA 7, TA 7.1), Protection Joint Functional Concept.*

##### **5.14.1.2.1 Supported Task: OPSSENS 3**

##### **5.14.1.2.2 Lateral Tasks: TASHA 1, TASHA 9**

##### **5.14.1.2.3 Supporting Task: N/A**

#### **5.14.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Significant urbanization. (C1.1.3.1)
2. Nuclear radiation effects. (C1.3.3.1.2)
3. Chemical effects. (C1.3.3.2)
4. Biological effects. (C1.3.3.3)

##### **Military**

1. Location—ashore, afloat, airborne. (C2.1.4.1)
2. Minimal time available. (C2.1.5)
3. Low personnel capability. (C2.2.4)
4. Negligible personnel experience. (C2.2.4.5)
5. Highly restricted information exchange. (2.3.1.8)
6. Negligible theater intelligence access. (C2.4.4)
7. Little or no intelligence dissemination and receipt. (C2.4.7)
8. Extreme threat. (C2.9.1)

**Civil**

1. Limited or negative foreign government support. (C3.1.2.3)
2. High mission priority. (C3.1.3.2)

**5.14.2 Functional Needs Analysis****5.14.2.1 Capability and Deficiency Assessment Summary**

Medical units, in the course of routine medical procedure, conduct medical surveillance to determine whether biological warfare attacks have taken place. The task includes employing epidemiological methods for biological attack assessment. This process is accomplished now as part of standard medical process. They also support all types of restoration operations by tracking the biological reactions to substances in the environment whether endemic or induced. Coordination of medical services promotes, improves, conserves, and restores the mental or physical well-being and performance of individuals or groups, and is performed in support of all Services (and other nations as required). This deployment process is accomplished now as part of standard medical processes.

**Current Capability and Deficiency**

The overall current capability is assessed as “yellow.” While Chairman of the Joint Chiefs of Staff Manual (CJCSM) 3113.01a provides guidance concerning general Theater Engagement Plan (TEP) considerations that can be modified to include restoration operation considerations, there is no definitive guidance for executing theater engagement restoration operation activities at this level. Training of restoration operation country assistance teams is not conducted as part of joint training. All Standing Joint Task Forces are proficient at restoration operation TEP. Inclusion or restoration operation TEP is standard in all pertinent schools/courses.

**Projected Near/Mid-Term Capability and Deficiency**

Significant DOTLPF changes in capability are projected in the near/mid term for this task, so the overall projected near/mid-term capability will improve to “green.”

**Projected Far-Term Capability and Deficiency**

No changes in capability are projected in the far term for this task, so the overall projected far-term capability will remain “green.”

**Table 5.14-1. TASENS 14: Capability and Deficiency Assessment**

<b>Capability: Observation of Indigenous Population for CBRN/TIM Attack Indicators</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>
<b>Current Overall Capability</b>	5 <sup>1</sup>	5 <sup>2</sup>	10 <sup>3</sup>	5 <sup>4</sup>
<b>Near/Mid-Term Overall Capability</b>	5	10	10	10
<b>Far-Term Overall Capability</b>	5	10	10	10

	<b>FAA Measure</b>	<b>Scale</b>
M1	Troops have been trained to recognize abnormal events in the indigenous population?	10: Complete capability 5: Partial capability 0: No capability
M2	Procedures exist to gather and monitor available indigenous population information from local sources and organizations?	10: Complete capability 5: Partial capability 0: No capability
M3	Medical personnel have been trained to recognize the early indicators of a CBRN/TIM attack in the indigenous population?	10: Complete capability 5: Partial capability 0: No capability
M4	There is effective DOTLPF in place to conduct task?	10: DOTLPF exists and is adequate for this task. Task can be effectively performed with minor limitations with little or no direct impact upon operation 5: Most critical aspects of DOTLPF for this task are addressed; task can be performed with limitations requiring work-arounds 0: DOTLPF is inadequate or does not exist for this task; task can not be effectively accomplished

<sup>1</sup>Nonmedical personnel (e.g., military patrols) have been trained to recognize abnormal events or indicators of abnormal activity in the indigenous population. However, they typically have limited CBRN-awareness training. According to JP 3-40, locating, characterizing, and tracking indicators and incidents of actual proliferation, employment, and/or use of WMD is required for joint force counterproliferation operations, and this capability is required restoration operations as well. While CJCSM 3113.01a provides guidance concerning general TEP considerations that can be modified to include restoration operation considerations, there is no definitive guidance for executing theater engagement restoration operation activities at this level. Training of restoration operation country assistance teams is not conducted as part of joint training. All Standing Joint Task Forces are proficient at restoration operation TEP. Inclusion or restoration operation TEP is standard in all pertinent schools/courses.

<sup>2</sup>Procedures do exist to gather and monitor available indigenous population information from local sources and organizations. However, these liaisons must establish relationships with these organizations to solicit the appropriate information, which requires an adequate communications infrastructure. This infrastructure does not exist in all cases.

<sup>3</sup>In the course of routine medical procedure, medical units conduct medical surveillance to determine whether biological warfare attacks have taken place. They also support all types of restoration operations by tracking the biological reactions to substances in the environment whether endemic or induced. Medical personnel review medical intelligence data and report observations via disease reports and after action reports.

<sup>4</sup>Most critical aspects of DOTLPF for this task are addressed. There are deficiencies related to gathering, identifying, interpreting and disseminating (reporting) medically relevant intelligence information.

### 5.14.3 Functional Solution Analysis

#### 5.14.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, that deficiency is then reassessed in the IMAs section.

1. **Deficiency:** Nonmedical personnel have limited CBRN awareness training.  
**Non-Materiel Solutions:** *Leadership:* Inclusion of Joint Professional Military Education (JPME) leader-learning areas for biological warfare considerations of medical surveillance.
2. **Deficiency:** Lack of definitive guidance for executing theater engagement restoration operation activities.  
**Non-Materiel Solutions:** *Training:* Integration of tactics, techniques, and procedures (TTP) for testing a Joint Task Force (JTF) Headquarters' ability to correctly correlate medical and BW information into training center plans as plans are made for the establishment of a Joint National Training Center (Quadrennial Defense Review Report—September 2001).

#### 5.14.3.2 IMA Assessment Summary

N/A

## **5.15 Task TASENS 15: Sense the tactical deployment of CBRN weapons on the battlefield**

### **5.15.1 Functional Area Analysis**

#### **5.15.1.1 Definition**

To obtain tactical information and data from all sources that determine when a threat force is preparing to conduct or is conducting a tactical deployment of CBRN/TIM weapons. Includes information on civil and military plans related to deployment, training conducted by military forces and civilians, and the overall CBRN/TIM defensive preparedness of threat forces.

#### **5.15.1.2 Derivation**

*UJTL TA 7, UJTL TA 7.1, Protection Joint Functional Concept.*

##### **5.15.1.2.1 Supported Task: OPSSENS 2**

##### **5.15.1.2.2 Lateral Task: N/A**

##### **5.15.1.2.3 Supporting Task: N/A**

#### **5.15.1.3 Condition**

Perform this task under conditions of:

##### **Physical. NA**

##### **Military**

1. Minimal time available (C2.1.5)
2. Negligible to marginal intelligence database (C2.4.2)
3. Negligible to difficult theater intelligence access (C2.4.4)
4. Little or no certitude of data (C2.4.6)
5. Nuclear, chemical, and biological threat form. (C2.9.2)

##### **Civil**

1. Negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)
3. No international organization support. (C3.1.2.5)

## **5.15.2 Functional Needs Analysis**

### **5.15.2.1 Capability and Deficiency Assessment Summary**

Table 5.15-1 discusses the capability of intelligence gathering and specialized detection systems to perform the task to the designated standards. There is no single capability that can independently perform the task. Different intelligence-gathering methods (e.g., imagery intelligence [IMINT] and communication intelligence [COMINT]) may be used in collaboration with specialized detection systems (e.g., Swept Frequency Acoustic Interferometry detector) to detect and identify tactical deployment of CBRN weapons on the battlefield.

#### **Current Capability and Deficiency**

The overall current capability is assessed as “yellow.” Currently, detection and identification of deployment is typically presumptive (indicators suggest, but do not confirm, deployment) and not in near-real time (analysis of intelligence is required and is frequently performed by personnel).

#### **Projected Near/Mid-Term Capability and Deficiency**

The overall projected near/mid-term capability is assessed as “yellow.” The fielding of the Joint Warning and Reporting Network (JWARN) should eliminate some deficiencies, such as the current inability to provide CBRN weapons deployment warnings to forces in near-real time. However, in the future, detection and identification of deployment will likely remain presumptive, and it will not likely occur in near-real time (due to analysis time).

#### **Projected Far-Term Capability and Deficiency**

No changes in capability are projected in the far term for this task, so the overall projected far-term capability will remain “yellow.”

**Table 5.15-1. TASENS 15: Capability and Deficiency Assessment**

M5	All data are correlated in near-real time?	10: Complete capability 5: Partial capability 0: No capability
M6	CBRN weapons deployment warning to forces is provided in near-real time?	10: Complete capability 5: Partial capability 0: No capability
M7	There is effective DOTLPF in place to conduct task?	10: DOTLPF exists and is adequate for this task. Task can be effectively performed with minor limitations with little or no direct impact upon operations 5: Most critical aspects of DOTLPF for this task are addressed; task can be performed with limitations requiring work-arounds 0: DOTLPF is inadequate or does not exist for this task; task can not be effectively accomplished

<sup>1</sup>Detection of CBRN weapon/unit deployment is primarily based on the gathering and analysis of intelligence (signals intelligence, IMINT, measurement and signature intelligence, and human intelligence) which suggests CBRN weapon/unit deployment. Intelligence could be obtained through COMINT and/or IMINT. Imagery could be obtained through UAV photography or IR imaging.

<sup>2</sup>Since detection is primarily based on intelligence, it would not likely occur in near-real time. Indicators of deployment must be detected, and compiled data must be analyzed before deployment can be concluded. Detection of CBRN weapon/unit deployment generally takes hours, days, if not weeks. Nevertheless, it is possible that unequivocal evidence of deployment could be obtained during deployment, which may lead to near-real time detection of deployment.

<sup>3</sup>Identification of deployed CBRN weapons/units is mainly based on visual recognition of the munitions, ancillary equipment (e.g., decontamination teams), and/or individual protective equipment (IPE). Classification is actually more likely. Presumptive identification of deployed chemical weapons can be achieved nonintrusively through the use of the Swept Frequency Acoustic Interferometry (SFAI) detector (a handheld, nonintrusive instrument) that can rapidly (~20 seconds) identify CW agents within proximal munitions, railcars, ton containers. Portable isotopic neutron spectroscopy (PINS) can also nonintrusively identify CW agents; however, the equipment is much larger and identification takes ~1000 seconds. Biological weapon identification or classification may be achieved through recognition of the munitions or munitions markings. Radiological and nuclear weapons/units may be identified (and possibly confirmed) by radiation signature intelligence.

<sup>4</sup>Identification is not likely to occur in near-real time. Ostensibly, presumptive identification can be achieved through IMINT once weapons/units have been located and if the munitions can be immediately identified. Nevertheless, classification of deployed weapons/units is more likely, though, it too will not likely occur in near-real time. Indicators of a deployed CBRN weapon/unit through equipment and associated activities must be recognized and analyzed before identification or classification can occur. Analysis may not even fall under tactical operations. Though the Swept Frequency Acoustic Interferometry detector

can identify CW agents in near-real-time (~20 seconds), it must be positioned next to the container of interest. The time it takes to position the detector must be considered.

<sup>5</sup> Data is not typically correlated in near-real time. Though theoretically computer data correlation could occur in near-real time, analysis depends on a variety of factors. Even after a sufficient amount of data has been collected, it must be processed, which generally involves human analysis. Human analysis can take hours, days, even weeks.

<sup>6</sup> Currently warnings are not usually provided to all forces in near-real time.

<sup>7</sup> Additional training and personnel are required to conduct task.

<sup>8</sup> Detection of CBRN weapon/unit deployment will still generally take hours, days, if not weeks.

<sup>9</sup> In the near future computer data correlation might occur in near-real time. If data correlation includes human analysis, this will take hours, days, even weeks.

<sup>10</sup> JWARN will provide near-real-time dissemination of CBRN weapons deployment warnings to forces.

### 5.15.3 Functional Solution Analysis

#### 5.15.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, that deficiency is then reassessed in the IMAs section.

1. **Deficiency:** Lack of near-real time, confirmatory detection of CBRN weapon deployment.  
**Non-Materiel Solutions:** *Training:* Additional training of personnel in recognizing and analyzing indicators of CBRN weapons may decrease detection time, though it will not likely provide confirmatory detection. *Personnel:* Increasing the number of reconnaissance or intelligence personnel may decrease detection time, though it will not likely provide confirmatory detection
2. **Deficiency:** Lack of near-real-time confirmatory identification of deployed CBRN weapons.  
**Non-Materiel Solutions:** *Training:* Additional training of personnel in classifying and identifying CBRN weapons and their indicators may decrease identification time, though it will not likely provide confirmatory identification. *Personnel:* Increasing the number of reconnaissance or intelligence personnel may decrease identification time, though it will not likely provide confirmatory identification.

#### 5.15.3.2 IMA Assessment Summary

N/A

## **5.16 Task TASENS 16: Sense the employment of tactical CBRN weapons on the battlefield**

### **5.16.1 Functional Area Analysis**

#### **5.16.1.1 Definition**

To obtain information and data from all sources that determine when a military force or transnational organization is preparing to or is employing CBRN/TIM weapons on the battlefield. Areas of interest include when the weapons will be employed, joint operations area targets selected, weapons systems involved, locations of weapons systems, and forces/personnel involved in the employment. Extracts information from the medical, operational, intelligence, and environmental communities to identify potential biological warfare activities.

#### **5.16.1.2 Derivation**

*UJTL TA 7, UJTL TA 7.1, Protection Joint Functional Concept.*

##### **5.16.1.2.1 Supported Task: OPSENS 3**

##### **5.16.1.2.2 Lateral Task: N/A**

##### **5.16.1.2.3 Supporting Task: N/A**

#### **5.16.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Atmospheric CBRN effects (C1.3.3)

##### **Military**

1. Stressful mission. (C2.1)
2. No mission preparation. (C2.1.3)
3. Negligible personnel experience. (C2.2.4.5)
4. Conventional and terrorist threat form. (C2.9.2)

##### **Civil**

1. Negative foreign government support. (C3.1.2.3)

### **5.16.2 Functional Needs Analysis**

#### **5.16.2.1 Capability and Deficiency Assessment Summary**

Table 5.16-1 discusses the capability of intelligence gathering systems to perform the task to the designated standards. There is no single capability that can independently perform the task. Different intelligence gathering methods (e.g., IMINT and COMINT) may be collaboratively used to detect and identify tactical employment of CBRN weapons on the battlefield.

**Current Capability and Deficiency**

The overall current capability is assessed as “red.” Currently, detection and identification of CBRN weapon employment depends on timely collection and analysis of pertinent information. Findings are typically presumptive (indicators suggest, but do not confirm, deployment) and not provided in near-real time (analysis of intelligence is required and is frequently performed by personnel). In the near future, findings will likely remain presumptive and not be provided in near-real time.

**Projected Near/Mid-Term Capability and Deficiency**

No changes in capability are projected in the near/mid term for this task, so the overall projected near/mid-term capability will remain “red.”

**Projected Far-Term Capability and Deficiency**

No changes in capability are projected in the far term for this task, so the overall projected far-term capability will remain “red.”

**Table 5.16-1. TASENS 16: Capability and Deficiency Assessment**

<b>Intelligence Gathering</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>
<b>Current Overall Capability</b>	5 <sup>1</sup>	0 <sup>2</sup>	0 <sup>3</sup>	0 <sup>4</sup>	5 <sup>5</sup>
<b>Near/Mid-Term Overall Capability</b>	5	0	0	0	5
<b>Far-Term Overall Capability</b>	5	0	0	0	5

	<b>FAA Measure</b>	<b>Scale</b>
M1	CBRN attacks can be detected.	10: Complete capability 5: Partial capability 0: No capability
M2	CBRN attacks can be identified.	10: Complete capability 5: Partial capability 0: No capability
M3	Unambiguous attack warning can be provided in near-real time.	10: Complete capability 5: Partial capability 0: No capability
M4	Accurate attack assessments can be provided in near-real time.	10: Complete capability 5: Partial capability 0: No capability
M5	There is effective DOTLPF in place to conduct task.	10: DOTLPF exists and is adequate for this task. Task can be effectively performed with minor limitations with little or no direct impact upon operations 5: Most critical aspects of DOTLPF for this task are addressed; task can be performed with limitations requiring work-arounds 0: DOTLPF is inadequate or does not exist for this task; task cannot be effectively accomplished

<sup>1</sup> Detection of CBRN weapon/unit attacks is primarily based on the gathering and analysis of intelligence which suggests CBRN weapon/unit employment. COMINT may intercept a command for a CBRN attack, or IMINT may identify final preparations typically made before an attack. Pertinent and credible information must be collected and analyzed for detection to be achieved. Data collection methods and analysis capabilities for tactical commands are limited.

<sup>2</sup> Identification of a CBRN attack is more difficult than detecting it. For example, the presence of RADIACs may indicate that the weapon is radiological or nuclear. IPE may indicate the type of attack, though the choice of IPE suggests only a particular type of attack, as it may be simply improvised. Classification is more likely than identification. Classification and identification are primarily based on the gathering and analysis of intelligence which suggests employment of a particular CBRN agent or class of agents. Identifying the attack will likely require nontactical intelligence about the capabilities and intentions of the enemy. Like detection, identification or classification requires the capability to collect and analyze pertinent information. This capability is probably less developed than the detection capability.

<sup>3</sup> Unambiguous attack warnings are unlikely to be provided in near-real time since data analysis by human(s) is typically involved before issuance of a warning. Furthermore, these warnings would be presumptive, not confirmatory, since, in most cases, they will be based on indicators which suggest a particular attack.

<sup>4</sup> Attack assessments are based on the processing of gathered intelligence. The accuracy of the assessment is based on the credibility of the gathered data and aptitude of the processor. Accurate attack assessments are unlikely to be provided in near-real time since proper analysis typically requires a considerable amount of time.

<sup>5</sup> Additional training and personnel are required to conduct task.

### 5.16.3 Functional Solution Analysis

#### 5.16.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, that deficiency is then reassessed in the IMAs section.

1. **Deficiency:** Lack of near-real-time confirmatory detection of CBRN weapon employment.  
**Non-Materiel Solutions:** *Training:* Additional training of personnel in recognizing and analyzing indicators of CBRN weapons may decrease detection time, though it will not likely provide confirmatory detection. *Personnel:* Increasing the number of reconnaissance or intelligence personnel may decrease detection time, though it will not likely provide confirmatory detection.
2. **Deficiency:** Lack of near-real-time confirmatory identification of employed CBRN weapons.  
**Non-Materiel Solutions:** *Training:* Additional training of personnel in classifying and identifying CBRN weapons and their indicators may decrease identification time, though it will not likely provide confirmatory identification. *Personnel:* Increasing the number of reconnaissance or intelligence personnel may decrease identification time, though it will not likely provide confirmatory identification.

#### 5.16.3.2 IMA Assessment Summary

Satellite imagery and area monitoring capabilities are in development and may prove useful in determining whether a CBRN attack has taken place.

**5.17 Task TASENS 17: Verify completeness of decontamination operations****5.17.1 Functional Area Analysis****5.17.1.1 Definition**

To confirm completeness of decontamination operations by sensing the presence or absence of remaining CBRN/TIM hazards on humans, MWAs, and surfaces, as well as in water, following decontamination. Involves sensing low-level CBRN/TIM hazards to ensure completion of thorough decontamination operations.

**5.17.1.2 Derivation**

*UJTL TA 7, UJTL TA 7.1, Protection Joint Functional Concept.*

**5.17.1.2.3 Supporting Task:** N/A

**5.17.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Mountainous, desert, jungle, and arctic terrain. (C1.1.1)
2. Significant urbanization. (C1.1.3.1)
3. Tropical, arctic, and arid climates. (C1.3.1)
4. Summer, winter seasons. (C1.3.1.1)
5. Stormy weather. (C1.3.1.3)
6. Hot, very cold air temperature. (C1.3.1.3.1)
7. High surface-wind velocity. (C1.3.1.3.3)
8. High/low relative humidity. (C1.3.1.3.5)
9. Liquid, freezing, and frozen precipitation. (C1.3.1.3.6.1)
10. Heavy precipitation intensity. (C1.3.1.3.6.2)
11. Extreme turbulence and wind shear. (C1.3.1.3.8)
12. Negligible light. (C1.3.2.1)

**Military**

1. Stressful mission. (C2.1)
2. Location—ashore, afloat, airborne. (C2.1.4.1)
3. Minimal time available. (C2.1.5)
4. Low personnel capability. (C2.2.4)
5. Poor personnel morale. (C2.2.4.4)

6. Negligible personnel experience. (C2.2.4.5)

### **Civil**

1. Limited or no host nation support. (C2.8.5)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)
3. Ambiguous threat existence. (C2.9.3)
4. High mission priority. (C3.1.3.2)

## **5.17.2 Functional Needs Analysis**

### **5.17.2.1 Capability and Deficiency Assessment Summary**

Table 5.17-1 discusses the capability of detection, identification, and quantification systems to verify completeness of decontamination operations. Though it is possible that a single capability could be used to confirm decontamination thoroughness for each of chemical radiological/nuclear contamination (sensitive mass spectrometers for chemical and a sensitive multiradiation RADIAC for radiological/nuclear), there is no single capability for all biological contamination. Furthermore, one or more separate detectors may be used to substantiate findings.

### **Current Capability and Deficiency**

The overall current capability is assessed as “yellow.” Though there are capabilities to detect, identify, and quantify CBRN agents on surfaces, personnel, MWAs, and in water, there are multiple deficiencies. Most detectors, especially chemical and possibly biological as well, do not detect low-level contamination. The lack of efficient and reliable sampling techniques contributes to this deficiency. In addition, many detectors, particularly chemical detectors, are susceptible to chemical interference, which may result in false positives and negatives. The completeness of chemical and biological decontamination cannot be confirmed in near-real time. Also, the inability to detect low-level residual contamination on and in airlift aircraft and their cargo is a significant deficiency, due to global nature of airlift operations. Finally, there is little or no doctrine on when thorough decontamination is complete.

### **Projected Near/Mid-Term Capability and Deficiency**

The overall projected near/mid-term capability is assessed as “yellow.” The deployment of JCBAWM and JBAIDS is expected to reduce deficiencies in low-level chemical and biological contamination detection. Furthermore, the question “How clean is clean?” is expected to be answered in a thorough study to be released in the near/mid term. However, in the near future, reliable sampling techniques are still expected to be lacking, chemical detectors will remain susceptible to interference, and verifying completeness of decontamination operations will still not occur in near-real time.

**Projected Far-Term Capability and Deficiency**

The overall projected far-term capability is assessed as “yellow.” The deployment of JMCBDS may reduce deficiencies in low-level chemical and biological contamination detection. However, in the far-term future, reliable sampling techniques are still expected to be lacking, chemical detectors will remain susceptible to interference, and verifying completeness of decontamination operations will still not occur in near-real time.

**Table 5.17-1. TASENS 17: Capability and Deficiency Assessment**

Detection, Identification, and Quantification Systems	M1	M2	M3	M4	M5
<b>Current Overall Capability</b>	3 <sup>1</sup>	5 <sup>2</sup>	5 <sup>3</sup>	5 <sup>4</sup>	5 <sup>5</sup>
<b>Near/Mid-Term Overall Capability</b>	5 <sup>6</sup>	5 <sup>7</sup>	5 <sup>8</sup>	5 <sup>9</sup>	10 <sup>10</sup>
<b>Far-Term Overall Capability</b>	5 <sup>11</sup>	5 <sup>12</sup>	5 <sup>13</sup>	5 <sup>14</sup>	10

	FAA Measure	Scale
M1	Residual CBRN hazards can be detected at low-effect levels?	10: Complete capability 5: Partial capability 0: No capability
M2	Residual CBRN hazards can be identified?	10: Complete capability 5: Partial capability 0: No capability
M3	Residual CBRN hazards can be quantified?	10: Complete capability 5: Partial capability 0: No capability
M4	Residual CBRN hazards can be detected, identified, and/or quantified in near-real time?	10: Complete capability 5: Partial capability 0: No capability
M5	There is effective DOTLPF in place to conduct task?	10: DOTLPF exists and is adequate for this task. Task can be effectively performed with minor limitations with little or no direct impact upon operations 5: Most critical aspects of DOTLPF for this task are addressed 0: DOTLPF is inadequate or does not exist for this task; task cannot be effectively accomplished

<sup>1</sup> **Chemical hazards:** Most detectors cannot detect CWA at low levels (e.g., at Military air guideline, 1–14 days), which is required to verify thorough decontamination. MSs (e.g., Viking SpectraTrak, HAPSITE) can detect low levels, but efficient, reliable sampling is difficult. M8 and M9 paper can be used to detect liquid agent on surfaces. The M256A1 kit is a sensitive detection system used before demasking and thus may be used to verify decontamination completeness. MSs and M272 kit can detect chemical hazards in water. Adsorbed and absorbed chemical agents are extremely difficult to detect. Detection of agent vapor alone is insufficient in determining whether a surface is a potential contact hazard. Most detectors are susceptible to interference (false positives and negatives).

**Biological hazards:** Biological agents are extremely potent and for decontamination to be verified there must be an ability to detect very small amounts of agent. HHAs can detect most BWAs. There are not currently HHAs for all BWAs (particularly all viral-hemorrhagic fever agents), and there are few or no HHAs for TIBs. In addition, sampling is not sufficiently efficient or reliable. Ostensibly, all BWAs and TIBs can be detected at low levels by ELISA if an antigen or antibody for that hazard has been identified and replicated. PCR is even more sensitive than ELISA; however, it can detect nucleic acids only. Culturing and ELISA are typically the gold standards for pathogens and toxins, respectively. Sampling is a problem for these capabilities as well.

**Radiological and Nuclear hazards:** RADIACs can be extremely sensitive, and for the most part, low-level contamination can be detected (with the exception of contamination in water since water considerably attenuates the emitted radiation. Alpha-emitting contaminants are of primary concern since alpha particles have short ranges and are easily shielded. Most RADIACs detect beta/gamma radiation, but not alpha radiation.

<sup>2</sup> **Chemical hazards:** Detected residual chemical hazards are typically classified by detectors, though mass spectrometers can identify the specific agent.

**Biological hazards:** Most detection systems are highly specific for a particular agent; therefore, identification can usually be achieved.

Radiological and nuclear hazards: RADIACs identify the type of radiation detected, but not the specific radioisotope. For gamma emitters, a gamma spectroscopy system can identify the radioisotope.

<sup>3</sup> Chemical hazards: At low levels, only MSs are able to quantify agent (in ppm or ppb). Sampling is insufficiently efficient and reliable.

Biological hazards: HHAs provide only a generic indication of the hazard through the use of a reader. RT-PCR can provide a generic quantification capability as well. Some varieties of ELISA can absolutely quantify the antigen or antibody concentration. Sampling is insufficiently efficient and reliable.

Radiological and nuclear hazards: RADIACs quantify the amount of radiation being emitted from the contamination, not the amount of radioactive material.

<sup>4</sup> Chemical hazards: MSs take approximately 10 minutes to detect, identify, and quantify agent.

Biological hazards: HHAs take up to 15 minutes to detect, identify, and generically quantify agent. RAPID RT-PCR requires up to 30 minutes (following sample collection and preparation) to detect, identify, and generically quantify agent. ELISA requires 1–2 hours (following sample collection and preparation) for detection, identification, and if applicable, quantification, primarily because of incubation time.

Radiological and nuclear hazards: RADIACs and gamma spectrometers generally can detect, identify (if applicable), and quantify in near-real time.

<sup>5</sup> Doctrine exists for when decontamination is required. It is typically based on the amount of contamination, which is expected to incapacitate a certain percentage of personnel (FM 3-5); though, in some cases, it is an actual contamination density. There is little to no doctrine on when decontamination is complete. Currently it is operationally, not scientifically driven, since the question “How clean is clean?” has not yet been answered.

<sup>6</sup> Chemical hazards: JCBAWM will detect low-level hazards in water. MSs (e.g., Viking SpectraTrak, HAPSITE) will continue as capabilities to detect low levels, but efficient, reliable sampling will continue to be an issue. Nevertheless, many detectors will not be able to detect CWA at low levels (e.g., at Military air guideline, 1–14 days), which is required in order to verify thorough decontamination. Many detectors will detect few or no TICs at any level. Adsorbed and absorbed chemical agents will remain extremely difficult to detect. Most detectors will still be susceptible to interference (false positives and negatives).

Biological hazards: JBAIDS is expected to detect all low-level BWA hazards in water, and on surfaces, personnel, and MWAs. JBAIDS is not expected to detect any TIBs. Some TIBs may be detectable by particular HHAs. JCBAWM is expected to detect low-level biological hazards in water. Sampling will likely remain an issue.

Radiological and nuclear hazards: RADIACs will continue to be sensitive, and thus, for the most part, low-level contamination will be detected. More ADM-300s (which detect most forms of radiation) are likely to be deployed. Alpha-emitting contaminants will remain a concern since alpha particles have short ranges and are easily shielded. Many RADIACs will detect beta/gamma radiation, but not alpha radiation.

<sup>7</sup> Chemical hazards: JCBAWM is expected to identify the chemical hazard. Mass spectrometers will continue to be hazard-identifying capabilities.

Biological hazards: JBAIDS is expected to identify all detected agents. Since HHAs, PCR, and ELISA are highly specific for a particular agent, they will continue to identify the detected agent.

Radiological and nuclear hazards: RADIACs will continue to identify the type of radiation detected, but not the specific radioisotope. Thus, most detectors will not be able to identify the radioisotope. For gamma emitters, gamma spectroscopy systems will remain radioisotope-identifying capabilities.

<sup>8</sup> Chemical hazards: JCBAWM is expected to quantify low-level CWA/TIC hazards in water. Mass spectrometers will continue as capabilities to quantify CWA/TIC agent at ppm and ppb levels. Sampling will likely remain an issue.

Biological hazards: JBAIDS and JCBAWM are expected to quantify all detected agents in a sample. Sampling will likely remain an issue.

Radiological and nuclear hazards: RADIACs will continue as capabilities to quantify radiation being emitted from the contamination. In general, the amount of radiation, not the amount of radioactive material will be quantifiable.

<sup>9</sup> Chemical hazards: JCBAWM is expected to detect, identify, and quantify chemical hazards within 10 minutes.

Biological hazards: JBAIDS is expected to detect, identify, and quantify BWA hazards within 25–40 minutes. JCBAWM is expected to detect, identify, and quantify biological hazards within 10 minutes.

Radiological and nuclear hazards: RADIACs and gamma spectrometers are expected to generally detect, identify (if applicable), and quantify in near-real time.

<sup>10</sup> The question “How clean is clean?” is expected to be answered in the near/mid term. Once answered, it is predicted that doctrine will change accordingly. Doctrine will then be scientifically, not operationally, driven.

<sup>11</sup> Chemical hazards: JCBAWM will detect low-level hazards in water. JMCBDS may be able to detect low-level hazards on surfaces, personnel, and MWAs.

MSs (e.g., Viking SpectraTrak, HAPSITE) will continue as capabilities to detect low levels, but efficient, reliable sampling will continue to be an issue. Nevertheless, many detectors will not be able to detect CWA at low levels (e.g., at Military air guideline, 1–14 days), which is required to verify thorough decontamination. Many detectors will detect few or no TICs at any level. Adsorbed and absorbed chemical agents will remain extremely difficult to detect. Most detectors will still be susceptible to interference (false positives and negatives).

Biological hazards: JBAIDS is expected to detect all low-level BWA hazards in water, and on surfaces, personnel, and MWAs. JBAIDS is not expected to detect any TIBs. Some TIBs may be detectable by ELISA, PCR, and particular HHAs. JCBAWM is expected to detect low-level biological hazards in water. Sampling will likely remain an issue.

Radiological and nuclear hazards: RADIACs will continue to be sensitive, and thus, for the most part, low-level contamination will be detected. More ADM-300s (which detect most forms of radiation) are likely to be deployed. Alpha-emitting contaminants will remain a concern since alpha particles have short ranges and are easily shielded. Many RADIACs will detect beta/gamma radiation, but not alpha radiation.

<sup>12</sup> Chemical hazards: JCBAWM and JMCBDS are expected to identify the chemical hazard. Mass spectrometers will continue to be hazard-identifying capabilities.

Biological hazards: JBAIDS is expected to identify all detected agents. Since HHAs, PCR, and ELISA are highly specific for a particular agent, they will remain capabilities to identify detected agents.

Radiological and nuclear hazards: RADIACs will continue to identify the type of radiation detected, but not the specific radioisotope. Thus, most detectors will not be able to identify the radioisotope. For gamma emitters, gamma spectroscopy systems will remain radioisotope-identifying capabilities.

<sup>13</sup> Chemical hazards: JCBAWM is expected to quantify low-level CWA/TIC hazards in water. JMCBDS may be able to quantify low-level hazards on surfaces, personnel, and MWAs. Mass spectrometers will continue as capabilities to quantify CWA/TIC agent at ppm and ppb levels. Sampling will likely remain an issue.

Biological hazards: JBAIDS and JCBAWM are expected to quantify all detected agent in a sample. Sampling will likely remain an issue.

Radiological and nuclear hazards: RADIACs will continue as capabilities to quantify radiation being emitted from the contamination. In general, the amount of radiation, not the amount of radioactive material will be quantifiable.

<sup>14</sup> Chemical hazards: JMCBDS is expected to detect, identify, and quantify chemical hazards within 2 minutes. JCBAWM is expected to detect, identify, and quantify chemical hazards within 10 minutes.

Biological hazards: JBAIDS is expected to detect, identify, and quantify BWA hazards within 25–40 minutes. JCBAWM is expected to detect, identify, and quantify biological hazards within 10 minutes.

Radiological and nuclear hazards: RADIACs and gamma spectrometers are expected to generally detect, identify (if applicable), and quantify in near-real time.

### 5.17.3 Functional Solution Analysis

#### 5.17.3.1 DOTLPF Assessment Summary

This section states the deficiencies and suggests potential non-materiel solutions. If there are no solutions or there are only partial solutions for a particular deficiency, that deficiency is then reassessed in the IMAs section.

1. **Deficiency:** Inability of most chemical detectors to detect low-level contamination.  
**Non-Materiel Solutions:** None
2. **Deficiency:** Susceptibility of most chemical detectors to chemical interference.  
**Non-Materiel Solutions:** None
3. **Deficiency:** Inability to detect absorbed and adsorbed chemical agents.  
**Non-Materiel Solutions:** None
4. **Deficiency:** Efficiency and reliability of chemical sampling insufficient for absolute quantification.  
**Non-Materiel Solutions:** None
5. **Deficiency:** Efficiency and reliability of biological sampling insufficient for absolute quantification.  
**Non-Materiel Solutions:** None
6. **Deficiency:** Detection, identification, and quantification of chemical hazards not in real time or near-real time.  
**Non-Materiel Solutions:** None
7. **Deficiency:** Detection, identification, and quantification of biological hazards not in real time or near-real time.  
**Non-Materiel Solutions:** None
8. **Deficiency:** Limited ability to detect alpha-emitting radiological contamination.  
**Non-Materiel Solutions:** None
9. **Deficiency:** Inability of most RADIACs to detect alpha radiation.  
**Non-Materiel Solutions:** None
10. **Deficiency:** Inability of most RADIACs to detect neutron radiation.  
**Non-Materiel Solutions:** None
11. **Deficiency:** Lack of doctrine on when decontamination is complete.  
**Non-Materiel Solutions:** *Doctrine:* Develop scientifically based decontamination standards that account for low-level effects of contamination.

### **5.17.3.2 IMA Assessment Summary**

Table 5.17-2 identifies 14 ideas for materiel approaches that, if developed, may reduce or eliminate the deficiencies associated with verifying completeness of decontamination operations. Advances in a single technology cannot address all identified deficiencies.

Table 5.17-2. TASENS 17: IMA Assessment

TASENS 17. Verify completeness of decontamination operations <sup>1</sup>															
Identified Gap \ Idea for Materiel Approach (IMA)	Mass Spectrometry <sup>2</sup>	IR, UV, and Microwave Spectroscopy <sup>3</sup>	Ion Mobility Spectrometry <sup>4</sup>	Chemiluminescence Detection <sup>5</sup>	Surface Acoustic Wave Technology <sup>6</sup>	Multiple, Complementary Technologies (Orthogonal) <sup>7</sup>	Raman Spectroscopy	Flame Photometry <sup>8</sup>	Immunoassay (Antibody-Based) <sup>9</sup>	Genetic (Nucleic Acid-Based) <sup>10</sup>	Tissue-Based	Gas-filled Radiation Detectors <sup>11</sup>	Scintillation Radiation Detectors <sup>12</sup>	Semiconductor Radiation Detectors <sup>13</sup>	
	Inability of most chemical detectors to detect low-level contamination.	X <sup>14</sup>	X				X	X	X						
	Susceptibility of most chemical detectors to chemical interference.	X		X		X	X								
	Inability to detect absorbed and adsorbed chemical agents.														
	Efficiency and reliability of chemical sampling insufficient for absolute quantification.														
	Efficiency and reliability of biological sampling insufficient for absolute quantification.

- <sup>2</sup> Includes GC/MS, LC/MS, Matrix-Assisted Laser Desorption Ionization with Time-of-Flight Mass Spectrometry (MALDI-TOF MS).
- <sup>3</sup> Examples include CO<sub>2</sub> long-wave IR (LWIR) Differential Scattering/Differential Absorption of Light (DISC)/Differential Absorption LIDAR (DIAL), CO<sub>2</sub> conv mid-wave IR (MWIR) DISC/DIAL, solid-state (SS) conv MWIR DISC/DIAL, FTIR, Hyperspectral LWIR, Passive MWIR, SS conv LWIR DISC/DIAL, SS conv short-wave IR (SWIR) – LWIR, SS conv UV-LW IR, Active LWIR Polarization, Active MWIR Polarization, Passive LWIR Polarization, Filtered Forward-Looking IR (FLIR), UV Laser-Induced Fluorescence (LIF)/FTIR, and Microwave (GHz and THz) Spectroscopy.
- <sup>4</sup> May be coupled with GC; External Second Gate, Fourier Transform Ion Mobility Spectrometry approach can improve sensitivity and selectivity.
- <sup>5</sup> For example, PCD.
- <sup>6</sup> May be coupled with GC.
- <sup>7</sup> Examples include SAW/IMS, IMC/SAW/Electrochemical/SCCell (S-CAD), GC/IMS.
- <sup>8</sup> May be coupled with GC or reversed-phase liquid chromatography (RPLC).
- <sup>9</sup> Includes SAW technology.
- <sup>10</sup> Includes PCR and RT-PCR amplification, DNA microchip technology, SAW technology, and DNA-recognition enzymes.
- <sup>11</sup> Includes Geiger-Mueller detectors, proportional gas detectors, and ionization chambers.
- <sup>12</sup> Includes ZnS(Ag), anthracene, trans-stilbene, para-terphenyl, phenyl oxazole, NaI(Tl), CsI(Tl), bismuth germinate (Bi<sub>4</sub>Ge<sub>3</sub>O<sub>12</sub>), barium fluoride (BaF<sub>2</sub>)-based detectors.
- <sup>13</sup> Includes germanium, silicon, cadmium telluride (CdTe), and mercuric iodide (HgI<sub>2</sub>)-based detectors.
- <sup>14</sup> Distributing more Viking SpectraTraks and HAPSITES is a potential solution.
- <sup>15</sup> Classifies, but generally does not identify, agents.

## **CHAPTER 6. STRATEGIC NATIONAL SHAPE TASKS**

## Table of Contents

List of Acronyms .....	ii
6.0 Strategic National Shape .....	1
6.1 Task SNSHA 1: Characterize the global CBRN/TIM threat and situation.....	5
6.2 Task SNSHA 2: Conduct global CBRN/TIM vulnerability analysis.....	10
6.3 Task SNSHA 3: Coordinate international CBRND protocols, standards, and agreements ....	15
6.4 Task SNSHA 4: Coordinate CBRND within the interagency process .....	20
6.5 Task SNSHA 5: Determine joint CBRND capability to meet the global CBRN/TIM situation .....	24
6.6 Task SNSHA 6: Ensure joint CBRND readiness.....	29
6.7 Task SNSHA 7: Coordinate global CBRN information systems and processes .....	36
6.8 Task SNSHA 8: Establish national CBRND strategy, plans, and policy.....	44
6.9 Task SNSHA 9: Coordinate CBRND aspects of global medical operations .....	49
6.10 Task SNSHA 10: Coordinate global CBRND operations.....	53
6.11 Task SNSHA 11: Provide Shape “Global Family of Engagement Plan” policies and guidelines to combatant commanders .....	58
6.12 Task SNSHA 12: Establish global cooperative CBRN/TIM-detection policies, procedures, and networks.....	62
6.13 Task SNSHA 13: Coordinate internationally accepted standards and procedures for determining employment of CBRN/TIM weapons.....	67
6.14 Task SNSHA 14: Sense the exportation of CBRN/TIM weapons or components .....	71

## 6.0 Strategic National Shape

### 6.0.1 Introduction

At the strategic level of war, a nation, often as a member of a group of nations, determines national or multinational (alliance or coalition) security objectives and guidance, and develops and uses national resources to accomplish these objectives. Activities at this level establish national and multinational military objectives; sequence initiatives; define limits and assess risks for the use of military and other instruments of national power; develop global plans or theater war plans to achieve these objectives; and provide military forces and other capabilities in accordance with strategic plans. The strategic national sublevel encompasses U.S. Department of Defense (DoD), service, and interagency tasks. Fourteen Strategic National (SN) Shape (SHA) tasks were identified in the chemical, biological, radiological, and nuclear (CBRN) Functional Area Analysis (FAA).

This chapter, which details the strategic national Shape area, restates relevant information from the CBRN FAA, including a description of each of the 14 SNSHA tasks, derivation of the task, an indication of other linked-tasks, and the pertinent conditions. The Functional Needs Analysis (FNA) section addresses the capability and deficiency analysis, and a brief description of potential near-, mid-, and far-term changes. Once all the capabilities are considered, the assessment concludes with a separate, overarching look at the entire capability spectrum to identify remaining gaps and/or synergies. The Functional Solutions Analysis (FSA) section addresses possible solutions for the deficiencies identified in the FNA and categorizes them into materiel or non-materiel. The non-materiel solutions are addressed first and reflect one or more of the six areas of DOTLPP: doctrine, organization, training, leadership, personnel, and facilities. If there is no non-materiel solution to the deficiencies, then materiel solutions are considered. These encompass broad approaches that are not system-specific. These potential materiel approaches are addressed in the Ideas for Materiel Approaches (IMA) section. The IMAs provide a possible near-, mid-, or far-term resolution to identified deficiencies within the individual capabilities.

Most of the SNSHA tasks involve required capabilities of major staffs or staff sections within DoD. In those areas where a DoD staff or agency needed to interact within the interagency, the task focused on DoD capabilities required to facilitate the interaction.

### 6.0.2 FNA Summary

Table 6.0-1 below summarizes the overall current and projected capability to perform the SNSHA tasks identified in the CBRN FAA. The overall capability to conduct SNSHA tasks in the current time frame is assessed as “yellow.” The Joint Staff Directorate for Command, Control, Communications, and Computer Systems, J-6, leads the C4 community and leads in identifying and resolving military aspects of information-based issues of national importance, to include CBRN Defense (CBRND) Shape issues. Because of documented training, education, and experience issues, however, J-6 personnel may not have a full grasp of what needs to be resolved. As the Chairman of the Joint Chiefs of Staff’s single source of expertise in addressing CBRN defense issues involving the warfighter, the Joint Requirements Office for Chemical,

Biological, Radiological, and Nuclear Defense (JRO-CBRND) must proactively engage the J-6 to determine the adequacy of current and projected global CBRN information systems and processes to allow joint forces to effectively conduct operations in a CBRN environment. There are key deficiencies in DoD's ability provide shared CBRN/toxic industrial material (TIM) situational awareness and understanding to commanders at all levels. As an example, although a National Intelligence Support Team's (NIST) mission is to provide national-level, all-source intelligence support from throughout the intelligence community (IC) to commanders during crisis or contingency operations, there are deficiencies associated with NIST'S ability to characterize the global CBRN/TIM threat and situation. At issue is the task of providing the NIST with current and accurate CBRN/TIM threat intelligence. The recent realignment of the IC under the National Intelligence Director, along with new intelligence analysis techniques that neither overstate or understate adversary CBRN/TIM capabilities, will assist in the process of correcting recently identified deficiencies which prevent timely, current, and reliable actionable CBRN/TIM threat intelligence/information. Other deficient areas include the CBRN/TIM education and experience of the NIST and CBRND experts who are assigned. The pattern of deficiencies of CBRND education, experience, training, exercises, and experimentation holds true for all of the capabilities selected for assessment. Whether the NIST, the National Military Joint Intelligence Center (NMJIC), the CJCS J-3 Operations Directorate, or Joint Director of Military Support (JDOMS), the fundamental capability of the organization/staff is not in question; rather, their ability to fuse CBRND considerations with their basic mission is inadequate. Cooperative linkages between various global systems capabilities, although proposed, have not yet been coordinated. Since no linkages currently exist between various detection technologies (e.g., Biological Integrated Detection System [BIDS], phased-array radars, standoff motion detectors, passive monitors, vehicular-embedded detectors with Global Positioning System [GPS] linkages and automatic position reporting, individual detectors networked to centralized data servers, etc.), no cooperative CBRN/TIM-detection policies are required. It is projected that improvements due to coordination/ doctrine, organization, training, materiel, leadership and education, personnel, and facilities (DOTMLPF) enhancements will dramatically improve DoD's ability to articulate and assess Shape requirements, but the overall status will remain "yellow" due to the long lead time required for training and education to be matched by experience in CBRND issues and the current lack of detection networks.

**Table 6.0-1. Strategic National Shape Summary FNA Findings**

CBRN Strategic National Shape Task Number	CBRN Strategic National Shape Task Title	Capability		
		Current	Near/Mid	Far
SNSHA 1	Characterize the global CBRN/TIM threat and situation.	●	●	●
SNSHA 2	Conduct global CBRN/TIM vulnerability analysis.	●	●	●
SNSHA 3.	Coordinate international CBRND protocols, standards, and agreements.	●	●	●
SNSHA 4	Coordinate CBRND within the interagency process.	●	●	●

SNSHA 5	Determine joint CBRND capability to meet the global CBRN/TIM situation.	●	●	●
SNSHA 6	Ensure joint CBRND readiness.	●	●	●
SNSHA 7	Coordinate global CBRN information systems and processes.	●	●	●

### 6.0.3 FSA Summary

The paragraphs below summarize the assessment of all potential DOTMLPF (non-materiel and materiel) solutions for the capability gaps identified in the FNA section. The materiel approaches focus primarily the need for automated tools to assist analysis and the need for an integrated detection and information network for automated warning and reporting of the CBRN hazard.

#### 6.0.3.1 DOTLPF

The DOTLPF solutions identified in this chapter are associated primarily with staff education and training issues. It is recommended that changes be made to the CJCSI 1800.01B, Officer Military Education Policy. The new CJCSI 1800.01B Officer Military Education Policy is not directive enough to ensure that CBRND considerations are included in the cradle-to-grave educational process of all military personnel. It also does not address education/training for DoD civilians, many of whom staff strategic national-level positions. It is imperative that all non-CBRND subject matter expert (SME) staffs of all agencies that play a role in CBRND Shape issues have a fundamental understanding of key CBRND focus areas required in their functional domains. As CBRND Shape enabling concepts are proposed, they must be developed with the active participation of all DoD and Service staffs and agencies that will play a key role in their

evolution. Concepts must be tested and developed through comprehensive experimentation. Subsequent strategic national-level exercises must include all relevant DoD and interagency players so that Shape/functional and fusion areas are tested and lessons learned captured. As appropriate, tasks identified in the FAA must be incorporated into national-level exercises so expert observers can identify areas that require multi-staff/agency resolution.

#### **6.0.3.2 IMA**

This section summarizes possible material approaches that address the remaining materiel requirements of the DOTMLPF assessment. Development of cooperative linkages between various proponent and service CBRND and CBRN/TIM information, detection, and sensing technologies is required. Concepts must first be developed based on proposed linkages that will provide effective, integrated CBRND and CBRN/TIM detection, warning, and shared situational understanding capabilities. These concepts must be explored through experimentation and then cooperative linkages established and tested. The entire package should be developed as a system and fully integrated into a multiagency Common Operating Picture (COP). As each Service develops detection or sensing technologies, they should be analyzed for inclusion into the CBRN/TIM cooperative detection network, and modifications (if required) should be mandated for the Service systems. Continued work on analysis probability tools and models is required. No automated tools exist for assisting in the conduct of global vulnerability assessments focusing on potential adversary courses of action (COAs). Because of the wide range of options available to potential adversaries, tools must be available that can take as input that which is known, and then model and forecast all potential COAs. Development of automated tools is recommended to more adequately manage CBRN personnel, unit, and materiel, ensuring that these scarce assets are available and fully mission capable when needed.

**6.1 Task SNSHA 1: Characterize the global CBRN/TIM threat and situation****6.1.1 Functional Area Analysis****6.1.1.1 Definition**

To characterize the CBRN/TIM threat and situation for the Chairman of the Joint Chiefs of Staff (CJCS), national defense decision makers, and combatant commanders. Uses Sense data to move from situational awareness<sup>1</sup> as well as shared awareness<sup>2</sup> to shared understanding.<sup>3</sup> Allows military leadership to develop a clear understanding of the current and predicted CBRN/TIM situation in near-real time to inform personnel; provide actual and potential impacts of CBRN/TIM hazards; and envision critical Sense, Shield, and Sustain end states, including preparing for operations and visualizing the sequence of events that moves the force from its current state to those end states. Includes establishing collection priorities and coordination with intelligence agencies to collect information on CBRN/TIM capabilities encompassing such things as adversary intent and objectives, weapons availability and capacity, expected tactics, potential targets, and willingness or historic propensity to employ CBRN/TIM weapons. Also includes compiling and analyzing intelligence information and data provided by intelligence agencies or resources satisfying the global CBRN/TIM threat intelligence collection plan. Provides processed global CBRN/TIM threat intelligence for development of global vulnerability assessments and for an understanding of the current and predicted CBRN/TIM situation. Provides the basis for CBRND tasking of and warning to the combatant commanders and Services. Appropriate collaboration occurs with interagency and international parties. Further encompasses global medical intelligence to be collected in support of CBRN/TIM analysis.

**6.1.1.2 Derivation**

*UJTL (SN 1.1.6, SN 2.2.1, SN 2.4, SN 2.4.1.2, SN 2.5.1, SN 3.3.6, SN 3.4.6, SN 5.1.1, SN 5.1.2, SN 5.7.1, SN 7.5, SN 9, SN 9.1.3), Protection Joint Functional Concept.*

**6.1.1.2.1 Supported Task: N/A****6.1.1.2.2 Lateral Tasks: SSENS 1, SSENS 2, SSENS 3, SSENS 4, SSENS 5, SSENS 6, SSENS 7, SSENS 8, SSENS 9, SSENS 10, SSENS 11, SSENS 12, SSENS 13, SSENS 14, SSENS 16, SSENS 17, SNSHA 2****6.1.1.2.3 Supporting Task: STSHA 1****6.1.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Limited personnel expertise. (C2.2.4.5)

2. Limited modern military systems. (C2.2.5)
3. Marginal or negligible intelligence database. (C2.4.2)
4. Difficult theater intelligence access. (C2.4.4)
5. Little or no certitude of data. (C2.4.6)

**Civil. N/A**

## **6.1.2 Functional Needs Analysis**

### **6.1.2.1 Capability and Deficiency Assessment Summary**

Table 6.1-1 discusses the capability that currently exists to perform the task “Characterize the global CBRN/TIM threat and situation.” There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

NIST’s mission is to provide national-level, all-source intelligence support from throughout the IC to deployed commanders during crisis or contingency operations. The Joint staff J-2 is the NIST program’s executive agent and has delegated the NIST mission to the Deputy Directorate for Crisis Operations (J-2O). The National Intelligence Support Division (J-2O-1) manages daily operations and interagency coordination for all NISTs. The current ability is assessed as “green” although there are some limitations and deficiencies.

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. No near/mid-term initiatives are expected to improve limitations or deficiencies.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. DOTMLPF to support task should improve if effective experimentation addresses organizational deficiencies and closes knowledge gaps and training and education initiatives address deficiencies identified in this Joint Capabilities Integration and Development System (JCIDS).

---

<sup>1</sup> “Situational awareness is the ability to have accurate and real-time information of friendly, enemy, neutral, and noncombatant locations; a common, relevant picture of the battlefield scaled to specific level of interest and special needs.” (*Operational Requirements Document for Joint Effects Model*)

<sup>2</sup> “Shared awareness is a state that exists in the cognitive domain when two or more entities are able to develop a similar awareness of a situation. The degree of similarity required (or difference tolerable) will depend on the type and degree of collaboration and synchronization needed.” (Understanding Information Age Warfare, p. 26)

<sup>3</sup> Shared understanding is when two or more entities have similar and sufficient levels of knowledge to be able to draw inferences about the possible consequences of the situation, as well as sufficient awareness of the situation to predict future patterns.

<sup>1</sup> Joint intelligence and CBRN/TIM publications do not adequately address this issue. The JRO-CBRND is not adequately staffed and organized to meet its intelligence-related responsibilities. The NIST staff may not be adequately trained/educated in CBRN/TIM issues. CBRND staff officers are not adequately trained/educated in intelligence issues. Experimentation does not provide feedback on intelligence indicators for this task. JPME does not adequately cover the fusion of intelligence/CBRN/TIM issues.

<sup>2</sup> Yes. Multiple national means of collection exist.

<sup>3</sup> Limited. CBRN/TIM threat intelligence depends on factors that may prevent timely and current information.

<sup>4</sup> Limited. CBRN/TIM threat intelligence depends on factors that may prevent reliable information.

<sup>5</sup> Yes. NIST can develop collection plans for CBRN/TIM threats.

<sup>6</sup> Yes. NIST has the means to provide input for theater collection activities.

<sup>7</sup> Yes. All-source intelligence analysis is the process where integration and deconfliction occur.

<sup>8</sup> Yes. NIST can identify medical intelligence information requirements and processes.

<sup>9</sup> Yes. NIST can establish and define medical CBRN/TIM intelligence criteria.

<sup>10</sup> Yes. NIST does have the experience to sufficiently conduct CBRN/TIM threat assessment.

<sup>11</sup> Yes. NIST Chief transmits data through the COLISEUM RFI management system.

<sup>12</sup> Yes. NIST Chief transmits data through the COLISEUM RFI management system.

<sup>13</sup> DOTMLPF to support task should improve if effective experimentation addresses organizational deficiencies and closes knowledge gaps and training and education initiatives address deficiencies identified in this JCIDS.

### 6.1.3 Functional Solution Analysis

#### 6.1.3.1 DOTLPF Assessment Summary.

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA Summary.

1. **Deficiency:** CBRN/TIM threat intelligence is dependent on factors that may prevent timely and current information. At the time of this analysis, CBRN/TIM threat intelligence was dependent on an IC organizational model determined to be flawed by both a congressional investigation and a special presidential commission. Factors such as problems with interagency coordination and planning, clear delineation of lines of authority and responsibility, and organizational effectiveness contributed to the lack of timely and current information.

**Non-Materiel Solutions:** *Organization:* The IC has been realigned and reorganized in concert with recommendations from both the congressional investigation and the special presidential commission. While it is believed that this reorganization will substantially or totally correct the deficiency, it is vital that DoD document and verify the efficacy of the recent changes through lessons learned from training and exercises as well as focused concept experimentation covering all aspects of CBRND battlespace awareness at the strategic level of war.

2. **Deficiency:** CBRN/TIM threat intelligence is dependent on factors that may prevent reliable information. At the time of this analysis, CBRN/TIM threat intelligence was dependent on an IC organizational model determined to be flawed by both a congressional investigation and a special presidential commission. Factors such as problems with interagency coordination and planning, clear delineation of lines of authority and responsibility, and organizational effectiveness contributed to the lack of reliable information.

**Non-Materiel Solutions:** *Organization:* The IC has been realigned and reorganized in concert with recommendations from both the congressional investigation and the special presidential commission. While it is believed that this reorganization will correct the deficiency, it is vital that DoD document and verify the efficacy of the recent changes through lessons learned from training and exercises as well as focused concept experimentation covering all aspects of battlespace awareness at the strategic level of war.

3. **Deficiency:** Joint intelligence and CBRN/TIM publications do not adequately address this issue.

**Non-Materiel Solutions:** *Doctrine:* Joint intelligence and CBRN/TIM publications must be enhanced to adequately address this issue and to interface with each other so that roles and responsibilities are clearly delineated.

4. **Deficiency:** The JRO-CBRND is not adequately staffed and organized to meet its intelligence-related responsibilities.

**Non-Materiel Solutions:** *Organization:* JRO-CBRND should have a staff section dedicated to resolving CBRN intelligence community issues. *Personnel:* JRO-CBRND should have

adequate trained/experienced personnel assigned to man a staff section dedicated to resolving CBRN intelligence community issues.

5. **Deficiency:** The NIST staff is not adequately trained/educated in CBRN/TIM issues.  
**Non-Materiel Solutions:** *Training:* Develop training that will enable the NIST staff to better understand their CBRN/TIM role and enhance their ability to obtain intelligence that is required to support the Shape function of strategic national CBRND. *Leadership:* Develop an education program that will enable the J-2 staff to better understand their CBRN/TIM role and enhance their ability to obtain intelligence that is required to support the Shape function of strategic national CBRND.
6. **Deficiency:** CBRND staff officers are not adequately trained/educated in intelligence issues.  
**Non-Materiel Solutions:** *Training:* Develop training programs that allow CBRN staff officers to better support the CBRN intelligence process. *Leadership:* Develop education programs that allow CBRN staff officers to better understand the CBRN intelligence process and their roles and responsibilities.
7. **Deficiency:** Experimentation/red teaming does not provide feedback on intelligence indicators for this task.  
**Non-Materiel Solutions:** *Training:* JRO-CBRND must work with NIST and/or national intelligence organizations to integrate this task into both intelligence and CBRN experimentation campaign plans.
8. **Deficiency:** Joint Professional Military Education (JPME) does not adequately cover the fusion of intelligence/CBRN/TIM issues.  
**Non-Materiel Solutions:** *Leadership:* Integrate intelligence/CBRN fusion issues into JPME.
9. **Deficiency:** DoD CBRN/TIM experts detailed to the national intelligence organizations and the NIST do not receive adequate preparation, support, or briefing for DoD lessons learned.  
**Non-Materiel Solutions:** *Organization:* Ensure that CBRN organizations that provide DoD detailees to national intelligence organizations are proactive in ensuring their institutional CBRN intelligence needs are both understood and met and that the detailees they provide are prepared in every way. Ensure that CBRN SMEs assigned to the NIST are prepared in every way. *Leadership:* Provide CBRN DoD detailees to national intelligence organizations or those assigned to the NIST with formal educational preparation. *Personnel:* CBRN DoD detailees to national intelligence organizations or those assigned to the NIST must possess adequate skill and experience.

#### 6.1.3.2 IMA Assessment Summary

N/A

**6.2 Task SNSHA 2: Conduct global CBRN/TIM vulnerability analysis****6.2.1 Functional Area Analysis****6.2.1.1 Definition**

To conduct continual global vulnerability assessments focusing on potential adversary's COAs. This global strategic assessment compares regional-based vulnerabilities and risks. Development of a shared understanding of potential adversary's CBRN/TIM COAs and the associated vulnerabilities and risks enables timely and effective preparations for any potential adversary acts. Includes the development of associated risk assessments.

**6.2.1.2 Derivation**

## **6.2.2 Functional Needs Analysis**

### **6.2.2.1 Capability and Deficiency Assessment Summary**

Table 6.2-1 discusses the capability that currently exists to perform the task “Conduct global CBRN/TIM vulnerability analysis.” There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

NMJIC has the ability to conduct global vulnerability assessments focusing on potential adversary COAs. The current capability is assessed as “yellow” as the result of numerous DOTMLPF limitations.

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. No improvements are expected over the near/mid term.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. For the far term, experimentation leading to better coordination efforts, and DOTMLPF will raise the overall capability to “green.” The inability to discern threat CBRN/TIM intent with reliability will continue to be a problem.

Table 6.2-1. SNSHA 2: Capability and Deficiency Assessment

Capability: National Military Joint Intelligence Center	M1	M2	M3	M4	M5	M6	M7	M8	M9
Current Overall Capability <sup>1</sup>	Y <sup>2</sup>	Y <sup>3</sup>	Y <sup>4</sup>	Y <sup>5</sup>	G <sup>6</sup>	Y <sup>7</sup>	Y <sup>8</sup>	Y <sup>9</sup>	Y <sup>10</sup>
Near/Mid-Term Overall Capability	Y	Y	Y	Y	G	Y	Y	Y	Y
Far-Term Overall Capability	G <sup>11</sup>	G	G	G	G	Y	Y	Y	G

	FAA Measure	Scale
M1	Policies and guidelines for conducting global vulnerability analysis are established.	G – Yes, Y – Limited, R – No
M2	Policies and guidelines for conducting global risk assessment are established.	G – Yes, Y – Limited, R – No
M3	Analytical tools used to evaluate plausible adversary COAs are adequate.	G – Yes, Y – Limited, R – No
M4	Vulnerability assessment process exploits time-sensitive or priority actionable CBRN intelligence.	G – Yes, Y – Limited, R – No
M5	Means are available to collaboratively perform assessments.	G – Yes, Y – Limited, R – No
M6	Means exist to visualize the impact of adversary COAs on forces of interest.	G – Yes, Y – Limited, R – No
M7	Operational and analytical/planning staffs have the training and experience to effectively assess adversary CBRN/TIM COAs.	G – Yes, Y – Limited, R – No
M8	Sufficient doctrine and tactics, techniques, and procedures (TTPs) for effective vulnerability assessment are available.	G – Yes, Y – Limited, R – No
M9	Joint exercises/experimentation provides feedback on efficacy of vulnerability analysis doctrine and TTPs.	G – Yes, Y – Limited, R – No

<sup>1</sup> Partial. As a DoD asset, NMJIC has little influence over the CBRN assessments made by other departments and activities. DOTMLPF for generic vulnerability analysis may be adequate, but CBRND integration into the process is inadequate.

<sup>2</sup> Limited. NMJIC has guidelines for conducting global vulnerability analyses; however, the global CBRN vulnerability analysis process is not solely within the purview of DoD.

<sup>3</sup> Limited. NMJIC has guidelines for conducting risk assessments; however, global CBRN risk assessments are not solely within the purview of DoD.

<sup>4</sup> Yes. NMJIC has analytical tools to evaluate plausible adversary COA. The standard military decision making process for evaluating COA's has been considered adequate. But CBRN/TIM integration of the analytical tools may not be adequate.

<sup>5</sup> Partial. NMJIC has an ability to exploit time-sensitive or priority-actionable CBRN/TIM intelligence through netcentric means.

<sup>6</sup> Yes. NMJIC has the means to perform assessments in collaboration with other agencies.

<sup>7</sup> Limited. The accuracy with which NMJIC interprets adversary intent is dependent on intelligence covering many adversary capabilities, including CBRN employment doctrine, release authority, resources, adversary forces, and rules of engagement.

<sup>8</sup> Limited. The NMJIC has the trained operational and analytical/planning staff to effectively assess potential adversary CBRN/TIM COAs. However, the NMJIC may not be able to interpret adversary intent with 100 percent accuracy.

<sup>9</sup> Limited. NMJIC has TTPs for global CBRN/TIM situational awareness. Global CBRN vulnerability assessment tools are available although more extensive automation would be desirable. There are still issues with determining threat CBRN/TIM intent.

<sup>10</sup> Partial. The task of assessing the efficacy of global CBRN vulnerability analysis doctrine and TTPs is a multidisciplinary, multinational matter that surpasses the authority of the DoD NMJIC. This assessment activity may include feedback from joint exercises/experimentation, as well as encompass other activities such as: the Joint Interagency Coordinating Group, other U.S. government departments and agencies, the selection of nongovernmental organizations, foreign military, intelligence and law enforcement assets.

<sup>11</sup> For the far term, experimentation leading to better coordination efforts and DOTMLPF will raise our overall capability to "green." The inability to discern threat CBRN/TIM intent with reliability will continue to be a problem.

### 6.2.3 Functional Solution Analysis

#### 6.2.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA Summary.

- 1. Deficiency:** DoD's global CBRN risk and vulnerability analysis processes are not fully established.  
**Non-Materiel Solutions:** *Organization:* Incorporate NMJIC input into overall IC activities.
- 2. Deficiency:** Cannot routinely validate or prioritize actionable CBRN intelligence in a timely manner.  
**Non-Materiel Solutions:** *Training:* Validity of raw intelligence is a continuing problem. Training for CBRN issues needs to be reinforced.
- 3. Deficiency:** The accuracy with which NMJIC interprets adversary intent is dependent on intelligence covering many adversary capabilities, including CBRN employment doctrine, release authority, resources, adversary forces, and rules of engagement.  
**Non-Materiel Solutions:** *Training:* Ability to interpret adversary intent is a continuing problem. Continued work on analysis probability tools and models—and training—is required. *Leadership:* Ability to interpret adversary intent is a continuing problem. Continued work on analysis probability tools and models—and education—is required.
- 4. Deficiency:** The current compartmentalization of the intelligence community which results in a lack of collaboration during assessments.  
**Non-Materiel Solutions:** *Organization:* As a DoD asset, NMJIC previously had little influence over assessments of other departments and activities of adversary CBRN capability and intent. The recently completed federal review of intelligence capabilities provides a multitude of recommendations and new initiatives that DoD must participate in to rectify this problem.
- 5. Deficiency:** Lack of automated means to conduct global vulnerability assessments that focus on potential adversary COAs.  
**Non-Materiel Solutions:** None.

#### 6.2.3.2 IMA Assessment Summary

Table 6.2-2 shows possible materiel approaches that address the remaining materiel requirements of the DOTMLPF assessment.

**Table 6.2-2. SNSHA 2. IMA Assessment**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Automated Tools	Continued work on analysis probability tools and models is required. No automated tools exist for assisting in the conduct of global vulnerability assessments that focus on potential adversary COAs. Because of the wide range of options available to potential adversaries, tools must be available that can take in what is known and then model and forecast all potential COAs.

**6.3 Task SNSHA 3: Coordinate international CBRND protocols, standards, and agreements****6.3.1 Functional Area Analysis****6.3.1.1 Definition**

To negotiate and coordinate the military aspects of international protocols, standards, and agreements for CBRND with representatives of other nations and regional/international organizations. This task promotes interoperability and integration of CBRND capabilities, including establishing, reviewing, and modifying existing protocols, standards, and agreements when appropriate and necessary. Includes the establishment of interoperability and common procedures and formats for CBRN/TIM hazard alarm, warning, and reporting. Also includes establishment and maintenance of international standards and formats for plotting and predicting CBRN/TIM hazards.

**6.3.1.2 Derivation**

*UJTL (SN 1.1.6, SN 2.2.1, SN 2.4.1.2, SN 2.5.1, SN 3.3.6, SN4.3, SN 5.1.2, SN 5.1.3, SN 9, SN 9.1.3, SN 9.2.2), Protection Joint Functional Concept, Military Transformation: A Strategic Approach, Transformation Planning Guidance.*

**6.3.1.2.1 Supported Task: N/A****6.3.1.2.2 Lateral Tasks: SNSHA 5, SNSHA 8, SNSHLD 1, SNSHLD 2, SNSHLD 3, SNSHLD 4, SNSHLD 5, SNSHLD 6, SNSHLD 7, SNSHLD 8, SNSHLD 9, SNSUST 1, SNSUST 2, SNSUST 4, SNSUST 5****6.3.1.2.3 Supporting Task: N/A****6.3.1.3 Condition**

Perform this task under conditions of:

**Physical. N/A****Military**

1. Restrictive mission instructions. (C2.1.1)
2. No preexisting arrangements. (C2.1.1.2)
3. Limited personnel expertise. (C2.2.4.5)
4. Some or no interoperability. (C2.2.6)
5. Poor multinational integration. (C2.3.1.2)
6. Moderate staff expertise. (C2.3.1.3)

**Civil**

1. Limited foreign government support. (C3.1.2.3)
2. Uncertain international organization support. (C3.1.2.5)

**6.3.2 Functional Needs Analysis****6.3.2.1 Capability and Deficiency Assessment Summary**

Table 6.3-1 discusses three capabilities that currently exist to coordinate international CBRND protocols, standards, and agreements. These are the only capabilities that exist, and no other capabilities are projected that will accomplish this task.

**Current Capability and Deficiency**

American, British, Canadian, and Australian Armies Program (ABCA) and North Atlantic Treaty Organization (NATO) working groups have established mature and beneficial relationships that allow CBRND protocols, standards, and agreements to be coordinated and reviewed. Problems still exist with many of the nations of the world and the various international conventions that have been established. The current assessment is “green” although there are a number of limitations with existing international conventions.

**Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Limited changes/improvements are expected in the international community at large in the near/mid term.

**Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. Limited changes/improvements are expected in the international community at large in the far term. Continual improvements are expected across the board as ABCA/NATO exercises/experimentation efforts provide valuable lessons learned at appropriate levels. U.S. CBRND experimentation efforts at the SN level of war will be applied to ABCA/NATO applications.

**Table 6.3-1. SNSHA 3: Capability and Deficiency Assessment**

Capability/Measure	M1	M2	M3	M4	M5	M6
<b>Current</b>

<b>Current Overall Capability</b>	G	G	G	G	G	Y
<b>Near/Mid-Term Overall Capability</b>	G	G	G	G	G	Y
<b>Far-Term Overall Capability</b>	G	G	G	G	G	G

	FAA Measure	Scale
M1	Required CBRND protocols, standards, and agreements are established.	G – Yes, Y – Limited, R – No
M2	International CBRND standards are current.	G – Yes, Y – Limited, R – No
M3	U.S. and international staffs and agencies are in compliance with existing protocols, standards, and agreements.	G – Yes, Y – Limited, R – No
M4	There is a recurring program to update or maintain currency of international practices, procedures, and formats.	G – Yes, Y – Limited, R – No
M5	CBRND staffs and organizations have the training to effectively assess warning and reporting and hazard prediction models.	G – Yes, Y – Limited, R – No
M6	International exercises/experimentation provide feedback on efficacy of standards and agreements.	G – Yes, Y – Limited, R – No

<sup>1</sup> Limited. A number of efforts have been undertaken by the BTWC/CWC parties to develop and implement universal agreements and policies.

<sup>2</sup> Limited. A number of efforts have been undertaken by the BTWC/CWC parties to develop and implement international standards.

<sup>3</sup> Limited. A number of countries are delaying compliance with protocols and agreements due to frequently changing internal political environment.

<sup>4</sup> Limited. A number of countries are slow in updating and maintaining currency of international practices, procedures and formats due to frequently changing internal political environment.

<sup>5</sup> Yes. Current staff has the training and understanding of basic warning and reporting and hazard prediction modeling.

- 
- <sup>6</sup> Limited. The participation in international exercises/experimentation is voluntary. The efficacy of the feedback is limited to “openness” of participating states.
- <sup>7</sup> Yes. CBRND protocols, standards and agreements are established as Quadripartite Standardization Agreements (QSTAGs).
- <sup>8</sup> Yes. There are Quadripartite Working Groups that meet every two years.
- <sup>9</sup> Yes. The ABCA has a senior officer on duty in Washington, D.C. who regularly reviews the work of the overall program.
- <sup>10</sup> Yes. The ABCA has a senior officer on duty in Washington, D.C. who regularly reviews the work of the overall program.
- <sup>11</sup> Yes. The CBRND staff has the training to assess warning and reporting and hazard prediction models as established by Standardization Agreements (STANAGs) and QSTAGs.
- <sup>12</sup> While there have been many ABCA exercises, an exercise focused exclusively on all aspects of CBRND has not been conducted.
- <sup>13</sup> Yes. CBRND protocols, standards and agreements are established as NATO STANAGs.
- <sup>14</sup> Yes. NATO working groups meet on a regular basis.
- <sup>15</sup> Yes. NATO ensures compliance with appropriate protocols, standards, and agreements.
- <sup>16</sup> Yes. NATO working groups meet on a regular basis.
- <sup>17</sup> Yes. The CBRND staff has the training to assess warning and reporting and hazard prediction models as established by STANAG.
- <sup>18</sup> While there have been many NATO exercises, an exercise focused exclusively on all aspects of CBRND has not been conducted.
- <sup>19</sup> Limited changes/improvements are expected in the near/mid term.
- <sup>20</sup> Limited changes/improvements are expected in the near/mid term.
- <sup>21</sup> Limited changes/improvements are expected in the near/mid term.
- <sup>22</sup> Limited changes/improvements are expected in the international community at large.
- <sup>23</sup> Continual improvements are expected across the board as ABCA exercises/experimentation efforts provide valuable lessons learned at appropriate levels.
- <sup>24</sup> U.S. CBRND experimentation efforts at the SN level of war will be applied to ABCA applications.
- <sup>25</sup> Continual improvements are expected across the board as NATO exercises/experimentation efforts provide valuable lessons learned at appropriate levels.
- <sup>26</sup> U.S. CBRND experimentation efforts at the SN level of war will be applied to NATO applications.

### 6.3.3 Functional Solution Analysis

#### 6.3.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA Summary.

1. **Deficiency:** International CBRND protocols, standards, and agreements that promote interoperability are not in effect.  
**Non-Materiel Solutions:** *Doctrine:* Differences still exist over “rolling text” and the Chairman’s text. Outreach to all nonsignatory nations must take place to encourage participation.
2. **Deficiency:** Efficacy of standards and feedback has not been determined through exercises and experimentation in all CBRND areas and is limited to countries that are open to participate.  
**Non-Materiel Solutions:** *Training:* NATO and ABCA exercises and experimentation must explore all aspects of CBRND. Nations outside of ABCA and NATO should be encouraged to participate.
3. **Deficiency:** Additional policy and doctrine needs to be developed along with an effective inspection regime to strengthen the BTWC/CWC.  
**Non-Materiel Solutions:** *Doctrine:* The Quadripartite Group and NATO need to build a QSTAG/STANAG for considering weapons of mass destruction (WMD)–related terrorism as a causative action for establishing international procedures and mutual support agreements for restoration operations.

#### 6.3.3.2 IMA Assessment Summary

N/A

**6.4 Task SNSHA 4: Coordinate CBRND within the interagency process****6.4.1 Functional Area Analysis****6.4.1.1 Definition**

To work with representatives of the other Executive departments and agencies to resolve issues and ensure that CBRND responsibilities are coordinated. Includes organizations within DoD, as well as interagency capabilities. Organizations with appropriate resources are designated and tasked, as necessary, to support and/or provide the identified CBRND capabilities. Includes allocating and tasking resources in accordance with established agreements with other non-DoD national agencies.

**6.4.1.2 Derivation**

*UJTL (SN 1.1.6, SN 2.2.1, SN 5.1.1, SN 5.1.2, SN 5.1.3, SN 5.2.1, SN 5.2.3, SN 7.5, SN 9, SN 9.2, SN 9.2.1, SN 9.2.2), Protection Joint Functional Concept, Military Transformation: A Strategic Approach, Transformation Planning Guidance.*

**6.4.1.2.1 Supported Task:** N/A

**6.4.1.2.2 Lateral Tasks:** SNSHA 2, SNSHA 8, SNSHA 9, SNSHA 10, SNSHA 13

**6.4.1.2.3 Supporting Task:** N/A

**6.4.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Restrictive mission instructions. (C2.1.1)
2. Partial preexisting arrangements. (C2.1.1.2)
3. Negligible military commitments from other nations. (C2.1.1.7)
4. Marginal forces assigned. (C2.2.1)
5. Limited personnel expertise. (C2.2.4.5)
6. Some or no interoperability. (C2.2.6)
7. Partial Joint Staff integration. (C2.3.1.1)
8. Moderate staff expertise. (C2.3.1.3)

**Civil**

Uncooperative interdepartmental/interagency relationships. (C3.1.1.3)

## **6.4.2 Functional Needs Analysis**

### **6.4.2.1 Capability and Deficiency Assessment Summary**

Table 6.4-1 discusses the capabilities that currently exist to perform the task to the designated standard. These are the only capabilities that exist, and no other capabilities are projected that will accomplish this task.

#### **Current Capability and Deficiency**

JDOMS serves as the action agent for the Secretary of Defense to coordinate and direct execution of DoD assistance to civil authorities. In addition, JDOMS serves as the action agent for consequence management operations and plans. The J-3 Operations Directorate is responsible for synchronizing and monitoring worldwide military operations and activities, including coordinating the joint CBRND requirements that are within the interagency process. The current capability assessment is “yellow.”

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. No near/mid-term capability improvement is anticipated.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused interagency experimentation. For the far term the assessment should become “green.”

**Table 6.4-1. SNSHA 4: Capability and Deficiency Assessment**

Capability/Measure	M1	M2	M3	M4	M5
<b>Current</b>					
Joint Department of Military Support	G <sup>1</sup>	G <sup>2</sup>	Y <sup>3</sup>	G <sup>4</sup>	G <sup>5</sup>
Joint Staff Directorate for Operations, J-3	G <sup>6</sup>	G <sup>7</sup>	Y <sup>8</sup>	G <sup>9</sup>	G <sup>10</sup>
<b>Near/Mid</b>					
Joint Department of Military Support	G	G	Y	G	G
Joint Staff Directorate for Operations, J-3	G	G	Y	G	G
<b>Far</b>					
Joint Department of Military Support)	G	G	G <sup>11</sup>	G	G
Joint Staff Directorate for Operations, J-3	G	G	G <sup>12</sup>	G	G
<b>Current Overall Capability</b>	G	G	Y	G	G
<b>Near/Mid-Term Overall Capability</b>	G	G	Y	G	G
<b>Far-Term Overall Capability</b>	G	G	G	G	G

	FAA Measure	Scale
M1	Current allocation of responsibility is adequate to satisfy current capability and operational requirements.	G – Yes, Y – Limited, R – No
M2	Projected responsibilities can be determined based on changes in the global CBRN/TIM situation.	G – Yes, Y – Limited, R – No
M3	Current CBRND requirements are satisfied through existing DoD resources.	G – Yes, Y – Limited, R – No
M4	CBRND capabilities not available within DoD are provided through agreement with non-DoD agencies.	G – Yes, Y – Limited, R – No
M5	Extent of mutual support available from other agencies or organizations meets requirements.	G – Yes, Y – Limited, R – No

<sup>1</sup> Current assignment of responsibility is adequate to satisfy current capability and operational requirements.

<sup>2</sup> Able to determine projected responsibilities based on changes in the global CBRN situation.

<sup>3</sup> Existing DoD resources cannot completely satisfy current CBRND requirements.

<sup>4</sup> CBRND capabilities not available within DoD are provided through agreement with non-DoD agencies.

<sup>5</sup> Extent of mutual support available from other agencies or organizations meets requirements.

<sup>6</sup> Yes. Current assignment of responsibilities is able to satisfy current capability and operational requirements.

<sup>7</sup> Yes. J-3 is able to determine projected responsibilities based on changes in the global CBRN situation.

<sup>8</sup> Limited. The current DoD and interagency coordination resources to support CBRND and domestic response requirements are limited in size and scope. For example, current resources cannot handle a large scale series of simultaneous, multiple CBRN events.

<sup>9</sup> Very limited. Many CBRND capabilities available within DoD can be provided to the interagency, but both DoD and non-DoD equipment, TTPs, and standards may not be compatible nor compliant with other agency requirements.

<sup>10</sup> Very limited. While some CBRN mutual support exists, DoD and non-DoD capabilities are often incompatible.

<sup>11</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused interagency experimentation.

<sup>12</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused interagency experimentation.

### 6.4.3 Functional Solution Analysis

#### 6.4.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA Summary.

1. **Deficiency:** The current capabilities can not handle a large scale series of simultaneous, multiple CBRN events.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs for CBRND mutual capabilities support between DoD and non-DoD executive agencies. *Training:* Develop experimentation for interagency CBRND cooperation to provide lessons learned. Integrate lessons learned into training and exercises for CBRND mutual capabilities support between DoD and non-DoD executive agencies. *Leadership:* Develop JPME for CBRND mutual support capabilities between DoD and non-DoD executive agencies.
2. **Deficiency:** DoD and non-DoD procedures and equipment may not be compatible.  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs for CBRND mutual support capabilities between DoD and non-DoD executive agencies. *Training:* Develop training and exercises to enhance CBRND mutual support capabilities between DoD and non-DoD executive agencies. *Leadership:* Develop JPME for CBRND mutual support capabilities between DoD and non-DoD executive agencies.
3. **Deficiency:** DoD and non-DoD TTPs may not be compatible (e.g., personnel decontamination, equipment decontamination, and facilities decontamination).  
**Non-Materiel Solutions:** *Doctrine:* Develop TTPs for DoD elements that allow equivalent CBRND procedures when a request for assistance is received.

#### 6.4.3.2 IMA Assessment Summary

N/A

## **6.5 Task SNSHA 5: Determine joint CBRND capability to meet the global CBRN/TIM situation**

### **6.5.1 Functional Area Analysis**

#### **6.5.1.1 Definition**

To determine joint CBRND capability requirements based on changes in the current and projected global CBRN/TIM situation, including management of JCIDS. JCIDS defines capability gaps, capability needs, and approaches to provide those capabilities within the CBRND functional area. These capabilities derive from a common understanding of existing joint force operations and DOTMLPF capabilities and deficiencies. The JCIDS analyses result in DOTMLPF capabilities and provide the necessary information for the development of the Initial Capabilities Document (ICD) if required. Also includes the procurement of appropriate CBRND systems, equipment, and supplies.

#### **6.5.1.2 Derivation**

*CJCSI 3170.01D, CJCSM 3170.01A, UJTL (SN 2.2.1, SN 3.3.6, SN 5.7.1, SN 7.5, SN 9.2.1), Protection Joint Functional Concept, Joint Enabling Concept for CBRN Defense, Transformation Planning Guidance.*

##### **6.5.1.2.1 Supported Task: N/A**

##### **6.5.1.2.2 Lateral Tasks: SNSHA 3, SNSHA 8, SNSHLD 10, SNSHLD 11, SNSHLD 12**

##### **6.5.1.2.3 Supporting Task: STSHA 3**

#### **6.5.1.3 Condition**

Perform this task under conditions of:

##### **Physical. N/A**

##### **Military**

1. High military systems reliability. (C2.2.5.3)
2. Limited interoperability. (C2.2.6)
3. Limited personnel expertise. (C2.2.4.5)
4. Limited deployed supplies. (C2.8.2)
5. Adequate continental United States (CONUS) resupply. (C2.8.3)
6. Slow pipeline responsiveness (C2.8.3.1)
7. Negligible commercial procurement. (C2.8.6)

##### **Civil**

1. Uncooperative interdepartmental/interagency relationships. (C 3.1.1.3)

## **6.5.2 Functional Needs Analysis**

### **6.5.2.1 Capability and Deficiency Assessment Summary**

Table 6.5-1 discusses the capability that currently exists to perform the task to the designated standards. There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

JRO-CBRND has the ability to determine joint CBRN capability to meet the global CBRN situation. While JRO has the basic ability to perform the task, only a small amount of data at the operational level and above has been gathered through lessons learned in exercises or through experimentation. There are also a number of shortfalls in materials available to guide and train CBRND observer/controllers and to assist exercise developers in the integration of CBRND objectives in operational-level and above exercises. The current capability assessment is “yellow.”

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. No capability improvement is forecast for the near/mid term.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. Realistic modeling, simulation, exercises and experimentation will make comprehensive analysis possible at all levels of war as a result of current ongoing efforts. Capability assessments via operational experiments, operational/developmental test and evaluation, and lessons learned will continue to mature and will have enough depth to allow total analysis. The capstone DOTMLPF experimentation using UNIFIED ENDEAVOR will not take place in FY2009/FY2010. DOTMLPF to support task should improve if effective experimentation addresses organizational deficiencies and closes knowledge gaps and doctrine and if training and education initiatives address deficiencies identified in this JCIDS, raising the far-term assessment to “green.”

**Table 6.5-1. SNSHA 5: Capability and Deficiency Assessment**

<b>Capability: Joint Requirements Office Chemical, Biological, Radiological, and Nuclear Defense</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>
<b>Current Overall Capability<sup>1</sup></b>	Y <sup>2</sup>	G <sup>3</sup>	Y <sup>4</sup>	Y <sup>5</sup>
<b>Near/Mid-Term Overall Capability</b>	Y	G	G	Y
<b>Far-Term Overall Capability<sup>6</sup></b>	G <sup>7</sup>	G	G	G <sup>8</sup>

	<b>FAA Measure</b>	<b>Scale</b>
M1	JCIDS analyses reflect comprehensive capability requirements at all levels of war.	G – Yes, Y – Limited, R – No
M2	Non-materiel (DOTLPF) requirements are addressed per CJCSI 3170D- and 3180-series procedures.	G – Yes, Y – Limited, R – No
M3	All CBRND systems and logistical support are acquired in sufficient quantity and maintained to support global operations.	G – Yes, Y – Limited, R – No
M4	Capability assessments via operational experiments, operational/developmental test and evaluation, and lessons learned are available.	G – Yes, Y – Limited, R – No

<sup>1</sup> Limited. Doctrine and TTPs focusing on CBRND at the operational and strategic theater levels are very limited, even though JP 3-11 provides broad doctrinal guidance for CBRND and the new JP 3-40 provides broad doctrine for combating WMD. CBRND staff positions and staffing positions at all levels are not consistently manned, making it difficult to apply CBRND subject matter expertise to planning and evaluating exercises when required. CBRND staffs are not adequately trained/experienced on strategic CBRND issues. JPME does not adequately address CBRND issues.

<sup>2</sup> No. Limited CBRND systems and logistical support are acquired and maintained in quantities based on budgetary allocation and the program objectives memorandum.

<sup>3</sup> Yes. The JRO-CBRND will address non-materiel (DOTLPF) requirements per CJCSI 3180-series procedures.

<sup>4</sup> Yes. CBRND systems and logistical support are acquired and maintained in quantities.

<sup>5</sup> Limited. Capability assessments via operational experiments, operational/developmental test and evaluation, and lessons learned are now becoming available but do not currently have enough depth to allow total analysis. The capstone DOTMLPF experimentation using UNIFIED ENDEAVOR will not take place until FY2009/FY2010.

<sup>6</sup> DOTMLPF to support task should improve if effective experimentation addresses organizational deficiencies/closes knowledge gaps and doctrine, training and education initiatives address deficiencies identified in this JCIDS.

<sup>7</sup> Capability assessments via operational experiments, operational/developmental test and evaluation, and lessons learned will continue to mature and will have enough depth to allow total analysis. The capstone DOTMLPF experimentation using UNIFIED ENDEAVOR will not take place in FY2009/FY2010.

<sup>8</sup> Capability assessments via operational experiments, operational/developmental test and evaluation, and lessons learned will continue to mature and will have enough depth to allow total analysis. The capstone DOTMLPF experimentation using UNIFIED ENDEAVOR will not take place in FY2009/FY2010.

### 6.5.3 Functional Solution Analysis

#### 6.5.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA Summary.

- 1. Deficiency:** An exercise including fully integrated objectives or focused on CBRND and combating WMD for a strategic force has not been conducted.  
**Non-Materiel Solutions:** *Doctrine:* Establish guidelines, checklists, and exercise planning tools to integrate CBRND and combating WMD objectives into joint exercises. *Training:* Facilitate the development of exercises that include fully integrated exercise objectives or are totally focused on CBRND and combating WMD for joint strategic forces. *Facilities:* Incorporate infrastructure and telemetric requirements into development of the Joint National Training Center.
- 2. Deficiency:** Relevant and comprehensive operational/strategic-level issues are virtually nonexistent.  
**Non-Materiel Solutions:** *Doctrine:* Develop guides for observer/controllers so that they are better able to capture relevant lessons learned from exercises. Integrate captured data into future JCIDS analysis. *Organization:* Ensure that organizations that conduct joint exercises likely to reveal relevant data are adequately staffed with CBRN subject matter experts or that external observer/controller teams (provided by JRO) can be easily integrated into the exercise control/data collection plan. *Training:* Provide assistance to joint exercise developers on CBRND and combating WMD scenarios and objectives and develop CBRN-centric training for observer/controllers. *Leadership:* Integrate techniques for developing joint exercise CBRND and combating WMD training objectives into leader training. *Personnel:* Ensure that personnel chosen to be observer/controllers have requisite combination of technical expertise, operational/exercise experience, and CBRN-centric joint exercise observer/controller training.
- 3. Deficiency:** There have been no experiments focusing on operational/strategic-level warfighting restoration operations concepts and issues.  
**Non-Materiel Solutions:** *Training:* Include CBRND and combating WMD tasks and concepts in the JRO experimentation campaign plan for FY2009/FY2010 UNIFIED ENDEAVOR and all work-ups.
- 4. Deficiency:** There is a limited capability to provide strategic-level CBRN investment strategy.  
**Non-Materiel Solutions:** *Doctrine (partial):* Develop methodology for how to forecast/determine adequate CBRND and combating WMD capability or medical capability for strategic forces.
- 5. Deficiency:** There are very few concepts, doctrine, and TTPs focusing on CBRND and combating WMD requirements at the operational and strategic theater levels.

**Non-Materiel Solutions:** *Doctrine:* Develop robust concepts, doctrine and TTPs focusing on CBRND and combating WMD requirements at the operational and strategic levels.

- 6. Deficiency:** CBRND staffs are not adequately trained/experienced on strategic CBRND issues.

**Non-Materiel Solutions:** *Doctrine:* Develop guides and TTPs focusing on CBRND staff roles, responsibilities, and procedures for planning and conducting restoration operation at the operational and strategic theater levels. *Training:* Analyze training received by CBRND specialists assigned to joint staffs. Recommend training changes, enhancements, or alternative fixes as required. *Leadership:* Analyze education received by CBRND specialists assigned to joint staffs. Recommend education changes, enhancements, or alternative fixes as required.

- 7. Deficiency:** JPME does not currently address this issue.

**Non-Materiel Solutions:** *Leadership:* Commanders, staff directors, and leaders at all levels require extensive education on CBRND issues. Without a complete understanding of how CBRND issues can impact the warfight, they are unable to fully appreciate operational implication of CBRND and therefore assess and record CBRND exercise lesson's learned.

#### 6.5.3.2 IMA Assessment Summary

Table 6.5-2 shows possible materiel approaches that address the remaining materiel requirements of the DOTMLPF assessment.

**Table 6.5-2. SNSHA 5: IMA Assessment**

Idea for Materiel Approach	Description
Automated tools.	Develop automated tools that take the available data and provide a means to forecast strategic force CBRND and combating WMD requirements

**6.6 Task SNSHA 6: Ensure joint CBRND readiness****6.6.1 Functional Area Analysis****6.6.1.1 Definition**

To ensure the military forces of the United States are prepared to accomplish assigned missions in a CBRN/TIM environment. Joint CBRND training, exercises, and rehearsals are key components to ensure unit readiness for operations in a CBRN/TIM-contaminated environment. Operational concepts and new systems are evaluated in realistic exercises and experimental environments. Coalition partners, allies, and nonaligned nations achieve similar capability readiness through military assistance or engagement programs, including developing policy and standards for CBRND training, including what is necessary for eligible civilians. This task also ensures the availability of appropriate units and personnel in the correct quantities and locations to support national strategy and objectives. Encompasses the management of CBRND logistical resources for global operations. Also encompasses availability of CBRND expertise to joint forces operating worldwide.

**6.6.1.2 Derivation**

*UJTL (SN 1.1.6, SN 2.2.1, SN 3.4.4, SN 3.4.6, SN 4, SN 4.2.2, SN 4.3.3, SN 5.1.1, SN 5.1.2, SN 5.2.3, SN 5.2.4.1.2, SN 6.1, SN 7.4, SN 7.5, SN 8, SN 8.1, SN 9, SN 9.1.2, SN 9.2.1, SN 9.2.2), Transformation Planning Guidance, Military Transformation: A Strategic Approach, Protection Joint Functional Concept, Training Transformation Implementation Plan.*

**6.6.1.2.1 Supported Task:** N/A

**6.6.1.2.2 Lateral Tasks:** SNSHA 2, SNSUST 9, SNSUST 10

**6.6.1.2.3 Supporting Task:** STSHA 4

**6.6.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Restrictive mission instructions. (C2.1.1)
2. Partially completed mission preparation. (C2.1.3)
3. Marginal forces assigned. (C2.2.1)
4. Multiple competing apportionments. (C2.2.2)
5. Marginal forces allocated. (C2.2.3)
6. Partial personnel capability. (C2.2.4)
7. Limited personnel experience. (C2.2.4.5)
8. Low military systems reliability. (C2.2.5.3)

9. Some or no interoperability. (C2.2.6)
10. Poor Joint Staff integration. (C2.3.1.1)
11. Poor multinational integration. (C2.3.1.2)
12. Limited staff expertise. (C2.3.1.3)
13. Limited to short deployed supplies. (C2.8.2)
14. Limited to negligible CONUS resupply. (C2.8.3)
15. Slow pipeline responsiveness. (C2.8.3.1)
16. Limited or no prepositioned materiel. (C2.8.4)
17. Limited commercial procurement. (C2.8.6)

## Civil

1. Uncooperative interdepartmental/interagency relationships. (C3.1.1.3)
2. Limited foreign government support. (C3.1.2.3)
3. Poor information management. (C3.3.7.4)

## 6.6.2 Functional Needs Analysis

### 6.6.2.1 Capability and Deficiency Assessment Summary

Table 6.6-1 discusses a capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

## Current Capability and Deficiency

The Joint Staff, J-3 Readiness, is the single office within DoD responsible for the planning, coordination, and oversight of joint CBRN defense operational requirements. The current overall assessment is “yellow” due to the facts that policies are not in place throughout the force structure and those that are in place only pertain to immediate survivability. Scarce CBRN experts are dispersed throughout the DoD force structure and are frequently only one or two deep in any given organization. DOTMLPF does not adequately ensure Joint CBRN readiness.

## Projected Near/Mid-Term Capability and Deficiency

No other capability is currently projected for the near/mid term. No improvements are forecast for the near/mid term.

## Projected Far-Term Capability and Deficiency

No other capability is currently projected for the far-term future. In the far-term the situation will improve but remain “yellow.” Joint standards will be developed and enforced among the services. JPME/OPME will stipulate CBRND learning areas but will take some time after these actions to reach full capability in this area. As DOTMLPF enhancements are introduced, the expertise of senior leaders will improve, mitigating the need for such extensive callback capabilities. DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

Table 6.6-1. SNSHA 6: Capability and Deficiency Assessment

Capability: Joint Staff, J-3 Readiness	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10	M11	M12	M13	M14	M15	M16	M17	M18
Current Overall Capability <sup>1</sup>	Y <sup>2</sup>	Y <sup>3</sup>	Y <sup>4</sup>	G <sup>5</sup>	R <sup>6</sup>	Y <sup>7</sup>	G <sup>8</sup>	Y <sup>9</sup>	Y <sup>10</sup>	Y <sup>11</sup>	Y <sup>12</sup>	Y <sup>13</sup>	Y <sup>14</sup>	Y <sup>15</sup>	Y <sup>16</sup>	Y <sup>17</sup>	R <sup>18</sup>	R <sup>19</sup>
Near/Mid-Term Overall Capability	Y	Y	Y	G	R	Y	G	Y	Y	Y	Y	Y	Y	Y	Y	Y	R	R
Far-Term Overall Capability <sup>20</sup>	Y	Y	Y	G	Y <sup>21</sup>	Y	G	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y <sup>22</sup>	Y <sup>23</sup>

	FAA Measure	Scale
M1	Doctrine and TTPs are adequate for operations envisioned over the next 5–10 years.	G – Yes, Y – Limited, R – No
M2	CBRN/TIM events and defense operations are incorporated in joint and Service exercises routinely.	G – Yes, Y – Limited, R – No
M3	National and joint exercises are held that focus on CBRND operations.	G – Yes, Y – Limited, R – No
M4	Joint- or Service-sponsored experiments focusing on CBRND operations occur annually.	G – Yes, Y – Limited, R – No
M5	Policies for training of joint forces are enforced.	G – Yes, Y – Limited, R – No
M6	Policies are in place to train those civilians not members of the joint force.	G – Yes, Y – Limited, R – No
M7	Standards are established for CBRND readiness.	G – Yes, Y – Limited, R – No
M8	A training program is established for potential evacuees.	G – Yes, Y – Limited, R – No
M9	Training of CBRND specialists is adequate.	G – Yes, Y – Limited, R – No
M10	Training of CBRND units is adequate.	G – Yes, Y – Limited, R – No
M11	Training of CBRND staff cells is adequate.	G – Yes, Y – Limited, R – No
M12	Training of joint force staffs is adequate.	G – Yes, Y – Limited, R – No
M13	Personnel assigned to diplomatic posts or employed in at-risk nations are effectively trained to respond to a CBRN/TIM event.	G – Yes, Y – Limited, R – No
M14	Tools and processes are available to globally manage CBRND personnel and units.	G – Yes, Y – Limited, R – No
M15	Tools and processes are available to globally manage CBRND materiel resources.	G – Yes, Y – Limited, R – No
M16	CBRND logistics tracking system is sufficient.	G – Yes, Y – Limited, R – No
M17	CBRN expert access is readily available for all CBRND topics.	G – Yes, Y – Limited, R – No
M18	Sufficient experts are available to meet peak demand.	G – Yes, Y – Limited, R – No

<sup>1</sup> Very limited. DOTMLPF does not adequately ensure Joint CBRN readiness.

<sup>2</sup> Limited. As a result of the global war on terror, CBRN doctrine and TTPs are adequate for operations envisioned over the next 3–5 years, but not 7–10 years. Additional emphasis must be placed on the full realm of threats envisioned in JV 2010 and JV 2020.

<sup>3</sup> Very limited. CBRN events and defense operations are incorporated, but emphasis should be placed on the full spectrum of CBRND operations. This emphasis should include the new JP 3-40, combating WMD, counterproliferation, and consequence management.

<sup>4</sup> Limited. CBRN specific exercises need to occur more often and cover more topics. CBRN/TIM scenarios need to be integrated into every national and joint exercise because of the recurring need to test capabilities in realistic CBRN/TIM scenarios. Two exercises that focus on CBRN operations are the TOPOFF exercises and the Determined Promise exercises that are held on a recurring basis.

<sup>5</sup> Advanced Technology Demonstrations and Advanced Technology Concept Demonstrations have been conducted on CBRND operations. Once it is initiated, the new JRO-CBRND-sponsored CBRND Experimentation Campaign Plan will provide an excellent plan for experimentation.

<sup>6</sup> No. Training enforcement is service-, situation-, and scenario-specific even though there is joint training involving two or more services. JPME is not specific enough for CBRND requirements.

<sup>7</sup> Limited. Policies are not in place throughout the force structure, and those that are in place only pertain to immediate survivability. Individual training requirements are established for CONUS DoD civilians and contract support personnel.

<sup>8</sup> Yes. IAW JSCAP and JP 1-03.

<sup>9</sup> Limited. U.S. Forces Korea does this. However, this capability does not exist across the force structure.

<sup>10</sup> Limited. This requirement is unique to each service. Tactical-level preparation is adequate with all services. Leader training and education for operational-level and above is nonexistent except for elective courses. Multiservice institutional training occurs with the Army as the lead Service.

<sup>11</sup> Limited. Training standards vary between Services. The number and type of exercises involving CBRND units varies. The amount of time available to Reserve Component units restricts the level of their training to the most crucial collective tasks.

<sup>12</sup> Limited. Training standards are different among services. The number and types of exercises involving CBRN staff cells differs.

<sup>13</sup> Limited. Training standards differ. The number and types of exercises involving CBRN training events varies as does the depth and level of expertise within joint staffs. With few exceptions, CBRN training events do not adequately portray the level and complexity of a real-world situation.

<sup>14</sup> Limited. Training is limited to initial survival and evacuation scenarios.

<sup>15</sup> Limited. CBRN personnel and units are managed in the same manner as other deployable personnel and units. However, due to the unique mission of CBRN personnel and units, tools should be developed to intensively manage them.

<sup>16</sup> Limited. CBRN materiel is managed in the same manner as other materiel (e.g., through various classes of supply). However, due to the unique character of CBRN materiel, tools should be developed to intensively manage and track it.

<sup>17</sup> Limited. Currently, CBRN logistics are tracked the same as other assets. However, given the probable heavy medical and logistical requirements that would occur in a CBRN response, a separate CBRND logistics tracking systems should be developed.

<sup>18</sup> Very limited. The Defense Threat Reduction Agency (DTRA) sponsors a call-back capability. Scarce CBRN experts are dispersed throughout the DoD force structure and are frequently only one or two deep in any given organization.

<sup>19</sup> Very limited. In most cases, CBRN experts are readily available (e.g., from DTRA, the Centers for Disease Control, the U.S. Army Medical Research Institute for Infectious Diseases, etc.). However, experts embedded in units are frequently only one or two deep and may not be available to meet peak demand.

<sup>20</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>21</sup> Joint standards will be developed and enforced among the services. JPME/Officer Professional Military Education will stipulate CBRND learning areas. It will take some time after these actions to reach full capability in this area.

<sup>22</sup> As DOTMLPF enhancements are introduced, the expertise of senior leaders will improve, mitigating the need for such extensive call-back capabilities. It will take some time after these actions to reach full capability in this area.

<sup>23</sup> As DOTMLPF enhancements are introduced, the expertise of senior leaders will improve, mitigating the need for such extensive call-back capabilities. It will take some time after these actions to reach full capability in this area.

### 6.6.3 Functional Solution Analysis

#### 6.6.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA Summary.

1. **Deficiency:** CBRN doctrine and TTPs are not adequate for operations envisioned over the next 7–10 years.  
**Non-Materiel Solutions:** *Doctrine:* Devise a system that allows for more frequent revision and update to the CBRND doctrinal literature cycle.
2. **Deficiency:** Emphasis is not placed on the full spectrum of CBRND operations and considerations which range from counterproliferation to consequence management in joint and service exercises.  
**Non-Materiel Solutions:** *Doctrine:* Implement the full range of CBRN-related activities in doctrine: deterrence; counterproliferation; nonproliferation; interdiction; elimination; restoration. *Training:* Institute the full range of CBRN options in doctrine followed immediately by courses in the joint and Service institutional base which reflect all considerations from counterproliferation to consequence management.
3. **Deficiency:** Training enforcement is specific to service, situation, and scenario. JPME lacks specificity for WMD requirements.  
**Non-Materiel Solutions:** *Training:* Develop JPME that mandates minimum standards of proficiency in all CBRN institutional training.
4. **Deficiency:** Policies are in place to train DoD civilians throughout the force structure but only pertain to immediate survivability.  
**Non-Materiel Solutions:** *Doctrine:* Develop policies to train DoD civilians throughout the force structure beyond mere immediate survivability. *Training:* Develop training for DoD civilians throughout the force structure beyond mere immediate survivability.
5. **Deficiency:** The capability to establish training programs for potential civilian evacuees does not exist across the force structure.  
**Non-Materiel Solutions:** *Training:* Establish standardized training programs for potential civilian evacuees across the force structure.
6. **Deficiency:** Sustainment training for CBRND specialists (once they reach their assigned duty stations) is probably not adequate.  
**Non-Materiel Solutions:** *Training:* Develop standards of proficiency for sustainment training for CBRND specialists across the force structure.
7. **Deficiency:** Training of CBRND units is not standardized. There is a lack of realism in training which emphasizes CBRN. Sustainment training does not adequately reinforce perishable collective technical CBRN-related skills.

**Non-Materiel Solutions:** *Training:* Across the force structure, develop one set of standards of proficiency for all CBRND units and staffs.

8. **Deficiency:** Institutional training of CBRND staffs is not standardized. Sustainment training does not adequately reinforce perishable collective technical CBRN-related skills.

**Non-Materiel Solutions:** *Training:* Develop standardized institutional training of CBRND staffs across the force structure.

9. **Deficiency:** The number and type of exercises involving CBRN events differ widely. Few involve the full spectrum of activities required in an actual CBRN event.

**Non-Materiel Solutions:** *Training:* Develop exercises that more completely include the full spectrum of activities required in multiple, simultaneous actual CBRN events.

10. **Deficiency:** The depth and level of CBRN expertise within various joint staff sections varies.

**Non-Materiel Solutions:** *Doctrine:* Develop TTPs and exercises to ensure staff proficiency in the full range of CBRN considerations from interdiction and elimination operations, through humanitarian assistance, to restoration operations. *Training:* Develop TTPs and exercises to ensure staff proficiency in the full range of CBRN considerations from interdiction and elimination operations, through humanitarian assistance, to restoration operations.

11. **Deficiency:** There are no tools that can intensively manage CBRN personnel and units.

**Non-Materiel Solutions:** *Doctrine (partial):* Develop TTPs that more adequately train CBRN personnel and units to ensure these scarce assets are available, fully mission-capable, and able to operate in a joint and combined environment. *Training (partial):* Develop TTPs that more adequately train CBRN personnel and units to ensure these scarce assets are available, fully mission-capable, and able to operate in a joint and combined environment.

12. **Deficiency:** CBRN expertise is scarce throughout the force structure.

**Non-Materiel Solutions:** *Organization:* Within end-strength constraints, consideration should be given to increasing the capabilities of CBRND units and staffs. *Personnel:* Within end-strength constraints, consideration should be given to increasing the capabilities of CBRND units and staffs.

### 6.6.3.2 IMA Assessment Summary

Table 6.6-2 shows possible materiel approaches that address the remaining materiel requirements of the DOTMLPF assessment.

**Table 6.6-2. SNSHA 6: IMA Assessment**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Automated Tools	Develop automated tools that more adequately manage CBRN personnel, unit, and materiel to ensure that these scarce assets are available and fully mission-capable when needed. All data should be available to/through the Joint Operational Effects Federation. The personnel component of the tool should include projected availability, education, experience, and special skills. The unit component of the tool should include unit capability description, required training for unit, last date of required training, and training required but not completed. The unit component should also address equipment fill data, equipment readiness data, and special logistical requirements. The materiel component should list all required materiel, percentage of materiel on hand/available and availability dates, and materiel condition descriptions.

**6.7 Task SNSHA 7: Coordinate global CBRN information systems and processes****6.7.1 Functional Area Analysis****6.7.1.1 Definition**

To ensure that global CBRN/TIM information systems and processes allow joint forces to effectively conduct operations in a CBRN/TIM environment. Establishes the standards, common operating procedures, and formats for plotting and predicting CBRN/TIM hazards, along with alarm, warning, and reporting of the hazards. Also includes standards and procedures for displaying hazard information via the global COP. Ensures that interoperability procedures are followed and adhered to for integration into the DoD classified and unclassified networks. Includes maintaining worldwide shared awareness of the current and projected CBRN/TIM threat and situation.

**6.7.1.2 Derivation**

*UJTL (SN 1.1.6, SN 2.2.1, SN 2.4.1.2, SN 3.3.6, SN 4.3.3, SN 4.3.4, SN 5.1.1, SN 5.1.2, SN 5.1.3, SN 5.1.3, SN 5.7.1, SN 7.5, SN 8.1.6, SN 9, SN 9.1.1, SN 9.1.2, SN 9.1.3, SN 9.2, SN 9.2.1, SN 9.2.2), Protection Joint Functional Concept, Military Transformation: A Strategic Approach, Transformation Planning Guidance, An Operational Concept for Biological Defense, Joint Enabling Concept for CBRN Operations.*

**6.7.1.2.1 Supported Task: N/A****6.7.1.2.2 Lateral Task: SNSUST 6****6.7.1.2.3 Supporting Task: STSHA 5****6.7.1.3 Condition**

Perform this task under conditions of:

**Physical. N/A****Military**

1. Low military systems reliability. (C2.2.5.3)
2. Some or no interoperability. (C2.2.6)
3. Partial Joint Staff integration. (C2.3.1.1)
4. High information volume. (C2.3.1.9)

**Civil**

1. Poor information management. (C3.3.7.4)

## **6.7.2 Functional Needs Analysis**

### **6.7.2.1 Capability and Deficiency Assessment Summary**

Table 6.7-1 discusses the capabilities that currently exist to perform the task to the designated standard.

#### **Current Capability and Deficiency**

All of the capabilities listed are directly responsible for their respective aspects of global CBRN information systems and processes. The Joint Staff Directorate for Command, Control, Communications, and Computer Systems, the J-6, leads the C4 community. It leads in identifying and resolving military aspects of information-based issues of national importance, to include CBRND issues. Because of documented training, education, and experience issues, J-6 personnel may not have a full grasp of the issues that need to be resolved. As the Chairman of the Joint Chiefs of Staff's single source of expertise in addressing CBRN defense issues involving the warfight, the JRO-CBRND must proactively engage the J-6 to determine the adequacy of current and projected global CBRN information systems and processes. For the purposes of this analysis, current capabilities are listed and issues that need to be further assessed and clarified are provided for JRO-CBRND/J-6 action. The current capability assessment is "yellow."

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. No capability improvement is expected in the near/mid term. Most near/mid-term measures will remain limited until the Joint Warning and Reporting Network (JWARN) automatically interfaces with the Global Command and Control System (GCCS).

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. DOTMLPF should improve in some deficient areas as a result of international and interagency initiatives that use data resulting from focused experimentation. Most far-term measures will remain limited until JWARN automatically interfaces with GCCS.

**Table 6.7-1. SNSHA 7: Capability and Deficiency Assessment**

	FAA Measure	Scale
M1	NCES is used to effectively manage and provide CBRN/TIM information.	G – Yes, Y – Limited, R – No
M2	Standardized CBRN/TIM hazard alarm, warning, and reporting formats and procedures are interoperable with interagency partners.	G – Yes, Y – Limited, R – No
M3	Sense data are integrated into the COP.	G – Yes, Y – Limited, R – No
M4	Distributed sensor arrays operating within the Integrated Detection Network (IDN) provide automated warning and reporting of the CBRN/TIM hazard.	G – Yes, Y – Limited, R – No
M5	Nonnetworked detections and manual reports are processed into the network.	G – Yes, Y – Limited, R – No
M6	Standards for plotting and prediction of CBRN/TIM hazards are established.	G – Yes, Y – Limited, R – No
M7	CBRN/TIM situational information from all global sources is communicated to the DoD and Joint Staff, as appropriate.	G – Yes, Y – Limited, R – No
M8	Mechanism exists to rapidly disseminate CBRN/TIM threat intelligence.	G – Yes, Y – Limited, R – No
M9	Information on the operational impact of CBRN/TIM events is integrated into the COP.	G – Yes, Y – Limited, R – No
M10	A CBRND operation reference information system is readily available.	G – Yes, Y – Limited, R – No

- 
- <sup>1</sup> Limited. Net-Centric Enterprise Services (NCES) is dependent on subsystems, including JPM-IS's Data Initiative. This mission will be achieved by developing a CBRN Data Model and related CBRN extensible markup language (XML). Until all subordinate systems are fully operational, DISA's NCES is less than fully mission-capable.
- <sup>2</sup> No. Interagency partners are not operating on a COP.
- <sup>3</sup> Limited. Interfacing software for SENSE data is not fully automated.
- <sup>4</sup> No. An integrated detection network does not currently exist for automated warning and reporting of the CBRN hazard.
- <sup>5</sup> Limited. Any operator can process reports into the network, but there are still problems with interoperability that continue to hinder the flow of CBRN information across the analysis spectrum.
- <sup>6</sup> Limited. Standards for plotting and prediction of CBRN hazards are established. A single standard for automated plotting and prediction CBRN hazards does not yet exist.
- <sup>7</sup> Limited. CBRN situational information from all global sources is not fully communicated to the DoD and Joint Staff, as appropriate.
- <sup>8</sup> Limited. Any authorized operator can query DTRIAC or J-2 resources. However, the NCES is not fully implemented.
- <sup>9</sup> Limited. Any authorized operator can query DTRIAC for the COP. However, the NCES is not fully implemented.
- <sup>10</sup> Limited. Interagency partners do not access DTRIAC.
- <sup>11</sup> Limited. The NCES is not fully implemented. The NCES, consisting of hardware, software, policy, processes, and procedures, will eventually provide a way for DoD to coordinate staff and allocate resources more efficiently.
- <sup>12</sup> No. Interagency partners are not operating on a COP.
- <sup>13</sup> Limited. Interfacing software for Sense data is not fully automated.
- <sup>14</sup> No. An integrated detection network does not currently exist for automated warning and reporting of the CBRN hazard.
- <sup>15</sup> Limited. Any operator can process reports into the network, but there are still problems with interoperability that continue to hinder the flow of CBRN information across the analysis spectrum.
- <sup>16</sup> Limited. Standards for plotting and prediction of CBRN hazards are established. A single standard for automated plotting and prediction CBRN hazards does not yet exist.
- <sup>17</sup> Limited. CBRN situational information from all global sources is not fully communicated to the DoD and Joint Staff, as appropriate.
- <sup>18</sup> Limited. Any authorized operator can query DTRIAC or J-2 resources. However, the NCES is not fully implemented.
- <sup>19</sup> Limited. Any authorized operator can query DTRIAC for the COP. However, the NCES is not fully implemented.
- <sup>20</sup> Limited. Interagency partners do not access DTRIAC.
- <sup>21</sup> Limited. CBRND information must be manually inserted onto GCCS-J.
- <sup>22</sup> No. Interagency partners operate on different Command and Control systems.
- <sup>23</sup> Limited. Sense data are manually input into the COP.
- <sup>24</sup> No. An integrated detection network does not currently exist for automated warning and reporting of the CBRN hazard.
- <sup>25</sup> Yes. Any authorized operator can manually process reports into GCCS-J.
- <sup>26</sup> Limited. Standards for plotting and prediction of CBRN hazards are established through STANAG 2103 and ATP-45. But there is no single standard for automated plotting and prediction CBRN hazards .
- <sup>27</sup> Limited. CBRN situational information from all global sources is not fully automated and communicated to the DoD and Joint Staff, as appropriate.
- <sup>28</sup> Limited. Any authorized operator can query GCCS-J. However, the NCES is not fully implemented.
- <sup>29</sup> Limited. Any authorized operator can query the COP. However, the NCES is not fully implemented.
- <sup>30</sup> Limited. Interagency partners do not access GCCS-J.
- <sup>31</sup> Limited. JPM-IS is working to eliminate interoperability problems across the joint CBRN information spectrum.
- <sup>32</sup> No. Interagency partners operate on different Command and Control systems.
- <sup>33</sup> Limited. Sense data can only be manually integrated into the COP. JPM-IS is working to eliminate interoperability problems across the joint CBRN information spectrum.
- <sup>34</sup> Limited. JPM-IS is working to eliminate interoperability problems across the joint CBRN information spectrum.
- <sup>35</sup> Limited. Current progress toward creating automation standards is encouraging but work still needs to be done. The programs within JPM have already benefited from the JPM-IS data model and schema.
- <sup>36</sup> Limited. CBRN situational information from all global sources is not fully automated and communicated to the DoD and Joint Staff. There is still a problem with data-interoperability, but the emerging NCES includes mandates to solve this problem.
-

<sup>37</sup> Limited. Any authorized operator can query GCCS-J. However, the NCES and NCES are not fully implemented.

<sup>38</sup> Limited. Any authorized operator can query the COP. However, the NCES and NCES are not fully implemented.

<sup>39</sup> Limited. The JPM-IS Data Initiative is creating a structure for the CBRN community of operations and phenomena that will include CBRN-related terms and definitions that are formatted relationally.

<sup>40</sup> No. There is no integrated detection network to provide automated warning and reporting of the CBRN hazard. However, JPM-IS is working to create a common data schema to facilitate automated reporting envisioned in JWARN, Joint Effects Model (JEM), and Joint Operational Effects Federation (JOEF).

### 6.7.3 Functional Solution Analysis

#### 6.7.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA Summary.

1. **Deficiency:** Interagency partners operate on different Command and Control technical architecture systems.  
**Non-Materiel Solutions:** *Doctrine:* CJCS should coordinate with interagency partners to craft a policy that compels partners to fully integrate CBRN information management systems. Tasks for the interagency *Universal Joint Task List (UJTL)* must address these issues. Interagency partners should fully participate in the JPM-IS initiative. *Training:* CJCS should continue to encourage the development of training programs and future operational capabilities that integrate CBRN information management systems using *UJTL* tasks to develop interagency training. JPM-IS CBRN Data Initiative should continue as chartered.
2. **Deficiency:** Interoperability problems with CBRN information systems continue to exist.  
**Non-Materiel Solutions:** *Doctrine:* JPM-IS CBRN Data Initiative should continue as chartered. JRO-CBRND and J-6 should work together through experimentation and exercises to identify and solve interoperability problems.
3. **Deficiency:** An integrated detection network does not currently exist for automated warning and reporting of the CBRN hazard.  
**Non-Materiel Solutions:** *Doctrine:* Develop ideas, proposals, and concepts for cooperatively linked detection technologies. *Training:* Before concepts for cooperatively linked detection technologies can be fully developed and tested, exercises and experiments will be necessary to refine and test concept hypothesis.
4. **Deficiency:** CBRN situational information from all global sources is not fully automated.  
**Non-Materiel Solutions:** *Doctrine:* Automate CBRN situational information from all global sources so that the COP portrays real-time shared situational understanding. JPM-IS CBRN Data Initiative should continue as chartered.
5. **Deficiency:** The NCES and JPM-IS CBRN Data Initiative are not fully implemented.  
**Non-Materiel Solutions:** *Doctrine:* The Global Information Grid Enterprise Services and JPM-IS CBRN Data Initiative should continue as chartered.
6. **Deficiency:** Joint standards, common operating procedures, and formats for plotting and predicting CBRN hazards, along with alarm, warning, and reporting of the hazards do not exist.  
**Non-Materiel Solutions:** *Doctrine:* JRO-CBRND should foster the development of truly Joint (versus multi-Service) standards and formats for automated plotting and predicting CBRN hazards and alarm and warning systems.

- 7. Deficiency:** Interagency partners are not all sharing a COP.  
**Non-Materiel Solutions:** *Doctrine:* CJCS should coordinate with interagency partners to craft policy that compels partners to fully integrate CBRN information management systems so that all U.S. agencies share the same CBRND COP. Tasks for the interagency *UJTL* must address these issues. Interagency partners should fully participate in the JPM-IS initiative.
- 8. Deficiency:** With the exception of STANAG 2103 and ATP-45, no standards for common operating procedures, formats, plotting, and predicting CBRN hazards exist. Further, hazard alarm, warning, and reporting are not standardized, automated, nor fully integrated into the COP for use by interagency partners.  
**Non-Materiel Solutions:** *Doctrine:* Standardize common operating procedures, and formats for plotting and predicting CBRN hazards, along with alarm, warning, and reporting of the hazards among interagency partners.
- 9. Deficiency:** With the exception of STANAG 2103 and ATP-45 there are no joint (versus multi-Service) standards for common operating procedures or for formats for plotting and predicting CBRN hazards. Nor are alarm, warning, and reporting of the hazards standardized, automated, and fully integrated into the COP.  
**Non-Materiel Solutions:** *Doctrine:* Fully integrate and automate CBRND information, detection, and sensing technologies into the COP.
- 10. Deficiency:** Interagency partners do not access GCCS-J.  
**Non-Materiel Solutions:** *Doctrine:* CJCS should coordinate with interagency partners to craft policy that compels partners to fully integrate CBRN information management systems. Tasks for the interagency *UJTL* must address these issues. Interagency partners should fully participate in the JPM-IS initiative.
- 11. Deficiency:** Several issues hinder the effectiveness of the J-6 and JRO-CBRND in their joint responsibility for identifying and resolving issues involving global CBRN information systems and processes with agencies outside of the joint staff.  
**Non-Materiel Solutions:** *Doctrine:* Joint Command, Control, Communications, Computers, Intelligence, Surveillance, and Reconnaissance (C4ISR) and CBRN publications must be enhanced to adequately address this issue and to interface with each other so that roles and responsibilities are clearly delineated. *Organization:* JRO-CBRND should have a staff section dedicated to resolving C4ISR community issues. Ensure that CBRN organizations that provide DoD detailees to national C4ISR organizations are proactive in ensuring their institutional CBRN C4ISR needs are both understood and met and that the detailees they provide are prepared in every way. *Training:* Develop training that will enable the J-6 staff to better understand their CBRN role and enhance their ability to identify and resolve CBRND C4 issues that are required to support the Shape function of strategic national CBRND. Develop training programs that allow CBRN staff officers to better support the CBRN C4ISR process. JRO-CBRND must work with J-6 and/or national C4ISR organizations to integrate this task into both C4ISR and CBRN experimentation campaign plans. *Leadership:* Develop an education program that will enable the J-6 staff to better understand their CBRN role and enhance their ability to identify and resolve CBRND C4 issues that are required to support the Shape function of strategic national CBRND. Develop education programs that

allow CBRN staff officers to better understand the CBRN C4ISR process and their roles and responsibilities. Integrate C4ISR CBRN fusion issues into JPME. CBRN DoD detailees to national C4ISR organizations must be provided with formal educational preparation.

*Personnel:* CBRN DoD detailees to national C4ISR organizations must possess adequate skill and experience.

**12. Deficiency:** Lack of interoperable CBRN/TIM networked detection technologies.

**Non-Materiel Solutions:** *Doctrine (partial):* Develop ideas, proposals, and concepts for cooperatively linked detection technologies. *Training (partial):* Before concepts for cooperatively linked detection technologies can be fully developed and tested, exercises and experiments will be necessary to refine and test concept hypothesis.

### 6.7.3.2 IMA Assessment Summary

Table 6.7-2 shows possible material approaches that address the remaining materiel requirements of the DOTMLPF assessment.

**Table 6.7-2. SNSHA 7. IMA Assessment**

Idea for Materiel Approach	Description
Networked information, detection, and sensing system	There is a need to develop cooperative linkages between various proponent and service CBRND and CBRN/TIM information, detection, and sensing technologies. Concepts must first be developed based on proposed linkages that will provide capabilities for effective, integrated CBRND and CBRN/TIM detection, warning, and shared situational understanding. These concepts must be explored through experimentation and the cooperative linkages that result need to be tested. The entire package should be developed as a system and fully integrated into a multi-agency COP. As each Service develops detection or sensing technologies, they should be analyzed for inclusion into the CBRN/TIM cooperative detection network and necessary modifications should be mandated for the Service systems.

**6.8 Task SNSHA 8: Establish national CBRND strategy, plans, and policy****6.8.1 Functional Area Analysis****6.8.1.1 Definition**

To produce and disseminate national strategy, plans, and policy providing strategic goals and end states for CBRND capabilities. Joint, multiagency, and international considerations are included. This task is geared to enabling the national strategies. Includes providing strategic guidance for restoration and elimination operations.

**6.8.1.2 Derivation**

*UJTL (SN 1.1.6, SN 2.2.1, SN 2.4.1.2, SN 2.5.1, SN 3.4.4, SN 5.1.1, SN 5.1.2, SN 5.1.3, SN 5.2.3, SN 7.5, SN 8.1.6, SN 9, SN 9.1.3, SN 9.2, SN 9.2.1, SN 9.2.2), Protection Joint Functional Concept, Military Transformation: A Strategic Approach, Transformation Planning Guidance, An Operational Concept for Biological Defense, Joint Enabling Concept for CBRN Operations.*

**6.8.1.2.1 Supported Task: N/A****6.8.1.2.2 Lateral Tasks: SSENS 15, SNSHA 2, SNSHA 3, SNSHA 4, SNSHA 5, SNSHA 9, SNSHA 10, SNSHA 11, SNSHA 12, SNSHA 13, SNSUST 3, SNSUST 4****6.8.1.2.3 Supporting Task: STSHA 6****6.8.1.3 Condition**

Perform this task under conditions of:

**Physical. N/A****Military**

1. Restrictive mission instructions. (C2.1.1)
2. Partial preexisting arrangements. (C2.1.1.2)
3. Partial Joint Staff integration. (C2.3.1.1)

**Civil**

1. Uncooperative interdepartmental/interagency relationships. (C3.1.1.3)

## **6.8.2 Functional Needs Analysis**

### **6.8.2.1 Capability and Deficiency Assessment Summary**

Table 6.8-1 discusses the Joint Staff, Directorate for Strategic Plans and Policy (J5) ability to establish national CBRN strategy, plans, and policy. This is the only capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The current capability assessment is “yellow.” Current plans do not adequately address global restoration operations. However, JRO-CBRND, ICW J5 and J8 have developed a *Joint Integrating Concept (JIC) for CBRND*. The JEC establishes a construct to support the *National Strategy to Combat Weapons of Mass Destruction* wherein restoration operations are part of consequence management. These two initiatives can serve as the foundation for future plan development. Not all pertinent Sense, Shape, Shield, and Sustain information is currently included in strategy, plans, and policy. However, once *UJTL 5.0* is formally approved, all Sense, Shape, Shield and Sustain domains must be considered and incorporated into strategy, plans, and policy.

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. No capability improvement is expected over the near/mid term.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. In the far term, the success of initiatives recommended by this JCIDS and DOTMLPF enhancements across the board, made possible by focused experimentation and lessons learned from exercises will improve all measures to a “green” rating.

.

**Table 6.8-1. SNSHA 8: Capability and Deficiency Assessment**

Capability/Measure	M1	M2	M3	M4	M5	M6	M7	M8
<b>Current Overall Capability<sup>1</sup></b>	Y <sup>2</sup>	G <sup>3</sup>	Y <sup>4</sup>	Y <sup>5</sup>	Y <sup>6</sup>	G <sup>7</sup>	G <sup>8</sup>	Y <sup>9</sup>
<b>Near/Mid-Term Overall Capability</b>	Y	G	Y	Y	Y	G	G	Y
<b>Far-Term Overall Capability</b>	G <sup>10</sup>	G	G	G	G	G	G	G

	FAA Measure	Scale
M1	Plans are provided for global restoration operations.	G – Yes, Y – Limited, R – No
M2	Plans are provided for global elimination operations.	G – Yes, Y – Limited, R – No
M3	Plans are provided for global CBRND operations.	G – Yes, Y – Limited, R – No
M4	All pertinent Sense, Shape, Shield, and Sustain information is included in strategy, plans, and policy.	G – Yes, Y – Limited, R – No
M5	Strategic planning staffs have the training and experience to effectively plan for CBRND operations.	G – Yes, Y – Limited, R – No
M6	There are sufficient doctrine and TTPs for strategic planning.	G – Yes, Y – Limited, R – No
M7	Plans and policies are updated regularly.	G – Yes, Y – Limited, R – No
M8	National and joint exercises and experimentation provide feedback on efficacy of plans and policy.	G – Yes, Y – Limited, R – No

<sup>1</sup> Limited. Presidential Decision Directives 17, 39, and 62 provide national-level policy and doctrine. Additionally, doctrine found in JP 3-11 series and JP 3-40, provide adequate baseline doctrine and TTPs for national CBRND planning. However, TTPs needs to address more specific techniques. JPME does not adequately cover the art of strategic planning for CBRN issues.

<sup>2</sup> Limited. Current plans do not adequately address global restoration operations. However, JROCBRND, ICW J5 and J8 have developed a *Joint Enabling Concept (JEC)* for CBRND. The JEC establishes a construct to support the *National Strategy to Combat Weapons of Mass Destruction* wherein restoration operations are part of consequence management. These two initiatives can serve as the foundation for future plan development.

<sup>3</sup> Yes. Current plans for global elimination operations do exist.

<sup>4</sup> Limited. Current information does not adequately address plans for global CBRND operations. Most CBRND planning is done at the combatant command level.

<sup>5</sup> Limited. All pertinent Sense, Shape, Shield, and Sustain information is not currently included in strategy, plans, and policy. However, once UJTL 5.0 is formally approved, all Sense, Shape, Shield and Sustain domains must be considered and incorporated into strategy, plans and policy.

<sup>6</sup> Limited. Strategic planning staffs are not adequately trained and educated in CBRN issues. CBRN staff officers are not adequately trained and educated in planning issues. JPME does not adequately cover the fusion of planning. CBRN CJCSI 1800.01a does not require baseline CBRND instruction in JPME. Given the complex nature of planning for CBRN defense operations at the strategic national level, these planning staffs must include multi-disciplined CBRND experienced senior planners.

<sup>7</sup> Yes. The Joint Services Capability Plan, along with the JP 3-11 series and JP 3-40, provide adequate baseline doctrine and TTPs for strategic national CBRND planning.

<sup>8</sup> Yes.

<sup>9</sup> Limited. There are some Senior Service College tabletop exercises that provide feedback on efficacy of plans and policy. (e.g., Solo Challenge, Joint Land, Aerospace and Sea Simulation [JLASS]).

<sup>10</sup> In the far term, the success of initiatives recommended by this JCIDS and DOTMLPF enhancements across the board, made possible by focused experimentation and lessons learned from exercises will improve all measures to a “green” rating.

### 6.8.3 Functional Solution Analysis

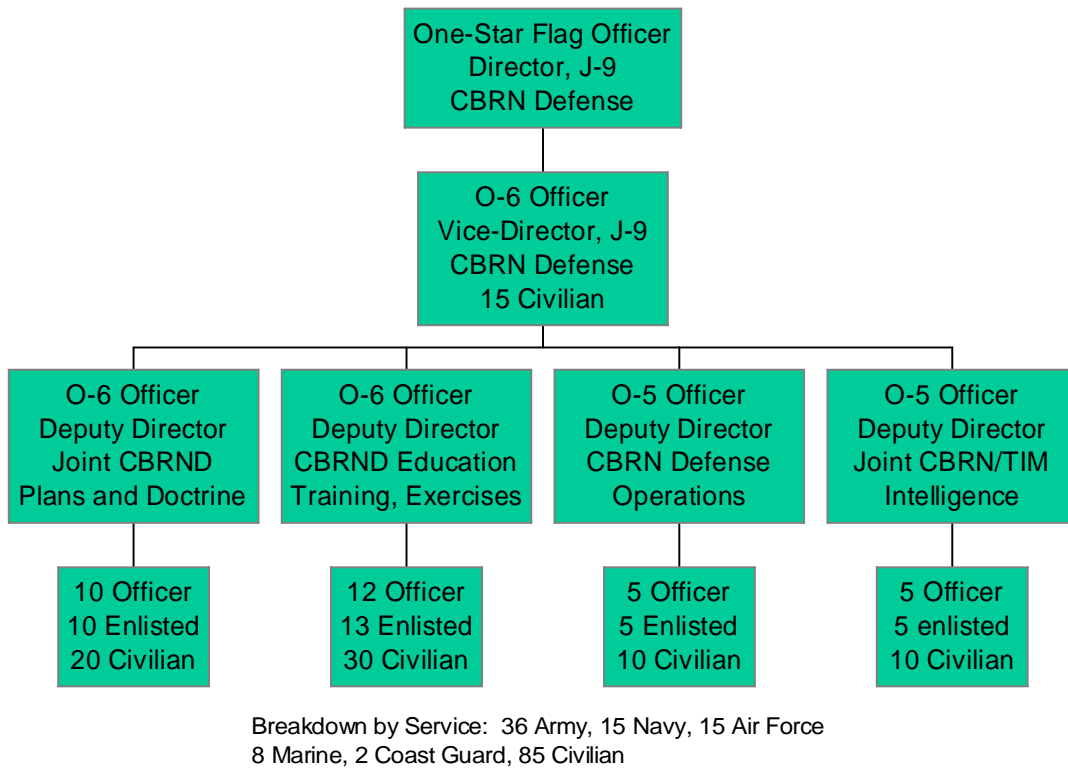

#### 6.8.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA Summary.

1. **Deficiency:** Current plans do not adequately address global CBRN restoration operations.  
**Non-Materiel Solutions:** *Doctrine:* Develop plans that adequately address global restoration operations. Considerations must include operations, logistics, medical, economic, infrastructure, the use of nongovernmental organizations, and displaced population relocation.
2. **Deficiency:** Not enough plans address global CBRND operations.  
**Non-Materiel Solutions:** *Doctrine:* Develop plans that refine global CBRND and restoration operations. Include TIM hazards, radiological hazards, novel and third-generation CB hazards, protection, and decontamination.
3. **Deficiency:** Not all pertinent Sense, Shape, Shield, and Sustain information is currently included in strategy, plans, and policy.  
**Non-Materiel Solutions:** *Doctrine:* Upon publication and approval of *UJTL 5.0*, review and integrate the Sense, Shape, Shield, and Sustain domains into strategy, plans, and policy.
4. **Deficiency:** Not all CBRN scenarios and contingencies can be envisioned in the planning process.  
**Non-Materiel Solutions:** *Doctrine:* Employ CBRN Red Teaming in the plan development process.
5. **Deficiency:** JPME does not adequately cover the art of strategic planning for CBRN issues.  
**Non-Materiel Solutions:** *Training:* Develop JPME that more adequately covers the art of strategic planning for CBRN issues.
6. **Deficiency:** JRO-CBRND is not optimally placed within the Joint staff.  
**Non-Materiel Solutions:** *Organization:* Given the unique JRO-CBRND charter for CBRN defense, consider its optimal positioning within the Joint Staff. It is now imbedded within the J-8 but has much broader responsibilities. Access is hampered by geographic positioning outside of the Pentagon. Given the enormous military responsibilities (the Chairman of the Joint Chiefs of Staff's single source of expertise in addressing CBRN defense issues), consider the resourcing of the office and rank-structure and staffing of personnel. There is no cooperative linkage with the Defense Threat Reduction Agency (DTRA). Consider the analogy of the J-2/DIA relationship. The Joint Staff Directorate for Intelligence, J-2, is a unique organization, in that it is both a major component of the Defense Intelligence Agency (DIA, a combat support agency) and a fully integrated element of the Joint Staff. Analysis of establishing a similar arrangement with DTRA should be conducted. Consideration should be

given to establishing JRO-CBRND as a numbered joint staff directorate. See Figure 6.8-1 for a recommendation.

**Figure 6.8-1 Proposed CJCS J-9 WMD Staff**

### 6.8.3.2 IMA Assessment Summary

N/A

**6.9 Task SNSHA 9: Coordinate CBRND aspects of global medical operations****6.9.1 Functional Area Analysis****6.9.1.1 Definition**

To coordinate CBRND aspects of global medical operations. Sets standards for personnel health and fitness required for potential exposure to CBRN/TIM conditions. Provides guidance for the conduct of medical CBRN/TIM health assessments. Establishes threshold criteria for medical CBRN/TIM health assessments, which determine deployment eligibilities for sustained operations in a CBRN/TIM threat environment. Includes the coordination of medical surveillance across the joint force for indications of CBRN/TIM attack or release.

**6.9.1.2 Derivation**

*UJTL (SN 1.1.6, SN 2.2.1, SN 2.5.1, SN 3.3.6, SN 3.4.4, SN 4.3.3, SN 4.3.4, SN 5.1.1, SN 5.1.2, SN 5.1.3, SN 7.5, SN 9, SN 9.1.3, SN 9.2, SN 9.2.1, SN 9.2.2), Transformation Planning Guidance.*

**6.9.1.2.1 Supported Task:** N/A

**6.9.1.2.2 Lateral Tasks:** SNSHA 2, SNSHA 4, SNSHA 8, SNSHA 10, SNSUST 7

**6.9.1.2.3 Supporting Task:** STSHA 7

**6.9.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A**Military**

1. Restrictive mission instructions. (C2.1.1)
2. Fair personnel nutrition and health. (C2.2.4.1)
3. Limited personnel experience. (C2.2.4.5)
4. Limited staff experience. (C2.3.1.3)

**Civil**

1. Uncooperative interdepartmental/interagency relationships. (C3.1.1.3)
2. Uncertain international organization support. (C3.1.2.5)

## **6.9.2 Functional Needs Analysis**

### **6.9.2.1 Capability and Deficiency Assessment Summary**

Table 6.9-1 discusses the only capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The Joint Staffs Logistics Directorate (J-4) is responsible for medical response to WMD and nuclear, biological, and chemical warfare; consequence management; environmental health and surveillance; interagency medical support; preventive medicine; medical information management/information technology; and patient evacuation (DODD 6000.12).

#### **Projected Near/Mid-Term Capability and Deficiency**

No foreseeable changes in capability.

#### **Projected Far-Term Capability and Deficiency**

No foreseeable changes in capability.

**Table 6.9-1. SNSHA 9: Capability and Deficiency Assessment**

<b>Capability: Joint Staffs Logistics Directorate (J-4)</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>	<b>M6</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>G<sup>2</sup></b>	<b>G<sup>3</sup></b>	<b>G<sup>4</sup></b>	<b>G<sup>5</sup></b>	<b>G<sup>6</sup></b>	<b>G<sup>7</sup></b>
<b>Near/Mid-Term Overall Capability</b>	<b>G</b>	<b>G</b>	<b>G</b>	<b>G</b>	<b>G</b>	<b>G</b>
<b>Far-Term Overall Capability</b>	<b>G</b>	<b>G</b>	<b>G</b>	<b>G</b>	<b>G</b>	<b>G</b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Standards for joint force health and fitness that contribute to CBRND are established.	G – Yes, Y – Limited, R – No
M2	Medical health assessment guidance adequately addresses personnel readiness for sustained CBRN operations.	G – Yes, Y – Limited, R – No
M3	Medical surveillance and intelligence information are collected and analyzed.	G – Yes, Y – Limited, R – No
M4	Non-DoD sources are assessed for information.	G – Yes, Y – Limited, R – No
M5	A global system for tracking the status of CBRND medical information exists.	G – Yes, Y – Limited, R – No
M6	Global medical threats are identified and appropriate countermeasures are instituted.	G – Yes, Y – Limited, R – No

<sup>1</sup> Yes. There is sufficient DOTLPF to accomplish this task.

<sup>2</sup> Yes. DODD 6000.12 provides guidance for standards for joint force health and fitness.

<sup>3</sup> Yes. DODD 6205 provides guidance for medical health assessment for personnel readiness.

<sup>4</sup> Yes. DODD 6420.1 and JP 4-02 provide guidance for medical surveillance and intelligence collection and analysis.

<sup>5</sup> Yes. JP 4-02 directs coordination with non-DoD medical sources.

<sup>6</sup> Yes. DODD 6205 and DODD 6000.12 provide guidance for the tracking of CBRN medical information.

<sup>7</sup> Yes. DODD 6420.1 and JP 4-02 provide procedures for the identification of global medical threats through surveillance and intelligence activities. Medical authority recommends and institutes appropriate medical countermeasures based on identified threats.

### **6.9.3 Functional Solution Analysis**

#### **6.9.3.1 DOTLPF Assessment Summary**

There are no capability gaps identified for this task.

#### **6.9.3.2 IMA Assessment Summary**

N/A

**6.10 Task SNSHA 10: Coordinate global CBRND operations****6.10.1 Functional Area Analysis****6.10.1.1 Definition**

To provide overall coordination of global CBRND operations. Multiple CBRN/TIM events could occur in the same time frame around the globe. Rapid and effective response and mitigation coordination is required. CBRN/TIM event information provided in the COP is used to formulate appropriate actions and taskings. Includes the allocation and reallocation of CBRND resources to the combatant commanders. Includes overall coordination of multitheater restoration and elimination operations.

**6.10.1.2 Derivation**

*UJTL (SN 1.1.6, SN 2.2.1, SN 2.4.1.2, SN 3.4.4, SN 3.4.6, SN 4, SN 5.1.1, SN 5.1.2, SN 5.1.3, SN 5.7.1, SN 6.1, SN 7.4, SN 7.5, SN 8.1.6, SN 9, SN 9.1.3, SN 9.2, SN 9.2.1, SN 9.2.2), Protection Joint Functional Concept, Military Transformation: A Strategic Approach, Transformation Planning Guidance, An Operational Concept for Biological Defense, Joint Enabling Concept for CBRN Operations.*

**6.10.1.2.1 Supported Task: N/A****6.10.1.2.2 Lateral Tasks: SNSHA 4, SNSHA 8, SNSHA 9, SNSUST 8, SNSUST 12****6.10.1.2.3 Supporting Task: STSHA 8****6.10.1.3 Condition**

Perform this task under conditions of:

**Physical. N/A****Military**

1. Restrictive mission instructions. (C2.1.1)
2. No or partial preexisting arrangements. (C2.1.1.2)
3. No mission preparation. (C2.1.3)
4. Poor or partial Joint Staff integration. (C2.3.1.1)
5. Poor multinational integration. (C2.3.1.2)
6. Limited staff experience. (C2.3.1.3)

**Civil**

1. Uncooperative interdepartmental/interagency relationships. (C3.1.1.3)
2. Indifferent international politics. (C3.1.2)
3. Restrictive to vague command decisions. (C3.1.3)

## **6.10.2 Functional Needs Analysis**

### **6.10.2.1 Capability and Deficiency Assessment Summary**

Table 6.10-1 discusses the capability that currently exists to perform the task to the established standards. There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The Joint Staff Operations Directorate (J3) has primary responsibility for this task. The primary reasons why some standards were rated as deficient and limited in capability generally centered on JPME and CBRN specialists. JPME does not mandate a core minimum set of CBRNE tasks for mastery at the mid and Senior Service College levels. CBRN specialists do not receive training as strategic planners. Also, allocation adequacy for CBRN units, personnel and CBRND systems was considered less than fully capable. The overall current capability is assessed as “yellow.”

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. As *UJTL 5.0* comes into common usage and JRO initiatives to educate senior leaders becomes more widespread, Sense, Shape, Shield, and Sustain considerations will start to be integrated into all areas. DOTMLPF should begin to improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. In the far term, the success of initiatives recommended by this JCIDS and DOTMLPF enhancements across the board, made possible by focused experimentation and lessons learned from exercises, will improve all measures to a “green” rating.

**Table 6.10-1. SNSHA 10: Capability and Deficiency Assessment**

Capability/Measure	M1	M2	M3	M4	M5	M6	M7
<b>Current Overall Capability<sup>1</sup></b>	Y <sup>2</sup>	Y <sup>3</sup>	R <sup>4</sup>	Y <sup>5</sup>	Y <sup>6</sup>	Y <sup>7</sup>	Y <sup>8</sup>
<b>Near/Mid-Term Overall Capability<sup>9</sup></b>	Y	Y	Y <sup>10</sup>	Y	Y	Y	Y
<b>Far-Term Overall Capability</b>	G <sup>11</sup>	G	G	G	G	G	G

	FAA Measure	Scale
M1	CBRND units and personnel are adequately allocated.	G – Yes, Y – Limited, R – No
M2	CBRND systems and equipment are adequately allocated.	G – Yes, Y – Limited, R – No
M3	All pertinent Sense, Shape, Shield, and Sustain information is considered.	G – Yes, Y – Limited, R – No
M4	Coordination for CBRND operations includes transport, logistics, communications, and employment considerations.	G – Yes, Y – Limited, R – No
M5	Doctrine and TTPs for global CBRND coordination are available.	G – Yes, Y – Limited, R – No
M6	DoD and Joint Staffs are adequately trained to effectively coordinate CBRND operations.	G – Yes, Y – Limited, R – No
M7	International/joint exercises or experimentation provide feedback on efficacy of coordination of global CBRND operations.	G – Yes, Y – Limited, R – No

<sup>1</sup> No. JPME does not mandate a core minimum set of CBRNE tasks for mastery at the mid and Senior Service College levels. CBRN specialists do not receive training as strategic planners.

<sup>2</sup> Limited. CBRND units and personnel are insufficient for multitheater CBRN events and subsequent restoration operations in the event interdiction should fail against multiple adversaries with CBRN capability. Otherwise, current allocation within the force structure constraints is appropriate.

<sup>3</sup> Limited. Current CBRND end-item systems are scarce assets. CBRND resources, especially detection and force protection systems, must be focused on most critical assets.

<sup>4</sup> No. All pertinent Sense, Shape, Shield, and Sustain information is not considered. UJTL 4.7 does not establish Sense, Shape, Shield, and Sustain as critical domains. However, UJTL 5.0 will establish them.

<sup>5</sup> Limited. CJCS J-3 can establish coordination; however, given the fluid nature of current and future military engagement areas, precise and finite coordination must await execution orders.

<sup>6</sup> Limited. TIMs are not adequately addressed at the strategic national level. Joint Publication 3 Series (Operations) addresses CBRN coordination considerations.

<sup>7</sup> Limited. The Joint Senior Leaders Course provides a limited orientation at the strategic theater and operational levels. However, JPME does not mandate a core minimum set of CBRNE tasks for mastery at the mid and Senior Service College levels.

<sup>8</sup> Limited. Coordination of global CBRN/TIM defense operations at the strategic national level is limited to national policy, deterrence, interdiction, and elimination. CBRN/TIM defense operations occur at the strategic theater level and below.

<sup>9</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>10</sup> As UJTL 5.0 comes into common usage, and JRO initiatives to educate senior leaders becomes more widespread, Sense, Shape, Shield, and Sustain considerations will start to be integrated into all areas.

<sup>11</sup> In the far term, the success of initiatives recommended by this JCIDS and DOTMLPF enhancements across the board, made possible by focused experimentation and lessons learned from exercises will improve all measures to a “green” rating.

### 6.10.3 Functional Solution Analysis

#### 6.10.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA Summary.

1. **Deficiency:** Given multiple CBRN capable adversaries, CBRND units and personnel are insufficient for multitheater CBRN events and subsequent restoration operations.  
**Non-Materiel Solutions:** *Training:* Given the intensive requirements for reconnaissance and decontamination in a CBRN environment, reevaluate allocation rules for CBRND units.  
*Personnel:* Given the intensive requirements for information management, reconnaissance and decontamination in a CBRN environment, reevaluate allocation rules for CBRND personnel or automated decision aides.
2. **Deficiency:** All pertinent Sense, Shape, Shield, and Sustain information is not considered.  
**Non-Materiel Solutions:** *Doctrine:* UJTL 5.0 should effectively drive consideration of Sense, Shape, Shield, and Sustain domains.
3. **Deficiency:** Given the fluid nature of current and future military engagement areas, precise and finite CBRND logistical and operational coordination must await execution orders.  
**Non-Materiel Solutions:** *Doctrine:* Develop staff planning guidance for predictive CBRND operations and logistics.
4. **Deficiency:** Global TIM considerations are not adequately addressed at the strategic national level.  
**Non-Materiel Solutions:** *Doctrine:* Develop a global TIM assessment tool that allows staff planners predictive capability for TIM hazards.
5. **Deficiency:** JPME does not mandate a core minimum set of CBRND tasks for mastery at the mid and Senior Service College levels.  
**Non-Materiel Solutions:** *Training:* Conduct front-end analysis and training needs analysis to develop and implement appropriate instruction at the mid and Senior Service College level. Once training analysis is complete, resource manpower and time to support resident instruction and develop distributed training.
6. **Deficiency:** Lack of automated CBRN/TIM hazard assessment capabilities.  
**Non-Materiel Solutions:** None.

#### 6.10.3.2 IMA Assessment Summary

Table 6.10-2 shows possible materiel approaches that address the remaining materiel requirements of the DOTMLPF assessment.

**Table 6.10-2. SNSHA 10. IMA Assessment**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Automated tools	Develop a global CBRN automated assessment tool that allows staff planners predictive capability for CBRN hazards

**6.11 Task SNSHA 11: Provide Shape “Global Family of Engagement Plan” policies and guidelines to combatant commanders****6.11.1 Functional Area Analysis****6.11.1.1 Definition**

To formulate policy for Shape “Global Family of Engagement Plans” and to provide this policy, as well as specific guidelines, to combatant commanders for execution. In conjunction with interagency partners, CJCS establishes and develops these policy and guidelines. Because the threat of CBRN/TIM weapons is of concern to all nations and potential allies, offering assistance in establishing a Shape operational capability through training or equipment can help forge new friendships and cooperation. Provision of this assistance also will make Shape operational issues easier to address in remote or austere areas if the host nation has a Shape capability.

**6.11.1.2 Derivation**

*UJTL (SN 9.2.1, SN 8, SN 7.5, SN 5.4.3), CJCSM 3113.01a.*

**6.11.1.2.1 Supported Task: N/A****6.11.1.2.2 Lateral Tasks: SNSENS 15, SNSHA 8, SNSUST 11****6.11.1.2.3 Supporting Task: STSHA 9****6.11.1.3 Condition**

Perform this task under conditions of:

**Physical. N/A**

**Military**

1. No preexisting arrangements. (C2.1.1.2)
2. Limited personnel expertise. (C2.2.4.5)

**Civil. N/A**

**6.11.2 Functional Needs Analysis****6.11.2.1 Capability and Deficiency Assessment Summary**

Table 6.11-1 discusses the only capability that currently exists to perform the task to the designated standards. There is only one capability that exists, and no other capability is projected that will accomplish this task.

### **Current Capability and Deficiency**

The phrase “global family of engagement plan” is used in the *Theater Engagement Planning (TEP) Joint Manual*<sup>1</sup> to describe action to develop a process to globally integrate all military engagement activities. This integration is mandated by *Defense Planning Guidance FY 2002–2007, 6 April 2000*. The TEPs from each geographic combatant commander or designated Executive Agent are integrated into the “Global Family of Engagement Plans.” They are approved by the CJCS and forwarded to the Under Secretary of Defense for Policy for review. This process and the review, and any guidance or support to aid the combatant command in the initial development of the TEP, is a strategic national-level activity. TEP activities, particularly those dealing with CBRND, should be coordinated and integrated with the Theater Security Cooperation Plan where appropriate. Because of the requirement to Sense, Shape, Shield, and Sustain, as embodied in the CBRND Enabling Concept, the process must be accomplished, at a minimum, with the technical assistance and support of JRO-CBRND. The phrase “Shape Global Family of Engagement Plans” denotes the integration of Shape CBRND Enabling Concept ideas into any policies and guidelines that would have an impact on combatant command development of TEPs. The overall current capability is assessed as “red.”

### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Near/mid-term experimentation results (as recommended in this JCIDS analysis) may lead to development of new capabilities. It is projected that improvements due to coordination/DOTMLPF enhancements will dramatically improve DoD’s ability to articulate and provide Shape Global Family of Engagement Plans and to provide policy, as well as specific guidelines, to combatant commanders for execution. The overall status should improve to “yellow” due to these initiatives but is not anticipated to improve more than that due to the inherent difficulties posed by international relations.

### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. The overall status is likely to remain “yellow” due to the inherent difficulties posed by international relations.

---

<sup>1</sup> *CJCSM 3113.01a*.

**Table 6.11-1. SNSHA 11: Capability and Deficiency Assessment**

<b>Capability: CJCS</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>R<sup>2</sup></b>	<b>R<sup>3</sup></b>	<b>R<sup>4</sup></b>
<b>Near/Mid-Term Overall Capability</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>
<b>Far-Term Overall Capability</b>	<b>Y<sup>5</sup></b>	<b>Y</b>	<b>Y</b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	“Shape” Global Family of Engagement Plan policies and guidelines and Theater Security Cooperation Plan are established.	G – Yes, Y – Limited, R – No
M2	Existing policies and guidelines are updated regularly.	G – Yes, Y – Limited, R – No
M3	Joint exercises and experimentation provide feedback on the efficacy of strategic guidance development processes.	G – Yes, Y – Limited, R – No

<sup>1</sup> No doctrine, i.e., staff guidance or JTTPs, has been established specifically for Shape initiatives.

<sup>2</sup> No. Although generic guidance exists in *CJCSM 3113.01a*, the “Global Family of Engagement Plans” does not include Shape initiatives.

<sup>3</sup> There are no policies or guidelines to update.

<sup>4</sup> Joint exercises focused on restoration operations and the efficacy of Shape Global Family of Engagement Plan policies and guidelines have not been conducted.

<sup>5</sup> The overall status should improve to “yellow” due to a multitude of initiatives but is not anticipated to improve more than that due to the inherent difficulties posed by international relations.

### 6.11.3 Functional Solution Analysis

#### 6.11.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA Summary.

1. **Deficiency:** CBRND Shape considerations are not included in the “Global Family of Engagement Plan.”  
**Non-Materiel Solutions:** *Doctrine:* Ensure that “Global Family of Engagement Plan” policies and guidelines include CBRND Shape considerations.
2. **Deficiency:** No exercises focused on CBRND Shape considerations.  
**Non-Materiel Solutions:** *Doctrine:* Establish working groups to establish policies and guidelines that include CBRND Shape considerations into TEPs. *Training:* Develop exercises that include CBRND Shape considerations and focus on gathering information of the efficacy of global family of engagement planning. *Personnel:* Incorporate into Joint National Training Capability.
3. **Deficiency:** No doctrine (i.e., Staff guidance or Joint Tactics, Techniques, and Procedures [JTTPs]) has been established.  
**Non-Materiel Solutions:** *Doctrine:* Establish doctrine, i.e. staff guidance/policies (Chairman of the Joint Chiefs of Staff Instruction; Chairman of the Joint Chiefs of Staff Manual; or JTTPs). Such policies and guidelines should be included in documents like CJCSM 3113.01A Theater Engagement Planning, Defense Planning Guidance, the Joint Staff Capabilities Plan, and any CBRN-specific publications might provide guidance on CBRND integration into TEPs.
4. **Deficiency:** No training provides feedback.  
**Non-Materiel Solutions:** *Training:* Develop training on “Global Family of Engagement Plan” CBRND Shape considerations so that lessons learned can be gathered.
5. **Deficiency:** No JPME education on global family of engagement planning, including CBRND Shape considerations.  
**Non-Materiel Solutions:** *Leadership:* Develop JPME leader education on “Global Family of Engagement Plan” CBRND Shape considerations. Provide materials to the Joint Forces Staff College so it can use CBRND Shape considerations as a TEP example.

#### 6.11.3.2 IMA Assessment Summary

N/A

**6.12 Task SNSHA 12: Establish global cooperative CBRN/TIM-detection policies, procedures, and networks****6.12.1 Functional Area Analysis****6.12.1.1 Definition**

To link global active systems (such as satellite systems) with active and passive sensors integration into satellite uplinks with an acceptable share-warn software/hardware protocol with consideration to information classification. Builds a seamless web from the national capabilities down to individual tactical detectors within the global battlespace to provide a means of detecting both delivery vehicles and agents.

**6.12.1.2 Derivation**

*UJTL (SN 9.1.3, SN 2.4.1.2, SN 2.4.2.1, SN 3.5.3.3, SN 3.5.3.5), JP (2-0, 2-02).*

**6.12.1.2.1 Supported Task: N/A****6.12.1.2.2 Lateral Tasks: SNSHA 8, SNSHA 14****6.12.1.2.3 Supporting Task: STSHA 10****6.12.1.3 Condition**

Perform this task under conditions of:

**Physical. N/A****Military**

1. Partial preexisting arrangements. (C 2.1.1.2)

**Civil**

1. Limited foreign government support. (C3.1.2.3)
2. Moderately opposed foreign public opinion. (C3.1.2.4)

**6.12.2 Functional Needs Analysis****6.12.2.1 Capability and Deficiency Assessment Summary**

Table 6.12-1 discusses the capability that currently exists to perform the task “Establish global cooperative CBRN/TIM-detection policies, procedures, and networks” to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The current capability assessment is “yellow.” There currently are no cooperative linkages between various global systems capabilities, even though such linkages have been proposed. Global cooperative CBRN/TIM-detection policies, procedures and networks have not been established with all nonadversary nations.

**Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. No substantive improvement is expected over the near/mid term.

**Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. The assessment should remain at “yellow” in the far term. As cooperative linkages between various systems capabilities are coordinated and established between various detection technologies (e.g., BIDS, phased-array radars, standoff motion detectors, passive monitors, vehicular embedded detectors with GPS linkages and automatic position reporting, individual detectors networked to centralized data servers, etc.) global cooperative CBRN/TIM-detection policies, procedures and networks will be established in limited fashion. All supporting and required DOTMLPF enhancements will be initiated, but it will take years of experimentation, international policy debates, and exercises before full capability is realized.

Table 6.12-1. SNSHA 12: Capability and Deficiency Assessment

Capability: Joint Requirements Office for CBRND	M1	M2	M3	M4	M5	M6
Current Overall Capability <sup>1</sup>	R <sup>2</sup>	Y <sup>3</sup>	Y <sup>4</sup>	R <sup>5</sup>	Y <sup>6</sup>	Y <sup>7</sup>
Near/Mid-Term Overall Capability	R	Y	Y	R	Y	Y
Far-Term Overall Capability <sup>8</sup>	Y <sup>9</sup>	Y	Y	Y	Y	G <sup>10</sup>

	FAA Measure	Scale
M1	Global cooperative CBRN/TIM-detection policy is established.	G – Yes, Y – Limited, R – No
M2	Global cooperative CBRN/TIM-detection procedures are established.	G – Yes, Y – Limited, R – No
M3	Global cooperative CBRN/TIM-detection networks are established.	G – Yes, Y – Limited, R – No
M4	Policies and procedures have been established with all nonadversary nations.	G – Yes, Y – Limited, R – No
M5	Existing policies and procedures are updated regularly.	G – Yes, Y – Limited, R – No
M6	International/joint exercises or experimentation provide feedback on efficacy of coordination of global CBRN/TIM defense operations.	G – Yes, Y – Limited, R – No

<sup>1</sup> No. Effective organization, training, and doctrine cannot be established because some nonadversary nations are not parties to these proposals.

<sup>2</sup> There currently are no cooperative linkages between various global systems capabilities, even though such linkages have been proposed. No cooperative CBRN/TIM-detection policies are required because no linkages currently exist between various detection technologies (e.g., BIDS, phased-array radars, standoff motion detectors, passive monitors, vehicular-embedded detectors with GPS linkages and automatic position reporting, individual detectors networked to centralized data servers, etc.).

<sup>3</sup> Limited. Global cooperative detection procedures have been proposed.

<sup>4</sup> Limited. Global cooperative CBRN/TIM-detection networks are proposed.

<sup>5</sup> No. Global cooperative CBRN/TIM-detection policies, procedures and networks have not been established with all nonadversary nations.

<sup>6</sup> Limited. There is no need to update policies and procedures at present because global cooperative CBRN/TIM-detection policies, procedures, and networks are only in the proposal stages.

<sup>7</sup> Limited. Some exercises (e.g., TOPOFF, Determined Promise) can provide feedback on efficacy of coordination of global CBRN/TIM defense operations. **Only real-time warning in the virtual environment** is envisioned as a potential candidate for feedback in international and joint exercises because this task pertains to global cooperative CBRN/TIM-detection policies, procedures, and networks.

<sup>8</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>9</sup> As cooperative linkages between various systems capabilities are coordinated and established between various detection technologies (e.g., BIDS, phased-array radars, standoff motion detectors, passive monitors, vehicular-embedded detectors with GPS linkages and automatic position reporting, individual detectors networked to centralized data servers, etc.) global cooperative CBRN/TIM-detection policies, procedures and networks will be established in limited fashion. All supporting and required DOTMLPF enhancements will be initiated, but it will take years of experimentation, international policy debates, and exercises before full capability is realized.

<sup>10</sup> International and joint exercises will begin to yield effective lessons learned on global cooperative CBRN/TIM-detection policies, procedures, and networks.

### 6.12.3 Functional Solution Analysis

#### 6.12.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA Summary.

1. **Deficiency:** The National Military Command Authority (NMCA) could receive an inaccurate picture of the CBRN COP.  
**Non-Materiel Solutions:** *Doctrine:* Establish JTTPs and international protocols for cooperative CBRN/TIM detection.
2. **Deficiency:** NMCA does not have a real-time view of the CBRN COP.  
**Non-Materiel Solutions:** *Doctrine:* Establish JTTPs and international protocols for cooperative CBRN/TIM-detection networks.
3. **Deficiency:** Concepts have not been refined through experimentation.  
**Non-Materiel Solutions:** *Training:* Concepts must first be developed based on proposed linkages that will provide effective, integrated CBRN/TIM-detection capabilities. These concepts must be explored and refined through experimentation and then cooperative linkages established and tested.
4. **Deficiency:** Global cooperative CBRN/TIM-detection policies, procedures, and networks have not been established with all nonadversary nations.  
**Non-Materiel Solutions:** *Doctrine:* Establish cooperative CBRN/TIM-detection policies and procedures with nonadversary nations.
5. **Deficiency:** Lack of global CBRN/TIM-detection network capabilities.  
**Non-Materiel Solutions:** None.

#### 6.12.3.2 IMA Assessment Summary

Table 6.12-2 shows possible materiel approaches that address the remaining materiel requirements of the DOTMLPF assessment.

Table 6.12-2. SNSHA 12: IMA Assessment

Idea for Materiel Approach	Description
Networked detection system	There is a need to develop global cooperative linkages between various global, proponent and service detection and sensing technologies.. Concepts must first be developed based on proposed linkages that will provide effective, integrated CBRN/TIM-detection capabilities. These concepts must be explored through experimentation and then cooperative linkages established and tested. The entire package should be developed as a system. As each Service or allied country develops detection or sensing technologies, they should be analyzed for inclusion into the global CBRN/TIM cooperative detection network and modifications (if required) should be mandated for the Service systems.

**6.13 Task SNSHA 13: Coordinate internationally accepted standards and procedures for determining employment of CBRN/TIM weapons****6.13.1 Functional Area Analysis****6.13.1.1 Definition**

To develop and secure approval of internationally accepted standards and procedures for determining employment of CBRN/TIM weapons. Includes standards and procedures for determining first use of CBRN/TIM weapons by a nation state or transnational organization and the means by which verification of attack will be confirmed. Considers information classification.

**6.13.1.2 Derivation**

*UJTL (SN 9.1.3, SN 7.5, SN 8.1.12)*

**6.13.1.2.1 Supported Task: N/A****6.13.1.2.2 Lateral Tasks: SNSHA 4, SNSHA 8, SNSHA 14****6.13.1.2.3 Supporting Task: STSHA 11****6.13.1.3 Condition**

Perform this task under conditions of:

**Physical. N/A****Military**

1. No preexisting arrangements. (C 2.1.1.2)
2. Limited personnel expertise. (C2.2.4.5)
3. Restricted information exchange. (C2.3.1.8)
4. Ambiguous threat. (C2.9.3)

**Civil**

1. Mixed support for political policies. (C3.1)
2. Limited foreign government support. (C3.1.2.3.)

## **6.13.2 Functional Needs Analysis**

### **6.13.2.1 Capability and Deficiency Assessment Summary**

Table 6.13-1 discusses the capabilities that currently exist to perform the task to the established standards. These are the only capabilities that exist, and no other capabilities are projected that will accomplish this task.

#### **Current Capability and Deficiency**

OSD and the CJCS are responsible for ensuring that military representatives are able to coordinate with allies, allied military organizations, potential hosting nations, and coalition partners for establishing internationally accepted standards and procedures for determining employment of CBRN/TIM weapons. The capability to establish internationally accepted standards and procedures for determining employment of CBRN/TIM weapons exists now administratively. Mechanisms currently used are NATO working groups that develop Standardization Agreements and Allied Joint Publications (AJPs) as well as ABCA Quadripartite working groups. The current assessment is “yellow” because each nation in the international community has its own verification protocol. Also, use of TIM poses special problems in trying to determine whether it is an accident or an intentional attack. International recognition would have to currently be sought on an ad hoc basis. International exercises, even with Quadripartite and NATO partners, seldom use realistic CBRN/TIM scenarios or highlight verification exercise objectives.

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. No substantive improvement is expected in the near/mid term.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. In the far term, international exercises/experiments, with NATO partners, will use realistic CBRN/TIM scenarios and highlight verification exercise objectives and will result in some slight improvements. Only after lessons are learned from these exercises/experiments can progress be made in other areas. The far-term capability will improve to “green.”

**Table 6.13-1. SNSHA 13: Capability and Deficiency Assessment**

Capability/Measure	M1	M2	M3
<b>Current</b>			
ABCA Quadripartite Working Group	Y <sup>1</sup>	G <sup>2</sup>	Y <sup>3</sup>
NATO Working Groups	Y <sup>4</sup>	G <sup>5</sup>	Y <sup>6</sup>
<b>Near/Mid</b>			
ABCA Quadripartite Working Group	Y	G	Y
NATO Working Groups	Y	G	Y
<b>Far</b>			
ABCA Quadripartite Working Group	Y	G	G <sup>7</sup>
NATO Working Groups	Y	G	G <sup>8</sup>
<b>Current Overall Capability</b>	Y	G	Y
<b>Near/Mid-Term Overall Capability</b>	Y	G	Y
<b>Far-Term Overall Capability</b>	Y	G	G

	FAA Measure	Scale
M1	Internationally accepted standards and policy for determining employment of CBRN/TIM weapons are established.	G – Yes, Y – Limited, R – No
M2	Existing standards and policies are updated regularly.	G – Yes, Y – Limited, R – No
M3	International exercises/experimentation provide feedback on efficacy of standards and policy.	G – Yes, Y – Limited, R – No

<sup>1</sup> Within the Quadripartite, QSTAG 1999, the sampling and identification of biological and chemical agents (SIBCA), provides an outline of what is to be accomplished—but each nation has its own national verification protocol. Also, use of TIM poses special problems in trying to determine whether it is an accident or an intentional attack. International recognition would have to currently be sought on an ad hoc basis.

<sup>2</sup> Quadripartite groups meet on a regular basis.

<sup>3</sup> International exercises, even with Quadripartite and NATO partners, seldom use realistic CBRN/TIM scenarios or highlight verification exercise objectives.

<sup>4</sup> Within NATO, STANAG 4359, the sampling and identification of biological and chemical agents and provides an outline of what is to be accomplished, but each nation has its own national verification protocol. Also, use of TIM poses special problems in trying to determine whether it is an accident or an intentional attack. International recognition would have to currently be sought on an ad hoc basis.

<sup>5</sup> NATO working groups meet on a regular basis.

<sup>6</sup> International exercises, even with Quadripartite and NATO partners, seldom use realistic CBRN/TIM scenarios or highlight verification exercise objectives.

<sup>7</sup> International exercises, with Quadripartite partners, will use realistic CBRN/TIM scenarios and highlight verification exercise objectives. Only after lessons are learned from these exercises can progress be made in other areas.

<sup>8</sup> International exercises, with NATO partners, will use realistic CBRN/TIM scenarios and highlight verification exercise objectives. Only after lessons are learned from these exercises can progress be made in other areas.

### 6.13.3 Functional Solution Analysis

#### 6.13.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA Summary.

1. **Deficiency:** Each NATO/Quadripartite nation has its own national verification protocol.  
**Non-Materiel Solutions:** *Doctrine:* Develop universally accepted and employed verification protocols.
2. **Deficiency:** Nations not part of NATO or the Quadripartite must agree to use sampling and identification of biological and chemical agents (SIBCA) or some other arrangement.  
**Non-Materiel Solutions:** *Doctrine:* Engage nations not part of NATO and the Quadripartite to establish formal agreements to use sampling and identification of biological and chemical agents.
3. **Deficiency:** TIM poses special problems in trying to determine whether it is an accident or an intentional attack.  
**Non-Materiel Solutions:** *Doctrine:* Develop procedures and protocols for verification of TIM attacks.
4. **Deficiency:** International recognition would have to currently be sought on an ad hoc basis.  
**Non-Materiel Solutions:** *Doctrine:* Establish international verification standards.
5. **Deficiency:** Doctrine and TTPs need to be developed for collaborative verification procedures.  
**Non-Materiel Solutions:** *Doctrine:* Develop doctrine and TTPs for collaborative verification procedures that work for the international community.
6. **Deficiency:** There are no international exercises that provide feedback on the processes employed for determining employment of CBRN weapons and verification procedures.  
**Non-Materiel Solutions:** *Training:* Ensure development of and participate in international exercises that will provide feedback on the processes employed for determining employment of CBRN weapons.

#### 6.13.3.2 IMA Assessment Summary

N/A

**6.14 Task SNSHA 14: Sense the exportation of CBRN/TIM weapons or components****6.14.1 Functional Area Analysis****6.14.1.1 Definition**

To obtain information and data from all sources that determine when a nation state or transnational organization has initiated the exportation of CBRN/TIM weapons or components to other countries or transnational organizations. Areas of interest include nation states/organizations involved and types of CBRN/TIM weapons being exported.

**6.14.1.2 Derivation**

*UJTL (SN 9.1.3, SN 2.4.1.2, SN 8.1.10), JP (2-0, 2-02).*

**6.14.1.2.1 Supported Task: N/A****6.14.1.2.2 Lateral Tasks: SNSHA 2, SNSHA 12, SNSHA 13****6.14.1.2.3 Supporting Task: STSHA 8****6.14.1.3 Condition**

Perform this task under conditions of:

**Physical. N/A****Military**

1. Negligible intelligence database. (C2.4.2)
2. Negligible theater intelligence access. (C2.4.2)
3. Conventional and terrorist threat form. (C2.9.2)
4. Prehostilities state of conflict. (C2.10.1)

**Civil**

1. Negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)

**6.14.2 Functional Needs Analysis****6.14.2.1 Capability and Deficiency Assessment Summary**

Table 6.14-1 discusses the only capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The Joint Staff Directorate for Intelligence, J-2, is responsible for working with national-level organizations to obtain intelligence that is required to support joint operations. In the case of this task, the lead federal agency for nonproliferation issues and the coordination of the associated intelligence initiatives is the State Department. Per joint intelligence doctrine, the J-2 is responsible for coordinating all intelligence-related CBRN functions pertaining to adversary employment of CBRN weapons with the appropriate CBRN staff element, but because of documented training, education, and experience issues, J-2 personnel may not have a full grasp of what needs to be coordinated. As the Chairman of the Joint Chiefs of Staff's single source of expertise in addressing CBRN defense issues involving the warfight, JRO-CBRND must proactively engage the J-2 to determine the adequacy of current and projected national-level intelligence capabilities to sense the exportation of CBRN/TIM weapons or components. For the purposes of this analysis, current capabilities are listed and issues that need to be further assessed and clarified are provided for JRO-CBRND action. The current assessment is "yellow."

**Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Near/mid-term experimentation results (as recommended in this JCIDS analysis) may lead to development of new capabilities. It is projected that improvements due to coordination/DOTMLPF enhancements will dramatically improve DoD's ability to articulate and assess Sense requirements, but the overall status will remain "yellow" due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

**Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. New organizational structures or other capabilities resulting from near/mid-term experimentation results (as recommended in this JCIDS analysis) may dramatically improve DoD's ability to develop intelligence indicators for sensing the exportation of CBRN/TIM weapons or components, but the overall status is projected to remain "yellow" due to the inherent difficulty in gathering intelligence on CBRN/TIM proliferation activities.

**Table 6.14-1. SNSHA 14: Capability and Deficiency Assessment**

<b>Capability: Joint Staff Directorate for Intelligence, J-2</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>
<b>Current Overall Capability<sup>1</sup></b>	Y <sup>2</sup>	Y <sup>3</sup>	Y <sup>4</sup>
<b>Near/Mid-Term Overall Capability</b>	Y <sup>5</sup>	Y	Y
<b>Far-Term Overall Capability<sup>6</sup></b>	Y <sup>7</sup>	Y	Y

	<b>FAA Measure</b>	<b>Scale</b>
M1	Countries or transnational organizations initiating the exportation of CBRN/TIM weapons or components to other countries or transnational organizations are detected and identified.	G – Yes, Y – Limited, R – No
M2	Intelligence on countries or transnational organizations initiating exportation of CBRN/TIM weapons or components to other countries or transnational organizations is accurate.	G – Yes, Y – Limited, R – No
M3	Strategic surprise does not occur.	G – Yes, Y – Limited, R – No

<sup>1</sup> Joint intelligence and CBRN publications do not adequately address this issue. JRO-CBRND is not adequately staffed and organized to meet its intelligence-related responsibilities. The J-2 staff is not adequately trained/educated in CBRN issues. CBRN staff officers are not adequately trained/educated in intelligence issues. Experimentation does not provide feedback on intelligence indicators for this task. JPME does not adequately cover the fusion of intelligence/CBRN issues.

<sup>2</sup> The J-2 works with various national-level organizations to detect and identify countries or transnational organizations initiating the exportation of CBRN/TIM weapons or components to other countries or transnational organizations. Techniques and procedures to facilitate this process and to provide useful indicators may not be adequate.

<sup>3</sup> The J-2 works with various national-level organizations to ensure accuracy of intelligence on countries or transnational organizations initiating the exportation of CBRN/TIM weapons or components to other countries or transnational organizations. Techniques and procedures to facilitate this process and to ensure accuracy may not be adequate.

<sup>4</sup> The J-2 works with various national-level organizations to ensure that strategic surprise does not occur. Adequate resources and means may not be sufficiently applied to ensure countries or transnational organizations initiating the exportation of CBRN/TIM weapons or components to other countries or transnational organizations are detected.

<sup>5</sup> Near/mid-term improvements for all measures will depend upon the emphasis placed upon, and efficacy of experimentation which will be designed to close knowledge gaps.

<sup>6</sup> DOTMLPF to support task should improve if effective experimentation closes knowledge gaps.

<sup>7</sup> Once knowledge gaps are closed, concepts may be refined and new capabilities will be proposed and refined as a result of experimentation.

### 6.14.3 Functional Solution Analysis

#### 6.14.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA Summary.

1. **Deficiency:** Techniques and procedures to facilitate detecting and identifying countries or transnational organizations initiating the exportation of CBRN/TIM weapons or components to other countries or transnational organizations may not be adequate.

**Non-Materiel Solutions:** *Doctrine:* JRO-CBRND must work with J-2 and/or national intelligence organizations to develop effective techniques, procedures, and indicators for detecting and identifying countries/transnational organizations initiating the exportation of CBRN/TIM weapons or components to other countries/transnational organizations. These indicators must include the means to determine agent types, nuclear weapon types and yields, TIMs being considered, means by which to release TIMs, delivery modes or systems, countries and transnational organizations involved, business interests or industrial organizations involved, shipping mechanisms, techniques used to avoid detection and enter nation states, and routes.

2. **Deficiency:** Techniques and procedures to ensure accurate intelligence on countries or transnational organizations initiating the exportation of CBRN/TIM weapons or components to other countries or transnational organizations may not be adequate.

**Non-Materiel Solutions:** *Doctrine:* JRO-CBRND must work with J-2 and/or national intelligence organizations to develop effective techniques and procedures to ensure accurate intelligence on countries or transnational organizations initiating the exportation of CBRN/TIM weapons or components to other countries or transnational organizations and to develop metrics to measure accuracy.

3. **Deficiency:** Adequate resources and means may not be sufficiently applied to ensure that a nation state or transnational organization initiating the exportation of CBRN/TIM weapons or components to other countries or transnational organizations is detected.

**Non-Materiel Solutions:** *Organization:* The CBRN organization or staffing of the J-2 as well as each national intelligence organization must be analyzed from a DoD standpoint to ensure that they can provide required CBRN intelligence concerning CBRN hazards. These hazards need to be detected, identified and quantified in order for Shape to provide a clear understanding of the current and predicted CBRN situation to the commander. An organization dedicated to providing CBRN technical expertise and assistance to the J-2 and national-level intelligence organizations should be established. *Training:* JRO-CBRND must work with J-2 and/or national intelligence organizations to develop effective training for analysts as well as those managing all means of collection. The training must allow analysts and collection managers the means by which to determine inadequacy of collection mechanisms and a means to make recommendations for improvement. *Leadership:* JRO-CBRND must work with J-2 and/or national intelligence organizations to develop an effective CBRN education program for analysts as well as those managing all means of

collection. The education process must provide analysts and collection managers with the tools they need to assess the efficacy of their analysis and collection efforts. *Personnel*: Personnel should not be assigned to intelligence analysis or collection activities vital to CBRN areas without requisite CBRN education and/or experience. *Facilities*: Training requirements should be analyzed and special training facilities developed/modified if required.

4. **Deficiency**: Joint intelligence and CBRN publications do not adequately address this issue.  
**Non-Materiel Solutions**: *Doctrine*: Joint intelligence and CBRN publications must be enhanced to adequately address this issue and to interface with each other so that roles and responsibilities are clearly delineated.
5. **Deficiency**: JRO-CBRND is not adequately staffed and organized to meet its intelligence-related responsibilities.  
**Non-Materiel Solutions**: *Organization*: JRO-CBRND should have a staff section dedicated to resolving CBRN intelligence community issues. *Personnel*: JRO-CBRND should have adequate trained/experienced personnel assigned to man a staff section dedicated to resolving CBRN intelligence community issues.
6. **Deficiency**: The J-2 staff is not adequately trained/educated in CBRN issues.  
**Non-Materiel Solutions**: *Training*: Develop training that will enable the J-2 staff to better understand their CBRN role and enhance their ability to obtain intelligence that is required to support the Shape function of strategic national CBRND. *Leadership*: Develop an education program that will enable the J-2 staff to better understand their CBRN role and enhance their ability to obtain intelligence that is required to support the Shape function of strategic national CBRND.
7. **Deficiency**: CBRN staff officers are not adequately trained/educated in intelligence issues.  
**Non-Materiel Solutions**: *Training*: Develop training programs that allow CBRN staff officers to better support the CBRN intelligence process. *Leadership*: Develop education programs that allow CBRN staff officers to better understand the CBRN intelligence process and their roles and responsibilities.
8. **Deficiency**: Experimentation/red teaming does not provide feedback on intelligence indicators for this task.  
**Non-Materiel Solutions**: *Training*: JRO-CBRND must work with J-2 and/or national intelligence organizations to integrate this task into both intelligence and CBRN experimentation campaign plans. Interagency experimentation and exercises must also be developed to cover nonproliferation issues.
9. **Deficiency**: JPME does not adequately cover the fusion of intelligence/CBRN issues.  
**Non-Materiel Solutions**: *Leadership*: Integrate intelligence/CBRN fusion issues into JPME.
10. **Deficiency**: DoD CBRN experts detailed to the national intelligence organizations do not receive adequate preparation, support, or briefing for DoD lessons learned.

**Non-Materiel Solutions:** *Organization:* Ensure that CBRN organizations that provide DoD detailees to national intelligence organizations are proactive in ensuring their institutional CBRN intelligence needs are both understood and met and that the detailees they provide are prepared in every way. *Leadership:* CBRN DoD detailees to national intelligence organizations must be provided with formal educational preparation. *Personnel:* CBRN DoD detailees to national intelligence organizations must possess adequate skill and experience.

## **CHAPTER 7. STRATEGIC THEATER SHAPE TASKS**

## Table of Contents

List of Acronyms .....	ii
7.0 Strategic Theater Shape .....	1
7.1 Task STSHA 1: Characterize the theater CBRN/TIM threat and situation .....	5
7.2 Task STSHA 2: Conduct theater CBRN/TIM vulnerability analysis .....	11
7.3 Task STSHA 3: Determine CBRND resources required to meet the theater CBRND situation .....	17
7.4 Task STSHA 4: Ensure theater CBRND readiness .....	22
7.5 Task STSHA 5: Coordinate theater CBRND information systems and processes .....	27
7.6 Task STSHA 6: Provide theater CBRND strategy, plans, and policy .....	32
7.7 Task STSHA 7: Coordinate CBRND aspects of theater medical operations .....	36
7.8 Task STSHA 8: Coordinate theater CBRND operations .....	40
7.9 Task STSHA 9: Develop TEPs for Shape considerations and activities for assigned theater or designated countries .....	45
7.10 Task STSHA 10: Establish theater cooperative CBRN/TIM-detection policies, procedures, and networks .....	49
7.11 Task STSHA 11: Develop theater policies, standards, and procedures for determining employment of CBRN/TIM weapons .....	54

## **7.0 Strategic Theater Shape**

### **7.0.1 Introduction**

At the strategic level of war, a nation, often as a member of a group of nations, determines national or multinational (alliance or coalition) security objectives and guidance and develops and uses national resources to accomplish these objectives. Activities at this level establish national and multinational military objectives, sequence initiatives, define limits and assess risks for the use of military and other instruments of national power, develop global plans or theater war plans to achieve these objectives, and provide military forces and other capabilities in accordance with strategic plans. The strategic theater sublevel encompasses combatant command tasks. Eleven strategic theater shape tasks were identified in the chemical, biological, radiological, and nuclear (CBRN) Functional Area Analysis (FAA).

This chapter, detailing the Strategic Theater (ST) Shape (SHA) area, restates relevant information from the CBRND Defense (CBRND) FAA, including a description of each of the 11 STSHA tasks, derivation of the task, an indication of other linked-tasks, and the pertinent conditions. The Functional Needs Analysis (FNA) section addresses the capability and deficiency analysis and gives a brief description of potential near-term changes. Once all the capabilities are considered, the assessment concludes with a separate, overarching look at the entire capability spectrum to identify remaining gaps and/or synergies. The Functional Solutions Analysis (FSA) section addresses possible solutions for the deficiencies identified in the FNA section. These are categorized into materiel or non-materiel. The non-materiel solutions are addressed first and reflect one or more of the six areas of DOTLPP: doctrine, organization, training, leadership, personnel, and facilities. If there is no non-materiel solution to the deficiencies, then materiel solutions are considered. These encompass broad approaches that are not system-specific. These potential materiel approaches are addressed and in the Ideas for Materiel Approaches (IMA) section. The IMAs provide a possible near- or far-term resolution to identified deficiencies within the individual capabilities.

### **7.0.2 FNA Summary**

Table 7.0-1 summarizes the overall current and projected capability to perform the STSHA tasks identified in the CBRND FAA. The overall capability to conduct these tasks in the current time frame is assessed as “yellow.” From a readiness point of view, any combatant command (COCOM) staff has a team of operational planners and information command and control specialists to include CBRND subject matter experts. This team of experts forms the backbone of the COCOM staff and command structure. The COCOM staff is responsible for readiness, to include CBRN issues and concerns. Joint Tactics, Techniques, and Procedures (JTTPs) and tools to evaluate and assess CBRND staffs, capabilities, systems, and concepts within an Area of Responsibility (AOR) are limited. Forces and staffs of other nations may or may not have training, equipment, or experience to effectively conduct CBRND operations. The theater CBRN/toxic industrial material (TIM) vulnerability analysis and risk assessments process surpasses the sole purview of DoD. Actionable CBRN intelligence is only as valid as its source and the time it takes to process. Possible and plausible CBRN employment and TIM hazards are not necessarily also included in visualizing the impact of adversary Courses of Action (COAs)

on forces of interest. TIM vulnerability assessment tools are limited; TIM vulnerability analysis must be conducted manually on a region-by-region basis. There are also deficiencies associated with a COCOM's ability to coordinate theater CBRND information systems and processes required to meet the theater CBRN/TIM situation. As programmed, the Joint Warning and Reporting Network (JWARN) is a suite of hardware and software that should, once fully operational, provide adequate coverage to each of the measures listed in Table 7.0-1. Until JWARN is fully operationally capable, limitations to CBRN information systems and processes include manual data receipt and entry, limited interface with the Common Operating Picture (COP), restricted information flow into the Global Command and Control System (GCCS) and limitations to real-time situational awareness. JWARN is available within the theater and interfaces with the GCCS but is currently limited to manual input and retrieval. Capability will improve dramatically with the anticipated fielding initial operational capability (IOC) of the Joint Effects Model (JEM) Block I in FY2006 and the IOC of the Joint Operational Effects Federation (JOEF) Block I, Increment I in FY2008. JOEF will provide a significant CBRN-adaptive planning capability. The JEM will provide a single, validated capability to predict and track CBRN and TIM events and effects. The JOEF will provide an operational requirements modeling and simulation system which accurately predicts CBRN effects on personnel, equipment, and operations.

Despite continuing improvements in all of these areas, STSHA is projected only to "yellow" over the mid term. The overall projected assessment remaining the same for ST-level Shape tasks is based on anticipated extrapolated results of current and programmed doctrine, organization, training, materiel, leadership and education, personnel, and facilities (DOTMLPF) initiatives. There are no major technological barriers to be overcome, but major emphasis in future budgeting and programming of resources will be required to initiate or enhance recommended DOTMLPF solutions. The estimated pace of change reflected in this assessment could be accelerated or slowed based on decisions to accelerate or slow the implementation of recommended solutions. An additional assessment challenge is to anticipate and incorporate the contribution that an educated, trained, and experienced leadership base will make to improvements in CBRND Shape capability. Integration of CBRND capability improvements and enhancements into the fabric of all DoD functions will be possible only when leaders at every level have a foundational and practical understanding of the impacts of CBRN effects on their functional areas. Leaders must be able to assess these impacts and to develop solutions within their functional domains that will mitigate or eliminate these impacts.

Many of the current DOTMLPF solution recommendations have been made to correct deficiencies in leader CBRND education and training. A CBRND-experienced leadership base will be realized only when future education and training initiatives have been established long enough to produce educated and trained leaders. As of October 2004 a new CJCSI 1800.01B, Officer Professional Military Education Policy has been produced with no CBRND learning areas or objectives. Lack of inclusion of CBRND learning areas/objectives has in the past been cited by academic deans as a justification for why more emphasis could not be placed on CBRND issues in their curricula. One of the 10 special areas of emphasis approved and proposed for 2005 by the July 2004 Joint Faculty Education Conference Initial Assessment is combating weapons of mass destruction (WMDs). But even if this proposal is accepted, special areas of emphasis are nonbinding. Until this Chairman of the Joint Chiefs of Staff Instruction (CJCSI)

provides definitive and directive guidance for providing CBRND integration into Joint Professional Military Education (JPME) curricula, this problem will continue.

**Table 7.0-1. Strategic Theater Shape Summary FNA Findings**

### 7.0.3 FSA Summary

The paragraphs below summarize the assessment of all potential DOTMLPF (non-materiel and materiel) solutions for the capability gaps identified in the FNA section.

#### 7.0.3.1 DOTLPF

The DOTLPF solutions identified in this chapter are associated primarily with training and doctrinal issues and include the development of JTTPs. Before a CBRN/TIM attack, the combatant commander will need to be proactive in determining and shaping the theater CBRN/TIM situation. In large measure, this shaping will be conducted in a virtual and simulated

environment. Although some CBRN-related training and evaluation may be conducted, such events at the theater level are frequently stovepiped and compartmentalized. Therefore, an accurate assessment of true capabilities is difficult to obtain. JTTPs, training, and exercises must be developed to facilitate assessing theater CBRND readiness. Means and methods must be developed to ensure currency and accuracy of intelligence throughout the intelligence acquisition community. Incorporate Joint Intelligence Center (JIC) queries into overall intelligence community (IC) capabilities. Develop formal JTTPs which address TIM hazards and their impact on friendly and adversary COAs. Develop JTTPs to address regional TIM and biological warfare agent vulnerability analysis. *Universal Joint Task List (UJTL)* 5.0 should be approved and published at the earliest opportunity after being vetted. Staff planning guidance that provides factors for CBRN resources under varying threat levels should be developed. Resource materiel management positions with qualified logistics-CBRN experts are needed. JTTPs that specifically address a joint CBRND logistic tracking system and JTTPs that specifically address joint CBRND materiel resources, below the wholesale level, should be developed. The COCOM commander will need to have a dedicated staff cell within the HQ to provide theater CBRND, plans, policies, and guidance. JTTPs and joint training and education courses need to be developed to focus planners on the complex nature of planning for CBRND operations, restoration and elimination operations, and the development of planning guidance. Other solutions include improvement in environmental health and safety training of deploying forces and JTTPs for medical management of TIM casualties. International exercises must be held to identify capability gaps in international CBRN/TIM employment verification procedures. New doctrine and TTPs need to address procedures for all of the international community and approaches to verifying TIM employment.

### 7.0.3.2 IMA

This paragraph summarizes possible material approaches that address the remaining materiel requirements of the DOTLPP assessment. Continued work on analysis probability tools and models is required. No automated tools exist for assisting in the conduct of global vulnerability assessments focusing on potential adversary COAs. Because of the wide range of options available to potential adversaries, tools must be available that can take as input that which is known, and then model and forecast all potential COAs. Formal automated analytical processes to facilitate TIM vulnerability analysis must be developed. Development of cooperative linkages between various proponent and service detection and sensing technologies is required. Other materiel needs include an automated global database/software program of CBRN/TIM hazards and an automated plume-prediction technology tied to real-time geospatial unit location such as JEM and JOEF.

**7.1 Task STSHA 1: Characterize the theater CBRN/TIM threat and situation****7.1.1 Functional Area Analysis****7.1.1.1 Definition**

To characterize the CBRN/TIM threat and situation for the combatant commanders and theater component commanders. Uses Sense data to move from situational awareness as well as shared awareness to shared understanding. Allows military leadership to develop a clear understanding of the current and predicted CBRN/TIM situation and its impact on theater operations in near-real time. Informs personnel; provides actual and potential impacts of CBRN/TIM hazards; and envisions critical Sense, Shield, and Sustain end states, including preparing for operations and visualizing the sequence of events that moves the theater force from its current state to those end states. Includes establishing collection priorities and coordination with intelligence agencies to collect information on CBRN/TIM capabilities encompassing such things as adversary intent and objectives, weapons availability and capacity, expected tactics, potential targets, and willingness or historic propensity to employ CBRN/TIM weapons. Also includes compiling and analyzing intelligence information and data provided by intelligence agencies or resources satisfying the theater CBRN/TIM threat intelligence collection plan. Provides processed theater CBRN/TIM threat intelligence for development of regional vulnerability assessments and for an understanding of the current and predicted CBRN/TIM situation. Provides the basis for CBRND tasking of and warning to the combatant commanders and Services. Appropriate collaboration occurs with interagency and international parties. This task further encompasses theater medical intelligence to be collected in support of CBRND analysis.

**7.1.1.2 Derivation**

*UJTL (ST 2.2.1, ST 2.4, ST 2.4.1, ST 2.5, ST 5.2.1, ST 5.3.3, ST 5.4.1, ST 6, ST 8.1.4, ST 8.2, ST 9, ST 9.4, ST 9.5, ST 9.6), Protection Joint Functional Concept, Military Transformation: A Strategic Approach, Transformation Planning Guidance.*

**7.1.1.2.1 Supported Task: SNSHA 1****7.1.1.2.2 Lateral Tasks: STSENS 1, STSENS 2, STSENS 3, STSENS 4, STSENS 5, STSENS 6, STSENS 8, STSENS 9, STSHA 2****7.1.1.2.3 Supporting Tasks: OPSHA 1, OPSHA 10****7.1.1.3 Condition**

Perform this task under conditions of:

**Physical** N/A

**Military**

1. Restrictive mission instructions. (C2.1.1)

2. No preexisting arrangements. (C2.1.1.2)
3. No or outlined mission preparation. (C2.1.3)
4. Few modern military systems. (C2.2.5)
5. Few modern military simulation systems. (C2.2.5.5)
6. Poor Joint Staff integration. (C2.3.1.1)
7. Poor multinational integration. (C2.3.1.2)
8. Limited staff expertise. (C2.3.1.3)
9. Highly restricted information exchange. (C2.3.1.8)
10. High information volume. (C2.3.1.9)
11. Negligible intelligence database. (C2.4.2)
12. Negligible theater intelligence access. (C2.4.4)
13. Little or no certitude of data. (C2.4.6)
14. Negligible deployed supplies. (C2.8.2)

### **Civil**

1. Correct interdepartmental/interagency relationships. (C3.1.1.3)
2. Negative foreign government support. (C3.1.2.3)
3. Uncertain international organization support. (C3.1.2.5)
4. Restrictive Presidential and/or Secretary of Defense decisions. (C3.1.3)
5. Low internationalism. (C3.2.6.5)
6. High health risk. (C3.3.1.5)
7. Unspecified TIM present in the civilian sector. (C3.3.7.5)

## **7.1.2 Functional Needs Analysis**

### **7.1.2.1 Capability and Deficiency Assessment Summary**

Table 7.1-1 discusses the proposed capability to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

### **Current Capability and Deficiency**

The Joint Intelligence Center of the joint force headquarters is responsible for providing and producing the intelligence required to support the joint force commander and staff, components, task forces and elements, and the national intelligence community (Joint Publication 1-02). Joint intelligence and CBRN publications do not adequately address characterizing the theater CBRN/TIM threat and situation. The theater-level CBRN staff is not adequately staffed and organized to meet its intelligence-related responsibilities. The J2 staff is not adequately trained/educated in CBRN issues. CBRN staff officers are not adequately trained/educated in intelligence issues. Experimentation does not provide feedback on the accurate characterization of the threat for this task. JPME does not adequately cover the fusion of intelligence/CBRN issues. Therefore, the current overall assessment is “yellow.”

### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Capability improvements are forecast for the near/mid term through DOTMLPF improvements in all deficient areas as a result of initiatives that use data resulting from focused experimentation. The overall assessment in the near/mid term is “green.”

### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. Continued DOTMLPF enhancements will result from exercise and wargame lessons learned, resulting in an assessment of “green” for the far term.

**Table 7.1-1. STSHA 1: Overall Capability and Deficiency Assessment**

Capability: Joint Force HQ JIC	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10
Current Overall Capability <sup>1</sup>	R <sup>2</sup>	R <sup>3</sup>	R <sup>4</sup>	G <sup>5</sup>	G <sup>6</sup>	G <sup>7</sup>	G <sup>8</sup>	G <sup>9</sup>	Y <sup>10</sup>	G <sup>11</sup>
Near/Mid-Term Overall Capability <sup>12</sup>	Y <sup>13</sup>	Y <sup>14</sup>	Y <sup>15</sup>	G	G	G	G	G	G <sup>16</sup>	G
Far-Term Overall Capability <sup>17</sup>	G	Y	Y	G	G	G	G	G	G	G

	FAA Measure	Scale
M1	Means exist to collect intelligence on designated theater adversaries.	G – Yes, Y – Limited, R – No
M2	Theater CBRN/TIM threat intelligence is current.	G – Yes, Y – Limited, R – No
M3	Theater CBRN/TIM threat intelligence is reliable.	G – Yes, Y – Limited, R – No
M4	All CBRN/TIM threat priority intelligence requests are covered by a collection plan.	G – Yes, Y – Limited, R – No
M5	Adequate means are available for CBRND staff to influence theater collection activities.	G – Yes, Y – Limited, R – No
M6	Multiple sources are integrated and deconflicted.	G – Yes, Y – Limited, R – No
M7	Medical intelligence guidance identifies information requirements and processes.	G – Yes, Y – Limited, R – No
M8	Medical CBRN/TIM intelligence criteria are established and defined.	G – Yes, Y – Limited, R – No
M9	Staff has sufficient training and experience to conduct the threat assessment.	G – Yes, Y – Limited, R – No
M10	CBRN/TIM threat intelligence is disseminated in near-real time.	G – Yes, Y – Limited, R – No

<sup>1</sup> Although multiple national means of collection exist and can be requested by the COCOM staff, recent operational experience in S.W. Asia and congressional investigations have rendered the efficacy of national intelligence collection, particularly human intelligence (HUMINT), suspect at best.

<sup>2</sup> CBRN threat intelligence, particularly that relying on HUMINT, is dependent on factors that may prevent timely and current information.

<sup>3</sup> CBRN threat intelligence, particularly that relying on HUMINT, is dependent on factors that may preclude obtaining reliable information.

<sup>4</sup> Limited. CBRN threat intelligence is dependent on factors that may prevent reliable information.

<sup>5</sup> Yes. The COCOM JIC staff can develop collection plans for CBRN threats.

<sup>6</sup> Yes. The COCOM JIC has the means to provide input for theater collection activities.

<sup>7</sup> Yes. All source intelligence analysis is the process where integration and deconfliction occurs.

<sup>8</sup> Yes. The COCOM medical staff identifies intelligence information requirements and processes.

<sup>9</sup> Yes. The COCOM medical staff has the means to establish and define medical CBRN/TIM intelligence criteria.

<sup>10</sup> The JIC has the experience to conduct threat assessment but may be limited in CBRN training education and experience.

<sup>11</sup> CBRN threat intelligence is disseminated in near-real time, via COLISEUM.

<sup>12</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>13</sup> New national intelligence initiatives should provide enhanced means to collect intelligence on theater adversaries. Difficulties with HUMINT will continue to be a limiting factor.

<sup>14</sup> New national intelligence initiatives should provide enhanced means to ensure currency of intelligence. Difficulties with HUMINT will continue to be a limiting factor.

<sup>15</sup> New national intelligence initiatives should provide enhanced means to ensure reliability of intelligence. Difficulties with HUMINT will continue to be a limiting factor.

<sup>16</sup> CBRN training and exercises will benefit from JRO-sponsored enhancements. Staff members within the JIC will coordinate better with CBRND staffs and have more experience.

<sup>17</sup> Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.

### 7.1.3 Functional Solution Analysis

#### 7.1.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Currency of intelligence is dependent on the acquisition means and methods.  
**Non-Materiel Solutions:** *Doctrine:* Develop means and methods to ensure currency of intelligence throughout the intelligence acquisition and collection community.
2. **Deficiency:** Joint intelligence and CBRN publications do not adequately address this issue.  
**Non-Materiel Solutions:** *Doctrine:* Joint intelligence and CBRN publications must be enhanced to adequately address this issue and to interface with each other so that roles and responsibilities are clearly delineated.
3. **Deficiency:** COCOM CBRND staff is not adequately staffed and organized to meet its intelligence-related responsibilities.  
**Non-Materiel Solutions:** *Organization:* Each theater-level CBRND staff should have a section dedicated to resolving CBRN intelligence issues. *Personnel:* Each theater-level CBRND staff should have adequate trained/experienced personnel assigned to man a section dedicated to resolving CBRN intelligence issues.
4. **Deficiency:** COCOM J2/JIC staffs are not adequately trained/educated in CBRN issues.  
**Non-Materiel Solutions:** *Training:* Develop training that will enable each JIC staff to better understand their CBRN role and enhance their ability to obtain intelligence that is required to support the Shape function of theater-level CBRND. *Leadership:* Develop an education program that will enable JIC staff to better understand their CBRN role and enhance their ability to obtain intelligence that is required to support the Shape function of theater-level CBRND.
5. **Deficiency:** CBRN staff officers are not adequately trained/educated in intelligence issues.  
**Non-Materiel Solutions:** *Training:* Develop training programs that allow CBRN staff officers to better support the CBRN intelligence process. *Leadership:* Develop education programs that allow CBRN staff officers to better understand the CBRN intelligence process and their roles and responsibilities.
6. **Deficiency:** Experimentation/red teaming does not provide feedback on accurate characterization of the threat for this task.  
**Non-Materiel Solutions:** *Training:* JRO CBRND must work with both the intelligence and CBRN communities to integrate this task into both intelligence and CBRN experimentation campaign plans.
7. **Deficiency:** JPME does not adequately cover the fusion of intelligence/CBRN issues.  
**Non-Materiel Solutions:** *Leadership:* Integrate intelligence/CBRN fusion issues into JPME.

- 8. Deficiency:** JIC does not have influence over the national-level intelligence accuracy.  
**Non-Materiel Solutions:** *Doctrine:* Develop means and methods to ensure accuracy of intelligence throughout the intelligence acquisition and collection community.

**7.1.3.2 IMA Assessment Summary**

N/A

## 7.2 Task STSHA 2: Conduct theater CBRN/TIM vulnerability analysis

### 7.2.1 Functional Area Analysis

#### 7.2.1.1 Definition

To conduct theater vulnerability assessments focusing on potential adversaries' courses of action (COAs). This theater strategic assessment compares regional-based vulnerabilities and risks. Development of a shared understanding of potential adversaries' CBRN/TIM COAs and the associated vulnerabilities and risks enables timely and effective preparations for any potential adversary acts. Includes the development of associated risk assessments.

#### 7.2.1.2 Derivation

*UJTL (ST 2.2.1, ST 2.4, ST 2.4.1, ST 2.4.1.1, ST 2.4.1.2, ST 2.5, ST 5, ST 5.1, ST 5.1.1, St 5.1.3, ST 5.1.4, St 5.1.6, ST 5.2, ST 5.2.1, ST 5.3.1.1, ST 5.3.1.2, ST 5.3.1.3, ST 5.3.3, ST 6, ST 6.2, ST 6.1.6, ST 8.1.4, ST 8.2, ST 8.3.2, ST 9, ST 9.3, St 9.4, ST 9.5, ST 9.6), Protection Joint Functional Concept, Military Transformation: A Strategic Approach.*

##### 7.2.1.2.1 Supported Task: SNSHA 2

##### 7.2.1.2.2 Lateral Tasks: STSHA 1, STSHA 3, STSHA 4, STSHA 6, STSHA 7

##### 7.2.1.2.3 Supporting Task: OPSHA 2

#### 7.2.1.3 Condition

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. No or outline mission preparation. (C2.1.3)
2. Few modern military systems. (C2.2.5)
3. Few modern military simulation systems. (C2.2.5.5)
4. No or some interoperability. (C2.2.6)
5. Negligible intelligence database. (C2.4.2)
6. Negligible theater intelligence access. (C2.4.4)
7. Little or no certitude of data. (C2.4.6)

**Civil.** N/A

## **7.2.2 Functional Needs Analysis**

### **7.2.2.1 Capability and Deficiency Assessment Summary**

Table 7.2-1 discusses the J2 JIC at the COCOM level: the only capability that currently exists to perform the task “Conduct theater CBRN/TIM vulnerability analysis.” The J2 JIC is the only capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The JIC is responsible for providing and producing the intelligence required to support the joint force commander and staff, components, task forces and elements, and the national intelligence community (Joint Publication 1-02). The current capability for the JIC to perform vulnerability and risk assessments is “yellow.” The primary reason for this assessment is that the vulnerability and risk assessment process requires information beyond organic DoD means. Also, there are deficiencies in the validity of intelligence and availability of vulnerability and risk assessment tools, particularly for TIM and biological warfare agents.

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Little capability improvement is forecasted for the near/mid term. DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far term. The assessment will improve to “green.” Vulnerability analysis guidelines will be enhanced to adequately address AOR-wide TIM concerns. TIM vulnerability assessment tools will be enhanced. Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.

Table 7.2-1. STSHA 2. Capability and Deficiency Assessment

Capability: J-2 JIC	M1	M2	M3	M4	M5	M6	M7	M8	M9
Current Overall Capability <sup>1</sup>	Y <sup>2</sup>	Y <sup>3</sup>	Y <sup>4</sup>	Y <sup>5</sup>	Y <sup>6</sup>	Y <sup>7</sup>	Y <sup>8</sup>	Y <sup>9</sup>	Y <sup>10</sup>
Near/Mid-Term Overall Capability <sup>11</sup>	Y	Y	Y	Y	Y	Y	Y	Y	Y
Far-Term Overall Capability <sup>12</sup>	G <sup>13</sup>	Y	G <sup>14</sup>	Y	G <sup>15</sup>	G <sup>16</sup>	G <sup>17</sup>	G <sup>18</sup>	G <sup>19</sup>

	FAA Measure	Scale
M1	Policies and guidelines for conducting theater vulnerability assessment are established.	G – Yes, Y – Limited, R – No
M2	Policies and guidelines for conducting theater risk assessment are established.	G – Yes, Y – Limited, R – No
M3	Analytical tools used to evaluate plausible adversary's COAs are adequate.	G – Yes, Y – Limited, R – No
M4	Vulnerability assessment process exploits time-sensitive or priority actionable CBRN/TIM intelligence.	G – Yes, Y – Limited, R – No
M5	Means are available to collaboratively perform assessments.	G – Yes, Y – Limited, R – No
M6	Means exist to visualize the impact of adversary's COAs on forces of interest.	G – Yes, Y – Limited, R – No
M7	Operational and analytical/planning staffs have the training and experience to effectively assess adversary's CBRN/TIM COAs.	G – Yes, Y – Limited, R – No
M8	Sufficient doctrine and TTPs for effective theater vulnerability and risk assessments are available.	G – Yes, Y – Limited, R – No
M9	Joint exercises/experimentation provide feedback on efficacy of vulnerability assessment doctrine and TTPs.	G – Yes, Y – Limited, R – No

<sup>1</sup> No. Extremely limited. JTTPs for regional TIM and biological warfare agent vulnerability analysis are very limited.

<sup>2</sup> Limited. The JIC either has been furnished or has developed vulnerability analysis guidelines. However, such guidelines may not adequately address an AOR-wide TIM concern.

<sup>3</sup> Limited. The JIC has guidelines for conducting risk assessments. However, AOR-wide CBRN risk assessments surpass the sole purview of DoD.

<sup>4</sup> The JIC has analytical tools used to evaluate plausible COAs. The military decision making process – classically used to evaluate COAs – has been considered adequate—but CBRN/TIM integration into these tools may not be adequate.

<sup>5</sup> Partial. The JIC has an ability to exploit time-sensitive or priority-actionable CBRN/TIM intelligence through net-centric means; however, actionable CBRN intelligence is only as valid as its source and the time it takes to process.

<sup>6</sup> Limited. The JIC has the means to collaboratively perform assessments with other agencies.

<sup>7</sup> Limited. The JIC has the means to visualize the impact of adversary COAs. However, possible and plausible CBRN employment and TIM hazards are not necessarily also included in this visualization.

<sup>8</sup> By definition, the JIC has the training and experience to assess adversary COAs. However, the JIC may not have the training and experience to assess adversary CBRN/TIM COAs.

<sup>9</sup> Limited. The JIC has doctrine and JTTPs for AOR CBRN/TIM situational awareness. However, TIM vulnerability assessment tools are limited.

<sup>10</sup> Limited. While joint exercises/experimentation can provide feedback on the vulnerability analysis process, TIM vulnerability analysis must be conducted manually on a region-by-region basis.

<sup>11</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>12</sup> Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.

<sup>13</sup> Vulnerability analysis guidelines will be enhanced to adequately address AOR-wide TIM concerns.

<sup>14</sup> CBRN/TIM considerations will be integrated into JIC analytical tools.

<sup>15</sup> Experimentation designed to discover required enhancements to interagency CBRND coordination issues will improve collaborative efforts.

<sup>16</sup> Possible/plausible CBRN and TIM hazards will be adequately represented in JIC COA visualization products.

<sup>17</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation, providing the JIC with the training and experience to assess adversary CBRN/TIM COAs.

<sup>18</sup> TIM vulnerability assessment tools will be enhanced.

<sup>19</sup> TIM vulnerability assessment tools will be enhanced.

### 7.2.3 Functional Solution Analysis

#### 7.2.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMAs section.

- 1. Deficiency:** AOR-wide CBRN risk assessments surpass the sole purview of DoD.  
**Non-Materiel Solutions:** *Doctrine:* Incorporate JIC queries into overall IC capabilities.
- 2. Deficiency:** There is a lack of sophisticated and validated techniques and procedures developed to assist collectors and collector managers in the acquisition of raw WMD information.  
**Non-Materiel Solutions:** *Doctrine:* Tactics, techniques, and procedures (TTPs) need to be developed to cover all of the unique aspects of intelligence collecting on WMD issues across the spectrum. *Training:* Discovery experimentation should be employed to investigate/validate new ways of fusing CBRN/intelligence issues. Training needs to be developed to assist collectors and collector managers in the acquisition of raw WMD information. This training needs to be developed in collaboration with both the intelligence and the CBRND communities. *Leader Education:* Learning areas and objectives covering CBRN/intelligence fusion issues should be institutionalized in Officer Professional Military Education (OPME)/JPME. These learning areas and objectives should be required at all intermediate/senior-level colleges and in the Joint Forces Staff College.
- 3. Deficiency:** Possible and plausible CBRN employment and TIM hazards are not necessarily included in visualizing the impact of adversary COAs on forces of interest.  
**Non-Materiel Solutions:** *Training:* Develop formal JTTPs that address CBRN employment/TIM hazards and their impact on friendly and adversary COA.
- 4. Deficiency:** Lack of automated tools exists for conducting global vulnerability assessments focusing on potential adversary COAs of CBRN, including use of TIMs.  
**Non-Materiel Solutions:** None
- 5. Deficiency:** JTTPs for regional TIM and biological warfare agent vulnerability analysis are limited.  
**Non-Materiel Solutions:** *Doctrine:* Develop JTTPs to address regional TIM and biological warfare agent vulnerability analysis.

#### 7.2.3.2 IMA Assessment Summary

Table 7.2-2 shows possible material approaches that address the remaining materiel requirements of the DOTMLPF assessment.

Table 7.2-2. STSHA 2. IMA Assessment

Idea for Materiel Approach	Description
Automated tools	Continued work on analysis probability tools and models is required. No automated tools exist for assisting in the conduct of global vulnerability assessments focusing on potential adversary CBRN/TIM COAs. Because of the wide range of options available to potential adversaries, tools must be available that can take as input that which is known, and then model and forecast all potential COAs. Develop formal automated analytical processes to evaluate CBRN/TIM vulnerability analysis.

### **7.3 Task STSHA 3: Determine CBRND resources required to meet the theater CBRND situation**

#### **7.3.1 Functional Area Analysis**

##### **7.3.1.1 Definition**

To determine CBRND unit, personnel, equipment, and logistics resources required for a specific theater of operations. Determines the required allocation, provisioning, positioning, tracking, and sustaining of CBRND units and personnel throughout the theater, ensuring the availability of appropriate units as well as personnel in the correct quantities and positions. Includes required allocation of CBRND equipment, supplies, and consumables throughout the theater of operations to include prepositioning and stockpiling. CBRND logistics are managed for extended operations. Also includes adjustments to TPFDD to ensure timely arrival and employment of CBRND resources.

##### **7.3.1.2 Derivation**

*UJTL (ST 1.1.2, ST 2.2.1, ST 2.4.1.1, ST 2.4.1.2, ST 4.2.6, ST 5, ST 5.1, ST 5.1.1, ST 5.1.2, ST 5.1.3, ST 5.1.4, ST 5.1.6, ST 5.2, ST 5.2.1, ST 5.3.3, ST 5.4.1, ST 6, ST 6.2, ST 6.2.1, ST 7.1.1, ST 8.2.3, ST 9, ST 9.3, ST 9.4, ST 9.5, ST 9.6), Protection Joint Functional Concept, Military Transformation: A Strategic Approach, Transformation Planning Guidance.*

##### **7.3.1.2.1 Supported Task: SNSHA 5**

##### **7.3.1.2.2 Lateral Tasks: STSHA 2, STSHA 6, STSHA 7, STSHA 8, STSHLD 1, STSHLD 2, STSHLD 9**

##### **7.3.1.2.3 Supporting Task: OPSHA 3**

##### **7.3.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Immediate, delayed, or potential long-term atmospheric weapons effects. (C1.3.3)

##### **Military**

1. Limited military commitments from other nations. (C2.1.1.7)
2. No or outline mission preparation. (C2.1.3)
3. Marginal forces assigned. (C2.2.1)
4. Multiple competing apportionments. (C2.2.2)
5. Marginal forces allocated. (C2.2.3)
6. Low personnel capability. (C2.2.4)
7. Low military systems reliability. (C2.2.5.3)

8. Limited staff expertise. (C2.3.1.3)
9. Highly restricted information exchange. (C2.3.1.8)
10. No or partial time-phased force and deployment data (TPFDD) availability. (C2.5.1.1)
11. Negligible or short deployed supplies. (C2.8.2)
12. Unresponsive or slow pipeline responsiveness. (C2.8.3.1)

### Civil

1. Limited foreign government support. (C3.1.2.3)
2. Limited international organization support. (C3.1.2.5)

## 7.3.2 Functional Needs Analysis

### 7.3.2.1 Capability and Deficiency Assessment Summary

Table 7.3-1 discusses the capabilities that currently exist to perform the task: determine CBRND resources required to meet the theater CBRND situation to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

### Current Capability and Deficiency

The capability to execute this task resides in the COCOM HQ staff, and the current capability assessment is “yellow.” The primary reason for this assessment centers around the mechanics of logistics for CBRND materiel. The current system is Service-specific, and there are no JTTPs that specifically address influences the flow of joint CBRN resources. The CBRND materiel management process is manual, requiring a dedicated individual in the supporting materiel management center (MMC). Training and experience are situation-dependent. CBRN considerations include a wide array of threat-based tasks that require visibility from the tactical to strategic theater level. Other concerns include tools and processes to manage CBRND personnel and units.

### Projected Near/Mid-Term Capability and Deficiency

No other capability is currently projected for the near/mid term. Some capability improvement is forecast for the near/mid term, raising the assessment to “green.” Planning staffs will have been provided the training and will acquire the experience necessary to determine required adjustments to the TPFDD based on CBRN considerations. *UJTL* 5.0 will be fully implemented, and Sense, Shape, Shield, and Sustain factors will be consistently considered as a result of training, education and experience.

### Projected Far-Term Capability and Deficiency

No other capability is currently projected for the far-term future. DOTMLPF should continue to improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

Table 7.3-1. STSHA 3: Capability and Deficiency Assessment

Capability: COCOM HQ	M1	M2	M3	M4	M5	M6	M7	M8	M9
Current Overall Capability <sup>1</sup>	G <sup>2</sup>	G <sup>3</sup>	Y <sup>4</sup>	Y <sup>5</sup>	Y <sup>6</sup>	Y <sup>7</sup>	G <sup>8</sup>	G <sup>9</sup>	Y <sup>10</sup>
Near/Mid-Term Overall Capability <sup>11</sup>	G	G	G <sup>12</sup>	Y	Y	Y	G	G	G <sup>13</sup>
Far-Term Overall Capability	G	G	G	Y	Y	Y	G	G	G

	FAA Measure	Scale
M1	CBRND staff cells have the ability to influence the TPFDD.	G – Yes, Y – Limited, R – No
M2	Means exist to adjust the TPFDD based on CBRND considerations.	G – Yes, Y – Limited, R – No
M3	Planning staffs have the training and experience to determine required adjustments to the TPFDD based on CBRND considerations.	G – Yes, Y – Limited, R – No
M4	Tools and processes are available to manage CBRND personnel and units.	G – Yes, Y – Limited, R – No
M5	Tools and processes are available to manage CBRND materiel resources.	G – Yes, Y – Limited, R – No
M6	CBRND logistics tracking system is sufficient.	G – Yes, Y – Limited, R – No
M7	Appropriate CBRND logistics management processes are in place.	G – Yes, Y – Limited, R – No
M8	Analytical tools are used to assess logistical demand.	G – Yes, Y – Limited, R – No
M9	All pertinent Sense, Shape, Shield, and Sustain factors are considered.	G – Yes, Y – Limited, R – No

<sup>1</sup> Limited. There are no JTTPs that specifically address joint CBRND materiel resources below the wholesale level.

<sup>2</sup> Yes. Operational staffs to include CBRND experts, have the ability to provide input to the TPFDD process.

<sup>3</sup> Yes. The force mix can be adjusted given adequate time and strategic lift capabilities.

<sup>4</sup> Limited. The force mix can be adjusted given adequate time and strategic lift capabilities. However, training and experience are situation-dependent. CBRN considerations include a wide array of threat-based tasks that require visibility from the tactical to strategic theater level.

<sup>5</sup> Limited. Processes exist to manage CBRND personnel and units, but allocation of those assets is subject to availability and in the case of units, readiness and deployability.

<sup>6</sup> Limited. Processes are available to manage CBRND materiel resources. However, the process is manual, requiring a dedicated individual in the supporting MMC.

<sup>7</sup> Limited. Any COCOM staff can track logistics. However, there is no dedicated system to track CBRND -related materiel.

<sup>8</sup> Yes. CBRND-related materiel spans five separate classes of supply. The concept of focused-logistics allows the operational level logistician to track and ship assets and deliver tailored packages and sustainment items. However, this process does not differentiate CBRND-specific items.

<sup>9</sup> Yes. GSORTS has the capability to monitor specified materiel. However, CBRN equipment does not maintain its own class of supply, therefore, each item must be manually tracked.

<sup>10</sup> Limited. Until UJTL 5.0 is fully implemented, Sense, Shape, Shield, and Sustain factors may not be fully considered.

<sup>11</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>12</sup> Planning staffs will have been provided the training and will acquire the experience necessary to determine required adjustments to the TPFDD based on CBRN considerations

<sup>13</sup> UJTL 5.0 will be fully implemented and Sense, Shape, Shield, and Sustain factors will be consistently considered as a result of training, education, and experience.

### 7.3.3 Functional Solution Analysis

#### 7.3.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMAs section.

- 1. Deficiency:** The current system is Service-specific. There are no JTTPs that specifically address adjusting the flow of joint CBRN resources, personnel, and units.  
**Non-Materiel Solutions:** *Doctrine:* Develop staff planning guidance that provides factors for CBRN resources under varying threat levels.
- 2. Deficiency:** Training and experience are situation-dependent. CBRN considerations include a wide array of threat-based tasks that require visibility from the tactical to strategic theater level.  
**Non-Materiel Solutions:** *Training:* Develop staff training that provides factors for CBRN resources under varying threat levels.
- 3. Deficiency:** The CBRND materiel management process is manual, requiring a dedicated individual in the supporting MMC.  
**Non-Materiel Solutions:** *Personnel:* Resource materiel management positions with qualified logistics-CBRN experts.
- 4. Deficiency:** The current system is Service-specific. There are no JTTPs that specifically address a joint CBRND logistic tracking system.  
**Non-Materiel Solutions:** *Doctrine:* Develop JTTPs that specifically address a joint CBRND logistic tracking system.
- 5. Deficiency:** Until *UJTL 5.0* is fully implemented, Sense, Shape, Shield, and Sustain factors may not be fully considered.  
**Non-Materiel Solutions:** *Doctrine:* Approve and publish *UJTL 5.0* at the earliest opportunity after being vetted.
- 6. Deficiency:** There are no JTTPs that specifically address joint CBRND materiel resources, below the wholesale level.  
**Non-Materiel Solutions:** *Training:* Develop JTTPs that specifically address joint CBRND materiel resources, below the wholesale level.

#### 7.3.3.2 IMA Assessment Summary

Table 7.3-2 shows possible material approaches that address the remaining materiel requirements of the DOTMLPF assessment.

**Table 7.3-2. STSHA 3. IMA Assessment**

Idea for Materiel Approach	Description
Automated tool common interface	There is a need for automated tools to have a common user interface. Minimizing information overload on the operator, as well as minimizing the software workload when operating in multiple applications, is a key factor for the automated decision support tools. Different software tools need to have the same “look and feel.”

## 7.4 Task STSHA 4: Ensure theater CBRND readiness

### 7.4.1 Functional Area Analysis

#### 7.4.1.1 Definition

To ensure theater forces are prepared to accomplish assigned missions in a CBRN/TIM environment. Joint CBRND training, exercises, and rehearsals are key components to ensure force readiness for operations in a CBRN/TIM environment. Operational concepts and new systems are evaluated in realistic exercises and multinational environments. Forces are evaluated and assessed for effective CBRND task performance across the range of military operations and in a variety of physical environments. CBRND systems are evaluated for operational effectiveness and performance utility. Includes the effective documentation and management of lessons learned information to provide a historical record for trend analysis and a repository for the warfighting staffs to examine during development of integrated priority lists.

#### 7.4.1.2 Derivation

*UJTL (ST 1.1.2, ST 2.2.1, ST 2.4.1, ST 2.4.1.1, ST 2.4.1.2, ST 4.2.4, ST 4.2.6, ST 5.1, ST 5.1.3, ST 5.1.4, ST 5.2.1, ST 5.3.1.1, ST 5.3.1.2, ST 5.3.1.4, ST 5.4.3, ST 6, ST 6.1.16, ST 6.2, ST 6.2.2, ST 9, ST 9.3, ST 9.4, ST 9.5, ST 9.6), Protection Joint Functional Concept, Military Transformation: A Strategic Approach, Transformation Planning Guidance, Training Transformation Implementation Plan.*

##### 7.4.1.2.1 Supported Task: SNSHA 6

##### 7.4.1.2.2 Lateral Tasks: STSHA 2, STSHA 6, STSHLD 4, STSHLD 8, STSHLD 9, STSHLD 11

##### 7.4.1.2.3 Supporting Task: OPSHA 4

#### 7.4.1.3 Condition

Perform this task under conditions of:

##### **Physical**

1. Immediate, delayed, or potential long-term atmospheric weapons effects. (C1.3.3)

##### **Military**

1. No or outline mission preparation. (C2.1.3)
2. Marginal forces assigned. (C2.2.1)
3. Low personnel capability. (C2.2.4)
4. Negligible personnel experience. (C2.2.4.5)
5. Few modern military systems. (C2.2.5)
6. Few modern military simulation systems. (C2.2.5.5)

7. Poor Joint Staff integration. (C2.3.1.1)
8. Limited staff expertise. (C2.3.1.3)
9. Highly restricted information exchange. (C2.3.1.8)
10. High information volume. (C2.3.1.9)
11. Little or no intelligence dissemination and receipt. (C2.4.7)

**Civil.** N/A

## **7.4.2 Functional Needs Analysis**

### **7.4.2.1 Capability and Deficiency Assessment Summary**

Table 7.4-1 discusses the only capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The current assessment is “yellow.” Any COCOM staff has a team of operational planners and information command and control specialists to include CBRND subject matter experts. This team of experts forms the backbone of the COCOM staff and command structure. The COCOM staff is responsible for readiness, to include CBRN issues and concerns. JTTPs and tools to evaluate and assess CBRND staffs, capabilities, systems, and concepts within an AOR are limited. Forces and staffs of other nations may or may not have training, equipment, or experience to effectively conduct CBRND operations.

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. No capability improvement is forecast for the near/mid term.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. Joint TTPs, training and exercises, and education will all improve leading to a far-term assessment of “green.”

Table 7.4-1. STSHA 4: Capability and Deficiency Assessment

Capability: COCOM J-3	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10	M11	M12
Current Overall Capability <sup>1</sup>	Y <sup>2</sup>	Y <sup>3</sup>	Y <sup>4</sup>	Y <sup>5</sup>	Y <sup>6</sup>	Y <sup>7</sup>	Y <sup>8</sup>	Y <sup>9</sup>	Y <sup>10</sup>	Y <sup>11</sup>	Y <sup>12</sup>	Y <sup>13</sup>
Near/Mid-Term Overall Capability	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
Far-Term Overall Capability	G <sup>14</sup>	G	G	G	G	G	G	G	G	G	G	G

	FAA Measure	Scale
M1	Tools and processes are available to evaluate and assess CBRND capability in theater.	G – Yes, Y – Limited, R – No
M2	Units and HQ staffs are routinely evaluated and assessed in performing CBRND tasks.	G – Yes, Y – Limited, R – No
M3	CBRND systems and concepts, both current and projected, are assessed and evaluated under realistic conditions.	G – Yes, Y – Limited, R – No
M4	CBRND operations are exercised with coalition partners.	G – Yes, Y – Limited, R – No
M5	CBRND staff cells and units have access to dedicated information technology to support training.	G – Yes, Y – Limited, R – No
M6	HQ/unit exercises are conducted under simulated CBRN/TIM conditions.	G – Yes, Y – Limited, R – No
M7	Adequate training tools are available.	G – Yes, Y – Limited, R – No
M8	CBRND specialists/staffs are trained to perform required CBRND tasks.	G – Yes, Y – Limited, R – No
M9	Forces/staffs of other nations are trained in CBRND operations.	G – Yes, Y – Limited, R – No
M10	CBRND staff cells conduct training and rehearsals.	G – Yes, Y – Limited, R – No
M11	An accessible, digital information repository system is available.	G – Yes, Y – Limited, R – No
M12	Information repository is available to all operating forces.	G – Yes, Y – Limited, R – No

<sup>1</sup> There are few training events that specifically address training forces/staffs of other nations for anticipated CBRND operations.

<sup>2</sup> Limited. COCOM staff has tools and processes to evaluate and assess CBRND capabilities in theater. However, the current system is Service-specific. There are no JTTPs that specifically addresses tools and processes to evaluate and assess joint CBRND capability.

<sup>3</sup> Limited. Any COCOM staff can routinely evaluate and assess CBRND tasks, but the current system is Service-specific. There are no JTTPs and familiarization training that specifically addresses evaluating and assessing joint CBRND tasks.

<sup>4</sup> Limited. Any COCOM staff can assess and evaluate systems under realistic conditions, but the current system is Service-specific. There are no JTTPs and familiarization training that specifically addresses assessing joint CBRND systems and concepts, both current and projected, under realistic conditions.

<sup>5</sup> Limited. Any COCOM staff has the ability to exercise with coalition partners, but there are few exercises that specifically address CBRND operations with coalition partners.

<sup>6</sup> Limited. Any COCOM staff has access to information technology to support training, but the current system is Service-specific. There are no JTTPs and familiarization training that specifically addresses CBRND staff cells and units having access to dedicated information technology to support training.

<sup>7</sup> The current system is Service-specific. There are no JTTPs and familiarization training that specifically addresses CBRND staff cells and units having access to dedicated information technology to support training.

<sup>8</sup> Limited. Any COCOM staff has the training, but the current system is Service-specific. There are no JTTPs and familiarization training that specifically addresses the joint force CBRND readiness.

<sup>9</sup> Limited. Any COCOM staff has CBRND specialists/staffs trained to perform CBRND tasks, but there are few JTTPs and familiarization training that specifically addresses the CBRND specialists/staff task on joint force CBRND readiness.

<sup>10</sup> Limited. Any COCOM staff has the ability to train forces/staffs of other nations, but there are few training events that specifically address training forces/staffs of other nations for anticipated CBRND operations. Political constraints inhibit training forces/staffs of other nations on CBRN operations.

<sup>11</sup> Limited. Any COCOM staff has the tools to conduct training and rehearsals, but there are limited JTTPs and familiarization training that specifically addresses joint force CBRND readiness.

<sup>12</sup> Limited. Any COCOM staff has access to digital information repository, but the units must know how to access it, through the Global Information Grid (GIG). There are limited JTTPs and familiarization training that specifically addresses accessing the digital information repository.

<sup>13</sup> Limited. Any COCOM staff has access to digital information repository, but the units must know how to access it, through the GIG. There are limited JTTPs and familiarization training that specifically addresses accessing the digital information repository.

14 DOTMLPF should improve in all deficient areas (for all measures in this row) as a result of initiatives that use data resulting from focused experimentation. Joint TTPs, training and exercises, and education will all improve.

### 7.4.3 Functional Solution Analysis

#### 7.4.3.1 DOTLPF Assessment Summary.

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMAs section.

1. **Deficiency:** Limited JTTPs and familiarization training that specifically address joint CBRND readiness.

**Non-Materiel Solutions:** *Doctrine:* Develop JTTP on joint CBRN readiness requirements to meet the Joint Task Force/Joint Operations Area CBRN situation. JTTP must address processes to evaluate and assess joint CBRND capability, tasks, systems, and concepts (both current and projected, under realistic conditions). JTTP must also address procedures to evaluate and assess CBRND specialists/staff in major units and headquarters. *Training:* Develop joint training on joint CBRN readiness requirements to meet the theater CBRN situation. *Leadership:* Expand joint leadership education course(s) on the joint CBRN readiness requirements to meet the theater CBRN situation.

2. **Deficiency:** There are few exercises that specifically address CBRND operations with coalition partners or the full spectrum of CBRN/TIM conditions.

**Non-Materiel Solutions:** *Training:* Develop exercises that specifically address CBRND operations with coalition partners and introduce the full spectrum of CBRN/TIM conditions.

#### 7.4.3.2 IMA Assessment Summary

N/A

**7.5 Task STSHA 5: Coordinate theater CBRND information systems and processes****7.5.1 Functional Area Analysis****7.5.1.1 Definition**

To ensure that theater CBRND information systems and processes allow joint forces to effectively conduct operations in a CBRN/TIM environment. Establishes theater standards, common operating procedures, and formats for plotting and predicting CBRN/TIM hazards, along with alarm, warning, and reporting of the hazards. Establishes standards and procedures for displaying CBRN/TIM hazard information via the theater COP. Includes maintaining theater shared awareness of the current and projected CBRN/TIM threat and situation. Includes establishing an interoperable CBRND Integrated Detection Network (IDN) to detect, characterize, and warn of CBRN/TIM hazards. Ensures the smooth integration and rapid dissemination of CBRND information across the GIG. Ensures that planners and staffs possess the appropriate tools to collaboratively plan, assess, and manage CBRND processes. This task includes access to automated collaborative workspace tools that are integrated/interoperable with existing Command, Control, Communications, Computers, Intelligence, Surveillance, and Reconnaissance (C4ISR) systems.

**7.5.1.2 Derivation**

*UJTL (ST 2.2.1, ST 2.2.3, ST 2.4.1.1, ST 2.5, ST 5.1, ST 5.1.1, ST 5.1.3, ST 5.1.4, ST 5.1.6, ST 5.2, ST 5.2.1, ST 5.3.1.1, ST 5.3.1.2, ST 5.3.1.3, ST 6, ST 6.1.6, ST 6.2, ST 6.2.1, ST 6.2.2, ST 7.1.1, ST 7.5, ST 8.1.4, ST 8.2, ST 8.2.3, ST 9, ST 9.3, ST 9.4, ST 9.5, ST 9.6), Protection Joint Functional Concept, Military Transformation: A Strategic Approach, Transformation Planning Guidance, Joint Enabling Concept for CBRN Operations, An Operational Concept for Biological Defense, DoD Net-Centric Data Strategy, DODI 8500.2.*

**7.5.1.2.1 Supported Task: SNSHA 7****7.5.1.2.2 Lateral Task: N/A****7.5.1.2.3 Supporting Task: OPSHA 5****7.5.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Immediate, delayed, or potential long-term atmospheric weapons effects. (C1.3.3)

**Military**

1. No preexisting arrangements. (C2.1.1.2)
2. Negligible personnel experience. (C2.2.4.5)

3. Low military systems reliability. (C2.2.5.3)
4. Few modern military simulation systems. (C2.2.5.5)
5. Some or no interoperability. (C2.2.6)
6. Partial Joint Staff integration. (C2.3.1.1)
7. Poor multinational integration. (C2.3.1.2)
8. Limited staff expertise. (C2.3.1.3)
9. Highly restricted information exchange. (C2.3.1.8)
10. High information volume. (C2.3.1.9)
11. Little or no intelligence dissemination and receipt. (C2.4.7)

### **Civil**

1. Limited foreign government support. (C3.1.2.3)
2. Limited international organization support. (C3.1.2.5)
3. Poor information management. (C3.3.7.4)

## **7.5.2 Functional Needs Analysis**

### **7.5.2.1 Capability and Deficiency Assessment Summary**

Table 7.5-1 discusses the only capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task. The COCOM HQ was assessed in light of current limited staff use of JWARN and the anticipated fielding IOC of the Joint Effects Model (JEM) Block I in FY 06 and the IOC of the JOEF Block I, Increment I in FY2008. JOEF will provide a significant CBRN-adaptive planning capability. The JEM will provide a single, validated capability to predict and track CBRN and TIM events and effects. The JOEF will provide an operational requirements modeling and simulation system which accurately predicts CBRN effects on personnel, equipment, and operations.

### **Current Capability and Deficiency**

The COCOM HQ was assessed in light of fielding of Block I of the JEM and JOEF. Since JEM/JOEF IOC will not be met until FY2006/FY2008, respectively, all standards were assessed as “yellow.” JWARN provides limited capability within the theater.

### **Projected Near/Mid-Term Capability and Deficiency**

The COCOM will benefit from JEM and JOEF Block I, which will be IOC for the near/mid term. All near/mid-term measures will be assessed as “green” if the IOC is met.

### **Projected Far-Term Capability and Deficiency**

JOEF will provide the COCOM with enhanced capabilities and algorithms as block II/III are IOC in FY2010.

Table 7.5-1. STSHA 5: Capability and Deficiency Assessment

Capability: COCOM Staff	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10	M11	M12	M13	M14	M15
Current Overall Capability	Y <sup>1</sup>	Y <sup>2</sup>	Y <sup>3</sup>	Y <sup>4</sup>	Y <sup>5</sup>	Y <sup>6</sup>	Y <sup>7</sup>	Y <sup>8</sup>	Y <sup>9</sup>	Y <sup>10</sup>	Y <sup>11</sup>	Y <sup>12</sup>	Y <sup>13</sup>	Y <sup>14</sup>	Y <sup>15</sup>
Near/Mid-Term Overall Capability	G <sup>16</sup>	G	G	G	G	G	G	G	G	G	G	G	G	G	G
Far-Term Overall Capability	G <sup>17</sup>	G	G	G	G	G	G	G	G	G	G	G	G	G	G

	FAA Measure	Scale
M1	Hazards effects models and tools are adequate and available at all appropriate levels for assessment and decision making.	G – Yes, Y – Limited, R – No
M2	Theater is adequately covered by the IDN.	G – Yes, Y – Limited, R – No
M3	Sensors managed at all echelons are networked to the IDN.	G – Yes, Y – Limited, R – No
M4	Sufficient doctrine and TTPs exist for effective IDN operation.	G – Yes, Y – Limited, R – No
M5	Joint forces are adequately trained to effectively operate the IDN.	G – Yes, Y – Limited, R – No
M6	All operation centers are networked to IDN.	G – Yes, Y – Limited, R – No
M7	IDN successfully tracks and monitors the hazard.	G – Yes, Y – Limited, R – No
M8	Means exist to disseminate routine, essential and critical CBRN/TIM threat intelligence rapidly.	G – Yes, Y – Limited, R – No
M9	Means exist to compile and display information on CBRN/TIM events that occurs throughout the theater.	G – Yes, Y – Limited, R – No
M10	Means exist to present information on the operational impact of a CBRN/TIM event.	G – Yes, Y – Limited, R – No
M11	Coalition and joint CBRND IDN provide automated warning and reporting.	G – Yes, Y – Limited, R – No
M12	CBRND information is easily disseminated onto the GIG.	G – Yes, Y – Limited, R – No
M13	CBRND data and information formats are interoperable across the coalition and interagency.	G – Yes, Y – Limited, R – No
M14	Required participants are able to exchange information through planning, assessment and management tools.	G – Yes, Y – Limited, R – No
M15	CBRND information is processed using existing C4ISR assets.	G – Yes, Y – Limited, R – No

<sup>1</sup> Limited. JWARN is available within the theater to make assessment and decision making based on the hazards effects, but JEM will not be IOC until FY2006, and JOEF will not be IOC until FY2008.

<sup>2</sup> Limited. JWARN provides no capability, JEM will not be IOC until FY2006, and JOEF will not be IOC until FY2008.

<sup>3</sup> Limited. JWARN provides no capability, JEM will not be IOC until FY2006, and JOEF will not be IOC until FY2008.

<sup>4</sup> Limited. Doctrine and TTP are being developed as the different modules and blocks are being fielded.

<sup>5</sup> Limited. Training is being conducted (new equipment training) and developed as the different modules and blocks are being fielded.

<sup>6</sup> Limited. JWARN provides no capability, JEM will not be IOC until FY2006, and JOEF will not be IOC until FY2008.

<sup>7</sup> Limited. JWARN is available within the theater and can be used to basically track and monitor the hazard, but JEM will not be IOC until FY2006, and JOEF will not be IOC until FY2008.

<sup>8</sup> Limited. JWARN is available within the theater and can disseminate routine, essential and critical CBRN threat intelligence rapidly, but JEM will not be IOC until FY2006, and JOEF will not be IOC until FY2008.

<sup>9</sup> Limited. JWARN is available within the theater and can compile and display information on CBRN events that occurs throughout the theater, but JEM will not be IOC until FY2006, and JOEF will not be IOC until FY2008.

<sup>10</sup> Limited. JWARN is available within the theater to basically present information on the operational impact of a CBRN event, but JEM will not be IOC until FY2006, and JOEF will not be IOC until FY2008.

<sup>11</sup> Limited. JWARN is available within the theater and can provide automated warning and reporting to the Coalition and joint forces, but JEM will not be IOC until FY2006, and JOEF will not be IOC until FY2008.

<sup>12</sup> Limited. JWARN is available within the theater but interfaces with only the GCCS, manually. JEM will not be IOC until FY2006, and JOEF will not be IOC until FY2008.

<sup>13</sup> Limited. JWARN is available within the theater and allows CBRND data and information formats to be interoperable across the coalition and interagency environment but is labor-intensive. JEM will not be IOC until FY2006, and JOEF will not be IOC until FY2008.

<sup>14</sup> Limited. JWARN is available within the theater and is able to exchange information manually through planning, assessment and management tools. JEM will not be IOC until FY2006, and JOEF will not be IOC until FY2008.

<sup>15</sup> Limited. JWARN is available within the theater and CBRND information is manually processed using existing C4ISR assets. JEM will not be IOC until FY2006, and JOEF will not be IOC until FY2008.

<sup>16</sup> All near/mid-term measures will improve dramatically with the IOC of JEM Block I in FY2006 and the IOC of JOEF Block I, Increment I in FY2008.

<sup>17</sup> All far-term measures will improve even more with JOEF Block II/III IOC in FY2010.

### 7.5.3 Functional Solution Analysis

#### 7.5.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMAs section.

1. **Deficiency:** JWARN is available but is currently limited to manual input and retrieval.

**Non-Materiel Solutions:** *Doctrine:* JWARN doctrine (TTPs) will need to be developed and updated as each module is fielded. *Training:* JWARN training will need to be developed and updated as each module is fielded. Exercises and experiments could provide valuable insight and feedback on JWARN capabilities. *Leadership:* JWARN leadership education will need to be developed and updated as each module is fielded.

#### 7.5.3.2 IMA Assessment Summary

N/A

**7.6 Task STSHA 6: Provide theater CBRND strategy, plans, and policy****7.6.1 Functional Area Analysis****7.6.1.1 Definition**

To provide theater strategy, plans, and policy providing goals and end states for CBRND capabilities. Includes joint, multiagency, and international considerations. This task is geared to enabling the national strategies. Includes providing strategic theater guidance for restoration and elimination operations. Considers all Sense, Shape, Shield, and Sustain factors. Staff action in deliberate and crisis planning modes is supported. Includes providing strategic guidance for theater restoration and elimination operations.

**7.6.1.2 Derivation**

*UJTL (ST 1.3.4, ST 1.3.7, ST 2.2.1, ST 2.2.3, ST 2.4.1, ST 2.4.1.1, ST 2.4.1.2, ST 4.2.4, ST 5, ST 5.1, ST 5.1.1, ST 5.1.2, ST 5.1.3, ST 5.1.4, ST 5.1.6, ST 5.2, ST 5.2.1, ST 5.3.1.3, ST 5.3.3, ST 5.4.1, ST 5.4.3, ST 6, ST 6.1.6, ST 6.2, ST 6.2.1, ST 7.1.1, ST 8.1.4, ST 8.2, ST 8.3.2, ST 9, ST 9.3, ST 9.4, ST 9.5, ST 9.6), Protection Joint Functional Concept, Military Transformation: A Strategic Approach, Transformation Planning Guidance, Combatant Commander's Planning Guide for WMD Elimination Operations.*

**7.6.1.2.1 Supported Task: SNSHA 8****7.6.1.2.2 Lateral Tasks: STSHA 2, STSHA 3, STSHA 4, STSHA 7, STSHA 8, STSHA 9, STSHA 10, STSHA 11, STSHLD 5, STSHLD 6, STSUST 1, STSUST 2, STSUST 3, STSUST 4, STSUST 5, STSUST 6, STSUST 14****7.6.1.2.3 Supporting Task: OPSHA 6****7.6.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Restrictive mission instructions. (C2.1.1)
2. No preexisting arrangements. (C2.1.1.2)
3. Negligible personnel experience. (C2.2.4.5)
4. Some or no interoperability. (C2.2.6)
5. Poor Joint Staff integration. (C2.3.1.1)
6. Limited staff expertise. (C2.3.1.3)
7. Negligible theater intelligence access. (C2.4.4)

**Civil.** N/A

## **7.6.2 Functional Needs Analysis**

### **7.6.2.1 Capability and Deficiency Assessment Summary**

Table 7.6-1 discusses the only capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

Any COCOM HQ has a team of operational planners and information command and control specialists to include a CBRN staff cell. This team of experts forms the backbone of the theater command structure. Restoration and interdiction/elimination operations are concepts that planning staffs will continue to mature given specific threats within their respective AORs and therefore could not be rated fully capable. The Military Decision-Making Process is a formal concept that is universally accepted, and therefore plans and planning guidance should incorporate considerations for all eventualities. However, as recent operations have shown, CBRND-specific considerations had shortfalls. No specific means is available at this time to identify and track CBRND resources or contaminated items that are required to be redirected, removed, or disposed of. Institutional training that is focused on planning for restoration operations and CBRN consequence management is limited. Therefore, the measures concerning CBRND plans and planning guidance were rated as “yellow.”

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. No capability improvement is forecast for the near/mid term.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. DOTMLPF should improve in all deficient areas (for all measures in this row) as a result of initiatives that use data resulting from focused experimentation. Joint TTPs, training and exercises, and education will all improve, raising the far-term forecast to “green.”

Table 7.6-1. STSHA 6: Capability and Deficiency Assessment

Capability: COCOM Staff	M1	M2	M3	M4	M5	M6	M7	M8	M9
Current Overall Capability <sup>1</sup>	Y <sup>2</sup>	Y <sup>3</sup>	Y <sup>4</sup>	Y <sup>5</sup>	G <sup>6</sup>	Y <sup>7</sup>	Y <sup>8</sup>	Y <sup>9</sup>	Y <sup>10</sup>
Near/Mid-Term Overall Capability	Y	Y	Y	Y	G	Y	Y	Y	Y
Far-Term Overall Capability	G <sup>11</sup>	G	G	G	G	G	G	G	G

	FAA Measure	Scale
M1	Means exist to formulate CBRND planning guidance.	G – Yes, Y – Limited, R – No
M2	Planning staffs have the training and experience to effectively plan for CBRND operations.	G – Yes, Y – Limited, R – No
M3	Plans address all pertinent Sense, Shape, Shield, and Sustain issues.	G – Yes, Y – Limited, R – No
M4	Doctrine and TTPs are sufficient for effective CBRND planning.	G – Yes, Y – Limited, R – No
M5	Standing plans are adaptable to dynamically changing CBRND situations.	G – Yes, Y – Limited, R – No
M6	Operational and analytical/planning staffs have the training and experience to effectively plan for restoration operations.	G – Yes, Y – Limited, R – No
M7	Operational and analytical/planning staffs have the training and experience to effectively plan for elimination operations.	G – Yes, Y – Limited, R – No
M8	Joint, multiagency, and international considerations are included.	G – Yes, Y – Limited, R – No
M9	Means are established to identify and track CBRND resources or contaminated items that are required to be redirected, removed, or disposed of.	G – Yes, Y – Limited, R – No

<sup>1</sup> Limited. Institutional training for planning staffs is available. Institutional training that is focused on planning for restoration operations and CBRN consequence management is limited.

<sup>2</sup> Limited. Any COCOM staff has the ability to formulate planning guidance, but there are few JTTPs and education and training that specifically address formulating CBRND planning guidance.

<sup>3</sup> Limited. Any COCOM staff has the training and experience to plan operations, but there are few JTTPs and education and training that specifically address CBRND operations.

<sup>4</sup> Limited. Any COCOM staff has the ability to develop plans, but there are few JTTPs that specifically address the process to select all pertinent Sense, Shape, Shield, and Sustain issues.

<sup>5</sup> Limited. There are doctrine and JTTPs that specifically address theater CBRND planning, but given the broad range of CBRN/TIM threats worldwide, each COCOM still needs to develop its own TTPs for CBRN planning.

<sup>6</sup> Yes. Standing plans are adaptable to dynamically changing CBRN situations.

<sup>7</sup> Limited. Any COCOM operational and analytical/planning staff has the training and experience to effectively plan, but there are few JTTPs and courses that specifically address restoration operations.

<sup>8</sup> Limited. Any COCOM operational and analytical/planning staff has the training and experience to effectively plan, but there are few JTTPs and courses that specifically address interdiction/elimination operations.

<sup>9</sup> Limited. Joint, multiagency, and international considerations are infrequently included in plans at this time.

<sup>10</sup> Limited. No specific means is available at this time to identify and track CBRND resources or contaminated items that are required to be redirected, removed, or disposed of.

<sup>11</sup> DOTMLPF should improve in all deficient areas (for all measures in this row) as a result of initiatives that use data resulting from focused experimentation. Joint TTPs, training and exercises, and education will all improve.

### 7.6.3 Functional Solution Analysis

#### 7.6.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMAs section.

- 1. Deficiency:** Few JTTPs specifically address formulating CBRND planning guidance.  
**Non-Materiel Solutions:** *Doctrine:* Develop joint doctrine on formulating CBRND planning guidance for the theater. *Training:* Expand joint training on formulating CBRND plans and policy for the theater.
- 2. Deficiency:** Few JTTPs specifically address CBRND operations.  
**Non-Materiel Solutions:** *Doctrine:* Develop joint doctrine on planning CBRND restoration and interdiction/elimination operations for the theater. *Training:* Develop joint training on planning CBRND restoration and interdiction/elimination operations for the theater. *Leadership:* Develop joint leader education course(s) on CBRND restoration and elimination operations for the theater.
- 3. Deficiency:** Few JTTPs specifically address the process to select all pertinent Sense, Shape, Shield, and Sustain issues and incorporate them into plans.  
**Non-Materiel Solutions:** *Doctrine:* Develop joint doctrine on the process to select and incorporate into plans all pertinent Sense, Shape, Shield, and Sustain issues. *Training:* Develop joint training on the process to select all pertinent Sense, Shape, Shield, and Sustain issues. *Leadership:* Develop joint education course(s) on the process to select all pertinent Sense, Shape, Shield, and Sustain issues.
- 4. Deficiency:** Given the broad range of CBRN/TIM threats worldwide, each COCOM still needs to develop its own TTPs for CBRN planning.  
**Non-Materiel Solutions:** *Doctrine:* Each COCOM HQ must develop procedures to incorporate theater-specific CBRN/TIM threats into plans and policy.
- 5. Deficiency:** Joint, multiagency, and international considerations are seldom included in plans at this time.  
**Non-Materiel Solutions:** *Doctrine:* Include joint, multiagency, and international considerations into all theater plans and policy.
- 6. Deficiency:** No specific means is available at this time to identify and track CBRND resources or contaminated items that are required to be redirected, removed, or disposed of.  
**Non-Materiel Solutions:** *Doctrine:* Develop specific TTPs or means to identify and track CBRND resources or contaminated items that are required to be redirected, removed, or disposed of.

#### 7.6.3.2 IMA Assessment Summary. N/A

**7.7 Task STSHA 7: Coordinate CBRND aspects of theater medical operations****7.7.1 Functional Area Analysis****7.7.1.1 Definition**

To coordinate CBRND aspects of theater medical operations. Sets standards for personnel health and fitness required for potential exposure to CBRN/TIM conditions (e.g., immuno-competency, lung capacity, cholinesterase levels). Provides theater guidance for the conduct of medical CBRND health assessments ensuring compliance with nationally established threshold criteria for medical CBRND health assessments. Includes the coordination of medical surveillance throughout the theater for indications of CBRN/TIM attack or release. Also includes pre- and post-deployment medical evaluation to determine exposure to CBRN/TIM agents. Includes developing medical courses of action for inclusion in theater planning. Includes all aspects of CBRND medical logistics.

**7.7.1.2 Derivation**

*UJTL (ST 2.2.1, ST 2.4.1, ST 2.4.1.1, ST 2.4.1.2, ST 4.2.6, ST 5, ST 5.1.1, ST 5.1.2, ST 5.1.3, ST 5.1.4, ST 5.1.6, ST 5.2, ST 5.2.1, ST 5.4.1, ST 5.4.3, ST 6, ST 6.2, ST 7.1.1, ST 8.1.4, ST 8.2.3, ST 8.3.2, ST 9.3, ST 9.4, ST 9.5, ST 9.6), Transformation Planning Guidance, Protection Joint Functional Concept.*

**7.7.1.2.1 Supported Task: SNSHA 9****7.7.1.2.2 Lateral Tasks: STSHA 2, STSHA 3, STSHA 6, STSHA 8, STSHLD 3****7.7.1.2.3 Supporting Task: OPSHA 7****7.7.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. No preexisting arrangements. (C2.1.1.2)
2. No or outline mission preparation. (C2.1.3)
3. Low personnel capability. (C2.2.4)
4. Poor personnel nutrition and health. (C2.2.4.1)
5. Negligible personnel experience. (C2.2.4.5)
6. Limited staff expertise. (C2.3.1.3)
7. Highly restricted information exchange. (C2.3.1.8)

**Civil**

1. Uncooperative interdepartmental/interagency relationships. (C3.1.1.3)
2. Limited international organization support. (C3.1.2.5)
3. High health risk. (C3.3.1.5)
4. Insignificant science and technology. (C3.3.7)

**7.7.2 Functional Needs Analysis****7.7.2.1 Capability and Deficiency Assessment Summary**

Table 7.7-1 discusses the only capability to coordinate CBRND aspects of theater medical operations to perform the task to the designated standard.

**Current Capability and Deficiency**

Medical screening is adequate and appropriate for this capability. Automated disease outbreak tracking systems are generally available at the strategic national level and therefore, the theater-level medical health care providers need a reachback capability. Personnel and record screening are assessed as adequate. Procedures to isolate/quarantine casualties are assessed as limited because the caveat included host nation individuals, a task outside the realm of the COCOM HQ. Health risk assessment for TIM hazards are limited because a broad analysis of chemical and toxic material production/storing capabilities has not been accomplished globally. The task concerning units that were potentially or actually exposed to CBRN/TIM was rated limited because a real-time/near-real-time geospatial understanding of units on the battlefield has not been realized. The overall current assessment is on the low side of “yellow.”

**Projected Near/Mid-Term Capability and Deficiency**

JEM and JOEF are projected to be fielded in the near/mid-term future. JOEF will support real-time decision making that will allow the commander to assess and react to actual and potential impacts on the warfighting mission due to NBC hazards, logistical concerns, medical support needs (e.g. casualty estimation, troop exposures, casualty care and treatment, etc.) and deployment of NBC defense equipment. The project overall near/mid-term capability is “green.”

**Projected Far-Term Capability and Deficiency**

No changes in the foreseeable future. The project overall far-term capability is “green.”

**Table 7.7-1. STSHA 7: Capability and Deficiency Assessment**

Capability: COCOM Medical Staff/Unit	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10	M11
<b>Current Overall Capability<sup>1</sup></b>	G <sup>2</sup>	G <sup>3</sup>	Y <sup>4</sup>	Y <sup>5</sup>	Y <sup>6</sup>	G <sup>7</sup>	Y <sup>8</sup>	Y <sup>9</sup>	Y <sup>10</sup>	Y <sup>11</sup>	G <sup>12</sup>
<b>Near/Mid-Term Overall Capability</b>	G	G	Y	Y	G <sup>13</sup>	G	G <sup>13</sup>	Y	G <sup>13</sup>	G <sup>13</sup>	G
<b>Far-Term Overall Capability</b>	G	G	Y	Y	G	G	G	Y	G	G	G

	FAA Measure	Scale
M1	Personnel are screened for deployment eligibility.	G – Yes, Y – Limited, R – No
M2	Medical records are assessed for medical indicators.	G – Yes, Y – Limited, R – No
M3	Standards for personnel health and fitness are effective for potential CBRN/TIM environments.	G – Yes, Y – Limited, R – No
M4	Casualties (US, host nation, and third country nationals), both human and MWA, restricted by medical/veterinary isolation/quarantine, are identified.	G – Yes, Y – Limited, R – No
M5	A theater-wide system for tracking the status of CBRND medical information exists.	G – Yes, Y – Limited, R – No
M6	Theater medical threats are identified and appropriate counter-measures are instituted.	G – Yes, Y – Limited, R – No
M7	CBRND health risk assessment estimate is available.	G – Yes, Y – Limited, R – No
M8	Units, potentially or actually exposed/contaminated by CBRN/TIM or ROTA event, are identified and tracked.	G – Yes, Y – Limited, R – No
M9	CBRND medical courses of action are integrated into theater planning.	G – Yes, Y – Limited, R – No
M10	Logistics requirements and deficiencies are identified.	G – Yes, Y – Limited, R – No
M11	Non-DoD sources are accessed for information.	G – Yes, Y – Limited, R – No

<sup>1</sup> Limited. There is limited JTTPs to specifically address this task.

<sup>2</sup> Yes. Personnel are screened before deployment.

<sup>3</sup> Yes. Medical staffs can sufficiently assess records.

<sup>4</sup> DoD-wide standards for general military personnel health and fitness are well documented and sustained. However, medical linkage to health criteria for CBRN should be developed. Drawing of baseline cholinesterase levels needs to be standardized across the services.

<sup>5</sup> Limited. Most theater medical/veterinary personnel are proficient at quarantine protocol. However, coordination across the joint services medical community (as well as host nations/coalition partners) for identifying, screening, isolating, and quarantining infected personnel should be improved, to include the use of automated disease-outbreak tracking systems. These systems should be fed into the J-2, CBRN, and preventive medicine experts to provide population indicators of biological weapons use in AOR.

<sup>6</sup> There is a current limited capability to track the status of CBRND medical information, which will increase with the fielding of JEM and JOEF.

<sup>7</sup> Yes. National medical assets can identify potential medical threats and institute limited medical countermeasures.

<sup>8</sup> Limited. TIMs health risk assessment requires a broad analysis of chemical and toxic material production/storing capabilities in the area of operations. A database of global to local TIM hazards does not currently exist. However, expertise can be made available to the COCOM to conduct a health risk assessment based on regional hazards.

<sup>9</sup> Limited. Most COCOM staffs can track adequately those units actually or potentially exposed to CBRN/TIM. However, real-time/near-real-time understanding of the geographical location of units on the battlefield, tied to automated plume prediction technology is necessary.

<sup>10</sup> Unless specifically requested, medical COAs for CBRND are not typically included in theater plans, particularly for TIMs.

<sup>11</sup> Logistics requirements are identified for some medical issues, but CBRND medical issues are typically not addressed.

<sup>12</sup> Yes. Reachback capabilities exist for multiple medical need analyses.

<sup>13</sup> JEM and JOEF increases the capability from partial to full.

### 7.7.3 Functional Solution Analysis

#### 7.7.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMAs section.

1. **Deficiency:** Coordination across the joint services medical community (as well as host nations/coalition partners) for identifying, screening, isolating, and quarantining infected personnel should be improved.  
**Non-Materiel Solutions:** *Doctrine:* Doctrine for early identification for nonstandard and novel chemical/biological threats needs to be developed. *Training:* Training on early identification for nonstandard and novel chemical/biological threats needs to be implemented.
2. **Deficiency:** A global database of local CBRN/TIM hazards does not currently exist.  
**Non-Materiel Solutions:** None
3. **Deficiency:** Real-time/near-real-time understanding of the geographical location of units on the battlefield tied to automated plume prediction technology does not exist.  
**Non-Materiel Solutions:** None
4. **Deficiency:** There is limited JTTPs to specifically address coordinating CBRND/TIM aspects of theater medical operations.  
**Non-Materiel Solutions:** *Doctrine:* Improvement in environmental health and safety training of deploying forces is needed, JTTPs for medical management of CBRND/TIM casualties needs to be improved or some form of reachback capability needs to be implemented for health care professionals to conduct adequate assessments, diagnoses, and treatment.

#### 7.7.3.2 IMA Assessment Summary

Table 7.7-2 shows possible material approaches that address the remaining materiel requirements of the DOTMLPF assessment.

**Table 7.7-2. STSHA 7: IMA Assessment**

Idea for Materiel Approach	Description
Automated database	Development of an automated global database/software program of CBRN/TIM hazards or development of a theater medical personnel reachback capability to national medical and occupational safety and health databases.
Automated tool	Development of automated plume prediction technology tied to real-time geospatial unit location is necessary.

## 7.8 Task STSHA 8: Coordinate theater CBRND operations

### 7.8.1 Functional Area Analysis

#### 7.8.1.1 Definition

To provide overall coordination of theater CBRND operations. Preparatory activities are coordinated with affected joint forces, coalition partners, and appropriate nongovernmental organizations and indigenous agencies. Preparations are extended to cooperative nonaligned nations to reduce their CBRN/TIM vulnerability and enhance collaborative operating potential. CBRND resources provided by other nations and agencies, including resources identified under agreements and treaties, are integrated into preparations. Multiple CBRN/TIM events could occur in the same time frame throughout the theater. Rapid and effective response and mitigation coordination is required. CBRN/TIM event information provided in the COP is used to formulate appropriate actions and taskings. Includes the allocation and reallocation of CBRND resources to joint commanders throughout the theater. Includes overall coordination and tracking of theater restoration and elimination operations.

#### 7.8.1.2 Derivation

*UJTL (ST 1.1.2, ST 2.2.1, ST 2.4.1, ST 2.5, ST 5, ST 5.1, ST 5.2, ST 5.2.1, ST 5.3.1, ST 5.4.1, ST 5.4.3, ST 6, ST 7.1.1, ST 8.1, ST 8.2, ST 8.3.2, ST 9), Joint Enabling Concept for CBRN Operations, Protection Joint Functional Concept, Military Transformation: A Strategic Approach, Transformation Planning Guidance, An Operational Concept for Biological Defense.*

**7.8.1.2.1 Supported Tasks:** SNSHA 10, SNSHA 14

**7.8.1.2.2 Lateral Tasks:** STSHA 3, STSHA 6, STSHA 7, STSUST 7, STSUST 11, STSUST 12, STSUST 14

**7.8.1.2.3 Supporting Tasks:** OPSHA 8, OPSHA 12

#### 7.8.1.3 Condition

Perform this task under conditions of:

##### **Physical**

1. Immediate, delayed, or potential long-term atmospheric weapons effects. (C1.3.3)

##### **Military**

1. No preexisting arrangements (C2.1.1.2)
2. No or outline mission preparation (C2.1.3)
3. Few modern military systems. (C2.2.5)
4. Few modern military simulation systems. (C2.2.5.5)
5. Poor Joint Staff integration. (C2.3.1.1)

6. Poor multinational integration. (C2.3.1.2)
7. Limited staff experience. (C2.3.1.3)
8. Negligible deployed supplies. (C2.8.2)

### **Civil**

1. Correct interdepartmental/interagency relationships. (C3.1.1.3)
2. Negative foreign government support (C3.1.2.3)
3. Uncertain international organization support (C3.1.2.5)
4. Restrictive Presidentail and/or Secretary of Defense decisions. (C3.1.3)

## **7.8.2 Functional Needs Analysis**

### **7.8.2.1 Capability and Deficiency Assessment Summary**

Table 7.8-1 discusses the only capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The COCOM operations directorate (J-3) provides the capability to perform this task. The current capability is assessed as “yellow,” primarily centering on the JPME (does not mandate a core minimum set of CBRNE tasks for mastery at the mid and Senior Service College levels) and CBRN specialists (do not receive training as strategic planners). Also, allocation adequacy for CBRN units, personnel, and CBRND systems was considered limited.

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Little capability improvement is forecast for the near/mid term with the exception that *UJTL* 5.0 will be fully implemented and Sense, Shape, Shield, and Sustain factors will be consistently considered as a result of training, education, and experience.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. Little capability improvement is forecast for the far term with the exception that DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

**Table 7.8-1. STSHA 8: Capability and Deficiency Assessment**

<b>Capability: COCOM J-3</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>	<b>M6</b>	<b>M7</b>
<b>Current Overall Capability<sup>1</sup></b>	Y <sup>2</sup>	Y <sup>3</sup>	R <sup>4</sup>	Y <sup>5</sup>	Y <sup>6</sup>	Y <sup>7</sup>	Y <sup>8</sup>
<b>Near/Mid-Term Overall Capability<sup>9</sup></b>	Y	Y	G <sup>10</sup>	Y	Y	Y	Y
<b>Far-Term Overall Capability<sup>11</sup></b>	Y	Y	G	Y	Y	Y	Y

	<b>FAA Measure</b>	<b>Scale</b>
M1	CBRND units and personnel are adequately allocated.	G – Yes, Y – Limited, R – No
M2	CBRND systems and equipment are adequately allocated.	G – Yes, Y – Limited, R – No
M3	All pertinent Sense, Shape, Shield, and Sustain information is considered.	G – Yes, Y – Limited, R – No
M4	Coordination for CBRND operations includes transport, logistics, communications, and CBRND unit employment considerations.	G – Yes, Y – Limited, R – No
M5	Doctrine and TTPs for theater CBRND coordination are available.	G – Yes, Y – Limited, R – No
M6	Theater staffs are adequately trained to effectively coordinate CBRND operations.	G – Yes, Y – Limited, R – No
M7	Theater exercises or experimentation provide feedback on efficacy of coordination of theater CBRND operations.	G – Yes, Y – Limited, R – No

<sup>1</sup> No. JPME does not mandate a core minimum set of CBRNE tasks for mastery at the mid and Senior Service College levels. CBRN specialists do not receive training as strategic planners.

<sup>2</sup> Limited. Current apportionment to theaters within force structure constraints is appropriate. However, should interdiction fail, given multiple CBRN capable adversaries, CBRND units and personnel are insufficient for multitheater CBRN events and subsequent restoration operations.

<sup>3</sup> Limited. Current CBRND end-item systems are scarce assets. CBRND resources, especially detection and force protection systems, must be focused on most critical assets.

<sup>4</sup> No. Not all pertinent Sense, Shape, Shield, and Sustain information is considered. UJTL 5.0 will establish Sense, Shape, Shield, and Sustain as critical domains. However, UJTL 4.7 does not.

<sup>5</sup> Limited. COCOM J-3 can establish coordination; however, given the fluid nature of current and future military engagement areas, precise and finite coordination must await execution orders.

<sup>6</sup> Limited. Joint Publication 3 Series (Operations) addresses CBRND coordination considerations. However, TIM are not adequately addressed at the Strategic Theater level.

<sup>7</sup> Limited. Joint Senior Leaders Course provides a limited orientation at the Strategic Theater and Operational levels. However, JPME does not mandate a core minimum set of CBRNE tasks for mastery at the mid and Senior Service College levels.

<sup>8</sup> Limited. Few exercises or experimentation adequately incorporate appropriate CBRN/TIM issues.

<sup>9</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>10</sup> UJTL 5.0 will be fully implemented, and Sense, Shape, Shield, and Sustain factors will be consistently considered as a result of training, education, and experience.

<sup>11</sup> Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.

### 7.8.3 Functional Solution Analysis

#### 7.8.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMAs section.

- 1. Deficiency:** Given multiple CBRN capable adversaries, CBRN units and personnel are insufficient for multitheater CBRN events and subsequent restoration operations and individual theater resources will be constrained.  
**Non-Materiel Solutions:** *Organization:* Given the intensive requirements for reconnaissance and decontamination in a CBRN environment, reevaluate allocation rules for CBRN units. *Personnel:* Given the intensive requirements for information management, reconnaissance and decontamination in a CBRN environment, reevaluate allocation rules for CBRN personnel.
- 2. Deficiency:** Lack of automated CBRN/TIM hazard assessment capability.  
**Non-Materiel Solutions:** None
- 3. Deficiency:** Few exercises or experimentation adequately incorporate appropriate CBRN/TIM issues.  
**Non-Materiel Solutions:** *Doctrine:* UJTL 5.0 should effectively drive consideration of Sense, Shape, Shield, and Sustain domains. *Training:* Incorporate appropriate CBRN/TIM issues into all theater-level exercises and experimentation.
- 4. Deficiency:** Given the fluid nature of current and future military engagement areas, precise and finite CBRN logistical and operational coordination must await execution orders.  
**Non-Materiel Solutions:** *Doctrine:* Develop staff planning guidance for predictive CBRN operations and logistics.
- 5. Deficiency:** Theater TIM considerations are not adequately addressed at the Strategic Theater level.  
**Non-Materiel Solutions:** *Doctrine:* Develop a process and plan to address TIMs at the Strategic Theater level.
- 6. Deficiency:** JPME does not mandate a core minimum set of CBRNE tasks for mastery at the mid and Senior Service College levels.  
**Non-Materiel Solutions:** *Training:* Conduct front-end analysis and training needs analysis to develop and implement appropriate instruction at the intermediate and Senior Service College level. Once training analysis is complete, resource manpower and time to support resident instruction and develop distributed training.

#### 7.8.3.2 IMA Assessment Summary

Table 7.8-2 shows possible material approaches that address the remaining materiel requirements of the DOTMLPF assessment.

**Table 7.8-2. STSHA 8: IMA Assessment**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Automated tool	Develop a theater TIM automated assessment tool that allows staff planners predictive capability for TIM hazards

**7.9 Task STSHA 9: Develop TEPs for Shape considerations and activities for assigned theater or designated countries****7.9.1 Functional Area Analysis****7.9.1.1 Definition**

To develop Theater Engagement Plans (TEPs) that will develop cooperation and trust through a combination of restoration operations exercises, training, equipment exchange, and other cooperative efforts. Many nations that would normally support U.S. initiatives may feel threatened by hostile neighbors or nations that possess CBRN/TIM weapons. To ensure cooperation and interoperability, the combatant commander develops TEPs for assigned theater or designated countries. TEPs that include Shape considerations and activities can help to mitigate reluctance to support the United States. If countries are provided with the means to achieve situational understanding after CBRN/TIM attacks or if they are assured of U.S. assistance, they will feel less threatened.

**7.9.1.2 Derivation**

*UJTL (ST 9.4, ST 8.2.1, ST 8.1.2), CJCSM 3113.01A.*

**7.9.1.2.1 Supported Task: SNSHA 11****7.9.1.2.2 Lateral Tasks: STSENS 7, STSHA 6, STSUST 8****7.9.1.2.3 Supporting Task: OPSHA 9****7.9.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. No preexisting arrangements. (C 2.1.1.2)
2. Limited personnel expertise. (C2.2.4.5)

**Civil**

1. Mixed support for political policies. (C3.1)
2. Limited foreign government support. (C3.1.2.3.)

## **7.9.2 Functional Needs Analysis**

### **7.9.2.1 Capability and Deficiency Assessment Summary**

Table 7.9-1 discusses the only capability that currently exists to perform the task to the designated standards. There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The combatant command develops TEPs for Shape considerations and activities for assigned theater or designated countries. Nothing precludes the COCOM staff from establishing these TEPs now, but there is very little in the way of existing doctrine or TTPs to help guide them. Theater engagement planning is primarily a strategic planning document intended to link COCOM-planned regional engagement activities with national strategic objectives. TEPs are based on defense planning guidance. COCOM-planned and -supported operations and activities produce multiple benefits in readiness, modernization, and engagement. However, peacetime military engagement activities must be prioritized to ensure efforts are focused on those that are of greatest importance, without sacrificing warfighting capability. Because weapons of mass destruction represent the most significant threat to global security, it is an ideal candidate for theater engagement planning, which identifies the synchronization of these activities on a regional basis and illustrates the efficiencies gained from regional COCOM engagement activities that support national strategic objectives. Nothing precludes a COCOM staff from initiating theater engagement planning for Shape-related considerations. No guidance has been provided and no doctrine exists specifically addressing for Shape-related consideration integration into TEPs. No Shape-related exercises/experimentation have been conducted to provide feedback on efficacy of TEPs for specific countries. No doctrine has been developed. Leader education does not address this issue.

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Near/mid-term experimentation results (as recommended in this Joint Capabilities Integration and Development System [JCIDS] analysis) may lead to development of new capabilities. It is projected that improvements due to coordination/DOTLPF enhancements will dramatically improve the ability of the COCOM staff to develop TEPs for Shape-related issues, but the overall status will remain “yellow” due to the inherent difficulty in initiating and developing new theater engagement planning programs.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. The overall status is likely to remain “yellow” due to the inherent difficulties posed by international relations.

**Table 7.9-1. STSHA 9: Capability and Deficiency Assessment**

Capability: COCOM HQ	M1	M2	M3	M4
<b>Current Overall Capability</b> <sup>1</sup>	Y <sup>2</sup>	G <sup>3</sup>	Y <sup>4</sup>	R <sup>5</sup>
<b>Near/Mid-Term Overall Capability</b>	Y	G	Y	R
<b>Far-Term Overall Capability</b> <sup>6</sup>	Y	G	Y	Y <sup>7</sup>

	FAA Measure	Scale
M1	Shape TEPs are established for designated countries.	G – Yes, Y – Limited, R – No
M2	TEPs are modified after substantive changes are recommended and approved.	G – Yes, Y – Limited, R – No
M3	TEPs meet guidelines of <i>CJCSM 3113.01A</i> .	G – Yes, Y – Limited, R – No
M4	Joint exercises/experimentation provide feedback on efficacy of TEPs for specific countries.	G – Yes, Y – Limited, R – No

<sup>1</sup> No doctrine has been developed. Leader education does not address this issue.

<sup>2</sup> Nothing precludes a COCOM staff from initiating TEP for Shape-related considerations. No guidance has been provided, and no doctrine exists specifically addressing Shape integration into TEP.

<sup>3</sup> Nothing precludes meeting this standard once Shape-related TEPs are established.

<sup>4</sup> CJCSM 3113.01A does not address integration of Shape-related considerations into TEP.

<sup>5</sup> No Shape-related exercises/experimentation have been conducted to provide feedback on efficacy of TEPs for specific countries.

<sup>6</sup> Doctrine will be developed. Leader education will begin to address this issue.

<sup>7</sup> Results of experimentation and feedback from insertion in training exercises will begin to provide valuable data on TEP-related issues.

### 7.9.3 Functional Solution Analysis

#### 7.9.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMAs section.

1. **Deficiency:** No guidance has been provided, and no doctrine/TTPs exists specifically addressing Shape integration into TEPs.  
**Non-Materiel Solutions:** *Doctrine:* Establish policies, TTPs, and guidelines that include practical ways to enhance Shape-related consideration integration into TEPs.
2. **Deficiency:** No Shape exercises/experimentation have been conducted to provide feedback on efficacy of TEPs for specific countries.  
**Non-Materiel Solutions:** *Training:* Develop exercises to include Shape-related considerations with TEP countries to determine efficacy of policy once established.
3. **Deficiency:** Leader education does not address this issue.  
**Non-Materiel Solutions:** *Leadership:* At the urging of the Joint Forces Staff College (JFSC), and as part of a Joint Requirements Office for Chemical, Biological, Radiological, and Nuclear Defense (JRO-CBRND) joint education initiative, a team began to investigate ways to develop CBRN defense initiatives as part of theater engagement planning. The subject matter experts at the JFSC felt that in the current global environment, CBRND was an ideal platform for military engagement, enhancing a common global defense capability against weapons of mass destruction. The team plans to present these JCIDS tasks to the JFSC as a foundation for the development of TEP education materials when they are finalized.

#### 7.9.3.2 IMA Assessment Summary

N/A

**7.10 Task STSHA 10: Establish theater cooperative CBRN/TIM-detection policies, procedures, and networks****7.10.1 Functional Area Analysis****7.10.1.1 Definition**

To link theater active systems (such as Air Defense Radar) with passive detectors (such as Biological Integrated Detection System [BIDS]) to produce a theater cooperative CBRN/TIM-detection network. Builds a seamless web from the theater capabilities down to individual tactical detectors within the theater battlespace to provide a means of detecting both delivery vehicles and agents.

**7.10.1.2 Derivation**

*UJTL (OP 7.5, OP 2.2.2).*

**7.10.1.2.1 Supported Task: SNSHA 12****7.10.1.2.2 Lateral Task: STSHA 6****7.10.1.2.3 Supporting Task: OPSHA 11****7.10.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Partial preexisting arrangements. (C2.1.1.2)

**Civil**

1. Limited foreign government support. (C3.1.2.3)
2. Moderately opposed foreign public opinion. (C3.1.2.4)

**7.10.2 Functional Needs Analysis****7.10.2.1 Capability and Deficiency Assessment Summary**

Table 7.10-1 discusses the only capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

While any theater-level staff can develop policies and procedures specific and unique to its operational circumstances, this task is asking much more. This task is not normally a function of a theater commander. This capability must be developed and facilitated by Strategic National assets and passed to the field commander as a vetted operational capability package. Because of this current deficiency, the capability is assessed as “red.” The capability to incorporate cooperatively linked detection technologies does not currently exist; therefore, effective DOTMLPF has not yet been developed.

**Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. No capability improvement is forecast for the near/mid term.

**Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. In the far term the capability assessment should improve to “yellow.” A COCOM HQ has the ability to establish CBRN/TIM-detection policies within the theater. As cooperative linkages between various systems capabilities are coordinated and established between various detection technologies (e.g., BIDS, phased-array radars, standoff motion detectors, passive monitors, vehicular-embedded detectors with Global Positioning System (GPS) linkages and automatic position reporting, individual detectors networked to centralized data servers, etc.) theater cooperative CBRN/TIM-detection policies, procedures, and networks will be established in limited fashion. All supporting and required DOTMLPF enhancements will be initiated, but it will take years of experimentation and exercises before full capability is realized.

**Table 7.10-1. STSHA 10: Capability and Deficiency Assessment**

<b>Capability: COCOM HQ</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>	<b>M6</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>R<sup>2</sup></b>	<b>R<sup>3</sup></b>	<b>R<sup>4</sup></b>	<b>R<sup>5</sup></b>	<b>G<sup>6</sup></b>	<b>R<sup>7</sup></b>
<b>Near/Mid-Term Overall Capability</b>	<b>R</b>	<b>R</b>	<b>R</b>	<b>R</b>	<b>G</b>	<b>R</b>
<b>Far-Term Overall Capability</b>	<b>Y<sup>8</sup></b>	<b>Y</b>	<b>Y</b>	<b>Y</b>	<b>G</b>	<b>Y</b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Theater cooperative CBRN/TIM-detection policy is established.	G – Yes, Y – Limited, R – No
M2	Theater cooperative CBRN/TIM-detection procedures are established.	G – Yes, Y – Limited, R – No
M3	Theater cooperative CBRN/TIM-detection networks are established.	G – Yes, Y – Limited, R – No
M4	Policy and procedures have been established with theater allies.	G – Yes, Y – Limited, R – No
M5	Existing policy and procedures are updated regularly.	G – Yes, Y – Limited, R – No
M6	Multinational exercises/experimentation provide feedback on efficacy of policies and procedures.	G – Yes, Y – Limited, R – No

<sup>1</sup> Limited. Conceivably, any COCOM HQ could incorporate cooperatively linked detection technologies; however, the capability does not currently exist, therefore, effective DOTMLPF is irrelevant.

<sup>2</sup> A COCOM HQ has the ability to establish CBRN/TIM-detection policies within the theater as outlined in the Theater Security Cooperation Plan. However, cooperative linkages between various systems capabilities, although proposed, have not yet been coordinated. Since no linkages currently exist between various detection technologies (e.g., BIDS, phased-array radars, standoff motion detectors, passive monitors, vehicular-embedded detectors with GPS linkages and automatic position reporting, individual detectors networked to centralized data servers, etc.), no theater cooperative CBRN/TIM-detection policies are required.

<sup>3</sup> Any COCOM HQ CBRN cell has the ability to establish CBRN/TIM-detection procedures within the theater. However, distributed, cooperative CBRN/TIM-detection capabilities do not currently exist, and theater cooperative CBRN detection procedures are not established.

<sup>4</sup> Any COCOM HQ communications cell has the ability to establish networks within the theater. However, cooperative linkages between various system capabilities do not currently exist; therefore, cooperative CBRN/TIM-detection networks need not be established.

<sup>5</sup> Any COCOM HQ has the ability to establish policies and procedures. However, cooperative linkages between various system capabilities do not exist currently; therefore, policies and procedures need not be established.

<sup>6</sup> Any COCOM HQ has the ability to update policies and procedures regularly.

<sup>7</sup> Since the capability to establish cooperative linkages between various detection technologies does not currently exist, exercises and experiments to provide feedback are not yet necessary.

<sup>8</sup> A COCOM HQ has the ability to establish CBRN/TIM-detection policies within the theater. As cooperative linkages between various systems capabilities are coordinated and established between various detection technologies (e.g., BIDS, phased-array radars, standoff motion detectors, passive monitors, vehicular-embedded detectors with GPS linkages and automatic position reporting, individual detectors networked to centralized data servers, etc.) theater cooperative CBRN/TIM-detection policies, procedures, and networks will be established in limited fashion. All supporting and required DOTMLPF enhancements will be initiated, but it will take years of experimentation and exercises before full capability is realized.

### 7.10.3 Functional Solution Analysis

#### 7.10.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMAs section.

1. **Deficiency:** Lack of a networked CBRN/TIM-detection capability.  
**Non-Materiel Solutions:** None
2. **Deficiency:** Since the capability to establish cooperative linkages between various detection technologies does not currently exist, proposals and concepts must be tested in exercises and experiments to provide feedback and test hypotheses.  
**Non-Materiel Solutions:** *Doctrine:* Develop ideas, proposals, and concepts for cooperatively linked detection technologies. *Training:* Before concepts for cooperatively linked detection technologies can be fully developed and tested, exercises and experiments will be necessary to refine and test concept hypotheses.
3. **Deficiency:** The capability of cooperatively linked detection technologies does not currently exist; therefore, effective DOTLPF has not been established.  
**Non-Materiel Solutions:** *Doctrine:* Before cooperatively linked detection technologies reach IOC, effective doctrine and JTTPs should be developed. *Organization:* Before cooperatively linked detection technologies reach IOC, organizational requirements and changes should be developed and executed. *Training:* Before cooperatively linked detection technologies reach IOC, effective training for theater-level staffs should be developed. *Leadership:* Before cooperatively linked detection technologies reach IOC, leader education should be developed and integrated into the Joint Forces Staff College. *Personnel:* Before cooperatively linked detection technologies reach IOC, personnel requirements need to be identified. *Facilities:* Before cooperatively linked detection technologies reach IOC, facility needs must be identified.

**7.10.3.2 IMA Assessment Summary**

Table 7.10-2 shows possible material approaches that address the remaining materiel requirements of the DOTMLPF assessment.

**Table 7.10-2. STSHA 10: IMA Assessment**

Idea for Materiel Approach	Description
Networked detection system	Development of cooperative linkages between various proponent and service detection and sensing technologies is required. Concepts must first be developed based on proposed linkages that will provide effective, integrated CBRN/TIM-detection capabilities. These concepts must be explored through experimentation and then cooperative linkages established and tested. The entire package should be developed as a system. As each Service develops detection or sensing technologies, they should be analyzed for inclusion into the CBRN/TIM cooperative detection network and modifications (if required) be mandated for the Service systems.

**7.11 Task STSHA 11: Develop theater policies, standards, and procedures for determining employment of CBRN/TIM weapons****7.11.1 Functional Area Analysis****7.11.1.1 Definition**

To develop theater policy, standards, and procedures for verifying compliance with internationally accepted standards and procedures. Includes standards and procedures to be used by theater forces for determining first use of CBRN/TIM weapons by a nation-state or transnational organization and the means by which verification of attack will be confirmed.

**7.11.1.2 Derivation**

*UJTL (ST 9.6, ST 7.1.5, ST 7.2.3, ST 8.2.10).*

**7.11.1.2.1 Supported Task: SNSHA 13****7.11.1.2.2 Lateral Tasks: STSHA 6, STSHLD 7****7.11.1.2.3 Supporting Task: N/A****7.11.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. No preexisting arrangements. (C 2.1.1.2)
2. Limited personnel expertise. (C2.2.4.5)
3. Restricted information exchange. (C2.3.1.8)
4. Ambiguous threat. (C2.9.3)

**Civil**

1. Mixed support for political policies. (C3.1)
2. Limited foreign government support. (C3.1.2.3.)

**7.11.2 Functional Needs Analysis****7.11.2.1 Capability and Deficiency Assessment Summary**

Table 7.11-1 discusses the capability that currently exists to perform the task to the designated standards. There is only one capability that exists, and no other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

Any COCOM HQ has the basic ability to develop specific theater policies, standards, and procedures for determining employment of CBRN/TIM weapons for its assigned theater or with designated countries. In many cases national-level policy, standards, and procedures will already be established and should be observed. However, in those cases where national-level policy, standards, and procedures do not apply or where theater-specific situations require that they be augmented, the COCOM staff has the capability. Additionally, the capability to establish internationally accepted standards and procedures for determining employment of CBRN/TIM weapons exists now administratively. Mechanisms currently used are NATO working groups that develop Standardization Agreements (STANAGs) and Allied Joint Publications (AJPs) as well as American, British, Canadian, and Australian Armies Program Quadrapartite working groups. Theater exercises, even with close and traditional partners, seldom use realistic CBRN/TIM scenarios or highlight verification exercise objectives. Doctrine and TTPs have not yet been developed for collaborative verification procedures and for TIM. The capability is rated on the low side of “green.”

**Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. No capability improvement is forecast for the near/mid term.

**Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. The far-term outlook is “green,” however, as theater exercises will begin to use realistic CBRN/TIM scenarios and highlight verification exercise objectives. Comprehensive doctrine and TTPs will be developed for collaborative verification procedures and for TIM. International verification protocol will be established.

**Table 7.11-1. STSHA 11: Capability and Deficiency Assessment**

<b>Capability: COCOM HQ</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>G<sup>2</sup></b>	<b>G<sup>3</sup></b>	<b>Y<sup>4</sup></b>

<b>Far-Term Overall Capability</b>	<b>G</b>	<b>G</b>	<b>G<sup>5</sup></b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Theater policy and standards for determining employment of CBRN/TIM weapons are established.	G – Yes, Y – Limited, R – No
M2	Existing policy and standards are updated regularly.	G – Yes, Y – Limited, R – No
M3	Theater exercises/experimentation provide feedback on efficacy of policy and standards.	G – Yes, Y – Limited, R – No

<sup>1</sup> Although basic guidelines exist, more comprehensive doctrine and TTPs needs to be developed for collaborative verification procedures and for TIM. Every nation has its own national verification protocol.

<sup>2</sup> Standards and policies have been developed at the national level that can be used by any COCOM. COCOMs have established policies, standards, and procedures that can be used within the command and with traditional theater allies. When new international partners join a COCOM-sponsored coalition, they must be integrated into the determination process and provided with policies, standards, and procedures.

<sup>3</sup> Any COCOM staff can update standards and policies as required.

<sup>4</sup> Theater exercises, even with close and traditional partners, seldom use realistic CBRN/TIM scenarios or highlight verification exercise objectives.

<sup>5</sup> Theater exercises will begin to use realistic CBRN/TIM scenarios and highlight verification exercise objectives. Lessons learned will provide data for DOTMLPF enhancements.

### 7.11.3 Functional Solution Analysis

#### 7.11.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMAs section.

1. **Deficiency:** Doctrine and TTPs need to be developed for collaborative verification procedures.  
**Non-Materiel Solutions:** *Doctrine:* Develop doctrine and TTPs for collaborative verification procedures that work for the international community.
2. **Deficiency:** There are no theater exercises that provide feedback on the processes employed for determining employment of CBRN weapons and verification procedures.  
**Non-Materiel Solutions:** *Training:* Insure development of and participate in theater exercises that will provide feedback on the processes employed for determining employment of CBRN weapons.

## **8.0 Operational Shape**

### **8.0.1 Introduction**

The Operational (OP) level of war is where campaigns and major operations are planned, conducted, and sustained to accomplish strategic objectives within theaters or areas of operations. Activities at this level link tactics and strategy by establishing operational objectives needed to accomplish the strategic objectives, sequencing events to achieve the operational objectives, initiating actions, and applying resources to bring about and sustain these events. These activities imply a broader dimension of time or space than do tactics; they ensure the logistic and administrative support of tactical forces and provide the means by which tactical successes are exploited to achieve strategic objectives. Twelve Operational Shape (SHA) tasks were identified in the chemical, biological, radiological, and nuclear (CBRN) Functional Area Analysis (FAA).

This chapter, detailing the Operational Shape (OPSHA) area, restates relevant information from the CBRND Defense (CBRND) FAA including a description of each of the 12 OPSHA tasks, derivation of the task, an indication of other linked tasks, and the pertinent conditions. The Functional Needs Analysis (FNA) section addresses the capability and deficiency analysis, and a brief description of potential near-term changes. Once all the capabilities are considered, the assessment concludes with a separate, overarching look at the entire capability spectrum to identify remaining gaps and/or synergies. The Functional Solutions Analysis (FSA) section addresses possible solutions for the deficiencies identified in the FNA section. These are categorized into materiel or non-materiel. The non-materiel solutions are addressed first and reflect one or more of the six areas of DOTLPF: doctrine, organization, training, leadership, personnel, and facilities. If there is no non-materiel solution to the deficiencies, then materiel solutions are considered. These encompass broad approaches that are not system-specific. These potential materiel approaches are addressed and in the Ideas for Materiel Approaches (IMAs) section. The IMAs provide a possible near or far term resolution to identified deficiencies within the individual capabilities.

### **8.0.2 FNA Summary**

Table 8.0-1 summarizes the overall current and projected capability to perform the OPSHA tasks identified in the CBRND FAA. The overall capability to conduct these tasks in the current time frame is assessed as “red.” Before a CBRN/TIM attack, the joint force commander will need to be proactive in determining and shaping the Joint Operations Area (JOA) CBRN/toxic industrial material (TIM) situation. CBRND assets will be required to meet surge demands, and these demands could potentially outstrip the current logistical philosophy of just-in-time delivery. During the analysis, a conundrum for the planning staff was noticed. Active defense, interdiction, and elimination measures applied effectively under the Sense, Shape, and Shield domains could mitigate or even preclude the requirements for the extreme CBRND logistical and medical burden imposed under the Sustain domain. However, a failure to apply appropriate CBRND logistical planning and management factors early in the Shape domain could prove catastrophic, should more aggressive active defense measures fall short or be precluded by other restrictive criteria. Any operational-level HQ has a team of operational planners and information

command and control specialists to include CBRND subject matter experts. This team of experts will form the backbone of any joint task force command structure. Restoration and elimination operations are concepts that planning staffs will continue to develop given specific threats within their respective Areas of Responsibility (AORs) and therefore could not be rated fully capable. The Military Decision-Making Process is a formal concept that is universally accepted, and therefore plans and planning guidance should incorporate considerations for all eventualities. However, as recent operations have shown, CBRND-specific considerations had shortfalls. Therefore, the measures concerning CBRND plans and planning guidance were not rated fully capable. Joint Tactics, Techniques, and Procedures (JTTPs) and tools to evaluate and assess CBRND staffs, capabilities, systems, and concepts within an AOR are limited. There are no tactics, techniques, and procedures (TTPs) that specifically and comprehensively address the impact of CBRN/TIM hazards on operational objectives. Forces and staffs of other nations may not have training, equipment, or experience to effectively conduct CBRND operations. The organizational structure of a subordinate joint force's intelligence element is determined by the Joint Force Commander (JFC) based on the situation and mission. All subordinate joint force J-2s, however, will at a minimum require a core element of analytical and administrative capabilities. Most situations will require augmentation of joint force intelligence capabilities through the deployment and integration of theater intelligence elements into a joint intelligence support element (JISE). Capabilities of the JISE include order of battle analysis; identification of adversary centers of gravity (COGs); analysis of adversary command, control, communications, and computers; targeting support; collection management; and maintenance of a 24-hour watch. The biggest deficiency from a CBRN/TIM aspect is currency and reliability of intelligence data and products. There are major deficiencies associated with an operational-level staff's ability to coordinate JOA/JTF CBRND information systems and processes required to meet the JTF/JOA CBRN/TIM situation. As programmed, the Joint Warning and Reporting Network (JWARN) is a suite of hardware and software that should, once fully operational, provide adequate capability from a CBRND Command, Control, Communications, Computers, Intelligence, Surveillance, and Reconnaissance (C4ISR) standpoint. Until JWARN is fully operationally capable (FOC), limitations to CBRN information systems and processes include manual data receipt and entry, limited interface with the Common Operating Picture (COP), restricted information flow into the Global Command and Control System (GCCS), and limitations to real-time situational awareness. Anticipated improvements over the near/mid term will raise the projected capability rating to "yellow."

Table 8.0-1. Operational Shape Summary FNA Findings

### 8.0.3 FSA Summary

The paragraphs below summarize the assessment of all potential doctrine, organization, training, materiel, leadership and education, personnel, and facilities (DOTMLPF, non-materiel and materiel) solutions for the capability gaps identified in the FNA section.

#### 8.0.3.1 DOTLPF

The DOTLPF solutions identified in this chapter are associated primarily with training and doctrinal issues and include the development of JTTPs. DOTMLPF recommendations include the development of doctrine for active defense, interdiction, and elimination measures. Development of joint training on determining joint CBRN resources required to meet the JTF/JOA CBRN situation is suggested, as well as development of joint leadership education course(s) on determining joint CBRN resources required to meet the JTF/JOA CBRN situation. It would also be advisable to develop JTTPs that address the following:

- Adjusting the flow of resources based specifically on CBRN conditions.
- Determining adjustment of resources based on joint CBRND considerations.
- Influencing the flow of joint CBRN resources.
- Determining joint CBRN resources required to meet the JTF/JOA CBRN situation.
- Addressing a truly joint CBRND logistics management process.
- Developing JTTPs that address joint analytical tools to assess CBRND logistical demands.

Proposed solutions to deficiencies associated with the J2's ability to conduct JOA CBRN/TIM vulnerability analysis and potential DOTMLPF solutions include a need to develop joint exercise/experiments that portray the JOA TIM threat and situation.

DOTMLPF solutions also suggest the following steps:

- Develop Joint Professional Military Education (JPME) courses that address JISE functions and CBRN/TIM threat and vulnerability analysis.
- Develop doctrine and TTPs for vulnerability assessments that include near- and far-term TIM hazard effects, mitigation, and remediation.
- Develop formalized courses which instruct intelligence and CBRN specialists in TIM vulnerability assessment processes and which include Occupational Safety and Health Administration (OSHA) and U.S. Environmental Protection Agency standards in CBRN JPME.
- Develop standardized U.S. Department of Defense (DoD) TIM vulnerability analysis and risk assessment processes.
- Develop formal analytical processes to evaluate adversary courses of action (COA)s in relation to TIM considerations.
- Develop formal TTPs and JPME courses which address TIM hazards and their impact on friendly and adversary COA.
- Deconflict TIM permissible exposure limits between OSHA, deployed military, and host nation guidelines, and standardize CBRN/TIM COA analysis process.
- Exercise and capture lessons learned concerning the efficacy of TIM vulnerability analysis processes.
- The Office of the Command Surgeon should promulgate TIM health hazard effects, mitigation techniques, and remediation processes for use by U.S. forces deployed abroad.
- Review force structure.
- Within end strength constraints, consider adjusting force structure as a result of lessons learned from joint exercises/experiments.
- Develop training support packages that incorporate lessons learned from joint exercises/experiments.
- Develop leadership education and JPME course(s) that incorporate lessons learned from CBRND issues in joint exercises/experiments.
- Review available data and lessons learned from historical wide area events, to validate logistical planning factors. Such events could include natural disasters, large TIM releases, terrorist activity, and testing historically conducted by the United States and the former Soviet Union.
- Develop a Joint Master Scenario Events List (JMSEL) and training for joint exercises/experiments that address coordination of CBRND operations within a JOA.
- Develop courses and JTTPs that address CBRND coordination within the JOA.
- Actively pursue a joint lessons learned program that captures CBRND lessons from exercises/experiments and real-world events.
- Incorporate all lessons into the Joint Universal Lessons Learned System (JULLS).

**8.0.3.2 IMA**

This paragraph summarizes possible material approaches that address the remaining materiel requirements of the DOTMLPF assessment. Materiel needs include an automated global database/software program of CBRN/TIM hazards, and an automated plume prediction technology tied to real-time geospatial unit location. Develop automated systems/tools designed specifically to provide information on and determine operational impacts due to CBRN/TIM hazards. Operational forces require the ability to determine operational effects and impacts due to CBRN/TIM hazards and potential DOTMLPF solutions. Automation must be integrated into existing systems to speed up the process and ensure accuracy.

## **8.1 Task OPSHA 1: Characterize the JOA CBRN/TIM threat and situation**

### **8.1.1 Functional Area Analysis**

#### **8.1.1.1 Definition**

To characterize the CBRN/TIM threat and situation for the Joint Task Force (JTF) or JFC in the JOA. Uses Sense data to move from situational awareness as well as shared awareness to shared understanding. Informs personnel; provides actual and potential impacts of CBRN/TIM hazards; and envisions critical Sense, Shield, and Sustain end states, including preparing for operations and visualizing the sequence of events that moves the JTF or joint force from its current state to those end states. Includes establishing collection priorities and coordination with intelligence organizations to collect information on CBRN/TIM capabilities encompassing such things as adversary intent and objectives, weapons availability and capacity, expected tactics, potential targets, and willingness or historic propensity to employ CBRN/TIM weapons. Also includes compiling and analyzing intelligence information and data provided by intelligence organizations or resources satisfying the JTF or JFC's CBRN/TIM threat intelligence collection plan. Provides processed CBRN/TIM threat intelligence for development of regional vulnerability assessments and for an understanding of the current and predicted CBRN/TIM situation. Provides the basis for CBRND tasking of and warning to the JTFs or JFCs. Further encompasses JOA medical intelligence to be collected in support of CBRND analysis.

*UJTL (OP 2.2, OP 2.2.1, OP 2.5, OP 2.4.1, OP 2.5.1, OP 2.4, OP 2.4.1.1, OP 2.4.2.1, OP 2.5, OP 2.5.3, OP 5.1.1, OP 5.1.2, OP 5.2, OP 5.2.1, OP 5.3, OP 5.3.9, OP 5.4.2, OP 5.4.5, OP 5.7, OP 5.7.6, OP 6.1.6, OP 6.2.10, OP 7), Protection Joint Functional Concept, Military Transformation: A Strategic Approach, Transformation Planning Guidance.*

##### **8.1.1.2.1 Supported Task: STSHA 1**

##### **8.1.1.2.2 Lateral Tasks: OPSENS 1, OPSENS 2, OPSENS 3, OPSENS 4, OPSHA 2, OPSUST 14**

##### **8.1.1.2.3 Supporting Tasks: TASHA 1, TASHA 2, TASHA 3, TASHA 4, TASHA 16**

#### **8.1.1.3 Condition**

Perform this task under conditions of:

##### **Physical**

1. Immediate, delayed, or potential long-term atmospheric weapons effects. (C1.3.3)

##### **Military**

1. Restrictive mission instructions. (C2.1.1)

2. No preexisting arrangements. (C2.1.1.2)
3. No or outline mission preparation. (C2.1.3)
4. Few modern military systems. (C2.2.5)
5. Few modern military simulation systems. (C2.2.5.5)
6. Poor joint staff integration. (C2.3.1.1)
7. Poor multinational integration. (C2.3.1.2)
8. Limited staff expertise. (C2.3.1.3)
9. Highly restricted information exchange. (C2.3.1.8)
10. High information volume. (C2.3.1.9)
11. Negligible intelligence database. (C2.4.2)
12. Negligible theater intelligence access. (C2.4.4)
13. Little or no certitude of data. (C2.4.6)
14. Negligible deployed supplies. (C2.8.2)

### Civil

1. Correct interdepartmental/interagency relationships. (C3.1.1.3)
2. Negative foreign government support. (C3.1.2.3)
3. Restrictive Presidential and/or Secretary of Defense decisions. (C3.1.3)
4. Uncertain international organization support. (C3.1.2.5)
5. Low internationalism. (C3.2.6.5)
6. High health risk. (C3.3.1.5)
7. Unspecified TIM present in the civilian sector. (C3.3.7.5)

## 8.1.2 Functional Needs Analysis

### 8.1.2.1 Capability and Deficiency Assessment Summary

Table 8.1-1 discusses the capability that currently exists to perform the task to the designated standards. There is only one capability that exists, and no other capability is projected that will accomplish this task.

### Current Capability and Deficiency

The organizational structure of a subordinate joint force's intelligence element is determined by the JFC based on the situation and mission. All subordinate joint force J-2s, however, will require (at a minimum) a core element of analytical and administrative capabilities. Most situations will require augmentation of joint force intelligence capabilities, through the deployment and integration of theater intelligence elements into a joint intelligence support element. Capabilities of the JISE include order-of-battle analysis; identification of adversary COGs; analysis of adversary command, control, communications, and computers; targeting support; collection management; and maintenance of a 24-hour watch. The current capability is assessed as "yellow" primarily due to DOTMLPF deficiencies.

**Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Little capability improvement is forecast for the near/mid term. Except that DOTLMPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation

**Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. The far-term forecast should improve to “green.” New acquisition means and methods will ensure currency of intelligence in the far term. National-level intelligence accuracy will improve in the far term as a result of new intelligence initiatives. Continued DOTLMPF enhancements will result from exercise and wargame lessons learned.

Table 8.1-1. OPSHA 1: Capability and Deficiency Assessment

Capability: JISE	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10	M11	M12	M13	M14
Current Overall Capability <sup>1</sup>	G <sup>2</sup>	G <sup>3</sup>	G <sup>4</sup>	R <sup>5</sup>	R <sup>6</sup>	R <sup>7</sup>	G <sup>8</sup>	G <sup>9</sup>	G <sup>10</sup>	R <sup>11</sup>	R <sup>12</sup>	G <sup>13</sup>	G <sup>14</sup>	G <sup>15</sup>
Near/Mid-Term Overall Capability <sup>16</sup>	G	G	G	Y <sup>17</sup>	Y <sup>18</sup>	Y <sup>19</sup>	G	G	G	R	R	G	G	G

	FAA Measure	Scale
M1	CBRND staff cells and units have access to dedicated information technology resources to perform tasks and responsibilities.	G – Yes, Y – Limited, R – No
M2	Means exist to formulate the collection plans for the CBRN/TIM threat.	G – Yes, Y – Limited, R – No
M3	Means are available to collect operational intelligence on adversaries' CBRN/TIM activities.	G – Yes, Y – Limited, R – No
M4	Means exist to collect intelligence on designated theater adversaries.	G – Yes, Y – Limited, R – No
M5	JOA CBRN/TIM threat intelligence is current.	G – Yes, Y – Limited, R – No
M6	JOA CBRN/TIM threat intelligence is reliable.	G – Yes, Y – Limited, R – No
M7	All CBRN/TIM threat priority intelligence requests are covered by a collection plan.	G – Yes, Y – Limited, R – No
M8	Adequate means are available for CBRN/TIM staff to influence JTF/joint force collection activities.	G – Yes, Y – Limited, R – No
M9	Multiple sources are integrated and deconflicted.	G – Yes, Y – Limited, R – No
M10	Medical intelligence guidance identifies information requirements and processes.	G – Yes, Y – Limited, R – No
M11	Medical CBRN/TIM intelligence criteria are established and defined.	G – Yes, Y – Limited, R – No
M12	Staff has sufficient training and experience to conduct the threat assessment.	G – Yes, Y – Limited, R – No
M13	CBRN/TIM threat intelligence is disseminated in near-real-time.	G – Yes, Y – Limited, R – No
M14	CBRN/TIM threat intelligence is available to all units in the JOA.	G – Yes, Y – Limited, R – No

<sup>1</sup> Joint intelligence and CBRN publications do not adequately address this issue. The operational-level CBRN staff is not adequately staffed and organized to interface with the JISE. The JISE staff is not adequately trained/educated in CBRN issues. CBRN staff officers are not adequately trained/educated in intelligence issues. Experimentation does not provide feedback on accurate characterization of the threat for this task. JPME does not adequately cover the fusion of intelligence/CBRN issues.

<sup>2</sup> Yes. The JISE has access to information technology resources that provide COP and access to national-level intelligence means.

<sup>3</sup> Yes. The JISE has means to formulate CBRN/TIM collection plans.

<sup>4</sup> Yes. Limited means are available to collect operational intelligence on adversaries' CBRN/TIM activities and potential production/storage facilities, as well as international trafficking in known precursor or dual-use materiel.

<sup>5</sup> Although the JISE has means available to access collected intelligence on designated theater adversaries through national-level intelligence assets, recent operational experience in S.W. Asia and congressional investigations have rendered the efficacy of national intelligence collection, particularly human intelligence (HUMINT), suspect at best.

<sup>6</sup> The JISE has means to update the JOA CBRN/TIM threat intelligence picture. However, currency of intelligence is dependent on the acquisition means and methods. HUMINT, in particular, is dependent on factors that may preclude timely and current information.

<sup>7</sup> The JISE CBRN/TIM intelligence reliability depends on national-level intelligence accuracy. Any national means relying on HUMINT is dependent on factors that may preclude obtaining reliable information

<sup>8</sup> Yes. The JISE has means available to ensure that CBRN/TIM threat priority intelligence requests are covered by a collection plan.

<sup>9</sup> Limited. The JISE has means available for CBRN/TIM staff to influence JTF/joint force collection activities, but these activities are subject to the commander's priority list. Normally, CBRN intelligence ranks very high on this list.

- 
- <sup>10</sup> Yes. The JISE is in a constant state of integrating and deconflicting multiple-source information.
- <sup>11</sup> No. The AF C4 Medical Functional Area Working Group has just identified medical intelligence shortcomings, including the information requirements process, as major areas of concern in preventing enhanced battlespace situational awareness.
- <sup>12</sup> No. The AF C4 Medical Functional Area Working Group has just identified medical intelligence shortcomings, including the establishment and definition of medical CBRN/TIM intelligence criteria, as major areas of concern in preventing enhanced battlespace situational awareness.
- <sup>13</sup> Yes. The JISE staff function and mission is to conduct threat assessment.
- <sup>14</sup> Yes. The JISE has means available to disseminate in near-real-time the CBRN/TIM threat intelligence. This intelligence dissemination process is limited distribution.
- <sup>15</sup> Yes. This intelligence dissemination is made on a limited-distribution basis.
- <sup>16</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.
- <sup>17</sup> New national intelligence initiatives should provide enhanced means to collect intelligence on theater adversaries. Difficulties with HUMINT will continue to be a limiting factor.
- <sup>18</sup> New national intelligence initiatives should provide enhanced means to ensure currency of intelligence. Difficulties with HUMINT will continue to be a limiting factor.
- <sup>19</sup> New national intelligence initiatives should provide enhanced means to ensure reliability of intelligence. Difficulties with HUMINT will continue to be a limiting factor.
- <sup>20</sup> Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.
- <sup>21</sup> New acquisition means and methods will ensure currency of intelligence in the far term.
- <sup>22</sup> National-level intelligence accuracy will improve in the far term as a result of new intelligence initiatives.
- <sup>23</sup> Shortfalls identified by the AF C4 Medical Functional Area Working Group as “red” are not expected to improve to “yellow” until far term (2014–2019).
- <sup>24</sup> Shortfalls identified by the AF C4 Medical Functional Area Working Group as “red” are not expected to improve to “yellow” until far term (2014–2019).

### 8.1.3 Functional Solution Analysis

#### 8.1.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Currency of intelligence is dependent on the acquisition means and methods.  
**Non-Materiel Solutions:** *Doctrine:* Develop means and methods to ensure currency of intelligence throughout the intelligence acquisition and collection community.
2. **Deficiency:** Joint intelligence and CBRN publications do not adequately address this issue.  
**Non-Materiel Solutions:** *Doctrine:* Joint intelligence and CBRN publications must be enhanced to adequately address this issue and to interface with each other so that roles and responsibilities are clearly delineated.
3. **Deficiency:** Combatant command (COCOM) CBRND staff is not adequately staffed and organized to meet its intelligence-related responsibilities.  
**Non-Materiel Solutions:** *Organization:* Each operational-level CBRND staff should have a section dedicated to resolving CBRN intelligence issues. *Personnel:* Each operational-level CBRND staff should have adequate trained/experienced personnel assigned to man a section dedicated to resolving CBRN intelligence issues.
4. **Deficiency:** The J2 staff is not adequately trained/educated in CBRN issues.  
**Non-Materiel Solutions:** *Training:* Develop training that will enable each JISE staff to better understand its CBRN role and enhance its ability to obtain intelligence that is required to support the Shape function of operational-level CBRND. *Leadership:* Develop an education program that will enable each JISE staff to better understand its CBRN role and enhance its ability to obtain intelligence that is required to support the Shape function of operational-level CBRND.
5. **Deficiency:** CBRN staff officers are not adequately trained/educated in intelligence issues.  
**Non-Materiel Solutions:** *Training:* Develop training programs that allow CBRN staff officers to better support the CBRN intelligence process. *Leadership:* Develop education programs that allow CBRN staff officers to better understand the CBRN intelligence process and their roles and responsibilities.
6. **Deficiency:** Experimentation/red teaming does not provide feedback on accurate characterization of the threat for this task.  
**Non-Materiel Solutions:** *Training:* JRO CBRND must work with both the intelligence and CBRN communities to integrate this task into both intelligence and CBRN experimentation campaign plans.
7. **Deficiency:** JPME does not adequately cover the fusion of intelligence/CBRN issues.  
**Non-Materiel Solutions:** *Leadership:* Integrate intelligence/CBRN fusion issues into JPME.

- 8. Deficiency:** The JISE does not have influence over the national-level intelligence accuracy.  
**Non-Materiel Solutions:** *Doctrine:* Develop means and methods to ensure accuracy of intelligence throughout the intelligence acquisition and collection community.
- 9. Deficiency:** The medical intelligence community has identified fundamental problems in their ability to contribute to CBRND battlespace awareness.  
**Non-Materiel Solutions:** *Doctrine:* Change Air force and joint doctrine to put medical intelligence on equal footing with line intelligence. Develop TTPs to define the medical role in CBRND/intelligence fusion areas.

#### **8.1.3.2 IMA Assessment Summary**

N/A

## 8.2 Task OPSHA 2: Conduct JOA CBRN/TIM vulnerability analysis

### 8.2.1 Functional Area Analysis

#### 8.2.1.1 Definition

To conduct JOA vulnerability assessments focused on potential adversaries' COAs. This operation-level assessment compares regional-based vulnerabilities and risks. Development of a shared understanding of potential adversaries' CBRN/TIM COAs and associated vulnerabilities and risks enables timely and effective preparations for any potential adversary acts. Includes the development of associated operational effects, impacts, and risk analyses and assessments.

#### 8.2.1.2 Derivation

## **8.2.2 Functional Needs Analysis**

### **8.2.2.1 Capability and Deficiency Assessment Summary**

Table 8.2-1 discusses the capability that currently exists to perform the task to the designated standards. There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The organizational structure of a subordinate joint force's intelligence element is determined by the JFC based on the situation and mission. All subordinate joint force J-2s, however, will at a minimum require a core element of analytical and administrative capabilities. Most situations will require augmentation of joint force intelligence capabilities through the deployment and integration of JOA intelligence elements into a joint intelligence support element. Capabilities of the JISE include order-of-battle analysis; identification of adversary COGs; analysis of adversary command, control, communications, and computers; targeting support; collection management; and maintenance of a 24-hour per day watch. Several deficiencies, including lack of training and experience in the staffs and ineffective DOTMLPF, result in a current assessment of "yellow."

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Little capability improvement is forecast for the near/mid term with the exception of DOTMLPF that should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. In the far term, DOTMLPF enhancements across the board made possible by focused experimentation and lessons learned from exercises will improve all measures to a "green" rating.

Table 8.2-1. OPSHA 2: Capability and Deficiency Assessment

Capability: JISE	M1	M2	M3	M4	M5	M6	M7	M8	M9
Current Overall Capability <sup>1</sup>	Y <sup>2</sup>	Y <sup>3</sup>	Y <sup>4</sup>	Y <sup>5</sup>	G <sup>6</sup>	Y <sup>7</sup>	R <sup>8</sup>	R <sup>9</sup>	R <sup>10</sup>
Near/Mid-Term Overall Capability <sup>11</sup>	Y	Y	Y	Y	G	Y	Y	R	R
Far-Term Overall Capability <sup>12</sup>	G <sup>13</sup>	G	G	G	G	G	G	G	G

	FAA Measure	Scale
M1	Guidelines for conducting JOA vulnerability analyses are established.	G – Yes, Y – Limited, R – No
M2	Guidelines for conducting JOA risk assessments are established.	G – Yes, Y – Limited, R – No
M3	Analytical tools used to evaluate plausible adversaries' COAs are adequate.	G – Yes, Y – Limited, R – No
M4	Vulnerability assessment process exploits time-sensitive or priority-actionable CBRN/TIM intelligence.	G – Yes, Y – Limited, R – No
M5	Means are available to collaboratively perform assessments (to have immediate access to appropriate subject matter experts/analysts no matter where they are physically located).	G – Yes, Y – Limited, R – No
M6	Means exist to visualize the impact of adversaries' COAs on forces of interest.	G – Yes, Y – Limited, R – No
M7	Operational and analytical/planning staffs have the training and experience to effectively assess adversaries' CBRN/TIM COAs.	G – Yes, Y – Limited, R – No
M8	Sufficient doctrine and TTPs for effective JOA vulnerability assessment are available.	G – Yes, Y – Limited, R – No
M9	Joint exercises/experimentation provide feedback on the efficacy of vulnerability assessment doctrine and TTPs.	G – Yes, Y – Limited, R – No

<sup>1</sup> No. Extremely limited. TTPs for TIM and biological warfare agent vulnerability analysis are very limited.

<sup>2</sup> Limited. The JISE either has been furnished or has developed vulnerability analysis guidelines. However, such guidelines may not adequately address a JOA-wide TIM concern.

<sup>3</sup> Limited. The JISE and operational staff have guidelines for conducting risk assessments. However, joint exercises/experiments need to be broadened to review the adequacy.<sup>3</sup>

<sup>4</sup> Limited. The JISE has analytical tools used to evaluate plausible COAs. However, adequacy of these tools depends on adequacy and accuracy of the adversary information against which they are applied.

<sup>5</sup> Limited. The JISE has the ability to exploit time-sensitive or priority-actionable intelligence activities. However, joint exercise/experiments and JPME do not adequately address TIM considerations in the vulnerability assessment process.

<sup>6</sup> Yes. The JISE has the means to collaboratively perform assessments, to include video teleconferences, phoneconferences, etc.

<sup>7</sup> Limited. The JISE has means to visualize impact of adversary CBRN employment against forces of interest, but TIM hazards are not necessarily included in this visualization.

<sup>8</sup> No. The JISE is the operational and analytical/planning augmentation staff to the J-2. By definition, this element has the training and experience to assess adversary COAs. However, CBRN/TIM COA analysis is highly subjective, particularly with regard to enemy employment intent and capability in light of interdiction operations.

<sup>9</sup> No. The JISE has doctrine and TTPs to conduct vulnerability assessments. However, assuming JOA TIM considerations are included in the vulnerability assessment, the JISE must decide which safety standards apply. OSHA chemical permissible exposure guidelines are much more restrictive than those of other nations.

<sup>10</sup> No. While joint exercises/experimentation can provide feedback on the vulnerability analysis process, TIM vulnerability analysis remains problematic.

<sup>11</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>12</sup> Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.

<sup>13</sup> In the far term, DOTMLPF enhancements across the board made possible by focused experimentation and lessons learned from exercises will improve all measures to a "green" rating.

## 8.2.3 Functional Solution Analysis

### 8.2.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** Joint exercise/experiments and JPME have not adequately addressed JOA TIM vulnerability analysis.  
**Non-Materiel Solutions:** *Training:* Develop joint exercise/experiments, which across the Global Information Grid (GIG) characterize the JOA TIM threat and situation. *Leadership:* Develop JPME courses that address JISE functions and CBRN/TIM threat and vulnerability analysis.
- 2. Deficiency:** Doctrine and TTPs for vulnerability assessments that include near and far term CBRN/TIM hazard effects, mitigation, and remediation are not standardized or promulgated.  
**Non-Materiel Solutions:** *Doctrine:* Develop doctrine and TTPs for vulnerability assessments that include near- and far-term TIM hazard effects, mitigation, and remediation. *Training:* Develop formalized courses which instruct intelligence and CBRN specialists in TIM vulnerability assessment processes.
- 3. Deficiency:** Guidelines for JOA TIM vulnerability analysis are limited and lack standardization.  
**Non-Materiel Solutions:** *Doctrine:* Develop standardized DoD TIM vulnerability analysis processes.
- 4. Deficiency:** Guidelines for conducting TIM risk assessments are not standardized.  
**Non-Materiel Solutions:** *Doctrine:* Develop standardized DoD TIM risk assessment processes.
- 5. Deficiency:** Analytical tools used to evaluate plausible adversary COAs in relation to TIM considerations are inadequate.  
**Non-Materiel Solutions:** *Doctrine:* Develop formal analytical processes to evaluate adversary COAs in relation to TIM considerations.
- 6. Deficiency:** Joint exercise/experiments outside the continental United States and JPME do not adequately address TIM hazards.  
**Non-Materiel Solutions:** *Training:* Develop formal JPME courses which address TIM hazards.
- 7. Deficiency:** TIM hazards are not necessarily included in the JISE visualization of adversary COAs on forces of interest.  
**Non-Materiel Solutions:** *Doctrine:* Develop formal TTPs which address TIM hazards and their impact on friendly and adversary COAs. *Training:* Develop formal JPME courses which address TIM hazards and their impact on friendly and adversary COAs.

- 8. Deficiency:** CBRN/TIM COA analysis is highly subjective, particularly with regard to enemy employment intent and capability in light of interdiction operations.  
**Non-Materiel Solutions:** *Doctrine:* Standardize CBRN/TIM COA analysis process.
- 9. Deficiency:** There is no joint doctrine for establishing or applying TIM exposure standards.  
**Non-Materiel Solution:** *Doctrine:* Develop joint doctrine to guide operationally focused risk management for determining TIM exposure limits for joint forces, including military personnel and eligible civilians.
- 10. Deficiency:** Joint exercises/experimentation need to capture data and lessons learned concerning the efficacy of TIM vulnerability analysis doctrine and TTPs.  
**Non-Materiel Solutions:** *Doctrine:* Exercise and capture lessons learned concerning the efficacy of TIM vulnerability analysis processes.
- 11. Deficiency:** Doctrine and TTPs for vulnerability assessments which include near-and far-term TIM hazard effects, mitigation, and remediation are not promulgated beyond the industrial hygiene community.  
**Non-Materiel Solutions:** *Doctrine:* The Office of the Command Surgeon should promulgate TIM health hazard effects, mitigation techniques, and remediation processes for use by U.S. forces deployed abroad. *Training:* Develop courses which include OSHA and U.S. Environmental Protection Agency standards in CBRN JPME.

### 8.2.3.2 IMA Assessment Summary

Table 8.2-2 shows possible material approaches that address the remaining materiel requirements of the DOTMLPF assessment.

**Table 8.2-2. OPSHA 2. IMA Assessment**

Idea for Materiel Approach	Description
Analytical Tools	The anticipated initial operational capability (IOC) of the Joint Effects Model (JEM) Block I is in FY2006, and the IOC of the Joint Operational Effects Federation (JOEF) Block I, Increment I is in FY2008. The JEM will provide a single, validated capability to predict and track CBRN and TIM events and effects. The JOEF will provide an operational requirements modeling and simulation system which accurately predicts CBRN effects on personnel, equipment, and operations. Ensure that both consider pertinent aspects of CBRN/TIM immediate and long-term health hazards and permissible exposure limits.

### **8.3 Task OPSHA 3: Determine CBRND resources required to meet the JTF/JOA CBRND situation**

#### **8.3.1 Functional Area Analysis**

##### **8.3.1.1 Definition**

To determine the CBRND unit, personnel, equipment, and logistics resources required for a specific JOA or JTF AOR. Determines the requirement for CBRND units and personnel throughout the JOA, ensuring the availability of appropriate units as well as personnel in the correct quantities and locations. Includes determination of required CBRND equipment, supplies and consumables throughout the JOA, including prepositioning and stockpiling. Logistical support of CBRND resources encompasses extended operations.

##### **8.3.1.2 Derivation**

*UJTL (OP 2.2, OP 2.5, OP 5, OP 5.1.1, OP 5.2, OP 5.2.1, OP 5.3, OP 5.3.9, OP 5.4, OP 5.4.2, OP 5.4.5, OP 5.5.1, OP 5.5.8, OP 5.7, OP 5.7.5, OP 5.7.6, OP 7.1, OP 7.2, OP 7.3, OP 7.4, OP 7.5), Protection Joint Functional Concept, Military Transformation: A Strategic Approach, Transformation Planning Guidance, Sense and Respond CONOPs, Sense and Respond Logistics: Co-evolution of an Adaptive Capability Document Concept.*

##### **8.3.1.2.1 Supported Task: STSHA 3**

##### **8.3.1.2.2 Lateral Tasks: OPSHA 2, OPSHA 6, OPSHA 7, OPSHA 8, OPSUST 8**

##### **8.3.1.2.3 Supporting Tasks: TASHA 10, TASHA 20**

##### **8.3.1.3 Condition**

Perform this task under conditions of:

#### **Physical**

1. Immediate, delayed, or potential long-term atmospheric weapons effects. (C1.3.3)

#### **Military**

1. Limited military commitments from other nations. (C2.1.1.7)
2. No or outline mission preparation. (C2.1.3)
3. Marginal forces assigned. (C2.2.1)
4. Multiple competing apportionments. (C2.2.2)
5. Marginal forces allocated (distributed limited resources). (C2.2.3)
6. Low personnel capability. (C2.2.4)
7. Low military systems reliability. (C2.2.5.3)
8. Limited staff expertise. (C2.3.1.3)
9. Highly restricted information exchange. (C2.3.1.8)

10. No or partial TPFDD availability. (C2.5.1.1)
11. Negligible deployed supplies. (C2.8.2)
12. Slow pipeline responsiveness. (C2.8.3.1)

## **Civil**

1. Limited foreign government support. (C3.1.2.3)
2. Limited international organization support. (C3.1.2.5)

### **8.3.2 Functional Needs Analysis**

#### **8.3.2.1 Capability and Deficiency Assessment Summary**

Table 8.3-1 discusses the standing JTF ability to determine CBRND resources required to meet the JTF/JOA CBRN situation. This is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The current capability is assessed as “green.” The capability exists to perform this task with some slight deficiencies. Management of CBRND-specific materiel, personnel, and units will require a systematic, dedicated program to ensure that timely, focused, and sufficient assets are on hand by the time they are required.

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. No capability improvement is forecast for the near/mid term.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. The forecast should improve and remain “green” in the far term. Processes available to manage CBRN personnel and units will have real-time capability. JTTPs that specifically address management of joint CBRND materiel resources will be developed. JTTPs that specifically address management of joint CBRND materiel resources will be developed. DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

Table 8.3-1. OPSHA 3: Capability and Deficiency Assessment

Capability: Standing Joint Force Headquarters (Joint Force)	M1	M2	M3	M4	M5	M6	M7	M8	M9
Current Overall Capability <sup>1</sup>	G <sup>2</sup>	G <sup>3</sup>	G <sup>4</sup>	Y <sup>5</sup>	Y <sup>6</sup>	Y <sup>7</sup>	G <sup>8</sup>	Y <sup>9</sup>	Y <sup>10</sup>
Near/Mid-Term Overall Capability	G	G	G	Y	Y	G	G	G	Y
Far-Term Overall Capability <sup>11</sup>	G	G	G	G <sup>12</sup>	G <sup>13</sup>	G	G	G	G <sup>14</sup>

	FAA Measure	Scale
M1	CBRND staff cells have the ability to influence the flow of resources to the JTF/JOA.	G – Yes, Y – Limited, R – No
M2	Means exist to adjust the flow of resources to the JTF/JOA based on CBRND considerations.	G – Yes, Y – Limited, R – No
M3	Planning staffs have the training and experience to determine required adjustments to resources based on CBRND considerations.	G – Yes, Y – Limited, R – No
M4	Tools and processes are available to manage CBRND personnel and units.	G – Yes, Y – Limited, R – No
M5	Tools and processes are available to manage CBRND materiel resources.	G – Yes, Y – Limited, R – No
M6	CBRND logistics tracking system is sufficient.	G – Yes, Y – Limited, R – No
M7	Appropriate CBRND logistics management processes are in place.	G – Yes, Y – Limited, R – No
M8	Analytical tools are used to assess logistical demand.	G – Yes, Y – Limited, R – No
M9	All pertinent Sense, Shape, Shield, and Sustain factors are considered.	G – Yes, Y – Limited, R – No

<sup>1</sup> Limited. Doctrine, TTPs, and organizational structures exist to manage materiel. CBRN-specific materiel and resources are not managed as a separate class of supply.

<sup>2</sup> Yes. CBRND staff cells have the ability to influence the flow of resources to the JTF/JOA through multiple operations and logistics channels.

<sup>3</sup> Yes. CBRN considerations can be applied to adjust the priority, sequencing, and flow of resources.

<sup>4</sup> Yes. Operational and logistics planning staffs are trained to determine adjustments to resources based on a number of conditions. CBRN is just one of those conditions.

<sup>5</sup> Limited. Processes are available to manage CBRN personnel and units, however not all tools have real-time capability.

<sup>6</sup> Limited. Tools and processes to manage materiel resources exist. CBRN materiel and resources are not handled as a separate DoD class of supply. There are no JTTPs that specifically address management of joint CBRND materiel resources.

<sup>7</sup> Yes. Military Traffic Management Command Transportation Engineering Agency has developed the Intelligent Road and Rail Information Server to track the real-time and near-real-time locations of any military shipments moving over land or water. The server is currently capable of accomplishing this anywhere in the world for all types of freight. Inventory information will be limited from a joint perspective, until the Joint Total Asset Visibility (JTAV) program is fully functional.

<sup>8</sup> Yes. Automated systems to manage requisition, location (depot to DLA), shipment, inventory management, and unit-level receipt are in place.

<sup>9</sup> Limited. Demand data are tracked by Line Item Number and Unit Identifier Code and can be programmed to highlight critical command-supported items. Limited tools exist to automatically determine CBRND resources needed based on a wide variety of scenarios and enemy COAs.

<sup>10</sup> Limited. Aggressive application of active defensive, interdiction, and elimination measures could mitigate the requirement for a burgeoning surge demand and capability for CBRND resources.

<sup>11</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>12</sup> Processes available to manage CBRN personnel and units, will have real-time capability.

<sup>13</sup> JTTPs that specifically address management of joint CBRND materiel resources will be developed.

<sup>14</sup> Aggressive application of active defensive, interdiction, and elimination measures will mitigate the requirement for a burgeoning surge demand and capability for CBRND resources.

### 8.3.3 Functional Solution Analysis

#### 8.3.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** No JTTPs specifically address joint CBRND resources required to meet the JTF/JOA CBRN situation.  
**Non-Materiel Solutions:** *Doctrine:* Develop JTTPs on determining joint CBRN resources required to meet the JTF/JOA CBRN situation. *Training:* Develop joint training on determining joint CBRN resources required to meet the JTF/JOA CBRN situation. *Leadership:* Develop joint leadership education course(s) on determining joint CBRN resources required to meet the JTF/JOA CBRN situation.
- 2. Deficiency:** No JTTPs exist for adjusting the flow of resources based specifically on CBRN conditions. However, the means to adjust flow of all resources does exist through operations, materiel, and personnel management sections.  
**Non-Materiel Solutions:** *Doctrine:* Develop JTTPs that address adjusting the flow of resources based specifically on CBRN conditions.
- 3. Deficiency:** No JTTPs specifically address when or how to make a determination to adjust resources based on joint CBRND considerations.  
**Non-Materiel Solutions:** *Doctrine:* Develop JTTPs that address when or how to make a determination to adjust resources based on joint CBRND considerations.
- 4. Deficiency:** No JTTPs specifically address influencing the flow of joint CBRN resources.  
**Non-Materiel Solutions:** *Doctrine:* Develop JTTPs that specifically address influencing the flow of joint CBRN resources.
- 5. Deficiency:** No JTTPs specifically address a truly joint CBRND logistics management process.  
**Non-Materiel Solutions:** *Doctrine:* Develop JTTPs that address a truly joint CBRND logistics management process.
- 6. Deficiency:** No JTTPs specifically address joint analytical tools to assess CBRND logistical demands.  
**Non-Materiel Solutions:** *Doctrine:* Develop JTTPs that address joint analytical tools to assess CBRND logistical demands.
- 7. Deficiency:** Without active defense, interdiction, and elimination measures, mitigation, even preclusion for the CBRND Shield and Sustain domains, could not occur.  
**Non-Materiel Solutions:** *Doctrine:* Develop doctrine for active defense, interdiction, and elimination measures.

**8.3.3.2 IMA Assessment Summary****Table 8.3-2. OPSHA 3: IMA Assessment**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Automated analytical tools	With fewer personnel available to perform resource determination, the JTF commander will rely increasingly on automated tools to determine CBRND unit, personnel, equipment, medical, and logistics resources.

## 8.4 Task OPSHA 4: Ensure JTF or joint force CBRND readiness

### 8.4.1 Functional Area Analysis

#### 8.4.1.1 Definition

To ensure theater forces are prepared to accomplish assigned missions in a CBRN/TIM environment. Joint CBRND training, exercises, and rehearsals are key components to ensure force readiness for operations in a CBRN/TIM environment. Operational concepts and new systems are evaluated in realistic exercises and multinational environments. Forces are evaluated and assessed for effective CBRND task performance across the range of military operations and in a variety of physical environments. CBRND systems are evaluated for operational effectiveness and performance utility. Includes the effective documentation and management of lessons learned information to provide a historical record for trend analysis and a repository for the warfighting staffs to examine during development of training.

#### 8.4.1.2 Derivation

*UJTL (OP 1.3.1, OP 2.2, OP 2.2.1, OP 2.2.3, OP 2.2.3, OP 2.4.1.1, OP 2.4.1.2, OP 2.4.2.1, OP 5, OP 5.1.1, OP 5.1.2, OP 5.1.3, OP 5.1.6, OP 5.2, OP 5.2.1, OP 5.2.2, OP 5.3.1, OP 5.3.4, OP 5.3.5, OP 5.3.6, OP 5.3.7, OP 5.3.8, OP 5.3.9, OP 5.4, OP 5.4.2, OP 5.4.4, OP 5.4.5, OP 5.4.6, OP 5.7, OP 5.7.3, OP 5.7.6, OP 6.1.6, OP 6.2.1, OP 6.2.10, OP 7, OP 7.3, OP 7.4, OP 7.5), Protection Joint Functional Concept, Military Transformation: A Strategic Approach, Transformation Planning Guidance.*

##### 8.4.1.2.1 Supported Task: STSHA 4

##### 8.4.1.2.2 Lateral Tasks: OPSHA 2, OPSHA 6, OPSHLD 4, OPSHLD 5, OPSHLD 6, OPSHLD 7, OPSHLD 8, OPSHLD 10

##### 8.4.1.2.3 Supporting Task: TASHA 8

#### 8.4.1.3 Condition

Perform this task under conditions of:

##### Physical

1. Immediate, delayed, or potential long-term atmospheric weapons effects. (C1.3.3)

##### Military

1. No or outline mission preparation. (C2.1.3)
2. Marginal forces assigned. (C2.2.1)
3. Low personnel capability. (C2.2.4)
4. Negligible personnel experience. (C2.2.4.5)
5. Few modern military systems. (C2.2.5)

6. Few modern military simulation systems. (C2.2.5.5)
7. Poor joint staff integration. (C2.3.1.1)
8. Limited staff expertise. (C2.3.1.3)
9. Highly restricted information exchange. (C2.3.1.8)
10. High information volume. (C2.3.1.9)
11. Little or no intelligence dissemination and receipt. (C2.4.7)

**Civil.** N/A

## **8.4.2 Functional Needs Analysis**

### **8.4.2.1 Capability and Deficiency Assessment Summary**

Table 8.4-1 discusses the only capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

Any JTF HQ has a team of operational planners and information command and control specialists to include CBRND subject matter experts. This team of experts forms the backbone of the joint task force command structure. The Standing Joint Force Headquarters (Joint Force) is responsible for operational trouble spots, including CBRN issues and concerns. JTTPs and tools to evaluate and assess CBRND staffs, capabilities, systems, and concepts within an AOR are limited. Forces and staffs of other nations may or may not have training, equipment or experience to effectively conduct CBRND operations. Therefore the current assessment is “yellow.”

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. No capability improvement is forecast for the near/mid term.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. In the far term, DOTMLPF enhancements across the board made possible by focused experimentation and lessons learned from exercises will improve all measures to a “green” rating.

Table 8.4-1. OPSHA 4: Capability and Deficiency Assessment

Capability: Joint Force	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10	M11	M12
Current Overall Capability <sup>1</sup>	Y <sup>2</sup>	Y <sup>3</sup>	Y <sup>4</sup>	Y <sup>5</sup>	Y <sup>6</sup>	Y <sup>7</sup>	Y <sup>8</sup>	Y <sup>9</sup>	Y <sup>10</sup>	Y <sup>11</sup>	Y <sup>12</sup>	Y <sup>13</sup>
Near/Mid-Term Overall Capability	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
Far-Term Overall Capability	G <sup>14</sup>	G	G	G	G	G	G	G	G	G	G	G

	FAA Measure	Scale
M1	Tools and processes are available to evaluate and assess CBRND capability in theater.	G – Yes, Y – Limited, R – No
M2	Units and HQ staffs are routinely evaluated and assessed in performing CBRND tasks.	G – Yes, Y – Limited, R – No
M3	CBRND systems and concepts, both current and projected, are assessed and evaluated under realistic conditions.	G – Yes, Y – Limited, R – No
M4	CBRND operations are exercised with coalition partners.	G – Yes, Y – Limited, R – No
M5	CBRND staff cells and units have access to dedicated information technology to support training.	G – Yes, Y – Limited, R – No
M6	HQ/unit exercises are conducted under simulated CBRN/TIM conditions.	G – Yes, Y – Limited, R – No
M7	Adequate training tools are available.	G – Yes, Y – Limited, R – No
M8	CBRND specialists/staffs are trained to perform required CBRND tasks.	G – Yes, Y – Limited, R – No
M9	Forces/staffs of other nations are trained in CBRND operations.	G – Yes, Y – Limited, R – No
M10	CBRND staff cells conduct training and rehearsals.	G – Yes, Y – Limited, R – No
M11	An accessible, digital information repository system is available.	G – Yes, Y – Limited, R – No
M12	Information repository is available to all operating forces.	G – Yes, Y – Limited, R – No

<sup>1</sup> There are few training events that specifically address training forces/staffs of other nations for anticipated CBRND operations.

<sup>2</sup> Limited. Staff has tools and processes to evaluate and assess CBRND capabilities in theater. However, the current system is Service-specific. There are no JTTPs that specifically addresses tools and processes to evaluate and assess joint CBRND capability.

<sup>3</sup> Limited. Any joint force staff can routinely evaluate and assess CBRND tasks, but the current system is Service-specific. There are no JTTPs and familiarization training that specifically addresses evaluating and assessing joint CBRND tasks.

<sup>4</sup> Limited. Any joint force staff can assess and evaluate systems under realistic conditions, but the current system is Service-specific. There are no JTTPs or familiarization training that specifically address assessing joint CBRND systems and concepts, both current and projected, under realistic conditions.

<sup>5</sup> Limited. Any joint force staff has the ability to exercise with coalition partners, but there are few exercises that specifically address CBRND operations with coalition partners.

<sup>6</sup> Limited. Any joint force staff has access to information technology to support training, but the current system is Service-specific. There are no JTTPs or familiarization training that specifically address CBRND staff cells and units having access to dedicated information technology to support training.

<sup>7</sup> Limited. Any joint force staff has the ability to exercise under CBRN/TIM conditions, but there are few exercises that specifically address the full spectrum of CBRN/TIM conditions.

<sup>8</sup> Limited. Any joint force staff has the training, but the current system is Service-specific. There are no JTTPs or familiarization training that specifically address joint force CBRND readiness.

<sup>9</sup> Limited. Any joint force staff has CBRND specialists/staffs trained to perform CBRND tasks, but there are few JTTPs and familiarization training that specifically address the CBRND specialists/staff task on joint force CBRND readiness.

<sup>10</sup> Limited. Any joint force staff has the ability to train forces/staffs of other nations, but there are few training events that specifically address training forces/staffs of other nations for anticipated CBRND operations. Political constraints inhibit training forces/staffs of other nations on CBRN operations.

<sup>11</sup> Limited. Any joint force staff has the tools to conduct training and rehearsals, but there are limited JTTPs and familiarization training that specifically address joint force CBRND readiness.

<sup>12</sup> Limited. Any joint force staff has access to digital information repository, but the units must know how to access it, through the GIG. There are limited JTTPs and familiarization training that specifically addresses accessing the digital information repository.

<sup>13</sup> Limited. Any joint force staff has access to digital information repository, but the units must know how to access it, through the GIG. There are limited JTTPs and familiarization training that specifically addresses accessing the digital information repository.

<sup>14</sup> In the far term, DOTMLPF enhancements across the board made possible by focused experimentation and lessons learned from exercises will improve all measures to a “green” rating.

### 8.4.3 Functional Solution Analysis

#### 8.4.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Limited JTTPs and familiarization training that specifically address joint CBRND readiness

**Non-Materiel Solutions:** *Doctrine:* Develop JTTPs on joint CBRN readiness requirements to meet the JTF/JOA CBRN situation. JTTPs must address processes to evaluate and assess joint CBRND capability, tasks, systems and concepts, both current and projected, under realistic conditions. JTTPs must also address CBRND staff cells and units having access to dedicated information technology to support training. Develop techniques addressing CBRND specialist/staff tasks for assessing joint force CBRND readiness and for accessing the digital information repository for CBRND information. *Training:* Develop joint training on joint CBRN readiness requirements to meet the JTF/JOA CBRN situation. *Leadership:* Expand joint leadership education course(s) on the joint CBRN readiness requirements to meet the JTF/JOA CBRN situation

2. **Deficiency:** There are few exercises that specifically address CBRND operations with coalition partners or the full spectrum of CBRN/TIM conditions.

**Non-Materiel Solutions:** *Training:* Develop exercises that specifically address CBRND operations with coalition partners and introduce the full spectrum of CBRN/TIM conditions.

#### 8.4.3.2 IMA Assessment Summary

N/A

## 8.5 Task OPSHA 5: Coordinate JTF/JOA CBRND information systems and processes

### 8.5.1 Functional Area Analysis

#### 8.5.1.1 Definition

To ensure that JTF/JOA CBRND information systems and processes allow joint forces to effectively conduct operations in a CBRN/TIM environment. Provides hazard prediction and effects modeling for situational awareness, response management, preparation, and planning within the operating area. Operates an Integrated Detection Network (IDN) to enable commanders to “detect to warn” and take effective countermeasures while on the move. Includes determining that IDN capabilities provide complete coverage where required throughout the JOA. Ensures the ability to monitor and identify a CBRN/TIM hazard prior to and after an attack or release other than attack (ROTA) incident has occurred. Includes providing warning to everyone who might be affected by the hazard, rapidly giving units time to assume protective posture and initiate avoidance actions. Ensures the smooth integration and rapid dissemination of CBRND information across the GIG within the JOA. Includes providing access to or availability of the appropriate C4ISR and CBRND information systems throughout the JOA to include small units on independent operations.

#### 8.5.1.2 Derivation

*UJTL (OP 2.2, OP 2.2.1, OP 2.2.3, OP 2.4.1.1, OP 2.4.1.2, OP 2.4.2.1, OP 2.5, OP 2.5.3, OP 5, OP 5.1.1, OP 5.1.2, OP 5.1.3, OP 5.2, OP 5.2.1, OP 5.3.4, OP 5.3.5, OP 5.3.6, OP 5.3.7, OP 5.3.9, OP 5.4, OP 5.4.4, OP 5.4.5, OP 5.5.1, OP 5.5.2, OP 5.5.5, OP 5.5.7, OP 5.5.8, OP 5.7, OP 5.7.3, OP 5.7.6, OP 6.1.5, OP 6.1.6, OP 7, OP 7.1, OP 7.2, OP 7.3, OP 7.4, OP 7.5), Protection Joint Functional Concept, Military Transformation: A Strategic Approach, Transformation Planning Guidance.*

##### 8.5.1.2.1 Supported Task: STSHA 5

##### 8.5.1.2.2 Lateral Task: OPSUST 10

##### 8.5.1.2.3 Supporting Tasks: TASHA 17, TASHA 28, TASHA 29, TASHA 30, TASHA 31

#### 8.5.1.3 Condition

Perform this task under conditions of:

##### Physical

1. Immediate, delayed, or potential long-term atmospheric weapons effects. (C1.3.3)

##### Military

1. No preexisting arrangements. (C2.1.1.2)

2. Negligible personnel experience. (C2.2.4.5)
3. Low military systems reliability. (C2.2.5.3)
4. Few modern military simulation systems. (C2.2.5.5)
5. Some or no interoperability. (C2.2.6)
6. Partial joint staff integration. (C2.3.1.1)
7. Poor multinational integration. (C2.3.1.2)
8. Limited staff expertise. (C2.3.1.3)
9. Highly restricted information exchange. (C2.3.1.8)
10. High information volume. (C2.3.1.9)
11. Little or no intelligence dissemination and receipt. (C2.4.7)

### **Civil**

1. Limited foreign government support. (C3.1.2.3)
2. Limited international organization support. (C3.1.2.5)
3. Poor information management. (C3.3.7.4)

## **8.5.2 Functional Needs Analysis**

### **8.5.2.1 Capability and Deficiency Assessment Summary**

Table 8.5-1 discusses the only capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

The Standing Joint Task Force Headquarters was assessed in light of fielding Block I of JWARN. Since JWARN full operational capability will not be met until FY2007/FY2008, all standards were assessed as limited capability resulting in a current assessment of “yellow.”

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. No capability improvement is forecast for the near/mid term.

#### **Projected Far-Term Capability and Deficiency**

Projected CBRN specific information systems will continue to evolve to enhance warfighter needs. The anticipated fielding of JOEF/JEM and capabilities they will provide are sufficient to evaluate the far term “green.”

Table 8.5-1. OPSHA 5: Capability and Deficiency Assessment

Capability: Joint Force	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10	M11	M12	M13	M14	M15
Current Overall Capability <sup>1</sup>	Y <sup>2</sup>	Y <sup>3</sup>	Y <sup>4</sup>	Y <sup>5</sup>	Y <sup>6</sup>	Y <sup>7</sup>	Y <sup>8</sup>	Y <sup>9</sup>	Y <sup>10</sup>	Y <sup>11</sup>	Y <sup>12</sup>	Y <sup>13</sup>	Y <sup>14</sup>	Y <sup>15</sup>	Y <sup>16</sup>
Near/Mid-Term Overall Capability	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
Far-Term Overall Capability	G <sup>17</sup>	G	G	G	G	G	G	G	G	G	G	G	G	G	G

	FAA Measure	Scale
M1	Hazards effects models and tools are adequate and available at all appropriate levels for assessment.	G – Yes, Y – Limited, R – No
M2	JOA is adequately covered by the IDN.	G – Yes, Y – Limited, R – No
M3	Sensors managed at all echelons are networked to the IDN.	G – Yes, Y – Limited, R – No
M4	Sufficient doctrine and TTPs exist for effective IDN operation.	G – Yes, Y – Limited, R – No
M5	Joint forces are adequately trained to effectively operate the IDN.	G – Yes, Y – Limited, R – No
M6	All operation centers are networked to IDN.	G – Yes, Y – Limited, R – No
M7	IDN successfully tracks and monitors the hazard.	G – Yes, Y – Limited, R – No
M8	Means exist to disseminate routine, essential and critical CBRN/TIM threat intelligence rapidly.	G – Yes, Y – Limited, R – No
M9	Means exist to compile and display information on CBRN/TIM events that occurs throughout the theater.	G – Yes, Y – Limited, R – No
M10	Means exist to present information on the operational impact of a CBRN/TIM event.	G – Yes, Y – Limited, R – No
M11	Coalition and joint CBRND IDNs provide automated warning and reporting.	G – Yes, Y – Limited, R – No
M12	CBRND information is easily disseminated onto the GIG.	G – Yes, Y – Limited, R – No
M13	CBRND data and information formats are interoperable across the coalition and interagency.	G – Yes, Y – Limited, R – No
M14	Required participants are able to exchange information through planning, assessment and management tools.	G – Yes, Y – Limited, R – No
M15	CBRND information is processed using existing C4ISR assets.	G – Yes, Y – Limited, R – No

<sup>1</sup> Limited. JWARN doctrine (TTPs) and training are being developed as the different modules and blocks are being fielded.

<sup>2</sup> Limited. JWARN is available within the JOA to make assessment and decision making based on the hazards effects.

<sup>3</sup> Limited. JWARN is not yet able within the JOA to interface with the GCCS.

<sup>4</sup> Limited. JWARN is not yet able within the JOA to interface with the GCCS.

<sup>5</sup> Limited. JWARN doctrine and TTPs are being developed as the different modules and blocks are being fielded.

<sup>6</sup> Limited. JWARN training is being conducted (new equipment training) and developed as the different modules and blocks are being fielded.

<sup>7</sup> Limited. JWARN is not yet able within the JOA to interface with the GCCS.

<sup>8</sup> Limited. JWARN is available within the JOA and can successfully track and monitor the hazard.

<sup>9</sup> Limited. JWARN is available within the JOA and can disseminate routine, essential, and critical CBRN threat intelligence rapidly but is not yet integrated into GCCS.

<sup>10</sup> Limited. JWARN is available within the JOA and can compile and display information on CBRN events that occurs throughout the theater.

<sup>11</sup> Limited. JWARN is available within the JOA and to present information on the operational impact of a CBRN event.

<sup>12</sup> Limited. JWARN is available within the JOA and can provide automated warning and reporting to the coalition and joint forces.

<sup>13</sup> Limited. JWARN is available within the JOA but only interfaces with the GCCS, manually.

<sup>14</sup> Limited. JWARN is available within the JOA and allows CBRND data and information formats to be interoperable across the coalition and interagency environment.

<sup>15</sup> Limited. JWARN is available within the JOA and is able to exchange information through planning, assessment, and management tools.

<sup>16</sup> Limited. JWARN is available within the JOA and CBRND information is manually processed using existing C4ISR assets.

<sup>17</sup> In the far term, enhancements to and integration of JWARN into GCCS and DOTMLPF enhancements across the board made possible by focused experimentation and lessons learned from exercises will improve all measures to a “green” rating.

### 8.5.3 Functional Solution Analysis

#### 8.5.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** JWARN is available but is currently limited to manual input and retrieval.

**Non-Materiel Solutions:** *Doctrine:* JWARN doctrine (TTPs) will need to be developed and updated as each module is fielded. *Training:* JWARN training will need to be developed and updated as each module is fielded. Exercises and experiments could provide valuable insight and feedback on JWARN capabilities. *Leadership:* JWARN leadership education will need to be developed and updated as each module is fielded.

#### 8.5.3.2 IMA Assessment Summary

N/A

## 8.6 Task OPSHA 6: Provide JTF/JOA CBRND plans and policy

### 8.6.1 Functional Area Analysis

#### 8.6.1.1 Definition

To provide plans and command policy to all JTF/JOA forces. Includes formulating and providing the JTF commander's intent and CBRND planning guidance for operational planning. Considers all Sense, Shape, Shield, and Sustain factors. Includes C4ISR, personnel, logistical, and medical planning considerations. Staffs collaboratively plan for CBRND actions to ensure prepared and ready forces, adequate CBRND force allocation, and timely response and mitigation. Includes ensuring that planners and staffs possess the appropriate tools to plan, assess, and manage, as well as access to automated workspace tools that are integrated and interoperable with existing C4ISR systems. Includes development of plans for assigned restoration, interdiction, or elimination operations.

#### 8.6.1.2 Derivation

*UJTL (OP 1.2.4.5, OP 1.2.4.7, OP 1.2.4.8, OP 1.3.1, OP 1.4.4, OP 2.2, OP 2.4.1.1, OP 2.4.1.2, OP 2.4.2.1, OP 2.5, OP 3.2.5.3, OP 5, OP 5.1.1, OP 5.1.2, OP 5.2, OP 5.2.1, OP 5.2.2, OP 5.3, OP 5.3.1, OP 5.3.2, OP 5.3.7, OP 5.3.9, OP 5.4.2, OP 5.4.4, OP 5.4.5, OP 5.5.1, OP 5.5.5, OP 5.5.8, OP 5.7, OP 7.1, OP 7.2, OP 7.3, OP 7.4, OP 7.5), Protection Joint Functional Concept, Military Transformation: A Strategic Approach, Transformation Planning Guidance, An Operational Concept for Biological Defense.*

##### 8.6.1.2.1 Supported Task: STSHA 6

##### 8.6.1.2.2 Lateral Tasks: OPSHA 2, OPSHA 3, OPSHA 4, OPSHA 7, OPSHA 8, OPSHA 9, OPSHA 11, OPSHA 12, OPSHLD 1, OPSUST 5

##### 8.6.1.2.3 Supporting Tasks: TASHA 7, TASHA 15, TASHA 21, TASHA 23, TASHA 32

#### 8.6.1.3 Condition

1. Perform this task under conditions of:

**Physical.** N/A

##### **Military**

1. Restrictive mission instructions. (C2.1.1)
2. No preexisting arrangements. (C2.1.1.2)
3. Negligible personnel experience. (C2.2.4.5)
4. Some or no interoperability. (C2.2.6)
5. Poor joint staff integration. (C2.3.1.1)
6. Limited staff expertise. (C2.3.1.3)
7. Negligible theater intelligence access. (C2.4.4)

**Civil.** N/A

## **8.6.2 Functional Needs Analysis**

### **8.6.2.1 Capability and Deficiency Assessment Summary**

Table 8.6-1 discusses the capability that currently exists to perform the task to the designated standards. There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

Any JTF HQ has a team of operational planners and information command and control specialists to include a CBRN staff cell. This team of experts forms the backbone of the joint task force command structure. CBRN staff planners will support the joint planning process concentrating across the five operational functions as defined by the Joint Operation Planning and Execution System (Vol. I, threat identification and assessment, strategy determination, course of action development, detailed planning, and implementation). Utilization of a common information structure/tools will enable an adaptive/collaborative planning process during the development of operational plans to include theater-level nuclear, chemical, biological, and radiological plans. Restoration and elimination operations are concepts that planning staffs will continue to mature, given specific threats within their respective AORs and therefore could not be rated fully capable. The military decision-making process is a formal concept that is universally accepted, and therefore plans and planning guidance should incorporate considerations for all eventualities. However, as recent operations have shown, CBRND-specific considerations had shortfalls. Therefore, the measures concerning CBRND plans and planning guidance were rated as limited resulting in an overall current capability assessment of “yellow.”

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. No capability improvement is forecast for the near/mid term.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. In the far term, DOTLMPF enhancements across the board made possible by focused experimentation and lessons learned from exercises will improve all measures to a “green” rating.

**Table 8.6-1. OPSHA 6: Capability and Deficiency Assessment**

<b>Capability: Joint Force</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>	<b>M6</b>	<b>M7</b>
<b>Current Overall Capability<sup>1</sup></b>	Y <sup>2</sup>	Y <sup>3</sup>	Y <sup>4</sup>	Y <sup>5</sup>	G <sup>6</sup>	Y <sup>7</sup>	Y <sup>8</sup>
<b>Near/Mid-Term Overall Capability</b>	Y	Y	Y	Y	G	Y	Y
<b>Far-Term Overall Capability</b>	G <sup>9</sup>	G	G	G	G	G	G

	<b>FAA Measure</b>	<b>Scale</b>
M1	Process exists to formulate CBRND planning guidance.	G – Yes, Y – Limited, R – No
M2	Planning staffs have the training and experience to effectively plan for CBRND operations.	G – Yes, Y – Limited, R – No
M3	Plans address all pertinent Sense, Shape, Shield and Sustain issues.	G – Yes, Y – Limited, R – No
M4	Doctrine and TTPs are sufficient for effective CBRND planning.	G – Yes, Y – Limited, R – No
M5	Standing plans are adaptable to dynamically changing CBRND situations.	G – Yes, Y – Limited, R – No
M6	Operational and analytical/planning staffs have the training and experience to effectively plan for restoration operations.	G – Yes, Y – Limited, R – No
M7	Operational and analytical/planning staffs have the training and experience to effectively plan for interdiction or elimination operations.	G – Yes, Y – Limited, R – No

<sup>1</sup> Limited. Institutional training for planning staffs is available. Institutional training that is focused on planning for restoration operations and CBRN consequence management is limited.

<sup>2</sup> Limited. Any joint force staff has the ability to formulate planning guidance, but there are few JTTPs and education and training that specifically address formulating CBRND planning guidance.

<sup>3</sup> Limited. Any joint force staff has the training and experience to plan operations, but there are few JTTPs and education and training that specifically address CBRND operations.

<sup>4</sup> Limited. Any joint force staff has the ability to develop plans, but there are few JTTPs that specifically address the process to select all pertinent Sense, Shape, Shield, and Sustain issues.

<sup>5</sup> Limited. There is doctrine and JTTPs that specifically addresses JTF/JOA CBRND planning, but given the broad range of CBRN/TIM threats worldwide, each SFJHQ still needs to develop its own TTPs for CBRN planning.

<sup>6</sup> Yes. Standing plans are adaptable to dynamically changing CBRN situations.

<sup>7</sup> Limited. Any joint force operational and analytical/planning staff has the training and experience to effectively plan, but there are few JTTPs and courses that specifically address restoration operations.

<sup>8</sup> Limited. Any joint force operational and analytical/planning staff has the training and experience to effectively plan, but there are few JTTPs and courses that specifically address interdiction/elimination operations.

<sup>9</sup> In the far term, DOTMLPF enhancements across the board made possible by focused experimentation and lessons learned from exercises will improve all measures to a “green” rating.

### 8.6.3 Functional Solution Analysis

#### 8.6.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Few JTTPs specifically address formulating CBRND planning guidance.  
**Non-Materiel Solutions:** *Doctrine:* Develop joint doctrine on formulating CBRND planning guidance for the JOA. *Training:* Expand joint training on formulating CBRND plans and policy for the JOA.
2. **Deficiency:** Few JTTPs specifically address CBRND operations.  
**Non-Materiel Solutions:** *Doctrine:* Develop joint doctrine on planning CBRND restoration and interdiction/elimination operations for the JOA. *Training:* Develop joint training on planning CBRND restoration and interdiction/elimination operations for the JOA.  
*Leadership:* Develop joint leader education course(s) on CBRND restoration and elimination operations for the JOA.
3. **Deficiency:** Few JTTPs specifically address the process to select all pertinent Sense, Shape, Shield, and Sustain issues and incorporate them into plans.  
**Non-Materiel Solutions:** *Doctrine:* Develop joint doctrine on the process to select and incorporate into plans all pertinent Sense, Shape, Shield, and Sustain issues. *Training:* Develop joint training on the process to select all pertinent Sense, Shape, Shield, and Sustain issues. *Leadership:* Develop joint education course(s) on the process to select all pertinent Sense, Shape, Shield, and Sustain issues.
4. **Deficiency:** Given the broad range of CBRN/TIM threats worldwide, each standing force joint headquarters (SFJHQ) still needs to develop its own TTPs for CBRN planning.  
**Non-Materiel Solutions:** *Doctrine:* Each SFJHQ must develop procedures to incorporate JOA-specific CBRN/TIM threats into plans and policy.

#### 8.6.3.2 IMA Assessment Summary

Table 8.6-2. OPSHA 6. IMA Assessment

Idea for Materiel Approach	Description
Automated analytical tools	With fewer personnel available to perform resource determination, the JTF commander will rely increasingly on automated tools to develop CBRND plans.

**8.7 Task OPSHA 7: Coordinate CBRND aspects of JOA medical operations****8.7.1 Functional Area Analysis****8.7.1.1 Definition**

To coordinate CBRND aspects of JTF/JOA medical operations. Provides medical monitoring and assessing of personnel and military working animals (MWAs) needed to ready JTF/JOA elements for deployment and sustained operations. Manages the processing of CBRN/TIM casualties throughout the JOA. Conducts medical tracking of CBRN/TIM exposed and affected personnel and MWAs, monitoring and assessing of personnel and MWAs for exposure to CBRN/TIM agents, and generation of medical COAs and TTPs, as well as event tracking. Also includes providing and assessing medical COAs.

**8.7.1.2 Derivation**

*UJTL (OP 1.6, OP 2.2, OP 2.2.1, OP 4.4.3, OP 5.1.1, OP 5.1.2, OP 5.2, OP 5.2.1, OP 5.2.2, OP 5.3, OP 5.3.2, OP 5.3.9, OP 5.4.2, OP 5.4.4, OP 5.4.5, OP 5.5.8, OP 6.2.10, OP 7, OP 7.2, OP 7.3, OP 7.4, OP 7.5), Protection Joint Functional Concept, Transformation Planning Guidance, Military Transformation: A Strategic Approach.*

**8.7.1.2.1 Supported Task: STSHA 7****8.7.1.2.2 Lateral Tasks: OPSHA 3, OPSHA 6, OPSHA 12, OPSHLD 3, OPSHLD 13, OPSHLD 14****8.7.1.2.3 Supporting Tasks: TASHA 12, TASHA 13, TASHA 14****8.7.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. No preexisting arrangements. (C2.1.1.2)
2. No or outline mission preparation. (C2.1.3)
3. Low personnel capability. (C2.2.4)
4. Poor personnel nutrition and health. (C2.2.4.1)
5. Negligible personnel experience. (C2.2.4.5)
6. Limited staff expertise. (C2.3.1.3)
7. Highly restricted information exchange. (C2.3.1.8)

**Civil**

1. Uncooperative interdepartmental/interagency relationships. (C3.1.1.3)

2. Limited international organization support. (C3.1.2.5)
3. High health risk. (C3.3.1.5)
4. Insignificant science and technology. (C3.3.7)

## **8.7.2 Functional Needs Analysis**

### **8.7.2.1 Capability and Deficiency Assessment Summary**

Table 8.7-1 discusses the only capability to coordinate CBRND aspects of JOA medical operations that enable the performance of the task to the designated standard.

#### **Current Capability and Deficiency**

Any operational-level headquarters has the capability to assess, train, and manage medical issues in relation to medical operations in a CBRN environment. Medical screening is adequate and appropriate for this capability. Automated disease outbreak tracking systems are generally available at the strategic national level, and therefore the operational-level medical health care providers need a reachback capability. However, there are some slight deficiencies in establishing quarantine protocols across the joint force and in conducting risk assessments and tracking of exposed personnel. The overall capability is currently “green.”

#### **Projected Near/Mid-Term Capability and Deficiency**

No foreseeable changes in capability in the near/mid term.

#### **Projected Far-Term Capability and Deficiency**

Improvements in DOTMLPF in the far term will raise the overall capability.

**Table 8.7-1. OPSHA 7: Capability and Deficiency Assessment**

<b>Capability: Joint Force</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>	<b>M6</b>	<b>M7</b>	<b>M8</b>	<b>M9</b>
<b>Current Overall Capability<sup>1</sup></b>	G <sup>2</sup>	G <sup>3</sup>	G <sup>4</sup>	Y <sup>5</sup>	Y <sup>6</sup>	G <sup>7</sup>	Y <sup>8</sup>	Y <sup>9</sup>	G <sup>10</sup>
<b>Near/Mid-Term Overall Capability</b>	G	G	G	Y	Y	G	Y	Y	G
<b>Far-Term Overall Capability</b>	G <sup>11</sup>	G	G	G	G <sup>12</sup>	G	G	G	G

	<b>FAA Measure</b>	<b>Scale</b>
M1	Personnel are screened for deployment eligibility.	G – Yes, Y – Limited, R – No
M2	Medical records are assessed for medical indicators.	G – Yes, Y – Limited, R – No
M3	Standards for personnel health and fitness are effective for potential CBRN/TIM environments.	G – Yes, Y – Limited, R – No
M4	Casualties (U.S., host nation, and third-country nationals), both human and MWA, restricted by medical/veterinary isolation/quarantine are identified.	G – Yes, Y – Limited, R – No
M5	System for tracking the status of CBRN medical information exists.	G – Yes, Y – Limited, R – No
M6	JOA medical threats are identified and appropriate counter-measures are instituted.	G – Yes, Y – Limited, R – No
M7	CBRND health risk assessment estimate is available.	G – Yes, Y – Limited, R – No
M8	Units potentially or actually exposed/contaminated by CBRN/TIM or ROTA events are identified and tracked.	G – Yes, Y – Limited, R – No
M9	Non-DoD sources are accessed for information.	G – Yes, Y – Limited, R – No

<sup>1</sup> Limited. There are limited JTTPs to specifically address this task.

<sup>2</sup> Yes. Personnel are screened before deployment.

<sup>3</sup> Yes. Most joint force medical staffs can sufficiently assess records.

<sup>4</sup> Yes. DoD-wide standards for general military personnel health and fitness are well documented and sustained, but medical linkage to health criteria for CBRN should be developed.

<sup>5</sup> Limited. Most joint force medical/veterinary personnel are proficient at quarantine protocol. However, coordination across the joint services medical community (as well as host nations/coalition partners) for identifying, screening, isolating, and quarantining infected personnel should be improved, including the use of automated disease outbreak tracking systems. These systems should be fed into the J-2, CBRN, and preventive-medicine experts to provide population indicators of biological weapons use in AOR.

<sup>6</sup> Limited. The capability to track chemical, biological, radiological, nuclear, and high-yield explosive medical information is only as good as the capability to track deployed medical personnel information, which is a work in progress, but is far from being solved.

<sup>7</sup> Yes. National medical assets can identify potential medical threats and institute limited medical countermeasures.

<sup>8</sup> Limited. TIMs health risk assessment requires a broad analysis of chemical and toxic material production/storing capabilities in the area of operations. A database of global to local TIM hazards does not currently exist. However, expertise can be made available to the joint force to conduct a health risk assessment based on regional hazards.

<sup>9</sup> Limited. Most joint force staffs can track adequately those units actually or potentially exposed to CBRN/TIM. However, real-time/near-real-time understanding of the geographical location of units on the battlefield, tied to automated plume prediction technology, is necessary.

<sup>10</sup> Yes. Reachback capabilities exist for multiple medical need analyses.

<sup>11</sup> In the far term, DOTMLPF enhancements across the board made possible by focused experimentation and lessons learned from exercises will improve all measures to a “green” rating.

<sup>12</sup> When the Theater Medical Information Program and Common Hardware/Software II are deployed and other information systems are integrated with these systems, the “green” rating for this measure will be justified.

### 8.7.3 Functional Solution Analysis

#### 8.7.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Coordination across the joint services medical community (as well as host nations/coalition partners) for identifying, screening, isolating, and quarantining infected personnel should be improved.  
**Non-Materiel Solutions:** *Doctrine:* Doctrine and training on early identification for nonstandard and novel chemical/biological threats needs to be implemented. *Training:* Doctrine and training on early identification for nonstandard and novel chemical/biological threats needs to be implemented.
2. **Deficiency:** A database of global to local TIM hazards does not currently exist.  
**Non-Materiel Solutions:** None
3. **Deficiency:** Lack of real-time/near-real-time understanding of the geographical location of units on the battlefield tied to automated plume prediction technology.  
**Non-Materiel Solutions:** None
4. **Deficiency:** There is limited JTTPs to specifically address coordinating CBRND/TIM aspects of JOA medical operations.  
**Non-Materiel Solutions:** *Doctrine:* Improvement in environmental health and safety training of deploying forces is needed. JTTPs for medical management of TIM casualties needs to be improved, or some form of reachback capability needs to be implemented for health care professionals to conduct adequate assessments, diagnoses, and treatment.

#### 8.7.3.2 IMA Assessment Summary

**Table 8.7-2. OPSHA 7: IMA Assessment**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Automated analytical tools	With fewer personnel available to perform casualty estimation and COA generation and assessment, the JTF commander will rely increasingly on automated tools.
Automated database	Development of an automated global database/software program of CBRN/TIM hazards, or provide joint force medical personnel reachback capability to national medical and occupational safety and health databases.
Automated tool	Development of automated plume prediction technology tied to real-time geospatial unit location is necessary.

## 8.8 Task OPSHA 8: Coordinate JTF/JOA CBRND operations

### 8.8.1 Functional Area Analysis

#### 8.8.1.1 Definition

To provide overall coordination of JTF/JOA CBRND operations. Preparatory activities are coordinated with affected joint forces, coalition partners, and appropriate nongovernmental and indigenous organizations. JTF/JOA staffs collaboratively manage the preparation of joint and coalition forces for CBRND operations within the battlespace. Data from assessments are used to evaluate and determine CBRND requirements and status based on policy, plans, and commander's intent. Multiple CBRN/TIM events could occur in the same time frame throughout the JOA. Rapid and effective response and mitigation coordination is required. CBRN/TIM event information provided in the COP is used to formulate appropriate actions and taskings. Uses planning and analysis tools to evaluate force responses to CBRN/TIM attacks against specific sites, positions, maneuvers, and missions. Includes development of TTPs to ensure effective and efficient execution of CBRND tasks. Provides sensor employment strategy. Includes management of theater restoration and elimination operations.

#### 8.8.1.2 Derivation

*UJTL (OP 1.3.1, OP 1.6, OP 2.2.1, OP 2.2, OP 2.4.1.1, OP 2.4.1.2, OP 4.4.3, OP 4.4.5, OP 4.7, OP 4.7.2, OP 4.7.8, OP 5.1.1, OP 5.1.2, OP 5.2, OP 5.2.1, OP 5.3, OP 5.3.2, OP-5.3.4, OP 5.3.6, OP-5.3.7, OP 5.3.9, OP 5.4, OP 5.4.2, OP 5.4.4, OP 5.4.5, OP 5.5.8, OP 5.7, OP 5.7.4, OP 6.1.6, OP 6.2.1, OP 6.1.6, OP 6.2.10, OP 7, OP 7.1, OP 7.2, OP 7.3, OP 7.4), Joint Enabling Concept for CBRN Operations, Protection Joint Functional Concept, Military Transformation: A Strategic Approach, Transformation Planning Guidance.*

#### 8.8.1.2.1 Supported Task: STSHA 8

#### 8.8.1.2.2 Lateral Tasks: OPSHA 3, OPSHA 6, OPSHLD 2, OPSUST 9, OPSUST 11, OPSUST 12, OPSUST 13

#### 8.8.1.2.3 Supporting Tasks: TASHA 9, TASHA 11, TASHA 18, TASHA 19, TASHA 24

#### 8.8.1.3 Condition

Perform this task under conditions of:

##### Physical

1. Immediate, delayed, or potential long-term atmospheric weapons effects. (C1.3.3)

##### Military

1. No preexisting arrangements. (C2.1.1.2)
2. No or outline mission preparation. (C2.1.3)

3. Few modern military systems. (C2.2.5)
4. Few modern military simulation systems. (C2.2.5.5)
5. Poor joint staff integration. (C2.3.1.1)
6. Partial multinational integration. (C2.3.1.2)
7. Limited staff expertise. (C2.3.1.3)
8. Negligible deployed supplies. (C2.8.2)

### **Civil**

1. Uncooperative interdepartmental/interagency relationships. (C3.1.1.3)
2. Negative foreign government support. (C3.1.2.3)
3. Uncertain international organization support. (C3.1.2.5)
4. Restrictive Presidential and/or Secretary of Defense decisions. (C3.1.3)

## **8.8.2 Functional Needs Analysis**

### **8.8.2.1 Capability and Deficiency Assessment Summary**

Table 8.8-1 discusses the capability that currently exists to perform the task to the designated standards. There is only one capability that exists, and no other capability is projected that will accomplish this task.

#### **Current Capability and Deficiency**

Any joint force has the ability to determine the requirements of units and personnel to support CBRND operations; source those requirements through time-phased force and deployment data (TPFDD) adjustment; determine the requirement of CBRND systems and equipment to support CBRND operations; coordinate CBRND operations, including transport, logistics, communications, and CBRND unit employment considerations; and follow doctrine and TTPs. There are deficiencies in all current measures that result in a capability rating of “yellow.”

#### **Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. No capability improvement is forecast for the near/mid term.

#### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. In the far term, DOTMLPF enhancements across the board made possible by focused experimentation and lessons learned from exercises will improve all measures to a “green” rating.

Table 8.8-1. OPSHA 8: Capability and Deficiency Assessment

Capability: Joint Force	M1	M2	M3	M4	M5	M6	M7	M8
Current Overall Capability <sup>1</sup>	Y <sup>2</sup>	Y <sup>3</sup>	Y <sup>4</sup>	Y <sup>5</sup>	Y <sup>6</sup>	Y <sup>7</sup>	Y <sup>8</sup>	Y <sup>9</sup>
Near/Mid-Term Overall Capability	Y	Y	Y	Y	Y	Y	Y	Y
Far-Term Overall Capability	G <sup>10</sup>	G	G	G	G	G	G	G

	FAA Measure	Scale
M1	Required CBRND units and personnel are available.	G – Yes, Y – Limited, R – No
M2	Required CBRND systems and equipment are available.	G – Yes, Y – Limited, R – No
M3	All pertinent Sense, Shape, Shield, and Sustain information is considered.	G – Yes, Y – Limited, R – No
M4	Coordination of CBRND operations includes transport, logistics, communications, and CBRND unit employment considerations.	G – Yes, Y – Limited, R – No
M5	Doctrine and TTPs for JOA CBRND coordination are available.	G – Yes, Y – Limited, R – No
M6	JTF/JOA staffs are adequately trained to effectively coordinate CBRND operations.	G – Yes, Y – Limited, R – No
M7	JTF/JOA exercises or experimentation provide feedback on efficacy of coordination of JOA CBRND operations.	G – Yes, Y – Limited, R – No
M8	Exercise comments are incorporated into coordinated doctrine and TTPs.	G – Yes, Y – Limited, R – No

<sup>1</sup> Limited. Doctrine is based on theoretical rather than practical experience.

<sup>2</sup> Limited. joint force has the ability to determine the requirements of units and personnel to support CBRN operations. Sourcing those requirements is a TPFDD issue and is adjusted based on capability needs. The CBRN staff provides input, but does not develop the TPFDD.

<sup>3</sup> Limited. joint force has the ability to determine the requirement of CBRN systems and equipment to support CBRN operations. Availability of required CBRND systems and equipment is a logistics issue and must be tracked from depot to end user. This tracking is a materiel management issue requiring designation and highlighting reportable end items, durable, and expendable items that are critical for sourcing a CBRND capability. Asset visibility within DoD normally is limited to end items and some durables. A system to track all CBRND-specific materiel may be required.

<sup>4</sup> Limited. joint force has the ability to address all pertinent Sense, Shape, Shield, and Sustain issues, but until *UJTL 5.0* takes effect, the Sense, Shape, Shield, Sustain domains may not be recognized by the joint force.

<sup>5</sup> Limited. joint force has the ability to coordinate CBRND operations. This coordination includes transport, logistics, communications, and CBRND unit employment considerations, but planning factors for logistics and transportation may not support real-world requirements following a CBRN event. Therefore, the three capabilities listed in the capabilities statement are sequential.

<sup>6</sup> Limited. joint force has the ability to follow doctrine and TTPs for JOA CBRND coordination. There are limited joint exercises/experiments that address CBRN coordination within a JOA. Limited exercises produce few lessons learned. Few lessons learned result in incomplete or hypothetical doctrine and TTPs.

<sup>7</sup> Limited. Staff who maintain CBRND specializations can assist in planning and executing CBRND operations. However, these specialists are limited in number and depth.

<sup>8</sup> Limited. Joint exercises/ experiments are limited in number and scope. Feedback from these CBRND exercises/experiments are limited to the data have been captured. Without an effective data capture instrument, efficacy of JOA CBRND operations coordination is questionable.

<sup>9</sup> Limited. Comments incorporated into doctrine and TTPs are restricted to those which have been captured and entered into JULLS.

<sup>10</sup> In the far term, DOTMLPF enhancements across the board made possible by focused experimentation and lessons learned from exercises will improve all measures to a “green” rating.

### 8.8.3 Functional Solution Analysis

#### 8.8.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** The CBRN Staff provides input but does not develop the TPFDD.  
**Non-Materiel Solutions:** *Doctrine:* Develop criteria for TPFDD planning considerations that include CBRN requirements and needs.
- 2. Deficiency:** A system to track all CBRND systems and equipment may be required.  
**Non-Materiel Solutions:** *Doctrine:* Develop a system or method to track all CBRND systems equipment.
- 3. Deficiency:** Until *UJTL* 5.0 takes effect, the Sense, Shape, Shield, Sustain domains may not be recognized by the joint force.  
**Non-Materiel Solutions:** *Doctrine:* Develop CBRN doctrine, TTPs, and planning factors resulting from lessons gleaned from joint exercises/experiment covering the action required under the operational elements of Sense, Shape, Shield, and Sustain. *Organization:* Review force structure. Within end strength constraints, consider adjusting force structure as a result of lessons learned from joint exercises/experiments. *Training:* Develop training support packages that incorporate lessons learned from joint exercises/experiments. *Leadership:* Develop leadership education and JPME course(s) that incorporate lessons learned from joint exercises/experiments.
- 4. Deficiency:** Planning factors for logistics and transportation may not support real-world requirements following a CBRN event.  
**Non-Materiel Solutions:** *Doctrine:* Review available data and lessons learned from historical, wide-area events to validate logistical planning factors. Such events could include natural disasters, large TIM releases, terrorist activity, and testing historically conducted by the United States and the former Soviet Union.
- 5. Deficiency:** Limited exercises produce few lessons learned. Few lessons learned result in incomplete or hypothetical doctrine and TTPs.  
**Non-Materiel Solutions:** *Doctrine:* Develop a JMSEL for joint exercises/experiments that address coordination of CBRND operations within a JOA. *Training:* Develop training for joint exercises/experiments that address coordination of CBRND operations within a JOA.
- 6. Deficiency:** These specialists are limited in number, and depth.  
**Non-Materiel Solutions:** *Doctrine:* Develop JMSEL for joint exercises/experiments that address coordination of CBRND operations within a JOA. *Training:* Develop training for joint exercises/experiments that address coordination of CBRND operations within a JOA.

7. **Deficiency:** Joint exercises/experiments are limited in number and scope. Feedback from these CBRND exercises/experiments is limited to the data have been captured. Without an effective data capture instrument, efficacy of JOA CBRND operations coordination is questionable.

**Non-Materiel Solutions:** *Doctrine:* Develop guidance and JTTPs that address capture of CBRND lessons learned from exercises. *Training:* Develop framework for capturing CBRND lessons learned in exercises.

8. **Deficiency:** Doctrine for CBRND operations to the extent practical is based on actual experience. However, much CBRND doctrine is predicated on theoretical modeling and simulation.

**Non-Materiel Solutions:** *Doctrine:* Actively pursue a joint lessons learned program that captures CBRND lessons from exercises/experiments and real-world events. Incorporate all lessons into JULLS. *Training:* Actively pursue a joint lessons learned program that captures CBRND lessons from exercises/experiments and real-world events. Incorporate all lessons into JULLS.

#### 8.8.3.2 IMA Assessment Summary

N/A

## **8.9 Task OPSHA 9: Provide Shape country assistance teams to support TEP**

### **8.9.1 Functional Area Analysis**

#### **8.9.1.1 Definition**

To provide Shape country assistance teams to support the Theater Engagement Plan (TEP) that has been provided by the combatant commander. Many nations that would normally support U.S. initiatives may feel threatened by hostile neighbors or nations that possess CBRN/TIM weapons. The TEPs for Shape considerations are executed by special teams and units that demonstrate Shape capability or provide Shape-related training to selected countries.

#### **8.9.1.2 Derivation**

*UJTL (OP 7.3, OP 4.7.1, ST 8.1.2), CJCSM 3113.01a.*

##### **8.9.1.2.1 Supported Task: STSHA 9**

##### **8.9.1.2.2 Lateral Tasks: OPSENS 8, OPSHA 6, OPSUST 7**

##### **8.9.1.2.3 Supporting Task: N/A**

#### **8.9.1.3 Condition**

Perform this task under conditions of:

##### **Physical. NA**

##### **Military**

1. No preexisting arrangements. (C2.1.1.2)
2. Negligible personnel expertise. (C2.2.4.5)

##### **Civil**

1. Mixed support for political policies. (C3.1)
2. Limited foreign government support. (C3.1.2.3)

### **8.9.2 Functional Needs Analysis**

#### **8.9.2.1 Capability and Deficiency Assessment Summary**

Table 8.9-1 discusses the only capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

Any JTF HQ has a team of operational planners and information command and control specialists. This team of experts has the skill to provide Shape country assistance teams to support the TEP, but there are some deficiencies that negatively impact on their ability to do so, resulting in a current capability assessment of “red.”

**Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Little capability improvement is forecast for the near/mid term with the exception that DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation. The overall capability will remain “red” in the near/mid term.

**Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. Several projected initiatives will raise the far-term projection of the JTF capability to “green.” Steps will be taken to establish and equip country assistance teams. JTTPs that addresses a Shape country assistance team support to TEP will be developed. Restoration exercises and experiments focused on Shape country assistance teams will be conducted. Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.

**Table 8.9-1. OPSHA 9: Capability and Deficiency Assessment**

<b>Capability: Operational-Level HQ</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>R<sup>2</sup></b>	<b>G<sup>3</sup></b>	<b>R<sup>4</sup></b>	<b>Y<sup>5</sup></b>
<b>Near/Mid-Term Overall Capability<sup>6</sup></b>	<b>R</b>	<b>G</b>	<b>R</b>	<b>Y</b>
<b>Far-Term Overall Capability<sup>7</sup></b>	<b>G<sup>8</sup></b>	<b>G</b>	<b>G<sup>9</sup></b>	<b>G<sup>10</sup></b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	Shape country assistance teams are properly manned, trained, and equipped.	G – Yes, Y – Limited, R – No
M2	Valid requests for Shape security assistance are met.	G – Yes, Y – Limited, R – No
M3	Procedures and checklists are developed to facilitate the ability to provide Shape country assistance teams to support TEPs.	G – Yes, Y – Limited, R – No
M4	Joint exercises provide feedback on Shape country assistance teams.	G – Yes, Y – Limited, R – No

<sup>1</sup> No specific doctrine has been developed.

The linkage of Shape and Shape country assistance teams is not integrated into leader education. This task is not a standard part of training.

<sup>2</sup> No. While any joint force staff can train and equip a country assistance team, none have ever been established. There has been no training or equipment developed that specifically addresses the training and equipment requirements for a Shape country assistance team.

<sup>3</sup> Yes. Any joint force staff can process and honor requests for a country assistance team. There is currently no experience base, however.

<sup>4</sup> No. Any joint force staff can develop procedures and checklist for a country assistance team, but there are no TTPs that addresses a Shape country assistance team support to TEPs.

<sup>5</sup> Limited. Few if any restoration exercises or experiments focused on Shape country assistance teams have been conducted.

<sup>6</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>7</sup> Continued DOTMLPF enhancements will result from exercise and wargame lessons learned.

<sup>8</sup> Steps will be taken to establish and equip country assistance teams.

<sup>9</sup> JTTPs that addresses a Shape country assistance team support to TEPs will be developed.

<sup>10</sup> Restoration exercises and experiments focused on Shape country assistance teams will be conducted.

### 8.9.3 Functional Solution Analysis

#### 8.9.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Shape country assistance teams requirements not defined.  
**Non-Materiel Solutions:** *Doctrine:* No one has developed an operational concept for Shape country assistance teams, and specific guidance (technical or procedural) on how to approach this task has not been provided. Develop TTPs, organizational structure, training, leadership education, and equipment for Shape country assistance teams to support TEPs.
2. **Deficiency:** Prototype country assistance teams not organized.  
**Non-Materiel Solutions:** *Organization:* Develop organizational table of distribution and allowances for Shape country assistance teams to support TEPs.
3. **Deficiency:** Training not adequate.  
**Non-Materiel Solutions:** *Training:* Develop training for Shape country assistance teams to support TEPs.
4. **Deficiency:** Leader education inadequate.  
**Non-Materiel Solutions:** *Deficiency: Leadership:* Develop JPME classes for Shape country assistance teams to support TEPs.
5. **Deficiency:** Joint exercises need to incorporate and provide feedback on Shape operation country assistance teams.  
**Non-Materiel Solutions:** *Training:* Develop and refine Shape exercises for a JTF that will provide feedback on efficacy of Shape country assistance teams. Incorporate lessons learned from into future exercises and TTPs.

#### 8.9.3.2 IMA Assessment Summary

N/A

**8.10 Task OPSHA 10: Provide JOA CBRN/TIM weapons information to the combatant commander****8.10.1 Functional Area Analysis****8.10.1.1 Definition**

To obtain information and data from all sources that provide information about the CBRN/TIM weapons situation in the JOA. These data are provided to the combatant commander.

**8.10.1.2 Derivation**

*UJTL (OP 7.5, OP 2.2.2).*

**8.10.1.2.1 Supported Task: STSHA 1****8.10.1.2.2 Lateral Tasks: OPSHA 2, OPSUST 1, OPSUST 2****8.10.1.2.3 Supporting Task: TASHA 25****8.10.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Negligible intelligence database. (C2.4.2)
2. Negligible theater intelligence access. (C2.4.2)
3. Conventional and terrorist threat form. (C2.9.2)

**Civil**

1. Negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)

**8.10.2 Functional Needs Analysis****8.10.2.1 Capability and Deficiency Assessment Summary**

Table 8.10-1 discusses a capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

The organizational structure of a subordinate joint force's intelligence element is determined by the JFC based on the situation and mission. All subordinate joint force J-2s, however, will at a minimum require a core element of analytical and administrative capabilities. Most situations will require augmentation of joint force intelligence capabilities through the deployment and integration of theater intelligence elements into a joint intelligence support element with a Terrorism/CBRN Analysis cell. Capabilities of the JISE include order-of-battle analysis; identification of adversary CBRN weapons systems; analysis of adversary command, control, communications, and computers; targeting support; collection management; and maintenance of a 24-hour watch. The ability of the JISE to perform this task is dependent on the completeness and accuracy of the Sense data that provide situational awareness of the CBRN/TIM weapons situation in the JOA. The ability of the JISE to shape these data into JOA CBRN/TIM weapon situational understanding for the combatant commander is hampered by this dependence on Sense input and by lack of doctrine and TTPs, resulting in an overall current assessment of "yellow."

**Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. Little capability improvement is forecast for the near/mid term except that DOTLMPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

**Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. In the far term, the success of intelligence initiatives and DOTLMPF enhancements across the board made possible by focused experimentation and lessons learned from exercises will improve all measures to a "green" rating.

**Table 8.10-1. OPSHA 10: Capability and Deficiency Assessment**

<b>Capability: JISE</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>Y<sup>2</sup></b>	<b>Y<sup>3</sup></b>	<b>Y<sup>4</sup></b>	<b>Y<sup>5</sup></b>
<b>Near/Mid-Term Overall Capability<sup>6</sup></b>	<b>Y</b>	<b>Y</b>	<b>Y</b>	<b>Y</b>
<b>Far-Term Overall Capability</b>	<b>G<sup>7</sup></b>	<b>G</b>	<b>G</b>	<b>G<sup>8</sup></b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	CBRN/TIM weapon capabilities in JOA are detected and identified.	G – Yes, Y – Limited, R – No
M2	Intelligence on enemy CBRN/TIM weapon systems is accurate.	G – Yes, Y – Limited, R – No
M3	CBRN/TIM weapons information is provided to the combatant commander.	G – Yes, Y – Limited, R – No
M4	Fidelity of information on CBRN/TIM agents and delivery means is assured.	G – Yes, Y – Limited, R – No

<sup>1</sup> This task is not integrated into experimentation and exercises. Red teaming is not adequately employed to expose methodologies and assessments to scrutiny and alternate analysis.

<sup>2</sup> The JISE has a dedicated Terrorism/CBRN Analysis cell but is dependent on the completeness and thoroughness of the CBRN and intelligence and exploitation data it receives.

<sup>3</sup> The JISE has a dedicated Terrorism/CBRN Analysis cell but is dependent on the accuracy of the intelligence and exploitation data it receives.

<sup>4</sup> Nothing precludes providing CBRN weapons information to the combatant commander. Proper techniques for setting forth the JISE's findings in such a way as to make clear to the combatant commander what is certain knowledge and what is reasoned judgment (and within the realm of the judgments what varying degrees of certitude lie behind each key assessment) are not available.

<sup>5</sup> In the event of terrorist possession of or use of CBRN, it may be difficult or impossible to have absolute assurance about fidelity of information concerning weapons systems or the attack. In the case of a biological attack or attacks involving TIM, it may be difficult to determine whether it is a natural disease outbreak or an accident. In the event of use not involving U.S. forces or allies, it may be difficult to assess fidelity of required information due to information access constraints. Techniques and procedures to facilitate this fidelity assurance process when it involves terrorists or non-U.S. allies and to detect or identify attacks may not be adequate. Methods and procedures for accurately reporting CBRN attacks against U.S. forces are mature and effective, but methods and procedures for accurately reporting third-party, terrorist, and TIM attacks may not be adequate.

<sup>6</sup> DOTLMPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>7</sup> In the far term, the success of intelligence initiatives and DOTLMPF enhancements across the board made possible by focused experimentation and lessons learned from exercises will improve all measures to a "green" rating.

<sup>8</sup> In the far term, the success of intelligence and international cooperation initiatives and DOTLMPF enhancements across the board made possible by focused experimentation and lessons learned from operations/exercises should improve CBRN/TIM agent and delivery means information fidelity assurance to a "green" rating.

### 8.10.3 Functional Solution Analysis

#### 8.10.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** The JISE Terrorism/CBRN Analysis cell is dependent on the completeness and thoroughness of the CBRN intelligence and exploitation data it receives.  
**Non-Materiel Solutions:** *Organization:* Ensure that intelligence and collection and exploitation organizations are staffed and equipped to enable them to provide the most complete and thorough CBRN/TIM weapon intelligence data possible.
- 2. Deficiency:** The JISE Terrorism/CBRN Analysis cell is dependent on the accuracy of the intelligence and exploitation data it receives.  
**Non-Materiel Solutions:** *Organization:* Ensure that intelligence and collection and exploitation organizations are staffed and equipped to enable them to provide the most accurate CBRN/TIM weapon intelligence data possible.
- 3. Deficiency:** Proper techniques for setting forth the JISE's key CBRN/TIM weapons findings in such a way as to make clear to the combatant commander what is certain knowledge and what is reasoned judgment (and within the realm of the judgments what varying degrees of certitude lie behind each key CBRN/TIM weapons assessment) are not available.  
**Non-Materiel Solutions:** *Doctrine:* Develop comprehensive methodologies and techniques for setting forth the JISE's key CBRN/TIM weapons findings in such a way as to make clear to the combatant commander what is certain knowledge and what is reasoned judgment (and within the realm of the judgments what varying degrees of certitude lie behind each key CBRN/TIM weapons assessment). *Training:* Ensure that rigorous training is developed to test the techniques for setting forth the JISE's key CBRN/TIM weapons findings.
- 4. Deficiency:** This task is not integrated into experimentation and exercises.  
**Non-Materiel Solutions:** *Training:* Ensure that this task is incorporated into experimentation so that concepts can be tested and improved. Integrate lessons learned into exercises and TTPs.
- 5. Deficiency:** Red teaming is not adequately employed to expose methodologies and assessments to scrutiny and alternate analysis.  
**Non-Materiel Solutions:** *Organization:* Employ red teaming to test the Shape capabilities to provide situational understanding about CBRN weapons systems to the combatant commander.
- 6. Deficiency:** This task is not integrated into JPME  
**Non-Materiel Solutions:** *Leadership:* Develop JPME courses that address JISE functions of CBRN/TIM threat analysis and integrate into all intelligence and CBRN education systems.

**8.10.3.2 IMA Assessment Summary**

N/A

## **8.11 Task OPSHA 11: Establish JOA cooperative CBRN/TIM detection policies, procedures, and networks**

### **8.11.1 Functional Area Analysis**

#### **8.11.1.1 Definition**

To link JOA active systems (e.g., Space and Air Defense Radar) with passive detectors (such as BIDS) to produce a JOA cooperative CBRN/TIM detection network. Builds a seamless web from the JTF capabilities down to individual tactical detectors within the JOA battlespace to provide a means of detecting both delivery vehicles and agents.

#### **8.11.1.2 Derivation**

*UJTL (OP 7.5, OP 2.2.2).*

##### **8.11.1.2.1 Supported Task: STSHA 10**

##### **8.11.1.2.2 Lateral Task: OPSHA 6**

##### **8.11.1.2.3 Supporting Tasks: TASHA 26, TASHA 27**

#### **8.11.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Partial preexisting arrangements. (C2.1.1.2)

**Civil**

1. Limited foreign government support. (C3.1.2.3)
2. Moderately opposed foreign public opinion. (C3.1.2.4)

### **8.11.2 Functional Needs Analysis**

#### **8.11.2.1 Capability and Deficiency Assessment Summary**

Table 8.11-1 discusses the only capability that will be able to accomplish some of the standards that are listed in the task. There is only one capability that exists, and no other capability is projected that will accomplish this task.

**Current Capability and Deficiency**

While any operational-level staff can develop policies and procedures specific and unique to its operational circumstances, this task asks much more. This task is not normally a function of an operational commander, and we recommend that the word “network” be removed until actual networked capabilities are fielded. This capability must be developed and facilitated by strategic national assets and passed to the field commander as a vetted operational capability package. The current assessment is “red” based on the fact that cooperative linkages between various systems capabilities, although proposed, have not yet been coordinated.

**Projected Near/Mid-Term Capability and Deficiency**

No other capability is currently projected for the near/mid term. No capability improvement is forecast for the near/mid term.

**Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. The far-term forecast is for improvement to “yellow.” A joint force has the ability to establish CBRN/TIM detection policies within the JOA. As cooperative linkages between various systems capabilities are coordinated and established between various detection technologies (e.g., BIDS, phased-array radars, standoff motion detectors, passive monitors, vehicular-embedded detectors with Global Positioning System [GPS] linkages and automatic position reporting, individual detectors networked to centralized data servers, etc.), JOA cooperative CBRN/TIM detection policies, procedures, and networks will be established in limited fashion. All supporting and required DOTMLPF enhancements will be initiated, but it will take years of experimentation and exercises before full capability is realized.

**Table 8.11-1. OPSHA 11: Capability and Deficiency Assessment**

<b>Capability: Joint Force</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>	<b>M6</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>R<sup>2</sup></b>	<b>R<sup>3</sup></b>	<b>R<sup>4</sup></b>	<b>R<sup>5</sup></b>	<b>G<sup>6</sup></b>	<b>R<sup>7</sup></b>
<b>Near/Mid-Term Overall Capability</b>	<b>R</b>	<b>R</b>	<b>R</b>	<b>R</b>	<b>G</b>	<b>R</b>
<b>Far-Term Overall Capability</b>	<b>Y<sup>8</sup></b>	<b>Y</b>	<b>Y</b>	<b>Y</b>	<b>G</b>	<b>Y</b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	JOA cooperative CBRN/TIM detection policy is established.	G – Yes, Y – Limited, R – No
M2	JOA cooperative CBRN/TIM detection procedures are established.	G – Yes, Y – Limited, R – No
M3	JOA cooperative CBRN/TIM detection networks are established.	G – Yes, Y – Limited, R – No
M4	Policies and procedures have been established with component commands.	G – Yes, Y – Limited, R – No
M5	Existing policies and procedures are updated regularly.	G – Yes, Y – Limited, R – No
M6	Joint exercises/experimentation provide feedback on efficacy of policies and procedures.	G – Yes, Y – Limited, R – No

<sup>1</sup> Limited. Conceivably, any joint force could incorporate cooperatively linked detection technologies; however, the capability does not currently exist, therefore, effective DOTMLPF is irrelevant.

<sup>2</sup> A joint force has the ability to establish CBRN/TIM detection policies within the JOA. However, cooperative linkages between various systems capabilities, although proposed, have not yet been coordinated. Since no linkages currently exist between various detection technologies (e.g., BIDS, phased-array radars, standoff motion detectors, passive monitors, vehicular-embedded detectors with GPS linkages and automatic position reporting, individual detectors networked to centralized data servers, etc.), no JOA cooperative CBRN/TIM detection policies are required.

<sup>3</sup> Any joint force CBRN cell has the ability to establish CBRN/TIM detection procedures within the JOA. However, distributed, cooperative CBRN/TIM detection capabilities do not currently exist, and JOA cooperative CBRN detection procedures are not established.

<sup>4</sup> Any joint force communications cell has the ability to establish networks within the JOA. However, cooperative linkages between various system capabilities do not currently exist; therefore, cooperative CBRN/TIM detection networks need not be established.

<sup>5</sup> Any joint force has the ability to establish policies and procedures. However, cooperative linkages between various system capabilities do not exist currently; therefore, policies and procedures need not be established.

<sup>6</sup> Any joint force has the ability to update policies and procedures regularly.

<sup>7</sup> Since the capability to establish cooperative linkages between various detection technologies does not currently exist, exercises and experiments to provide feedback are not yet necessary.

<sup>8</sup> A joint force has the ability to establish CBRN/TIM detection policies within the JOA. As cooperative linkages between various systems capabilities are coordinated and established between various detection technologies (e.g., BIDS, phased-array radars, standoff motion detectors, passive monitors, vehicular-embedded detectors with GPS linkages and automatic position reporting, individual detectors networked to centralized data servers, etc.), JOA cooperative CBRN/TIM detection policies, procedures, and networks will be established in limited fashion. All supporting and required DOTMLPF enhancements will be initiated, but it will take years of experimentation and exercises before full capability is realized.

### 8.11.3 Functional Solution Analysis

#### 8.11.3.1 DOTLPP Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Lack of CBRN/TIM detection network capabilities.

**Non-Materiel Solutions:** None

2. **Deficiency:** Since the capability to establish cooperative linkages between various detection technologies does not currently exist, proposals and concepts must be tested in exercises and experiments to provide feedback and test hypotheses.

**Non-Materiel Solutions:** *Doctrine:* Develop ideas, proposals, and concepts for cooperatively linked detection technologies. *Training:* Before concepts for cooperatively linked detection technologies can be fully developed and tested, exercises and experiments will be necessary to refine and test concept hypotheses.

3. **Deficiency:** The capability of cooperatively linked detection technologies does not currently exist; therefore, effective DOTMLPP has not been established.

**Non-Materiel Solutions:** *Doctrine:* Before cooperatively linked detection technologies reach IOC, effective doctrine and JTTPs should be developed. *Organization:* Before cooperatively linked detection technologies reach IOC, organizational requirements and changes should be developed and executed. *Training:* Before cooperatively linked detection technologies reach IOC, effective training for operational-level staffs should be developed. *Leadership:* Before cooperatively linked detection technologies reach IOC, leader education should be developed and integrated into the Joint Forces Staff College. *Personnel:* Before cooperatively linked detection technologies reach IOC, personnel requirements need to be identified. *Facilities:* Before cooperatively linked detection technologies reach IOC, facility needs must be identified.

#### 8.11.3.2 IMA Assessment Summary

Table 8.11-2 shows possible materiel approaches that address the remaining materiel requirements of the DOTMLPP assessment.

Table 8.11-2. OPSHA 11: IMA Assessment

Idea for Materiel Approach	Description
Networked detection system.	Development of cooperative linkages between various proponent and service detection and sensing technologies is required. Concepts must first be developed based on proposed linkages that will provide effective, integrated CBRN/TIM detection capabilities. These concepts must be explored through experimentation and then cooperative linkages established and tested. The entire package should be developed as a system. As each Service develops detection or sensing technologies, they should be analyzed for inclusion into the CBRN/TIM cooperative detection network and modifications (if required) be mandated for the Service systems.

## **8.12 Task OPSHA 12: Determine operational effects and impacts due to CBRN/TIM hazards**

### **8.12.1 Functional Area Analysis**

#### **8.12.1.1 Definition**

To determine operational effects and impacts due to CBRN/TIM hazards on the JTF or any joint forces in the JOA from a standpoint of operational implications. Uses shared awareness and shared understanding of the characterized JOA CBRN/TIM threat and situation for determination of operational effects and impacts. Provides for input into COA analysis. Allows military leaders to develop a clear understanding of the current and predicted CBRN/TIM situation's impact on JOA operations in near-real time.

#### **8.12.1.2 Derivation**

*UJTL (OP 2.2, OP 2.2.1, OP 2.5, OP 2.4.1, OP 2.5.1, OP 2.4, OP 2.4.1.1, OP 2.4.2.1, OP 2.5, OP 2.5.3, OP 5.1.1, OP 5.1.2, OP 5.2, OP 5.2.1, OP 5.3, OP 5.3.9, OP 5.4.2, OP 5.4.5, OP 5.7, OP 5.7.6, OP 6.1.6, OP 6.2.10, OP 7), Protection Joint Functional Concept, Military Transformation: A Strategic Approach, Transformation Planning Guidance.*

#### **8.12.1.2.1 Supported Task: STSHA 8**

#### **8.12.1.2.2 Lateral Tasks: OPSHA 2, OPSHA 6, OPSHA 7, OPSUST 3, OPSUST 4**

#### **8.12.1.2.3 Supporting Task: TASHA 22**

#### **8.12.1.3 Condition**

1. Perform this task under conditions of:

##### **Physical**

1. Immediate, delayed, or potential long-term atmospheric weapons effects. (C1.3.3)

##### **Military**

1. Restrictive mission instructions. (C2.1.1)
2. No preexisting arrangements. (C2.1.1.2)
3. No or outline mission preparation. (C2.1.3)
4. Few modern military systems. (C2.2.5)
5. Few modern military simulation systems. (C2.2.5.5)
6. Poor joint staff integration. (C2.3.1.1)
7. Poor multinational integration. (C2.3.1.2)
8. Limited staff expertise. (C2.3.1.3)
9. Highly restricted information exchange. (C2.3.1.8)
10. High information volume. (C2.3.1.9)

11. Negligible intelligence database. (C2.4.2)
12. Negligible theater intelligence access. (C2.4.4)
13. Little or no certitude of data. (C2.4.6)
14. Negligible deployed supplies. (C2.8.2)

### **Civil**

1. Correct interdepartmental/interagency relationships. (C3.1.1.3)
2. Negative foreign government support. (C3.1.2.3)
3. Restrictive Presidential and/or Secretary of Defense decisions. (C3.1.3)
4. Uncertain international organization support. (C3.1.2.5)
5. Low internationalism. (C3.2.6.5)
6. High health risk. (C3.3.1.5)
7. Unspecified TIM present in the civilian sector. (C3.3.7.5)

## **8.12.2 Functional Needs Analysis**

### **8.12.2.1 Capability and Deficiency Assessment Summary**

Table 8.12-1 discusses the only capability that currently exists to perform the task to the designated standard. There is only one capability that exists, and no other capability is projected that will accomplish this task.

### **Current Capability and Deficiency**

Any operational-level staff has a team of operational planners and command and control specialists, and most have CBRN subject matter experts. This team of experts has the skill to determine operational effects and impacts due to CBRN/TIM hazards, but there are some deficiencies that negatively impact on their accuracy and the speed they will be able to operate, resulting in a current assessment of “yellow.”

### **Projected Near/Mid-Term Capability and Deficiency**

JEM will dramatically improve effects modeling by FY2006, and JOEF will provide and interactive operational effects modeling capability/tool by FY2008. The overall assessment will improve to “green.”

### **Projected Far-Term Capability and Deficiency**

No other capability is currently projected for the far-term future. In the far term, DOTMLPF enhancements across the board made possible by focused experimentation and lessons learned from exercises will maintain all measures at a “green” rating.

**Table 8.12-1. OPSHA 12: Capability and Deficiency Assessment**

<b>Capability: Operational-Level Unit Staff</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>
<b>Current Overall Capability<sup>1</sup></b>	<b>Y<sup>2</sup></b>	<b>Y<sup>3</sup></b>	<b>Y<sup>4</sup></b>
<b>Near/Mid-Term Overall Capability<sup>5</sup></b>	<b>G</b>	<b>G</b>	<b>G</b>
<b>Far-Term Overall Capability</b>	<b>G<sup>6</sup></b>	<b>G</b>	<b>G</b>

	<b>FAA Measure</b>	<b>Scale</b>
M1	CBRND staff, cells, and units have access to dedicated information technology resources to determine/provide input on operational effects and impacts due to CBRN/ TIM hazards.	G – Yes, Y – Limited, R – No
M2	Operations staffs are able to use data developed by CBRND staffs or automated systems/tools to help them determine operational impacts due to CBRN/TIM hazards.	G – Yes, Y – Limited, R – No
M3	Means are available to provide determinations of operational effects and impacts due to CBRN/TIM hazards to COA assessments and planners.	G – Yes, Y – Limited, R – No

<sup>1</sup> No doctrine has been developed. The linkage of CBRN/TIM hazards and operational risk assessment is not integrated into leader education. This task is not a standard part of exercises or training.

<sup>2</sup> Any operational-level CBRN staff cell has access to information technology to help determine/provide input on operational effects and impacts due to CBRN/TIM hazards. There is also a callback capability to DTRA. But there will be no specific tools until JEM (FY2006) and JEOF (FY2010) are IOC.

<sup>3</sup> Any operations staff can use data developed by the CBRN staff, but there will be no specific tools until JEM (FY2006) and JEOF (FY2010) are IOC.

<sup>4</sup> Any operational-level staff can develop means (procedures and checklists), but there are no TTPs that specifically and comprehensively address the impact of CBRN/TIM hazards on operational objectives.

<sup>5</sup> DOTMLPF should improve in all deficient areas as a result of initiatives that use data resulting from focused experimentation.

<sup>6</sup> In the far term, DOTMLPF enhancements across the board made possible by focused experimentation and lessons learned from exercises will continue to improve all measures.

### 8.12.3 Functional Solution Analysis

#### 8.12.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Automated systems/tools are lacking.

**Non-Materiel Solutions:** None

2. **Deficiency:** No TTPs specifically and comprehensively address the impact of CBRN/TIM hazards on operational objectives.

**Non-Materiel Solutions:** *Doctrine:* Develop TTPs that specifically and comprehensively address the impact of CBRN/TIM hazards on operational objectives.

3. **Deficiency:** No doctrine has been developed.

**Non-Materiel Solutions:** *Doctrine:* Develop doctrine that specifically and comprehensively addresses the impact of CBRN/TIM hazards on operational objectives, outlines roles and responsibilities, and provides guidance on how the staff should work together to address this issue.

4. **Deficiency:** The linkage of CBRN/TIM hazards and operational risk assessment is not integrated into leader education.

**Non-Materiel Solutions:** *Leadership:* Ensure that the linkage of CBRN/TIM hazards and operational risk assessment is integrated into leader education.

5. **Deficiency:** This task is not a standard part of exercises or training

**Non-Materiel Solutions:** *Training:* Integrate the linkage of CBRN/TIM hazards and operational risk assessment into training and exercises.

9.8 Task TASHA 8: Conduct unit and individual CBRND training and rehearsal .....	60
9.9 Task TASHA 9: Track the processing of CBRN/TIM casualties and exposed personnel and MWA .....	69
9.10 Task TASHA 10: Manage CBRN personnel and unit resources to ensure effective CBRND task accomplishment .....	75
9.11 Task TASHA 11: Correlate observations of the indigenous population for indicators of CBRN/TIM attack or release .....	80
9.12 Task TASHA 12: Conduct medical surveillance based on syndromic information and data across the battlespace .....	87
9.13 Task TASHA 13: Conduct veterinary surveillance of MWA and indigenous animal population throughout the battlespace .....	95
9.14 Task TASHA 14: Conduct surveillance of food and water supplies throughout the battlespace.....	101
9.15 Task TASHA 15: Conduct CBRND preparations .....	108
9.16 Task TASHA 16: Conduct CBRN hazard prediction and effects modeling .....	117
9.17 Task TASHA 17: Operate an IDN to “detect to warn” and provide continuous hazard status.....	127
9.18 Task TASHA 18: Provide CBRN tactical situational awareness throughout the battlespace via the COP .....	135
9.19 Task TASHA 19: Provide CBRN warning, reporting, and alarming throughout the local or immediate battlespace.....	143

9.20	Task TASHA 20: Manage CBRN material resources to ensure effective CBRND task accomplishment.....	152
9.21	Task TASHA 21: Conduct immediate or local battlespace CBRN/TIM incident COA assessment for maneuvering forces .....	160
9.22	Task TASHA 22: Provide CBRN attack or TIM release impact assessment throughout the local or immediate battlespace .....	168
9.23	Task TASHA 23: Conduct immediate or local battlespace CBRN/TIM incident COA assessment for fixed and mobile sites .....	177
9.24	Task TASHA 24: Manage the CBRND response and mitigation efforts .....	184
9.25	Task TASHA 25: Provide tactical CBRN/TIM weapons information to the combatant commander .....	195
9.26	Task TASHA 26: Establish battlespace CBRND information integration and connectivity .....	203
9.27	Task TASHA 27: Ensure the means to collaboratively plan, assess, and manage .....	212
9.28	Task TASHA 28: Ensure CBRND information and data .....	220
9.29	Task TASHA 29: Coordinate the allocation and access to C4ISR assets to support battlespace CBRND operating requirements .....	228
9.30	Task TASHA 30: Initiate CBRN/TIM event history archiving.....	234
9.31	Task TASHA 31: Provide CBRN lessons learned and attack/release information .....	240
9.32	Task TASHA 32: Prepare for the WMD elimination mission.....	249

## 9.0 Tactical Shape

### 9.0.1 Introduction

At the tactical (TA) level of war, battles and engagements are planned and executed to accomplish military objectives assigned to tactical units or task forces. Activities at this level focus on the ordered arrangement and maneuver of combat elements in relation to each other and to the enemy to achieve combat objectives. Thirty-two tactical shape (SHA) tasks were identified in the chemical, biological, radiological, and nuclear (CBRN) Functional Area Analysis (FAA). Two tasks were combined during the FAA review process, and one task was moved into Tactical Shape from Tactical Sense.

This chapter, detailing the Tactical Shape (TASHA) area, restates relevant information from the CBRND Defense (CBRND) FAA, including a description of each of the 32 TASHA tasks, derivation of the task, an indication of other linked tasks, and the pertinent conditions. The Functional Needs Analysis (FNA) section addresses the capability and deficiency analysis, and a brief description of potential near-term changes. Once all the capabilities are considered, the assessment concludes with a separate, overarching look at the entire capability spectrum to identify remaining gaps and/or synergies. The Functional Solutions Analysis (FSA) section addresses possible solutions for the deficiencies identified in the FNA section. These are categorized into materiel or non-materiel. The non-materiel solutions are addressed first and reflect one or more of the six areas of DOTLPF: doctrine, organization, training, leadership and education, personnel, and facilities. If there is no non-materiel solution to the deficiencies, or if the non-materiel solutions do not fully correct the deficiencies, materiel solutions are considered. These encompass broad approaches that are not system-specific. These potential materiel approaches are addressed and evaluated in the Ideas for Materiel Approaches (IMA) section. The IMAs provide a possible near- to far-term resolution to identified deficiencies within the individual capabilities.

The TASHA tasks can best be summarized as “battlespace management.” Giving the on-site commanders and staff the tools needed to perform their jobs with respect to CBRND is essential. The need for speed in the areas of CBRN/ toxic industrial material (TIM) release sensing, reporting, analyzing, and warning is paramount. Current doctrine and training include the tools necessary to manage the CBRN aspects of the battlespace; however, these tools are slow, awkward to use, and often inaccurate. One important shortfall identified by this analysis is the lack of coordination and collaboration among the Services and other agencies and within each Service.

Shape is composed predominantly of processes for the collection, processing, correlation, compilation, analysis, decisioning, and dissemination of CBRND data and information. Materiel provides the infrastructure for this progression, but in and of itself, does not replace the existing processes—it enables or supplements. The current progression is predominantly manually performed. Improvements with assistive automated structures and systems incorporate many of these many processes, enabling decision makers and planners to achieve rapid situational awareness for action. These automated systems permit the collection of greater breadth and depth than achievable with strictly manual means. The integration of networked sensors and

interoperable information management structures support the characterization and shared awareness of the CBRN situation. The fusion of data coupled with visualization and decisioning tools provide the commander and staff with the ability to assess possible COAs and impacts. Decisions and information can be rapidly and accurately shared with relevant entities, establishing shared awareness and shared understanding, and will inevitably increase speed of command and mission effectiveness in a CBRN environment. Unlike the three other areas of CBRND (Shield, Sustain, and Sense), Shape is the process and ability of changing raw information and data into final action through shared awareness and understanding applying the combination of information technology and the training, skills, experience, and knowledge of commanders, staffs, and supporting entities.

## 9.0.2 FNA Summary

Table 9.0-1 summarizes the overall current and projected capability to perform the TASHA tasks identified in the CBRND FAA. The overall capability to conduct these tasks in the current time frame is assessed as “red.” This assessment is based on the almost total lack of automated tools to analyze CBRND information and disseminate the resulting analysis to the proper command elements to affect the outcome of conflicts. If funding for developmental joint programs continues, specific capabilities in the TASHA area will increase, but overall capability is projected to remain “yellow” during the mid and far term. Most, if not all of the identified materiel shortcomings associated with TASHA tasks have previously been identified and are being addressed in currently planned programs.

Metrics are applied to the identified measures within each task and are value scaled. Capabilities are evaluated against the metric scale and assigned an appropriate value for the appropriate defined time period. The value “0” is the lowest value of the scale and generally means the measure is nonexistent or absent and is “red” on the color scale. “Inadequate” or “insufficient,” depending upon the metric, is usually assigned a value ranging 1–3 for the measure and also is “red.” “Partially capable,” as defined by the metric, is 4–7 and “yellow” on the scale; while fully “capable” ranges 8–10 and is “green.” The values for each capability within the determined time period (current, near/mid term, and far term) are averaged for the number of measures assessed. The values are rounded off with half a point or higher rounded to the next higher number, and less than half a point rounded down. Colors are then applied using “red” for 0–3, “yellow” for 4–7, and “green” for 8–10. This process is reapplied for each task in the current and far term to determine the overall task capability in the table below. The overall TASHA capability is determined by assigning 0 to “red,” 1 to “yellow,” and 2 to “green” codes. The values for each of the tasks, by time period, are summed and divided by the total number of tasks. The values are rounded off with half a point or higher rounded to the next higher number and less than half a point rounded down.

**Table 9.0-1. Tactical Shape Summary FNA Findings**

CBRN Tactical Shape Task Number	CBRN Tactical Shape Task Title	Capability		
		Current	Near/Mid Term	Far Term
TASHA 1	Conduct intelligence operations among the indigenous population in the local area.	●	●	●
TASHA 2	Process local or immediate CBRN/TIM threat intelligence information and data.	●	●	●
TASHA 3	Disseminate CBRN threat intelligence for local or immediate battlespace use.	●	●	●
TASHA 4	Conduct immediate or local battlefield threat assessment.	●	●	●
TASHA 5	Conduct immediate or local battlespace vulnerability assessment.	●	●	●
TASHA 6	Conduct immediate or local battlespace risk assessment.	●	●	●
TASHA 7	Conduct collaborative response and mitigation planning for a CBRN attack or TIM release.	●	●	●
TASHA 8	Conduct unit and individual CBRND training and rehearsal.	●	●	●
TASHA 9	Track the processing of CBRN/TIM casualties and exposed personnel and MWA.	●	●	●
TASHA 10	Manage CBRN personnel and unit resources to ensure effective CBRND task accomplishment.	●	●	●
TASHA 11	Correlate observations of the indigenous population for indicators of CBRN/TIM attack or release.	●	●	●
TASHA 12	Conduct medical surveillance based on syndromic information and data across the battlespace.	●	●	●
TASHA 13.	Conduct veterinary surveillance of MWA and indigenous animal population throughout the battlespace.	●	●	●
TASHA 14	Conduct surveillance of food and water supplies throughout the battlespace.	●	●	●
TASHA 15	Conduct CBRND preparations.	●	●	●

### 9.0.3 FSA Summary

The paragraphs below summarize the assessment of all potential DOTMLPF (non-materiel and materiel) solutions for the capability gaps identified in the FNA section. The materiel approaches address both current and non-developed technologies for possible material solutions.

### 9.0.3.1 DOTMLPF

The main DOTLPF shortfalls identified in this chapter are centered on the perishable nature of trained skills in the area of managing CBRND operations. Some of the deficiencies can be partially solved with non-materiel solutions, while others require a materiel solution. Non-materiel solutions include the need for personnel to be trained on the latest automated tools as they become available. The capabilities of the medical and veterinary communities to help with CBRND operations by identifying, predicting, and treating warfighters for CBRN/TIM exposure needs to be fully integrated into tactics, techniques, and procedures (TTPs). Commanders (and the services) must look at available resources and determine how they can be best used to meet operational requirements. As the future battlespace develops, we will become more dependant on automated/electronic tools, thus command staff elements will need better access to Command, Control, Communications, Computers, Intelligence, Surveillance, and Reconnaissance (C4ISR) assets to contribute to the Common Operating Picture (COP) to keep the commander informed and ultimately affect the outcome. Existing doctrine needs to be implemented and updated where applicable. Leaders need to train force elements on observation and reporting indicators to include the training of staff to ensure information is relayed. Doctrine, policy, and, in turn, future leaders need to be trained on assets and capabilities. Changes may impact on the structure of military units (organizations) and personnel qualifications

### 9.0.3.2 IMA

Materiel solutions for TASHA include the development of automated processes (e.g., detection and warning) and tools (e.g., accurate downwind-hazard prediction and archived technical information) to aid the CBRN staff in providing the most accurate information to the commander so he will be enabled to make the right decisions to better the outcome of the battle. Near- to mid-term capabilities must provide the ability to support all CBRN operations outlined in the joint and multi-Service publications with automated programs. Additional quantities of C4ISR terminals/assets may be needed to address increased demand for hands-on time to use the new automated tools to their fullest capabilities. The need for rapid access to experts and data was also identified in the analysis.

Table 9.0-2 summarizes possible material approaches that address the remaining materiel requirements of the doctrine, organization, training, materiel, leadership and education, personnel, and facilities (DOTMLPF) assessment. These approaches are in various stages of development; therefore, some are more readily applicable than others. The IMAs identified in this analysis cover a wide array of concepts, but they can be organized into a system of systems approach. Ultimately, all of the identified potential solutions must feed processed data information into the C4ISR system to add to the COP so that commanders can make the best-informed decisions based on the most current situation. There are 26 distinct IMAs in the TASHA area. The analysis of TASHA tasks and measures often lead to the same or similar IMAs for different measures. A number of the IMAs focus procurements and modifications to current systems; this fact will impact program objective memorandum (POM) decisions and require setting priorities as they relate to these programs and others.

**Table 9.0-2. Tactical Shape Ideas for Materiel Approaches**

<b>Materiel Approach</b>	<b>Description</b>
Automated CBRN training system	Develop automated and interactive CBRN training system for individual and unit training, including training and exercise scenarios, evaluation and certification criteria, and automated tools to assist and complement individual and unit CBRN training.
Automated field CBRN intelligence system	Develop automated system for field application for the collection, compilation, and correlation of CBRN intelligence data.
Automated medical interface to COP	Develop automated modifications to existing and developing medical patient tracking systems to specifically track the status and treatment of CBRN/TIM casualties and link this information to CBRND automated systems and the COP.
CBRN staff cell C4ISR equipment	Procure and field dedicate C4ISR equipment to CBRN staff cells enabling connectivity with the COP and the performance of their responsibilities and tasks.
CBRN staff collaboration tools	Develop automated system among and between CBRND specialists and other functions (e.g., operations, logistics) to allow collaboration between these functional areas and link to the COP.
Collect, exchange and disseminate information	Develop a system that collects and analyzes CBRN information and sensor input, generates, edits, and disseminates nuclear, biological, and chemical (NBC) reports, including downwind-hazard plots and overlays, and verify receipt of reports and plots. Transmission of data uses existing communication nets.
Database	Develop a system for obtaining information, archiving data, accessing databases, performing information/data queries, and exchanging data files in support of CBRN functions and activities.
Data fusion	Develop a capability to automatically perform data fusion. "Data fusion" is combining automatically correlated information with data that refines the information or presents it in an intuitive format. Fused data in many cases will arrive later than real- or near-real-time data.
Enhanced C4ISR systems	Expand existing and programmed C4ISR systems capabilities to support increasing demands upon resources.
Event history archive	Develop a system that accepts manual and automatic CBRN/TIM event data input, then modifies, retrieves, displays, archives, and transfers data (e.g., intelligence, location of attack, source and sensor information) to repositories.
Field CBRN information resource	Develop a field resource system that will provide and search archived information for CBRN/TIM agents, effects, treatments, etc.

Hazard prediction tool	Develop a U.S. Department of Defense (DoD)-approved model for CBRN and TIM hazard-prediction capabilities, incorporating physics-based functionalities. The model acquires and integrates information from appropriate databases (i.e., terrain, structures, environmental, meteorological, intelligence, unit, population, etc.) to accurately predict, map, and graphically portray the hazard in near-real time.
Hazard status template	Develop a system that merges collected data and predictions of agent travel to provide hazard status.
IDN interface for sensors	Ensure developmental CBRN sensors include ability to interface with an Integrated Detection Network (IDN). Develop adaptors to interface existing CBRN sensors to the IDN.
Information assurance	Develop a CBRND system that processes and transmits information in accordance with information assurance defense in depth standards, including certification and accreditation in accordance with DoD and Chairman of the Joint Chiefs of Staff (CJCS) guidance.
Lessons-learned databases	Develop/consolidate databases for operational and training lessons learned.
Link to COP	Develop a CBRND information system resident in standard C4ISR systems with interface with geographical information system (GIS) to provide input to the COP.
Link to geographic information system	Develop a system resident in standard C4ISR systems with interface to GIS to provide input to the COP.
Link to logistics systems	Develop an automated interface that tracks CBRND supplies and equipment and their status and condition through existing DoD logistics systems.
Management of databases	Develop a system to link and manage the accuracy, adequacy, and availability of CBRND information databases. Includes access management, content control, and the conduct of data set management. Also includes process to identify database actions such as consolidation of similar databases, establishment of new databases, archiving of obsolete databases, etc.
Medical prediction/collaboration tools	Develop automated tools to model the spread and persistency of communicable diseases that interface with the COP to provide collaboration and accurate information for decision making.
Medical surveillance system enhancement—indigenous population surveillance	Develop automated modifications to existing and developing medical surveillance systems for the collection, correlation, processing, and reporting of CBRN event indicators within indigenous populations.

Modeling and simulation	Develop a DoD-approved and standardized model for CBRN and TIM hazard-prediction capabilities that incorporates physics-based functionalities. The model acquires information from databases (i.e., terrain, structures, environmental, meteorological, intelligence, unit and population) to display graphical output and map the hazard in near-real time. Develop a system including embedded training capable of simulating operational scenarios.
Modifications to medical information systems	Develop automated modifications to existing and developing medical patient tracking systems (e.g., DMSS, MAT, TMIP, etc.) to specifically track the status and treatment of CBRN/TIM casualties and link this information to CBRND automated systems.
Modifications to veterinary information system	Develop automated modifications to existing and developing veterinary tracking systems to collect and disseminate food- and water-testing information, collect/collate and process veterinary CBRN information, track the status of military working animal (MWA) isolation and quarantine operations, and link this information to medical automated systems and the COP.
Query sensor status	Develop a system capable of automatically requesting sensor status (health) of networked sensors.
Reachback capability	Develop a system providing the ability to rapidly and securely reach back and contact CBRN experts and obtain CBRND plans, procedures, information, support, and lessons learned.
Risk factor template	Develop a system merging CBRN, intelligence, and operational data and plans into standardized automated formats for application to effectively and rapidly accomplish CBRN/TIM functions and activities and threat assessments.
Simulants accurately depicting threat contaminants	Develop a system that collects and analyzes simulant data and distinguishes simulants from real agents to be used in modeling and simulation.
Simulation and models	Develop a system enabling operational commanders to display current operational picture and to efficiently execute “what if” scenarios and facilitate the evaluation of plausible adversary and friendly courses of action (COAs), CBRN employment, and TIM release other than attack (ROTA).
Veterinary automated tools	Develop automated tools that, on a systematic (routine) basis, automatically trigger testing of food and water supplies.

**9.1 Task TASHA 1: Conduct intelligence operations among the indigenous population in the local area****9.1.1 Functional Area Analysis****9.1.1.1 Definition**

Encompasses conducting active collection of CBRN and TIM intelligence in the local area and among the indigenous population. Elements of information are essential for exploitation intelligence for elimination operations and intelligence preparation of the battlespace. Intelligence, security, and CBRN specialist personnel, along with general warfighters who perform the tasks. Includes liaison with indigenous civil and service organizations, nongovernmental organizations (NGOs), and coalition forces. Also encompasses the identification of CBRN weapons development, deployment, and use. Routine military activities can identify indicators in the operating area and among indigenous populations. Key indicator examples are rapidly changing health among animal and human populations, increased anxiety among the population, and abandoned weapon storage or processing sites. Security patrols, civil affairs convoys, etc., can make these observations. Specific searches and investigations can also provide relevant information. This task also includes identifying TIM stockpiles or storage sites. Bulk quantities can be located in industrial areas, rail yards, and storage areas. Sampling and evidentiary processes must be considered. The focus is on identifying indicators for a pending or in-process attack and exploiting these observations in support of elimination operations.

**9.1.1.2 Derivation**

*UJTL (TA 2.4, TA 5, TA 5.2.1, TA 7, TA 7.1), Military Transformation: A Strategic Approach, Protection Joint Functional Concept.*

**9.1.1.2.1 Supported Task: OPSHA 1****9.1.1.2.2 Lateral Tasks: TASENS 14, TASUST 30****9.1.1.2.3 Supporting Task: N/A****9.1.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Limited staff expertise. (C2.3.1.3)
2. Negligible intelligence database. (C2.4.2)
3. Difficult theater intelligence access. (C2.4.4)

**Civil**

1. Limited foreign government support. (C3.1.2.3)
2. Significant TIM present in the civilian sector. (C3.3.7.5)

**9.1.2 Functional Needs Analysis****9.1.2.1 Capability and Deficiency Assessment Summary**

Table 9.1-1 discusses individual capabilities to perform this task to the designated standards. The current capability, “collection of information, items, and observation of activities among indigenous population,” applies two components to perform this task. These are reports and observations of regular/routine military activities such as convoys and patrols and weapons of mass destruction (WMD) evidence collection activities performed by specialized units. The overall capability for current, near/mid, and far term are assessed “yellow.”

**Current Capability and Deficiency**

CBRN/TIM threat intelligence is available to meet some of the needs of tactical commanders as part of standard intelligence information processing. Credibility of human sources is always difficult to ascertain. Deficiencies include absence of ability to penetrate indigenous populations and the adversary, need for adaptable doctrine (procedures and processes), and perishability of training.

**Projected Near/Mid-Term Capability and Deficiency**

No change is currently projected for this task.

**Projected Far-Term Capability and Deficiency**

No change is currently projected for this task.

**Table 9.1-1. TASHA 1: Capability and Deficiency Assessment**

<b>Capability: Local Intelligence Operations</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>
<b>Current Overall Capability</b>	6 <sup>1</sup>	3 <sup>2</sup>	6 <sup>3</sup>	8 <sup>4</sup>
<b>Near/Mid-Term Overall Capability</b>	6	5	6	8
<b>Far-Term Overall Capability</b>	6	8	6	8

	<b>FAA Measure</b>	<b>Scale</b>
M1	There is sufficient confidence in the accuracy of local intelligence collected.	8–10: Confidence in accuracy and timeliness of local intelligence is high. Intelligence is collected and correlated from multiple sources, and source automated information systems are interoperable. 4–7: Limited confidence in accuracy and timeliness of local intelligence. Predominantly manual processes collect and correlate local intelligence from sources and may be restricted in the number of sources assessed. 1–3: Low confidence in accuracy and timeliness of local intelligence. Predominantly manual processes collect and correlate local intelligence from internal sources and are restricted in the number of sources assessed. 0: No confidence in accuracy and timeliness of the collected and processed local intelligence.
M2	Mechanism exists to process CBRN/TIM threat intelligence rapidly to meet needs of tactical commanders.	8–10: Highly integrated dedicated system provides accurate, timely, and current CBRN/TIM threat intelligence. 4–7: Dedicated systems are in place to process CBRN/TIM threat intelligence against tactical commander priority intelligence requirements (PIRs). 1–3: In-place dedicated systems are inadequate to process CBRN/TIM threat intelligence against tactical commander PIRs. 0: Dedicated CBRN/TIM threat intelligence mechanisms do not exist for processing threat intelligence.
M3	There is sufficient training to identify indicators.	8–10: All force personnel are trained to identify CBRN/TIM threat indicators. Specialized collection functions are established in standard operational units for WMD investigation and evidentiary processes. 4–7: Selected specialized personnel and functions are trained to identify CBRN/TIM threat indicators. Limited training is provided to the general force. Temporary specialized collection functions are established as determined necessary for specific functions. 1–3: Selected specialized personnel are trained to identify CBRN/TIM threat indicators and perform all collection functions. 0: CBRN/TIM threat indicator training is nonexistent.
M4	There is effective DOTLPF in place to conduct task.	8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations. 4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds. 1–3: DOTLPF is inadequate for accomplishment of this task. 0: DOTLPF does not exist for this task.

<sup>1</sup> Processes exist for the collection, correlation, verification, and exploitation of CBRN intelligence from diverse sources, including national means, interagencies, patrols, convoys, drones, international and national NGOs, local authorities, and populace. These processes are largely manual and require both experience and training for effective application. Manual skills are perishable and require continuing training and skills growth. Information source systems are either not interoperable/accessible or possess limited interoperability/accessibility. There exist insufficient adaptable procedures and processes to support the nontraditional battlefield. Confidence in collected information is a function of ability to penetrate adversaries and indigenous populations, source reliability, and the correlation and verification of collected information with other sources.

<sup>2</sup> Doctrine and C4ISR systems are in place for the processing of CBRN intelligence. Process is predominantly manual, time-consuming, and labor-intensive. Information sources are either not interoperable or possess limited interoperability. CBRN intelligence and indicators must compete for resources and processing. Availability of information may be delayed due to lack of dedicated C4ISR capabilities for CBRN information collection, processing, and interpretation.

<sup>3</sup> Limited training is provided to intelligence specialists for the processing and interpretation of CBRN indicators. Similarly, limited training is provided to CBRN specialists for the processing and interpretation of CBRN intelligence indicators. However, the general force is not adequately trained on the observation, identification, and reporting of CBRN intelligence and potential indicators. Specialized units are formed for specific WMD evidence search operations but are generally dissolved upon completion of the specific mission. These highly mission-specific units are composed of personnel selected from pertinent specialties. Specialty personnel may also be attached to selected units for specific missions. However, a standard operational unit does not exist that is trained and dedicated for this purpose. Consistent training and refresher training is not performed of the force during general training in preparation and conduct of operations.

<sup>4</sup> Effective doctrine, policies, and TTPs exist for the manual performance of this task with limited automated support. Consistent training and refresher training is not performed of the force during general training in preparation and conduct of operations.

### 9.1.3 Functional Solution Analysis

#### 9.1.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** Lack of adaptable procedures and processes.  
**Non-Materiel Solutions:** *Doctrine:* Develop and refine adaptable procedures and processes. *Training:* Ensure adequate training programs for observation and collection skills. *Leadership:* Leaders need to ensure adherence to procedures and processes. *Personnel:* Develop penetration procedures and doctrine.
- 2. Deficiency:** Absence of ability to obtain reliable CBRN/toxic industrial chemical (TIC)/TIM data from local population.  
**Non-Materiel Solutions:** *Doctrine:* Ensure adequate personnel are assigned to tasks. *Organization:* Provide liaison with civil affairs units and ensure collaboration between NBC, intelligence, and civil affairs units. *Training:* Ensure training of penetration and interaction skills. *Leadership:* Leaders need to be trained to address the associated issues. *Personnel:* Ensure availability of personnel with the ability to work with indigenous populations or to penetrate them.
- 3. Deficiency:** Lack of ability to penetrate the adversaries.  
**Non-Materiel Solutions:** *Doctrine:* Refine procedures and practices for interagency coordination and collaboration. *Organization:* Ensure coordination collaboration with involved agencies; joint, interagency, multinational. *Training:* Ensure training of penetration skills, investigative skills. *Leadership:* Leaders need to be trained to address the associated issues. *Personnel:* Ensure the availability of personnel with the ability to investigate and/or penetrate the adversaries.
- 4. Deficiency:** Need to ensure continued vigilance of procedures and processes.  
**Non-Materiel Solutions:** *Doctrine:* Need to ensure doctrine is available for identifying indicators and the information processing of those indicators. *Training:* Ensure training is conducted to ensure indicator awareness and the processing of associated information. *Leadership:* Leaders need to maintain vigilance and ensure training is conducted.
- 5. Deficiency:** Lack of thorough training for troops conducting routine military activities around or among indigenous population.  
**Non-Materiel Solutions:** *Training:* Ensure general training of troops to operate effectively and intelligently among the indigenous populations with adversarial elements. *Leadership:* Ensure adequate training of the troops.

#### 9.1.3.2 IMA Assessment Summary

N/A

## **9.2 Task TASHA 2: Process local or immediate CBRN/TIM threat intelligence information and data**

### **9.2.1 Functional Area Analysis**

#### **9.2.1.1 Definition**

Includes compiling, correlating, and processing intelligence information and data gathered in the local battlespace and from the indigenous population regarding processed CBRN/TIM threat intelligence, including information and data from joint and coalition forces in the local or immediate battlespace and indigenous sources on adversary CBRN intent, objectives, availability of weapons, actual capacity to employ weapons, expected tactics, potential targets, development efforts, and willingness or historic propensity to employ CBRN weapons. Threat assessments, planning, and preparations are supported through this task.

#### **9.2.1.2 Derivation**

*UJTL (TA 2.4.1, TA 5, TA 5.2.1, TA 7), Protection Joint Functional Concept.*

##### **9.2.1.2.1 Supported Task: OPSHA 1**

##### **9.2.1.2.2 Lateral Task: N/A**

##### **9.2.1.2.3 Supporting Task: N/A**

#### **9.2.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

#### **Military**

1. Partial preexisting arrangements. (C2.1.1.2)
2. Abundant modern military systems. (C2.2.5)
3. High interoperability. (C2.2.6)
4. Partial joint staff integration. (C2.3.1.1)
5. Restricted information exchange. (C2.3.1.8)
6. High information volume. (C2.3.1.9)
7. Marginal intelligence database. (C2.4.2)
8. Moderate certitude of data. (C2.4.6)
9. Intelligence dissemination and receipt fully exists. (C2.4.7)

#### **Civil**

Limited foreign government support. (C3.1.2.3)

## **9.2.2 Functional Needs Analysis**

### **9.2.2.1 Capability and Deficiency Assessment Summary**

Table 9.2-1 discusses individual capabilities to perform this task to the designated standards. The current capability, “Processing of Local Intelligence,” applies to the range of activities for the compiling, correlation, and processing of local intelligence within the local battlespace.

Intelligence obtained from national means, patrols, convoys, drones, international and national NGOs, local authorities and populace, and other sources is integrated to identify the CBRN/TIM threat, adversary CBRN intent and objectives, WMD availability, potential targets, adversary developmental efforts, and adversary willingness to employ WMD. The task supports threat assessment and force planning/preparation. The overall capability for current, near/mid, and far term are assessed “yellow.”

#### **Current Capability and Deficiency**

CBRN/TIM threat intelligence is available to meet some of the needs of tactical commanders as part of standard intelligence information processing. The capability is improving as a result of improvements resulting from current conflicts. Interoperability within and among services continues to improve. Deficiencies include absence of ability to process real-time, actionable information and pass to the “shooter;” need for adaptable doctrine (procedures and processes); and perishability of training/skills. Overall capability is marginal.

#### **Projected Near/Mid-Term Capability and Deficiency**

No change is currently projected for this task.

#### **Projected Far-Term Capability and Deficiency**

No change is currently projected for this task.

Table 9.2-1. TASHA 2: Capability and Deficiency Assessment

Capability: Processing of Local Intelligence	M1	M2	M3	M4	M5	M6	M7
Current Overall Capability	6 <sup>1</sup>	5 <sup>2</sup>	5 <sup>3</sup>	5 <sup>4</sup>	6 <sup>1</sup>	2 <sup>5</sup>	8 <sup>6</sup>
Near/Mid-Term Overall Capability	6	8	5	5	7	4	8
Far-Term Overall Capability	6	9	5	5	7	6	8

	FAA Measure	Scale
M1	There is confidence in the collected CBRN/TIM threat intelligence.	8–10: Confidence in accuracy and timeliness of CBRN/TIM threat intelligence is high. Intelligence is actionable/of high value. Intelligence is collected and correlated from multiple sources and source automated information systems are interoperable. 4–7: Limited confidence in accuracy and timeliness of CBRN/TIM threat intelligence. Predominantly manual processes collect and correlate intelligence from sources and may be restricted in the number of sources assessed. 1–3: Low confidence in accuracy and timeliness of local threat intelligence. Predominantly manual processes collect and correlate local intelligence from internal sources and are restricted in the number of sources assessed. 0: No confidence in accuracy and timeliness of the collected and processed CBRN/TIM threat intelligence.
M2	Multiple sources are integrated and deconflicted.	8–10: Automated systems integrate and deconflict information from multiple sources accurately and rapidly require little or no manpower. 4–7: Multiple sources are integrated and deconflicted using manual means, are limited to available trained resources, and are inadequate to rapidly correlate information from a large number of multiple sources. 1–3: Limited number of sources are integrated and deconflicted using manual means, are limited to available trained resources, and are inadequate to rapidly correlate information from multiple sources. 0: No capability to integrate and deconflict multiple sources.
M3	Sufficient processes are used to compile and correlate CBRN/TIM threat intelligence.	8–10: Automated systems compile and correlate CBRN/TIM threat intelligence from multiple sources accurately and rapidly require little or no manpower. 4–7: CBRN/TIM threat intelligence is compiled and correlated predominantly using manual means, is limited to available trained resources, and is inadequate to rapidly compile and correlate CBRN/TIM threat intelligence from a large number of multiple sources. 1–3: CBRN/TIM threat intelligence is compiled and correlated predominantly using manual means, is limited to available trained resources, and is inadequate to rapidly compile and correlate CBRN/TIM threat intelligence from multiple sources. 0: No capability to compile and correlate CBRN/TIM threat intelligence from multiple sources.
M4	All known CBRN/TIM intelligence collection requirements are met	8–10: The commander's PIRs and other known CBRN/TIM intelligence/indicators from all sources are accurately and rapidly assessed and presented on a continuing and current basis by automated systems. 4–7: CBRN/TIM intelligence collection requirements identified by the commander's identified PIRs for known CBRN/TIM are met using predominantly manual and time-intensive means, are limited to available trained resources, and may not assess intelligence available from a large number of multiple sources. 1–3: CBRN/TIM intelligence collection requirements identified by the commander's identified PIRs for known CBRN/TIM are met using predominantly manual and time-intensive means, are limited to available trained resources, and may not assess intelligence available from multiple sources. 0: CBRN/TIM intelligence collection requirements are not met.

M5	Previously unknown and opportunistic intelligence is integrated into the processing.	8–10: Previously unknown and opportunistic intelligence is collected and correlated from multiple sources by automated systems, including local observations and reports, and source information systems are interoperable. 4–7: Predominantly manual processes collect and correlate previously unknown and opportunistic intelligence from sources, including local observations and reports, and may be restricted in the number of sources assessed. 1–3: Predominantly manual processes collect and correlate previously unknown and/or opportunistic intelligence from internal sources and are restricted in the number of sources assessed. 0: Local observations and reports are not included in the CBRN/TIM threat intelligence process.
M6	Sufficient numbers of experienced analysts are available for CBRN/TIM threat intelligence processing.	8–10: CBRN/TIM threat intelligence analysts are trained, experienced, and available in adequate quantities to conduct CBRN/TIM threat intelligence collection, compilation, correlation, and assessment from multiple and diverse sources in a timely and accurate manner or to perform oversight and evaluation of in place CBRN/TIM threat intelligence processing automated systems performing all these functions for all operational and routine requirements. 4–7: Limited numbers of CBRN/TIM threat intelligence analysts are trained, experienced, and available to conduct CBRN/TIM threat intelligence processing from a significant number of sources for operational requirements. 1–3: Limited numbers of CBRN/TIM threat intelligence analysts are trained, experienced, and available to conduct CBRN/TIM threat intelligence processing from a number of sources for operational requirements. 0: CBRN/TIM threat intelligence analysts are not trained, experienced or are in numbers insufficient to process intelligence available from a large number of sources and meet operational requirements for the processing of CBRN/TIM threat intelligence.
M7	There is effective DOTLPF in place to conduct task.	8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations. 4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds. 1–3: DOTLPF is inadequate for accomplishment of this task. 0: DOTLPF does not exist for this task.

<sup>1</sup>-Processes exist for the collection, correlation, verification, and exploitation of CBRN intelligence from diverse sources, including national means, patrols, convoys, drones, international and national NGOs, local authorities, and populace. These processes are largely manual and require both experience and training for effective application. Manual skills are perishable and require continuing training and skills growth. Information source systems are either not interoperable or possess limited interoperability. There exist insufficient adaptable procedures and processes to support the nontraditional battlefield. Confidence in collected information is a function of ability to penetrate adversaries and indigenous populations; source reliability; and the correlation and verification of collected information with other sources.

<sup>2</sup>-Integration and deconfliction of information is predominantly conducted using manual processes and is time- and labor-intensive. Information is correlated based upon the value of the information and credibility and reliability of sourcing and is dependent upon the availability and number/types of sources. Manual processes currently dictate limits upon the level of information actually correlated and sources applied. Manual skills are perishable and require continuing training and skill growth.

<sup>3</sup>-Compilation and correlation of CBRN/TIM threat intelligence is predominantly conducted using manual processes and is time- and labor-intensive. Information is compiled and correlated based upon the value of the information and credibility and reliability of sourcing and is dependent upon the availability and number/types of sources. Manual processes currently dictate limits upon the level of information actually processed and sources applied. Manual skills are perishable and require continuing training and skill growth. There is limited ability to perform combat risk assessment and for automated threat report generation and dissemination.

<sup>4</sup>-Processes exist for the identification and attainment of CBRN/TIM intelligence identified in the commander's PIRs. These processes are largely manual and time-consuming and require both experience and training for their effectiveness. The manual processes, time constraints, and limited number of assessment processing personnel places a ceiling upon the CBRN/TIM intelligence collection requirements which can be rapidly satisfied. Manual skills are perishable and require continuing training and skill growth.

<sup>5</sup>-Sufficient numbers of trained and experienced analysts are available for CBRN/TIM threat intelligence processing. Experience obtained from ongoing operations will wane over time. Manual skills are perishable and require continuing training and skill growth. Numbers of trained and experienced analysts are inadequate to meet most operational

requirements and for the processing of CBRN/TIM threat intelligence from a large number of sources. Consistent training and refresher training is not performed of the force during general training in preparation and conduct of operations.

<sup>6</sup> -Current DOTLPF adequately addresses the collection and processing of CBRN/TIM threat intelligence using predominantly manual means. Limited ability to perform combat risk assessment. However, lessons learned during operations in the Balkans and the Middle East are applied by units assigned to these locations. Personnel from the individual Service battle laboratories do visit field units to identify and collect unit developed techniques and adaptations for subsequent review. Consistent training and refresher training is not performed of the force during general training in preparation and conduct of operations.

## 9.2.3 Functional Solution Analysis

### 9.2.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** Lack of adaptable procedures and processes. Absence of ability to penetrate indigenous populations. Limited interoperability.  
**Non-Materiel Solutions:** *Doctrine:* Develop penetration procedures and doctrine. *Organization:* Ensure liaison with civil affairs units. Develop collaboration and systems interoperability between NBC, medical, intelligence, and civil affairs units. *Training:* Ensure training of penetration and interaction skills. *Leadership:* Train leaders to address the associated issues. *Personnel:* Ensure availability of personnel with the ability to work with indigenous populations or to penetrate them.
- 2. Deficiency:** Lack of ability to penetrate the adversaries.  
**Non-Materiel Solutions:** *Doctrine:* Refine procedures and practices for interagency coordination and collaboration. *Organization:* Ensure coordination collaboration with involved agencies; joint, interagency, multinational. *Training:* Ensure training of penetration skills, investigative skills. *Leadership:* Train leaders to address the associated issues. *Personnel:* Ensure the availability of personnel with the ability to investigate and/or penetrate the adversaries.
- 3. Deficiency:** Perishable skills require retraining and growth in skills. Limited ability to automate threat report generation and dissemination. Limited ability for combat risk assessment.  
**Non-Materiel Solutions:** *Training:* Ensure training programs for basic and refresher skill development. *Personnel:* Ensure availability of personnel with skills and experience.
- 4. Deficiency:** Inadequate intelligence information processing and collection activities.  
**Partial Non-Materiel Solutions:** *Doctrine:* Ensure doctrine is available for the processing of intelligence information on the CBRN Threat. *Organization:* Ensure adequate units are available to conduct collection activities.
- 5. Deficiency:** Consistent training and refresher training required in general training during preparation of operations and during the conduct of operations.  
**Non-Materiel Solutions:** *Training:* Ensure training is completed. *Leadership:* Ensure attentiveness to training.

### 9.2.3.2 IMA Assessment Summary

Table 9.2-4 is an idea for material approach and a corresponding description of the idea addressing the deficiency for field automated capabilities to process intelligence information.

**Table 9.2-4. TASHA 2: Materiel Approaches**

<b>Identified Deficiency</b>	<b>Idea for Materiel Approach</b>	<b>Description</b>
Inadequate intelligence information processing and collection activities	Automated field CBRN intelligence system	Develop automated system for field application for the collection, compilation, and correlation of CBRN intelligence data.

### **9.3 Task TASHA 3: Disseminate CBRN threat intelligence for local or immediate battlespace use**

#### **9.3.1 Functional Area Analysis**

##### **9.3.1.1 Definition**

Provide processed local or immediate battlespace CBRN threat intelligence for development of threat assessments and for a clear understanding of the current and predicted CBRN situation. For elimination operations and operations in a high CBRN threat environment, the information disseminated results in immediate action. Timely dissemination ensures effective warning and tasking.

##### **9.3.1.2 Derivation**

*UJTL TA 2.4.1, TA 5, TA 5.2.1, TA 7, Protection Joint Functional Concept, Military Transformation: A Strategic Approach, Transformation Planning Guidance.*

##### **9.3.1.2.1 Supported Task: OPSHA 1**

##### **9.3.1.2.2 Lateral Task: N/A**

##### **9.3.1.2.3 Supporting Task: N/A**

##### **9.3.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Abundant modern military systems. (C2.2.5)
2. Marginal intelligence database. (C2.4.2)
3. Intelligence dissemination and receipt partially exists. (C2.4.7)

**Civil.** N/A

#### **9.3.2 Functional Needs Analysis**

##### **9.3.2.1 Capability and Deficiency Assessment Summary**

Table 9.3-1 discusses individual capabilities to perform this task to the designated standards. The current capability, “CBRN Threat Intelligence Dissemination,” addresses the timely dissemination of processed CBRN threat intelligence to ensure effective warning and implementation of associated activities. The overall capability for current, near/mid, and far term are rated “yellow.” Although improvements between the periods occur for specific capabilities

and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

### **Current Capability and Deficiency**

Current DOTLPF adequately addresses the dissemination of CBRN/TIM threat intelligence using existing tactical communications systems and requires manual determination and action for accomplishment. Plans and procedures are developed during preparation for the dissemination of CBRN threat intelligence indicators to requiring centers. Commander guidance and operational situations dictate dissemination parameters. Existing and projected DoD information systems and infrastructure will allow for the discovery and dissemination of intelligence information. Manual ATP-45 format messages are created when automated warning systems are unavailable. However, existing communications systems are not fully interoperable and are dependent upon the systems available to elements of the Joint Task Force (JTF). Implementation and cross-element, particularly between Service components and with coalition partners, is dependent upon the attentiveness and awareness of the intelligence and operations centers in the mixed communications network. CBRND exercises do not specifically challenge and evaluate the dissemination of CBRN/TIM intelligence to requiring need-to-know centers. The dissemination of information is generally viewed as an inherent component of other criteria and is, therefore, a subsumed function/activity.

### **Projected Near/Mid-Term Capability and Deficiency**

Joint Warning and Reporting Network (JWARN) (Increment 1, initial operational capability [IOC]) is projected for initial fielding in the mid term to operational units. DOTLPF must continue to evolve as systems, tactics, and situations change. Developmental “born joint” DoD information systems will be compliant with the four elements of the Net Ready Key Performance Parameter (NR-KPP) ensuring interoperability, information assurance, integration to the appropriate community of interest as well as the Global Information Grid (GIG) architecture. Substantial upgrades to legacy systems are required to include Defense Information Systems Agency (DISA) standards and net-centric capabilities. Interoperability with coalition partners, especially non-NATO partners, may be a continuing issue requiring maintenance of attentiveness and awareness by the responsible centers. Further, the mix of legacy and compliant systems will continue to require the attentiveness and awareness of intelligence and operations center staffs to ensure effective dissemination of identified CBRN intelligence to requiring need-to-know centers until the legacy systems are either replaced or modified for compliance. CBRND exercise criteria and standards remain an area of concern. Interoperability barriers that limit collaboration between the DoD and other government organizations and coalition partners must be addressed through formalized agreements and standard operating procedures (SOPs).

### **Projected Far-Term Capability and Deficiency**

Joint developmental information systems programs are scheduled to field prior to the far term. All systems are to be in compliance with the joint staff-mandated NR-KPP and will fully support DoD interoperability across the Services.

**Table 9.3-1. TASHA 3: Capability and Deficiency Assessment**

<b>Capability: CBRN Threat Intelligence Dissemination</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>
<b>Current Overall Capability</b>	8 <sup>1</sup>	6 <sup>2</sup>	3 <sup>3</sup>	8 <sup>4</sup>
<b>Near/Mid-Term Overall Capability</b>	8	7	3	8
<b>Far-Term Overall Capability</b>	8	8	3	8

	<b>FAA Measure</b>	<b>Scale</b>
M1	Means exist and are employed to disseminate CBRN/TIM intelligence to all concerned.	8–10: Means exist and are employed for the dissemination of CBRN threat intelligence to all need-to-know centers. 4–7: Limited means exist and is employed for the dissemination of CBRN threat intelligence to most need-to-know centers. 1–3: Existing means and employment are inadequate for the dissemination of CBRN threat intelligence to requiring need-to-know centers. 0: Means do not exist for the dissemination of CBRN threat intelligence to requiring need-to-know centers.
M2	Indicator-based warnings are rapidly disseminated.	8–10: Plans, procedures, and means exist for the dissemination of indicator-based warnings to all need-to-know centers. 4–7: Plans, procedures, and means are limited for the rapid dissemination of indicator-based warnings to most need-to-know centers. 1–3: Plans, procedures, and means are limited for the dissemination of indicator-based warnings to most need-to-know centers 0: Plans, procedures, and/or means do not exist for the dissemination of indicator-based warnings to requiring need-to-know centers.
M3	Dissemination of CBRN/TIM intelligence challenged during exercises.	8–10: The rapid and accurate dissemination of CBRN/TIM intelligence to requiring need-to-know centers is a specific and integral CBRN exercise challenge criteria. 4–7: Dissemination of CBRN/TIM intelligence to requiring need-to-know centers is identified in CBRN exercise challenge criteria but is not specifically evaluated. 1–3: The dissemination of CBRN/TIM intelligence to requiring need-to-know centers is an inherent component of selected CBRN exercise challenge criteria but is not separately evaluated 0: The dissemination of CBRN/TIM intelligence to requiring need-to-know centers is not evaluated.
M4	There is effective DOTLPF in place to conduct task.	8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations. 4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds. 1–3: DOTLPF is inadequate for accomplishment of this task. 0: DOTLPF does not exist for this task.

<sup>1</sup> Existing DoD communication infrastructure systems and JWARN, where available, are used to disseminate CBRN intelligence and warnings. Manual ATP-45 format messages are created when automated warning systems are unavailable. However, existing communications systems are not fully interoperable and are dependent upon systems available to elements of the JTF. Attentiveness is required to ensure the effectiveness of the intelligence and operations centers in this mixed communications environment. Net-centric operations and mandatory DISA standards address interoperability and the interchange of information among elements. DoD systems are expected to be increasingly in compliance with the DISA standards and net-centric capable, as appropriate, during the mid term. New DoD systems are currently required to be in compliance with DISA standards and net-centric capable when fielded. Remaining legacy systems are projected to either be replaced by, or be fully compliant with, DISA standards and net-centric capable in the far term.

<sup>2</sup> Plans and procedures are developed during preparation for the dissemination of CBRN threat intelligence indicators to requiring centers. Implementation and cross-element, particularly between Service components and with coalition partners, is dependent upon the attentiveness and awareness of the intelligence and operations centers in the mixed communications network. Commander guidance and operational situations will dictate dissemination parameters. Interoperable and net-centric automated systems will enhance the interchange of information between elements. DoD systems are expected to be increasingly in compliance with the DISA standards and net-centric capable, as appropriate, during the mid term. New DoD systems are currently required to be in compliance with DISA standards and net-centric capable when fielded. All remaining legacy systems are projected to either be replaced by, or be fully compliant with, DISA standards and net-centric capable in the far term. Interoperability with coalition partners, especially non-NATO partners, may be a continuing issue requiring maintenance of attentiveness and awareness by the responsible centers.

<sup>3</sup> CBRND exercises do not specifically challenge and evaluate the dissemination of CBRN/TIM intelligence to requiring need-to-know centers. The dissemination of information is generally viewed as an inherent component of other criteria and is, therefore, a subsumed function/activity. CBRN/TIM intelligence development and dissemination is not generally exercised and evaluated. Time constraints, lack of process familiarity by evaluators, and other factors usually remove intelligence operations challenges for CBRN exercises and evaluations and replace with scripted and prepackaged intelligence inputs provided directly by the evaluators.

<sup>4</sup> Current DOTLPF adequately addresses the dissemination of CBRN/TIM threat intelligence using existing tactical communications systems and requires manual determination and action for accomplishment. DOTLPF will need to continue to evolve as systems, tactics, and situations change.

### 9.3.3 Functional Solution Analysis

#### 9.3.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** Attentiveness required ensuring effectiveness of the intelligence and operation centers.

**Non-Materiel Solutions:** *Doctrine:* Intelligence and operations centers procedures are required to promote attentiveness and awareness for the effectiveness of CBRN/TIM intelligence dissemination to all requiring need-to-know centers. *Training:* Training is required ensuring proficiency of intelligence and operations center personnel in the identification of requiring need-to-know centers and the dissemination of CBRN/TIM intelligence. *Leadership:* Leaders must ensure training attain and maintain capabilities and performance levels ensuring the effective dissemination of CBRN/TIM intelligence to all requiring need-to-know centers.
- 2. Deficiency:** Limited automation ability. Attentiveness required ensuring capability for rapid dissemination.

**Non-Materiel Solutions:** *Doctrine:* Intelligence and operations centers procedures are required to promote attentiveness and awareness for the effectiveness of CBRN/TIM intelligence dissemination to all requiring need-to-know centers. *Training:* Training is required ensuring proficiency of intelligence and operations center personnel in the identification of requiring need-to-know centers and the dissemination of CBRN/TIM intelligence.
- 3. Deficiency:** Training exercises do not adequately challenge CBRN intelligence transmission.

**Non-Materiel Solutions:** *Doctrine:* CBRN exercise criteria specifically challenge and establish evaluation standards for the dissemination of CBRN intelligence. *Training:* Training exercises must include scenarios challenging CBRN intelligence dissemination.

#### 9.3.3.2 IMA Assessment Summary

N/A

**9.4 Task TASHA 4: Conduct immediate or local battlespace threat assessment****9.4.1 Functional Area Analysis****9.4.1.1 Definition**

Based on local or mission-relevant threat information, plausible adversary intent and objectives are formulated for CBRN agents or TIM use. The threat specific to the mission, maneuver, or site is assessed, including TIM ROTA potential. The assessment includes adversary targeting, potential CBRN weapon configurations, employment schemes, objectives and intent. The development of a shared common picture of the immediate threat affords the commander the ability to maximize assessment visibility for the timely and effective preparations against any potential adversary's CBRN threat actions.

**9.4.1.2 Derivation**

*UJTL (TA 2.4, TA 5, TA 5.2.1, TA 7, TA 7.1), Military Transformation: A Strategic Approach, Protection Joint Functional Concept.*

**9.4.1.2.1 Supported Tasks: OPSHA 1, OPSHA 2****9.4.1.2.2 Lateral Task: N/A****9.4.1.2.3 Supporting Task: N/A****9.4.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. High interoperability. (C2.2.6)
2. Marginal intelligence database. (C2.4.2)
3. Growing theater intelligence organization. (C2.4.3)
4. Intelligence dissemination and receipt fully exists. (C2.4.7)

**Civil**

1. Significant TIMs present in the civilian sector. (C3.3.7.5)

## **9.4.2 Functional Needs Analysis**

### **9.4.2.1 Capability and Deficiency Assessment Summary**

Table 9.4-1 discusses individual capabilities to perform this task to the designated standards. Capability is currently manual processes for local threat assessments. The overall capability for current, near/mid, and far term are rated “yellow.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

#### **Current Capability and Deficiency**

Current processes are predominantly manual with limited automation. Process is labor- and time-consuming and dependent upon the training, experience, and availability of performing personnel as well as the quality of the assessed data. The current capability is achieved using doctrine and locally devised checklists. The process is slow and prone to human error. Data may not always be available for newly defined threats. Although limited simulation tools are available, these are not generally in use by operating forces. Existing DoD communication infrastructure systems and JWARN, where available, are used to disseminate CBRN intelligence and warnings. Manual ATP-45 format messages are created when automated warning systems are unavailable. However, existing communications systems are not fully interoperable and are dependent upon systems available to elements of the JTF. Attentiveness is required to ensure the effectiveness of the intelligence and operations centers in this mixed communications environment. Limited training is provided to intelligence, operations, and CBRN cell specialists for the processing and conduct of CBRN threat assessment. Consistent formal and refresher training on immediate or local battlefield CBRN threat assessment is not regularly and routinely performed. Limited routine training is provided and often is not focused until preparation for operations.

#### **Projected Near/Mid-Term Capability and Deficiency**

The mid-term fielding of JWARN (Increment 1 – IOC), the Joint Operational Effects Federation (JOEF), and the Joint Effects Model (JEM) are envisioned as providing forces with the tools to assess and simulate plausible adversary COAs and with the capability to refine cell specialist skills as part of local training and exercising/evaluations. Net-centric operations and mandatory DISA standards address interoperability and the interchange of information among elements. New DoD systems are expected to be in compliance with DISA standards and net-centric capable, as appropriate during the current and near term for interoperability and net-centric operations. Substantial upgrades to legacy systems are required to include DISA standards and net-centric capabilities. However, interoperability may not exist with coalition partner and host-nation systems. Further, the degree of interoperability between JTF element systems is dependent upon the extent of DISA standard and net-centric capable compliant replacement or modified legacy systems fielded by the Services in support of operations. DOTLPF will need to continue to evolve as systems, tactics, and situations change.

### **Projected Far-Term Capability and Deficiency**

Full fielding of JWARN, JOEF, and JEM is projected to be completed in the early far term. Continued fielding of DISA standard and net-centric capable systems to operational units enhances the capability to conduct CBRN/TIM threat information collection, dissemination, and interchange. All legacy systems are projected to either be replaced by, or be in compliance with, DISA standards and fully support net-centric operations in the far term.

Table 9.4-1. TASHA 4: Capability and Deficiency Assessment

Capability: Processes for Evaluating Adversary Course of Action	M1	M2	M3	M4	M5
Current Overall Capability	4 <sup>1</sup>	3 <sup>2</sup>	4 <sup>1</sup>	5 <sup>3</sup>	8 <sup>4</sup>
Near/Mid-Term Overall Capability	5	3	6	6	8
Far-Term Overall Capability	5	3	8	8	8

	FAA Measure	Scale
M1	Analytical processes are used to evaluate plausible adversary COAs.	8–10: Automated systems substantially or fully perform analytical processing of CBRN/TIM threat intelligence to evaluate plausible adversary COAs, including adversary CBRN employment or TIM ROTA. 4–7: Analytical processes for the evaluation of plausible adversary COAs (including CBRN employment) is performed predominantly using manual means and is limited to available trained resources and the quality of selected assessed data. 1–3: Evaluation of plausible adversary COAs is performed using manual means and is limited to available trained resources and the quality of selected assessed data. 0: No capability to perform analytical processes for the evaluation of plausible adversary COAs.
M2	Means exist and are employed to process CBRN/TIM threat intelligence rapidly to meet needs of operational commanders.	8–10: Means exist and are employed for the rapid and accurate processing and dissemination of CBRN threat intelligence. 4–7: Limited means exist and is employed for the processing and dissemination of CBRN threat intelligence. 1–3: Existing means and employment are inadequate for the dissemination of CBRN threat intelligence to requiring need-to-know centers. 0: Means do not exist or employment is inadequate for the processing and dissemination of CBRN threat intelligence.
M3	Threat assessment is used to prepare for plausible CBRN attacks and TIM ROTA.	8–10: Automated systems substantially or fully perform analytical processing of CBRN/TIM threat intelligence to evaluate plausible adversary COAs, including adversary CBRN employment or TIM ROTA. 4–7: Analytical processes for the evaluation of plausible adversary COAs (including CBRN employment) are performed predominantly using manual means and is limited to available trained resources and the quality of selected assessed data. 1–3: Evaluation of plausible adversary COAs is performed using manual means and is limited to available trained resources and the quality of the selected assessed data. 0: No capability to perform analytical processes for the evaluation of plausible adversary COAs.
M4	Staffs have sufficient training and experience to conduct the threat assessment.	8–10: All intelligence, operations, and CBRN staff personnel are formally trained and receive recurring refresher training on the conduct of CBRN/TIM threat assessment. 4–7: Limited training is provided, is inconsistent, and/or is administered in preparation for operations to intelligence, operations, and CBRN cell specialists for the processing and conduct of CBRN threat assessment. 1–3: CBRN/TIM threat assessment training is inadequate to support operations. 0: CBRN/TIM threat assessment training to support operations is nonexistent.
M5	There is effective DOTLPF in place to conduct task.	8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations. 4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds. 1–3: DOTLPF is inadequate for accomplishment of this task. 0: DOTLPF does not exist for this task.

<sup>1</sup> JOEF and JEM will address TIM hazards listed in ITF-40 with the specific capabilities articulated in the corresponding capability document. Process is labor- and time-consuming and dependent upon the training, experience, and availability of performing personnel as well as the quality of the assessed data. The current capability is achieved using doctrine and locally devised checklists. The process is slow and prone to human error. Data may not always be available for newly defined threats. TIM threat assessment evaluation processes are currently nonexistent for operational forces and data are limited to civilian HAZMAT and ITF-40 sources. Although limited simulation tools are available for CBRN, these are not generally in use by operating forces. JOEF and JEM are envisioned as providing forces with the tools to assess and simulate plausible adversary COAs. JOEF and JEM will be initially fielded in the mid term with full fielding early in the far term. Legacy systems will continue to require significant manual extraction, review, and reinput of information for application by JOEF and JEM. The continuing requirement for DoD systems to become and be in compliance with DISA standards will gradually provide interoperability of the systems with JOEF and JEM with projected full interoperability of systems in the far term. However, the extent to which JOEF and JEM will address TIM (and the specific agents to be included) is not as yet determined.

<sup>2</sup> Doctrine and C4ISR systems are in place for the processing of CBRN intelligence. Process is predominantly manual, time-consuming, and labor-intensive. Information sources are either not interoperable or possess limited interoperability. CBRN intelligence and indicators must compete for resources and processing. Availability of information may be delayed due to lack of dedicated C4ISR capabilities for CBRN information collection, processing, and interpretation.

<sup>3</sup> Limited training is provided to intelligence, operations, and CBRN cell specialists for the processing and conduct of CBRN threat assessment. Consistent formal and refresher training on immediate or local battlefield CBRN threat assessment is not regularly and routinely performed. Limited routine training is provided and often is not focused until preparation for operations. The fielding of JEM and JOEF provide capability to refine cell specialist skills as part of local training and exercising/evaluations. However, supporting and requiring DOTLPF is necessary to ensure attainment and maintenance of capability. Although current manual processes are adequate, as the availability of more sources of data become available for use, manual process will have to be automated and will require training.

<sup>4</sup> Current DOTLPF adequately addresses the conduct of CBRN/TIM threat assessment using existing largely manual processes and locally devised checklists for accomplishment. DOTLPF instituting and supporting rapid and secure reachback capabilities for joint CBRN expert support and assistance, and CBRND information, plans, procedures, and lessons learned does not exist DOTLPF will need to continue to evolve as systems, tactics, and situations change.

### 9.4.3 Functional Solution Analysis

#### 9.4.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Absence of refined automated processes.  
**Partial Non-Materiel Solutions:** *Doctrine:* Doctrine is required for automated processes.
2. **Deficiency:** Lack of staff training programs.  
**Partial Non-Materiel Solutions:** *Training:* Formal and refresher training is required.  
*Personnel:* Special attention to assigning experienced personnel where needed is required.
3. **Deficiency:** Inadequate recurring staff training.  
**Partial Non-Materiel Solutions:** *Training:* Reoccurring staff training is required.

#### 9.4.3.2 IMA Assessment Summary

Table 9.4-2 is a list of ideas for material approaches and a corresponding description of each idea. The material approaches identified focus on the development and fielding of automated processes and tools for CBRND. Table 9.4-3 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 9.4-2. TASHA 4: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Simulation and models	Develop a system enabling operational commanders to display current operational picture and to efficiently execute “what if” scenarios and facilitate the evaluation of plausible adversary and friendly COAs, CBRN employment, and TIM ROTA.
Database system	Develop a system for obtaining information, archiving data, accessing databases, performing information/data queries, and exchanging data files in support of CBRN functions and activities.
Field CBRN information resource	Develop a field resource system that will provide and search archived information for CBRN/TIM agents, effects, treatments, etc.
Reachback capability	Develop a system providing the ability to rapidly and securely reachback and contact CBRN experts and obtain CBRN information and lessons learned. If necessary, develop plans and procedures.
Risk factor templates	Develop a system merging CBRN, intelligence, and operational data and plans into standardized automated formats for application to effectively and rapidly accomplish CBRN/TIM functions and activities and threat assessments.

**Table 9.4-3. TASHA 4: IMA Assessment**

<div style="text-align: center;"> <b>Ideas for Material Approaches (IMA)</b>   <b>Identified Gaps</b> </div>	Simulation and Models	Database System	Field Information Resource	Reachback capability	Risk Factor Templates
Absence of refined automated processes	X	X	X	X	X
Lack of staff training programs	X	X	X		X
Inadequate recurring training	X	X			X

**9.5 Task TASHA 5: Conduct immediate or local battlespace vulnerability assessment****9.5.1 Functional Area Analysis****9.5.1.1 Definition**

Local commanders perform vulnerability assessments based on adversary and threat profiles for their respective area of operation. A vulnerability assessment is a continuous process encompassing a local intelligence preparation of the battlespace; detailed threat assessment; and determination of the capability to avoid or protect against contamination, sustain operations, and restore full mission capability. Includes an evaluation of the causative impact of local adversary COAs. Also includes identifying and assessing the impact on affected units, missions, and tasks. Assessment results are used to plan and prepare future operations and correlate with other local security and force protection means. Likely targets and attack means are identified via this task.

**9.5.1.2 Derivation**

*UJTL (TA 5, TA 5.2.1, TA 6.5, TA 7, TA 7.1), Protection Joint Functional Concept, Military Transformation: A Strategic Approach.*

**9.5.1.2.1 Supported Task: OPSHA 2****9.5.1.2.2 Lateral Task: N/A****9.5.1.2.3 Supporting Task: N/A****9.5.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Partial preexisting arrangements. (C2.1.1.2)
2. Limited modern military systems. (C2.2.5)
3. High interoperability. (C2.2.6)
4. Poor joint staff integration. (C2.3.1.1)
5. Marginal intelligence database. (C2.4.2)
6. Difficult theater intelligence access. (C2.4.4)
7. Moderate certitude of data. (C2.4.6)

**Civil.** N/A

## 9.5.2 Functional Needs Analysis

### 9.5.2.1 Capability and Deficiency Assessment Summary

Table 9.5-1 discusses individual capabilities to perform this task to the designated standards. Current (manual) capability includes commercial off-the-shelf (COTS) and government off-the-shelf (GOTS) equipment with JOEF, on standard C4ISR equipment, as the future capability to meet the identified standards. The overall capability for current, near/mid, and far term are rated “yellow.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

#### Current Capability and Deficiency

Current processes are predominantly manual with limited automation. Process is labor- and time-consuming, and dependent upon the training, experience, and availability of performing personnel as well as the quality of the assessed data. The current capability is achieved using Doctrine and locally devised checklists. The process is slow and prone to human error. Data may not always be available for newly defined threats. Although limited simulation tools are available, these are not generally in use by operating forces. Existing DoD communication infrastructure systems and JWARN, where available, are used to disseminate CBRN intelligence and warnings. Manual ATP-45 format messages are created when automated warning systems are unavailable. There is insufficient visibility of CBRND in the COP. However, existing communications systems are not fully interoperable and are dependent upon systems available to elements of the JTF. Attentiveness is required to ensure the effectiveness of the intelligence and operations centers in this mixed communications environment. Limited training is provided to intelligence, operations, and CBRN cell specialists for the processing and conduct of CBRN threat assessment. Consistent formal and refresher training on immediate or local battlefield CBRN threat assessment is not regularly and routinely performed. Limited routine training is provided and often is not focused until preparation for operations.

#### Projected Near/Mid-Term Capability and Deficiency

The mid-term initial fielding of JWARN (Increment 1 – IOC), JOEF, and JEM are envisioned as providing forces with the tools to assess and simulate plausible adversary COAs and provides the capability to refine cell specialist skills as part of local training and exercising/evaluations. Net-centric operations and mandatory DISA standards address interoperability and the interchange of information among elements. New DoD systems are expected to be in compliance with DISA standards and net-centric capable, as appropriate during the current and near term for interoperability and net-centric operations. Substantial upgrades to legacy systems are required to include DISA standards and net-centric capabilities. However, interoperability may not exist with coalition partner and host-nation systems. Further, the degree of interoperability between JTF element systems is dependent upon the extent of DISA standard and net-centric capable compliant replacement or modified legacy systems fielded by the Services in support of operations. DOTLPF will need to continue to evolve as systems, tactics, and situations change.

### **Projected Far-Term Capability and Deficiency**

Joint developmental information systems, including JOEF, JEM, and JWARN programs, are scheduled to field prior to the far term. All systems will be in compliance with the joint staff mandated NR-KPP and will fully support DoD interoperability across the services.

**Table 9.5-1. TASHA 5: Capability and Deficiency Assessment**

<b>Capability: Processes for Assessing Vulnerability</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>	<b>M6</b>	<b>M7</b>	<b>M8</b>
<b>Current Overall Capability</b>	6 <sup>1</sup>	6 <sup>2</sup>	7 <sup>3</sup>	4 <sup>4</sup>	2 <sup>5</sup>	5 <sup>6</sup>	4 <sup>7</sup>	8 <sup>8</sup>
<b>Near/Mid-Term Overall Capability</b>	7	7	8	5	5	5	4	8
<b>Far-Term Overall Capability</b>	8	8	8	6	8	5	4	8

	<b>FAA Measure</b>	<b>Scale</b>
M1	Vulnerability assessment is useful.	8–10: Vulnerability assessment utility is high and is based upon standardized automated system processing, analysis, and evaluation with trained staff review and involvement. 4–7: Vulnerability assessment utility exists but widely varies between units and staffs; depends on manual processes; and relies on the experience, training, and availability of the performing staff and the quality of selected assessed information. 1–3: Vulnerability assessment utility is low and unable to support operations. 0: Vulnerability assessment utility is nonexistent and unable to support operations.
M2	Analytical tools are used to evaluate plausible adversary COAs.	8–10: Automated systems substantially or fully perform analytical processing of CBRN/TIM threat intelligence to evaluate plausible adversary COAs, including adversary CBRN employment or TIM ROTA. 4–7: Analytical process for the evaluation of plausible adversary COAs (including CBRN employment) is performed predominantly using manual means and is limited to available trained resources and the quality of selected assessed data. 1–3: Evaluation of plausible adversary COAs are performed using manual means and is limited to available trained resources and the quality of the selected assessed data. 0: No capability to perform analytical processes for the evaluation of plausible adversary COAs.
M3	Vulnerability assessment process exploits time-sensitive or priority actionable CBRN/ TIM intelligence.	8–10: Time-sensitive or priority-actionable CBRN/TIM intelligence is exploited in the vulnerability assessment process, and the process provides for update and assessment as new intelligence is received. 4–7: Time-sensitive or priority-actionable CBRN/TIM intelligence is included in the initial vulnerability assessment process. Update and reassessment as new intelligence is received are inadequate. 1–3: Time-sensitive or priority-actionable CBRN/TIM intelligence is included in the vulnerability assessment process. Update and reassessment as new intelligence is received are absent. 0: Time-sensitive or priority-actionable CBRN/TIM intelligence is not exploited in the vulnerability assessment process.
M4	Means available to collaboratively perform assessments.	8–10: Electronic collaborative workspaces with automated tools exist and are predominantly applied for evaluation, assessment, planning, and decisioning processes. 4–7: Manual collaborative processes are predominantly applied for the evaluation, assessment, planning, and decisioning processes. 1–3: Collaborative processes are inadequate for the conduct of evaluation, assessment, planning, and decisioning processes. 0: Collaborative processes do not exist for the conduct of evaluation, assessment, planning, and decisioning processes.

M5	Means exist to visualize the extent of Adversary COAs on forces of interest.	8–10: Standardized modeling and simulation (M&S) capability exists to assess and visualize adversary COAs (both CBRN and TIM) and their effects, is applied by all operating forces and staffs, is integrated into the COP, and continuously refreshes as new information is drawn from interoperable sources. 4–7: Operating force staffs possess M&S capability and resources to perform M&S visualization of adversary COAs (CBRN or TIM) and their effects, is commonly applied by operating forces and staffs, is integrated into the COP, and refreshes as new information is processed. 1–3: Visualization is inadequate of adversary COAs and their effects. 0: Visualization of adversary COAs and their effects are nonexistent.
M6	Operational and analytical/planning staffs have the training and experience to effectively assess adversary CBRN COAs.	8–10: All intelligence, operations, and CBRN staff personnel are formally trained and receive recurring refresher training on the conduct of CBRN COA assessment. 4–7: Limited training is provided, is inconsistent, and/or is administered in preparation for operations to intelligence, operations, and CBRN cell specialists for the processing and conduct of adversary CBRN COA assessment. 1–3: Adversary CBRN COA assessment training is inadequate to support operations. 0: Adversary CBRN COA assessment training is nonexistent.
M7	There are sufficient doctrine and TTPs for effective vulnerability assessments.	8–10: Doctrine, policies, procedures, and TTPs are adequate for effective vulnerability assessments and are actively revised to exploit current, emerging, and projected technologies and changes to tactics, systems, capabilities, and situations. 4–7: Doctrine, policies, procedures, and TTPs for vulnerability assessment exist but are predominantly manual and are periodically revised to exploit technologies and operational changes. 1–3: Doctrine, policies, procedures, and TTPs are inadequate for the conduct of vulnerability assessments 0: Doctrine, policies, procedures, and TTPs for vulnerability assessments are nonexistent.
M8	There is effective DOTLPF in place to conduct task.	8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations 4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds. 1–3: DOTLPF is inadequate for accomplishment of this task. 0: DOTLPF does not exist for this task.

<sup>1</sup> Utility is dependent upon the experience, training, and availability of the necessary staff, as well as the quality and accessibility of information. Current capability is achieved using doctrine and locally devised checklists. The process is predominantly manual and prone to errors and omissions. JOEF and JEM are envisioned as providing forces with the tools to perform vulnerability assessments with higher levels of utility. These systems will be initially fielded in the mid term. The JOEF is projected to include analytical tools for the evaluation of COAs and conduct of assessments. Refinement and development of additional analytical tools that draw information from diverse sources operating using GIG Enterprise Services will further enhance the value and application of JOEF. Visualization through modeling and simulation is projected to be accomplished using JEM providing rapid recognition and attainment of situational awareness. JOEF and JEM are programmed to link with the COP via GIG Enterprise Service. JOEF and JEM will require dedicated automated resources. The efficiency and utility of JOEF and JEM will be influenced by emerging C4ISR systems and processes residing on and using GIG Enterprise Services. Legacy systems will continue to require significant manual extraction, review, and reinput of information for application by JOEF and JEM. The continuing requirement for DoD systems to become and be in compliance with DISA standards will gradually provide interoperability of the systems with JOEF and JEM with projected full interoperability of systems in the far term.

<sup>2</sup> Current processes are predominantly manual with limited automation. Process is labor- and time-consuming and dependent upon the training, experience, and availability of performing personnel as well as the quality of the assessed data. The current capability is achieved using doctrine and locally devised checklists. The process is slow and prone to human error and omissions. Data may not always be available for newly defined threats and possible countermeasures. TIM vulnerability assessment evaluation processes are currently nonexistent for operational forces and data are limited to civilian HAZMAT and ITF-40 sources. Although limited simulation tools are available for CBRN, these are not

generally in use by operating forces. JOEF and JEM are envisioned as providing forces with the tools to assess and simulate plausible adversary COAs. Additionally, they may be also used to assess actual events and for training. JOEF and JEM will be initially fielded in the mid term with full fielding completed early in the far term. However, the extent to which JOEF and JEM will address TIM (and the specific agents to be included) is not as yet determined. The JOEF is projected to include analytical tools for the evaluation of COAs. Refinement and development of additional tools for COA that draw information from diverse sources operating using GIG Enterprise Services will further enhance the value and application of JOEF. The efficiency and utility of JOEF and JEM will be influenced by emerging C4ISR systems and processes residing on and using GIG Enterprise Services. Legacy systems will continue to require significant manual extraction, review, and reinput of information for application by JOEF and JEM. The continuing requirement for DoD systems to become and be in compliance with DISA standards will gradually provide interoperability of the systems with JOEF and JEM with projected full interoperability of systems in the far term. Visualization through modeling and simulation is projected to be accomplished using JEM. JOEF and JEM are programmed to link with the COP via GIG Enterprise Service.

<sup>3</sup> Effective exploitation of time-sensitive or priority-actionable CBRN/TIM intelligence in processing is currently dependent upon the training, experience, and availability of performing personnel. Staff capabilities and performance will vary between units and levels of command from marginal to excellent. In all cases, exploitation in the process is human dependent and therefore subject to errors, omissions, and subjective evaluation. JOEF is projected to include analytical tools for the evaluation of plausible adversary COAs and the conduct of assessments. JOEF is programmed for initial fielding in the mid term with full fielding completed early in the far term. On-going collection of information and adjustments are projected to be integral to the system. Refinement and development of additional analytical tools that draw information from diverse sources operating using GIG Enterprise Services will further enhance the value and application of JOEF. JOEF is programmed to link with the COP via GIG Enterprise Service. The efficiency and utility of JOEF and JEM will be influenced by emerging C4ISR systems and processes residing on and using GIG Enterprise Services. Legacy systems will continue to require significant manual extraction, review, and reinput of information for application by JOEF. The continuing requirement for DoD systems to become and be in compliance with DISA standards will gradually provide interoperability of the systems with JOEF and JEM with projected full interoperability of systems in the far term. The efficiency and utility of the system will be influenced by emerging C4ISR systems and processes residing on and using the GIG Enterprise Service.

<sup>4</sup> Assessments currently require collaboration using traditional means such as telephone calls, personal visits, mail routing, e-mail, and other similar means. There is an absence of electronic collaborative workspaces within which differing functions and activities are able to cooperatively assist the evaluation, assessment, planning, and decisioning process without time delay and the need for physical presence. Automated tools could effectively enhance and be enhanced by these electronic rooms. Collaborative workspaces support net-centric operations. These workspaces are inevitable with the increasing utility of automation and information sharing.

<sup>5</sup> Insufficient simulation capability in available automated assessment tools or completely unavailable for manual vulnerability assessment. Currently available modeling and simulation tools are limited to HPAC- and VLSTRACK-based systems designed for graphics-enhanced systems. COTS M&S tools, such as ADASHI, provide limited capabilities but are not DISA certified. Current M&S tools, additionally, are not interoperable and are not linked within the COP. They must be manually data entered and manipulated. JOEF and JEM are envisioned as providing forces with the tools to assess and simulate plausible adversary COAs. Additionally, they may be also used to assess actual events and for training. JOEF and JEM will be initially fielded in the mid term with full fielding completed early in the far term. However, the extent to which JOEF and JEM will address TIM (and the specific agents to be included) is not as yet determined. JOEF is projected to include analytical tools for the evaluation of COAs and will draw information from diverse sources operating using GIG Enterprise Services. The efficiency and utility of JOEF and JEM will be influenced by emerging C4ISR systems and processes residing on and using GIG Enterprise Services. Legacy systems will continue to require significant manual extraction, review, and reinput of information for application by JOEF and JEM. The continuing requirement for DoD systems to become and be in compliance with DISA standards will gradually provide interoperability of the systems with JOEF and JEM with projected full interoperability of systems in the far term. Visualization through modeling and simulation is projected to be accomplished using JEM. JOEF and JEM are programmed to link with the COP via GIG Enterprise Service.

<sup>6</sup> Limited training is provided to intelligence, operations, and CBRN cell specialists for the processing and conduct of CBRN vulnerability assessment. Consistent formal and refresher training on immediate or local battlefield CBRN vulnerability assessment is not regularly and routinely performed. Limited routine training is provided and often is not focused until preparation for operations. The fielding of JEM and JOEF provide capability to refine cell specialist skills as part of local training and exercising/evaluations. However, supporting and requiring DOTLPF is necessary to ensure attainment and maintenance of capability.

<sup>7</sup> Doctrine, policies, procedures, and TTPs exist and are sufficient for the manual performance of effective vulnerability assessment. The same is not true for current, emerging, and projected automated and simulated based assessment tools. Doctrine, policies, procedures, and TTPs must evolve to accommodate changes in tactics, systems, capabilities, and situations.

<sup>8</sup> Current DOTLPF adequately address the conduct of CBRN/TIM vulnerability assessment using existing largely manual processes and locally devised checklists for accomplishment. DOTLPF will need to evolve as systems, tactics, and situations change.

### 9.5.3 Functional Solution Analysis

#### 9.5.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Absence of interactive assessment tools that work within GIG Enterprise Services.  
**Non-Materiel Solutions:** None
2. **Deficiency:** Current modeling and simulation do not rapidly predict CBRN and TIM impacts to support operations and planning.  
**Non-Materiel Solutions:** None
3. **Deficiency:** Lack of CBRN automated assessment tools within an electronic collaborative workspace in which automated assessment tools can be applied.  
**Non-Materiel Solutions:** None
4. **Deficiency:** Lack of a thorough simulation-based assessment tool.  
**Non-Materiel Solutions:** None
5. **Deficiency:** Too few experienced, highly skilled personnel are available for staffs.  
**Non-Materiel Solutions:** *Training:* Consistent formal and recurring refresher training programs to attain and maintain staff proficiency is required. *Personnel:* Priority needs to be given to developing and assigning adequate numbers of experienced and skilled personnel to the appropriate battle staffs.
6. **Deficiency:** Absence of easy-to-use automated vulnerability assessment tools.  
**Non-Materiel Solutions:** None
7. **Deficiency:** Absence of doctrine and TTPs for emergent automated and simulation based assessment tools.  
**Non-Materiel Solutions:** *Doctrine:* Doctrine, policies, procedures, and TTPs must maintain relevance and currency in the changing operational environment; exploit the full range of technologies available, emerging, and projected through the doctrine revision and life cycle; and provide for active and timely revisions to fully take advantage of changes in tactics, systems, and situations.

#### 9.5.3.2 IMA Assessment Summary

Table 9.5-4 is a list of ideas for material approaches and a corresponding description of each idea. Approaches identified point to CBRND automated tools as well as interfacing to existing and developmental C4ISR systems and providing for active collaboration between units, commands, services and coalitions. Table 9.5-5 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 9.5-4. TASHA 5: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Simulations and models	Develop a system enabling operational commanders to efficiently execute “what if” scenarios and facilitate the evaluation of plausible adversary and friendly COAs, CBRN employment, TIM ROTA impacts, and friendly force vulnerabilities.
Database	Develop a system for obtaining information, archiving data, accessing databases, performing information/data queries, and exchanging data files in support of CBRN functions and activities.
Reachback capability	Develop a system providing the ability to rapidly and securely reachback and contact CBRN experts and obtain CBRND plans, procedures, information, and lessons learned.
Risk factor templates	Develop a system merging CBRN, intelligence, and operational data and plans into standardized automated formats for application to effectively and rapidly accomplish CBRN/TIM functions and activities.
Link to GIS	Develop a system resident in standard C4ISR systems with interface to GIS to provide input to the COP.

Table 9.5-5. TASHA 5: IMA Assessment

<div>Identified Gaps</div> <div>Ideas for Material Approaches (IMA)</div>	Simulations and Models	Database	Reachback Capability	Risk Factor Templates	Link to GIS
Absence of tools that work within GIG Enterprise Services.				X	X
Absence of real-time assessment simulations to support operations and planning	X	X	X	X	X
Lack of electronic collaborative workspace, in which automated assessment tools can be applied.					X
Lack of thorough simulation based assessment tool that interactively links with the COP.	X	X	X	X	X
Absence of easy-to-use automated assessment tools.	X	X	X	X	X

**9.6 Task TASHA 6: Conduct immediate or local battlespace risk assessment****9.6.1 Functional Area Analysis****9.6.1.1 Definition**

Based on the vulnerability assessment of TASHA 5, plausible risks are assessed and prioritized. Probability and likely time of occurrence, along with potential impact and persistency are salient risk factors. This is a dynamic evaluation of the operational situation, which leads to a determination of the potential risk to operational capabilities and mission accomplishment given the potential CBRN/TIM threat. CBRN/TIM-based risks are correlated with all other operational risks. Staffs at the relevant echelons assess the potential impact of the risk assessment on affected JTF elements.

**9.6.1.2 Derivation**

*UJTL (TA 5, TA 5.2.1, TA 7, TA 7.1), Protection Joint Functional Concept, Military Transformation: A Strategic Approach.*

**9.6.1.2.1 Supported Task: OPSHA 2****9.6.1.2.2 Lateral Task: TASUST 24****9.6.1.2.3 Supporting Task: N/A****9.6.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Partial preexisting arrangements. (C2.1.1.2)
2. Limited modern military systems. (C2.2.5)
3. High interoperability. (C2.2.6)
4. Partial joint staff integration. (C2.3.1.1)
5. Marginal intelligence database. (C2.4.2)
6. Difficult theater intelligence access. (C2.4.4)
7. Moderate certitude of data. (C2.4.6)

Civil. N/A

## **9.6.2 Functional Needs Analysis**

### **9.6.2.1 Capability and Deficiency Assessment Summary**

Table 9.6-1 discusses capabilities to perform this task to the designated standards. Current (manual) capabilities to conduct battlespace risk assessment are limited to COTS and GOTS equipment. JWARN, JEM and JOEF, when fielded, will improve the capability. The overall capability for current, near/mid, and far term are rated “yellow.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

#### **Current Capability and Deficiency**

Current processes are predominantly manual with limited automation. Process is labor- and time-consuming, and dependent upon the training, experience, and availability of performing personnel as well as the quality of the assessed data. The current capability is achieved using doctrine and locally devised checklists. The process is slow and prone to human error. Data may not always be available for newly defined threats. Although limited simulation tools are available, these are not generally in use by operating forces. Existing DoD communication infrastructure systems and JWARN, where available, are used to disseminate CBRN intelligence and warnings. Manual ATP-45 format messages are created when automated warning systems are unavailable. There is insufficient visibility of CBRND in the COP. However, existing communications systems are not fully interoperable and are dependent upon systems available to elements of the JTF. Attentiveness is required to ensure the effectiveness of the intelligence and operations centers in this mixed communications environment. Limited training is provided to intelligence, operations, and CBRN cell specialists for the processing and conduct of CBRN threat assessment. Consistent formal and refresher training on immediate or local battlefield CBRN threat assessment is not regularly and routinely performed. Limited routine training is provided and often is not focused until preparation for operations.

#### **Projected Near/Mid-Term Capability and Deficiency**

The mid-term initial fielding of JWARN (Increment 1 – IOC), JOEF, and JEM are envisioned as providing forces with the tools to assess and simulate plausible adversary COAs and risks to friendly forces and operations and provide the capability to refine cell specialist skills as part of local training and exercising/evaluations. Net-centric operations and mandatory DISA standards address interoperability and the interchange of information among elements. New DoD systems are expected to be in compliance with DISA standards and net-centric capable, as appropriate during the current and near term for interoperability and net-centric operations. Substantial upgrades to legacy systems are required to include DISA standards and net-centric capabilities. However, interoperability may not exist with coalition partner and host-nation systems. Further, the degree of interoperability between JTF element systems is dependent upon the extent of DISA standard and net-centric capable compliant replacement or modified legacy systems

fielded by the Services in support of operations. DOTLPF will need to continue to evolve as systems, tactics, and situations change. Availability of trained and experienced personnel is essential to effective CBRN/TIM operations.

**Projected Far-Term Capability and Deficiency**

Full fielding of JWARN, JOEF, and JEM is projected to be completed in the early far term. Continued fielding of DISA standard and net-centric capable systems to operational units enhances the capability to conduct CBRN/TIM threat information collection, dissemination, and interchange. All legacy systems are projected to either be replaced by, or be in compliance with, DISA standards and fully support net-centric operations in the far term.

**Table 9.6-1. TASHA 6: Capability and Deficiency Assessment**

<b>Capability: Risk Assessment—COTS/GOTS</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>	<b>M6</b>
<b>Current Overall Capability</b>	6 <sup>1</sup>	6 <sup>2</sup>	5 <sup>3</sup>	4 <sup>4</sup>	2 <sup>5</sup>	8 <sup>6</sup>
<b>Near/Mid-Term Overall Capability</b>	7	7	5	4	5	8
<b>Far-Term Overall Capability</b>	8	8	5	4	8	8

	<b>FAA Measure</b>	<b>Scale</b>
M1	Risk assessment is useful.	8–10: Risk assessment utility is high and is based upon standardized automated system processing, analysis, and evaluation with trained staff review and involvement. 4–7: Risk assessment utility exists but widely varies between units and staffs and is dependent upon manual processes dependent reliant upon the experience, training, and availability of the performing staff and the quality of selected assessed information. 1–3: Risk assessment utility is low and unable to support operations. 0: Risk assessment utility is low or nonexistent and unable to support operations.
M2	Analytical tools are used to perform a risk assessment.	8–10: Automated systems substantially or fully perform analytical processing for execution of risk assessment. 4–7: Analytical process for conduct of risk assessment is performed predominantly using manual means and is limited to available trained resources and the quality of the selected assessed data. 1–3: Evaluation assessments of risks are performed using manual means and are limited to available trained resources and the quality of the selected assessed data. 0: No capability to perform analytical processes for the performance of risk assessment.
M3	Operational and analytical/ planning staffs have the training and experience to effectively assess risk base on adversary CBRN COAs.	8–10: All intelligence, operations, and CBRN staff personnel are formally trained and receive recurring refresher training on the conduct of risk assessment associated with adversary CBRN COAs. 4–7: Limited training is provided, is inconsistent, and/or is administered in preparation for operations to intelligence, operations, and CBRN cell specialists for the conduct of risk assessment associated with adversary CBRN COAs. 1–3: Adversary CBRN COA assessment training is inadequate to support operations. 0: Training on risk assessment for adversary CBRN COAs is nonexistent.
M4	There are sufficient doctrine and TTPs for effective risk assessments.	8–10: Doctrine, policies, procedures, and TTPs are adequate for effective risk assessments and is actively revised to exploit current, emerging, and projected technologies and changes to tactics, systems, capabilities, and situations. 4–7: Doctrine, policies, procedures, and TTPs for risk assessment exist but are predominantly manual and are periodically revised to exploit technologies and operational changes. 1–3: Doctrine, policies, procedures, and TTPs are inadequate for the conduct of risk assessments 0: Doctrine, policies, procedures, and TTPs for risk assessments are nonexistent.

M5	Means exist to visualize the extent of adversary COAs on forces of interest.	<p>8–10: Standardized M&amp;S capability exists to assess and visualize adversary COAs (both CBRN and TIM) and their effects, is applied by all operating forces and staffs, is integrated into the COP, and continuously refreshes as new information is drawn from interoperable sources.</p> <p>4–7: Operating force staffs possess M&amp;S capability and resources to perform M&amp;S visualization of adversary COAs (CBRN or TIM) and their effects, is commonly applied by operating forces and staffs, is integrated into the COP, and refreshes as new information is processed.</p> <p>1–3: Visualization is inadequate of adversary COAs and their effects.</p> <p>0: Visualization of adversary COAs and their effects are nonexistent.</p>
M6	There is effective DOTLPF in place to conduct task.	<p>8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations</p> <p>4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds.</p> <p>1–3: DOTLPF is inadequate for accomplishment of this task.</p> <p>0: DOTLPF does not exist for this task.</p>

<sup>1</sup> Utility is dependent upon the experience, training, and availability of the necessary staff, as well as the quality and accessibility of information. Current capability is achieved using doctrine and locally devised checklists. The process is predominantly manual and prone to errors and omissions. JOEF and JEM are envisioned as providing forces with the tools to perform risk assessments with higher levels of utility. These systems will be initially fielded in the mid term with full fielding completed early in the far term. JOEF is projected to include analytical tools for the evaluation of COAs and conduct of assessments. Refinement and development of additional analytical tools that draw information from diverse sources operating using GIG Enterprise Services will further enhance the value and application of JOEF. The efficiency and utility of JOEF and JEM will be influenced by emerging C4ISR systems and processes residing on and using GIG Enterprise Services. Legacy systems will continue to require significant manual extraction, review, and reinput of information for application by JOEF and JEM. The continuing requirement for DoD systems to become and be in compliance with DISA standards will gradually provide interoperability of the systems with JOEF and JEM with projected full interoperability of systems in the far term. Visualization through modeling and simulation is projected to be accomplished using JEM providing rapid recognition and attainment of situational awareness. JOEF and JEM are programmed to link with the COP via the GIG Enterprise Service. The efficiency and utility of JOEF and JEM will be influenced by emerging C4ISR systems and processes residing on and using GIG Enterprise Services.

<sup>2</sup> Current processes are predominantly manual with limited automation. Process is labor- and time-consuming, and dependent upon the training, experience, and availability of performing personnel as well as the quality of the assessed data. The current capability is achieved using doctrine and locally devised checklists. The process is slow and prone to human error and omissions. Data may not always be available for newly defined threats and possible countermeasures. TIM risk assessment evaluation processes are currently nonexistent for operational forces and data are limited to civilian HAZMAT and ITF-40 sources. Although limited simulation tools are available for CBRN, these are not generally in use by operating forces. JOEF and JEM are envisioned as providing forces with the tools to assess and simulate plausible adversary COAs. Additionally, they may be also used to assess actual events and for training. JOEF and JEM will be initially fielded in the mid term with full fielding completed early in the far term. However, the extent to which JOEF and JEM will address TIM (and the specific agents to be included) is not as yet determined. The JOEF is projected to include analytical tools for the evaluation of COAs. Refinement and development of additional tools for COA that draw information from diverse sources operating using GIG Enterprise Services will further enhance the value and application of JOEF. Visualization through modeling and simulation is projected to be accomplished using JEM. JOEF and JEM are programmed to link with the COP via the GIG Enterprise Service. The efficiency and utility of JOEF and JEM will be influenced by emerging C4ISR systems and processes residing on and using GIG Enterprise Services. Legacy systems will continue to require significant manual extraction, review, and reinput of information for application by JOEF and JEM. The continuing requirement for DoD systems to become and be in compliance with DISA standards will gradually provide interoperability of the systems with JOEF and JEM with projected full interoperability of systems in the far term.

<sup>3</sup> Limited training is provided to intelligence, operations, and CBRN cell specialists for the processing and conduct of CBRN risk assessment. Consistent formal and refresher training on immediate or local battlefield CBRN risk assessment is not regularly and routinely performed. Limited routine training is provided and often is not focused until preparation for operations. The fielding of JEM and JOEF provide capability to refine cell specialist skills as part of local training and exercising/evaluations. However, supporting and requiring DOTLPF is necessary to ensure attainment and maintenance of capability.

<sup>4</sup> Doctrine, policies, procedures, and TTPs exist are sufficient for the manual performance of effective risk assessment. This is not true for current, emerging, and projected automated and simulated based assessment tools. Doctrine, policies, procedures, and TTPs must evolve to accommodate changes in tactics, systems, capabilities, and situations.

<sup>5</sup> Insufficient simulation capability in available automated assessment tools or completely unavailable for manual risk assessment. Currently available modeling and simulation tools are limited to HPAC- and VLSTRACK-based systems designed for graphics-enhanced systems. COTS M&S tools, such as ADASHI, provide limited capabilities but are not DISA certified. Current M&S tools, additionally, are not interoperable and are not linked within the COP. They must be manually data entered and manipulated. JOEF and JEM are envisioned as providing forces with the tools to assess and simulate plausible adversary COAs. Additionally, they may be also used to assess actual events and for training. JOEF and JEM will be initially fielded in the mid term with full fielding completed early in the far term. However, the extent to which JOEF and JEM will address TIM (and the specific agents to be included) is not as yet determined. The JOEF is projected to include analytical tools for the evaluation of COAs and will draw information from diverse sources operating using GIG Enterprise Services. Visualization through modeling and simulation is projected to be accomplished using JEM. The efficiency and utility of JOEF and JEM will be influenced by emerging C4ISR systems and processes residing on and using GIG Enterprise Services. Legacy systems will continue to require significant manual extraction, review, and reinput of information for application by JOEF and JEM. The continuing requirement for DoD systems to become and be in compliance with DISA standards will gradually provide interoperability of the systems with JOEF and JEM with projected full interoperability of systems in the far term. JOEF and JEM are programmed to link with the COP via GIG Enterprise Service.

<sup>6</sup> Current DOTLPF adequately address the conduct of CBRN/TIM vulnerability assessment using existing largely manual processes and locally devised checklists for accomplishment. DOTLPF will need to evolve as systems, tactics, and situations change.

### 9.6.3 Functional Solution Analysis

#### 9.6.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Absence of tools that work within GIG Enterprise Services.  
**Non-Materiel Solutions:** None
2. **Deficiency:** Too few experienced, highly skilled personnel are available for staffs.  
**Non-Materiel Solutions:** *Training:* Consistent formal and recurring refresher training programs to attain and maintain staff proficiency is required. *Personnel:* Give priority to developing and assigning adequate numbers of experienced and skilled personnel to the appropriate battle staffs.
3. **Deficiency:** Absence of automated assessment tools that interoperate with the C4I infrastructure.  
**Non-Materiel Solutions:** None
4. **Deficiency:** Lack of a thorough simulation-based assessment tool.  
**Non-Materiel Solutions:** None

#### 9.6.3.2 IMA Assessment Summary

Table 9.6-2 is a list of ideas for material approaches and a corresponding description of each idea. Suggested approaches cover the additional automation and CBRND tools needed to accomplish this task, interfaces to the GIG, and developing the necessary simulations to aid in decision making. Table 9.6-3 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 9.6-4. TASHA 6: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Simulation and models	Develop a system that will enable operational commanders to display current operational picture and to efficiently execute “what if” scenarios and facilitate the evaluation of risk assessments.
Databases	Develop a system for obtaining information, archiving data, accessing databases, performing information/data queries, and exchanging data files in support of CBRN functions and activities.
Reachback capability	Develop a system providing the ability to rapidly and securely reachback and contact CBRN experts and obtain CBRND plans, procedures, information, support, and lessons learned.
Risk factor templates	Develop a system merging CBRN, intelligence, and operational data and plans into standardized automated formats for application to effectively and rapidly accomplish CBRN/TIM functions and activities.

Table 9.6-5. TASHA 6: IMA Assessment

<div> <div>Identified Gaps</div> <div>Ideas for Material Approaches (IMA)</div> </div>	Simulating and Models	Databases	Reachback Capability	Risk Factor Templates	Link to GIS
Absence of tools that work within GIG Enterprise Services	X	X	X		X
Absence of easy-to-use automated assessment tools	X	X	X	X	
Lack of thorough simulation based assessment tool that interactively links with the COP	X	X		X	X

**9.7 Task TASHA 7: Conduct collaborative response and mitigation planning for a CBRN attack or TIM release****9.7.1 Functional Area Analysis****9.7.1.1 Definition**

Staff planners collaboratively plan for CBRND actions to ensure prepared and ready forces, adequate CBRN force allocation, and timely response and mitigation. Includes access to planning tools, data repositories, and automated resources necessary to perform planning functions. Also includes collaboration among coalition and joint force elements at the appropriate echelons. Force protection, operations, logistics, medical, intelligence, and personnel considerations are critical in the planning process. Includes consideration of Shape, Sustain, Sense, and Shield planning factors. Includes planning for far-term contingencies, future and current operations, exercises and training. The operating premise is flexible response to ensure the means for staff elements to collaboratively plan in a dynamic, operational environment throughout the local or immediate battlespace. Plans are updated based on the operational situation.

**9.7.1.2 Derivation**

*UJTL (TA 2.4, TA 5, TA 5.2.1, TA 7, TA 7.1), Protection Joint Functional Concept, Military Transformation: A Strategic Approach.*

**9.7.1.2.1 Supported Task: OPSHA 6****9.7.1.2.2 Lateral Task: TASUST 25****9.7.1.2.3 Supporting Task: N/A****9.7.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Moderately developed land. (C1.1)
2. Precipitating and stormy weather. (C1.3.1.3)

**Military**

1. Minimal mission instructions. (C2.1.1)
2. Partial preexisting arrangements. (C2.1.1.2)
3. Partially completed mission preparation. (C2.1.3)
4. Some or no interoperability. (C2.2.6)
5. Partial joint staff integration. (C2.3.1.1)
6. Limited staff expertise. (C2.3.1.3)

## 7. High information volume. (C2.3.1.9)

Civil. N/A

**9.7.2 Functional Needs Analysis****9.7.2.1 Capability and Deficiency Assessment Summary**

Table 9.7-1 discusses individual capabilities to perform this task to the designated standards. Current planning capabilities are limited, and dependent on the skills of NBC specialists, predominantly manual processes, and doctrine. Increased automation and enhanced doctrine will improve this capability. The overall capability for current, near/mid, and far term are rated “yellow.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

**Current Capability and Deficiency**

Doctrine, policies, procedures, and TTPs provide the capability to plan for, respond to, and conduct mitigation of CBRN attacks and TIM releases. Though predominantly manual in nature, they do provide the commander and staff with a reasonable ability to consider CBRND activities and functions. Deficiencies include the need for the development of skilled and knowledgeable staff planners and NBC specialists, the provision of mandatory formal and recurrent refresher training of these personnel, the lack of automated tools and processes supporting planning and operational activities/functions, and collaboration and integration/interoperability with coalition partners and other authorized entities. Doctrine, policies, procedures, and TTPs must incorporate changes in systems, tactics, and situations reflective of not only that of the current force but considering both emerging and projected changes with potential to impact and enhance operations.

**Projected Near/Mid-Term Capability and Deficiency**

No change is currently projected for this task.

**Projected Far-Term Capability and Deficiency**

No change is currently projected for this task.

Table 9.7-1. TASHA 7: Capability and Deficiency Assessment

Capability: Collaborative Response and Mitigation Planning for a CBRN Attack or TIM	M1	M2	M3	M4	M5	M6	M7
Current Overall Capability	5 <sup>1</sup>	8 <sup>2</sup>	4 <sup>3</sup>	5 <sup>4</sup>	2 <sup>5</sup>	3 <sup>6</sup>	8 <sup>7</sup>
Near/Mid-Term Overall Capability	5	8	4	5	4	4	8
Far-Term Overall Capability	6	9	4	5	7	7	8

	FAA Measure	Scale
M1	Plans address all pertinent Sense, Shape, Shield, and Sustain issues.	8–10: Automated processes, templates, and collaborative spaces ensure all relevant issues and needs are addressed. Planners and CBRN specialists are highly trained and knowledgeable and possess access to needed reference material and impacting information. 4–7: Manual processes are predominantly applied to address pertinent CBRND issues and are dependent upon the training, skill, experience, and knowledge of planning participants. 1–3: Manual processes are predominantly applied to address interest issues and are dependent upon the training, skill, experience, and knowledge of planning participants and supporting staff. 0: Processes are inadequate or do not exist for the identification and planning of pertinent CBRND issues, and/or planning participants do not possess adequate training, skill, experience, and knowledge to perform the task.
M2	Disseminated plans are effective.	8–10: Plan utility is high and based upon collected information, available data, and capabilities of the force. 4–7: Plan utility is limited and meets most needs of the force. 1–3: Plan utility is low and unable to support and/or direct operations. 0: Plan utility is low or nonexistent and unable to support and/or direct operations.
M3	Planning staffs have the training and experience to effectively plan for CBRND operations.	8–10: All intelligence, operations, and CBRND staff personnel are formally trained, receive recurring refresher training, and possess experience in planning for CBRND operations. 4–7: Limited training is provided, is inconsistent, and/or is administered only as needed to prepare for operations to intelligence, operations, and CBRN cell specialists in planning for CBRND operations. 1–3: CBRND operations planning training is inadequate to support operations. 0: CBRND operations planning training is nonexistent.
M4	Doctrine and TTPs are sufficient for effective planning.	8–10: Doctrine, policies, procedures, and TTPs are adequate for effective CBRND planning and is actively revised to exploit current, emerging, and projected technologies and changes to tactics, systems, capabilities, and situations. 4–7: Doctrine, policies, procedures, and TTPs for CBRND planning exist but are predominantly manual and are periodically revised to exploit technologies and operational changes. 1–3: Doctrine, policies, procedures, and TTPs are inadequate for the conduct of CBRND planning 0: Doctrine, policies, procedures, and TTPs for CBRND planning are nonexistent.

M5	An interoperable, collaborative planning process is in place for all relevant echelons within joint force, coalition, and other relevant organizations.	<p>8–10: Secure, interoperable, and interactive electronic processes and workspaces with automated tools exist and are predominantly applied by all relevant echelons of the joint force, coalition partners, and other authorized entities.</p> <p>4–7: Collaborative and interoperable manual planning processes are predominantly applied by most planning staffs of the joint force, coalition partners, and other authorized entities. Collaboration is performed via formal and informal review and comments of drafted material, on-site representation, and/or voice discussions.</p> <p>1–3: Collaborative planning processes are inadequate or are not collaborative or interoperable within or between elements of the joint force, coalition partners, and other authorized entities.</p> <p>0: Collaborative planning processes do not exist.</p>
M6	Standing plans are adaptable to dynamically changing situations.	<p>8–10: Plans, processes, and systems facilitate the rapid ability to adjust plans and operations to dynamically changing conditions and situations and to effectively disseminate the adjustments as needed to meet operational requirements.</p> <p>4–7: Plans are designed to provide a measure of flexibility to meet changing situations. Although they may be manual in nature, processes facilitate the dissemination of information to operational elements for required taskings. Although plan segments may be overcome by events and require subsequent corrective action, the overall plan remains applicable and supportive of operations.</p> <p>1–3: Developed plans are inadequate or unable to facilitate rapid adaptation to meet dynamically changing and challenging operational circumstances. Preoperations plans are applied as guides providing overall intent and goals. Plans may be overcome by events and operational guidance is reliant upon the experience and knowledge of the staff and commander.</p> <p>0: Developed plans are inadequate or unable to facilitate rapid adaptation to meet dynamically changing and challenging operational circumstances and cannot be applied as guides providing overall intent and goals. Plans are easily and rapidly overcome by events and operational guidance is fully reliant upon the experience and knowledge of the staff and commander.</p>
M7	There is effective DOTLPP in place to conduct task.	<p>8–10: DOTLPP exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations</p> <p>4–7: Most critical aspects of DOTLPP for this task are addressed. Task can be performed with limitations requiring work-arounds.</p> <p>1–3: DOTLPP is inadequate for accomplishment of this task.</p> <p>0: DOTLPP does not exist for this task.</p>

<sup>1</sup> Manual processes exist and are applied by staff planners and NBC specialist. However, the breadth and depth of planning for CBRND issues is dependent upon the knowledge, skills, and experience of the participants in the planning process.

<sup>2</sup> Plan utility is usually high and based upon the collective knowledge, skills, and experience of planning participants drawing upon data, information, and doctrine pertinent to the anticipated operation.

<sup>3</sup> Training is generally limited to when essential and required, or as necessary to prepare for operations.

<sup>4</sup> Doctrine exists for the manual performance of CBRND planning and is revised periodically through change sheets to reflect necessary changes in operations, tactics, and concepts.

<sup>5</sup> Planning processes do not adequately support and address the collaborative and interoperable planning processes with coalition partners and other authorized entities. Such partners and entities may lack necessary advanced C4ISR systems and capabilities. There frequently exists training differentials between U.S. and coalition partner forces further complicating the development of effective and collaborative relationships.

<sup>6</sup> Plans are frequently developed in general terms to incorporate flexibility. Frequently, events and circumstances progress rapidly and demand the focused attention of the staff to adjust operations. In these circumstances, formal plans are changed based upon the experience and knowledge of the staff and commander and are based upon the plan's overall intent and goals. Taskings are disseminated as determined to meet perceived needs based upon available and recognized information. However, these changes are often in reaction to events and may not consider longer-term implications until tempo permits

<sup>7</sup> Current DOTLPF adequately address the conduct of CBRN/TIM planning, response, and mitigation using existing largely manual processes and locally devised checklists for accomplishment. DOTLPF will need to evolve as systems, tactics, and situations change.

### 9.7.3 Functional Solution Analysis

#### 9.7.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Inadequate emphasis upon continued training and proficiency development.  
**Non-Materiel Solutions:** *Training:* Continued formal and recurrent refresher training of staffs and NBC specialists is required. Develop exercises and evaluations closely simulating battlefield situations, circumstances, and tempo challenge and enhance acquired skills. *Leadership:* Leaders must emphasize continued training of staffs and NBC specialists are required.
2. **Deficiency:** Insufficient access and availability to automated tools.  
**Partial Non-Materiel Solutions:** *Doctrine:* Doctrine is required for automated processes.
3. **Deficiency:** Insufficient training.  
**Non-Materiel Solutions:** *Training:* Specialized formal and recurrent refresher training program is required for staff. *Leadership:* Leaders must emphasize continued training of staffs and NBC specialists required.
4. **Deficiency:** Insufficient availability of experienced personnel.  
**Non-Materiel Solutions:** *Personnel:* Special attention is required to ensure availability of experienced and trained personnel to staffs.
5. **Deficiency:** Insufficient doctrine and TTPs to ensure effective integrated, interoperable, and collaborative planning in a Net Centric operational environment.  
**Non-Materiel Solutions:** *Doctrine:* Doctrine, policies, procedures, and TTPs must maintain relevance and currency in the changing operational environment; exploit the full range of technologies available, emerging, and projected through the doctrine revision and life cycle; and provide for active and timely revisions to fully take advantage of changes in tactics, systems, and simulations.
6. **Deficiency:** Inadequate enhancement and adjustment of the planning process.  
**Non-Materiel Solutions:** *Doctrine:* Doctrine, the planning process, and enabling tools must exploit the full range of technologies available, emerging, and projected so as to enhance the effectiveness of plans and, concurrently, operations. *Training:* Staff training must include collaborative response for response and mitigation activities.
7. **Deficiency:** Lack of planning with coalition partners.  
**Non-Materiel Solutions:** *Doctrine:* Doctrine, the planning process, and enabling tools must exploit the full range of technologies available, emerging, and projected so as to enhance the effectiveness of plans and, concurrently, operations. Processes and systems

must support interoperability and collaboration with coalition partners and other relevant entities.

### **9.7.3.2 IMA Assessment Summary**

Table 9.7-4 is a list of ideas for material approaches and a corresponding description of each idea. The approach focuses on automated CBRND tools, processes, and their linkages to enhance operational capabilities, increase force effectiveness, and promote greater interoperability and integration of elements.

**Table 9.7-4. TASHA 7: Materiel Approaches**

<b>Identified Deficiency</b>	<b>Idea for Materiel Approach</b>	<b>Description</b>
Insufficient access and availability to automated tools.	Simulations and models	Develop a system enabling operational commanders to efficiently execute “what if” scenarios to facilitate the evaluation and selection of response and mitigation activities.
	Databases	Develop a system for obtaining information, archiving data, accessing databases, performing information/data queries, and exchanging data files in support of CBRN functions and activities.
	Reachback capability	Develop a system providing the ability to rapidly and securely reach back and contact CBRN experts and obtain CBRND plans, procedures, information, and lessons learned.
	Risk factor templates	Develop a system merging CBRN, intelligence, and operational data and plans into standardized automated formats for application to effectively and rapidly accomplish CBRN/TIM functions and activities.
	Link to GIS	Develop a system resident in standard C4ISR systems with interface with GIS to provide input to the COP.

**9.8 Task TASHA 8: Conduct unit and individual CBRND training and rehearsal****9.8.1 Functional Area Analysis****9.8.1.1 Definition**

Includes CBRND training and rehearsal for local or immediate actions to ensure readiness. Encompasses special training rehearsals by CBRN response teams, units, and staff cells. Non-CBRN personnel and units train to protect, avoid, and mitigate against attack effects. Tabletop and simulated exercises are useful for gaming plausible actions in a contaminated environment. Special attention is given to incorporating CBRND actions into local war games, evaluations, rehearsals, and exercises for all units.

**9.8.1.2 Derivation**

*UJTL (TA 2.4, TA 5, TA 5.2.1, TA 7, TA 7.1), Protection Joint Functional Concept, Military Transformation: A Strategic Approach.*

**9.8.1.2.1 Supported Task: OPSHA 4****9.8.1.2.2 Lateral Task: N/A****9.8.1.2.3 Supporting Task: N/A****9.8.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Partially completed mission preparation. (C2.1.3)
2. Marginal forces assigned. (C2.2.1)
3. Partial personnel capability. (C2.2.4)
4. Limited personnel experience. (C2.2.4.5)

**Civil.** N/A

**9.8.2 Functional Needs Analysis****9.8.2.1 Capability and Deficiency Assessment Summary**

Table 9.8-1 discusses individual capabilities to perform this task to the designated standards. Capabilities include CBRN staff cells and units, non-CBRND personnel and units trained and rehearsed to operate in a CBRN environment through the application of challenging exercises

and evaluations, realistic training tools, and comprehensive doctrine. The overall capability for current, near/mid, and far term are rated “yellow.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

**Current Capability and Deficiency**

The ability to conduct realistic training is currently limited due to operations tempo and lack of adequate resources. Training tools are predominantly manual in nature and are limited. CBRN/TIM specialists are trained to perform their tasks and sufficient CBRND equipment and material is available for the conduct of training and exercises. Current deficiencies include limited available time for CBRND training due to other demands on the unit; lack of adequate simulants, simulations, and models; and lack of accurate centralized CBRND data.

**Projected Near/Mid-Term Capability and Deficiency**

The application of the programmed JWARN (Increment 1 – IOC), JOEF, and JEM will provide the ability to conduct simulated CBRN/TIM environment operations to a greater degree of realism. The initial fielding of these systems is projected in the mid term. Projected deficiencies continue to include limitations due to routine operations tempo, insufficient simulants, and inadequate CBRND Staff resources. The lack of DOTLPF supporting automated CBRND processes is a deficiency associated with the fielding of automated CBRND systems.

**Projected Far-Term Capability and Deficiency**

Full fielding of JWARN, JOEF, and JEM is projected to be completed in the early far term.

Table 9.8-1. TASHA 8: Capability and Deficiency Assessment

Capability: CBRN Training and Rehearsal for Local or Immediate Actions to Ensure Readiness	M1	M2	M3	M4	M5	M6	M7	M8	M9
Current Overall Capability	4 <sup>1</sup>	1 <sup>2</sup>	4 <sup>3</sup>	8 <sup>4</sup>	5 <sup>5</sup>	4 <sup>6</sup>	2 <sup>7</sup>	5 <sup>8</sup>	8 <sup>9</sup>
Near/Mid-Term Overall Capability	4	1	5	8	5	4	6	5	8
Far-Term Overall Capability	4	1	7	8	5	4	8	5	8

	FAA Measure	Scale
M1	CBRN staff cell and units have access to dedicated information technology to support training.	8–10: CBRN staff cell and units possess dedicated information technology resources and tools for the accomplishment and performance of their duties and responsibilities. These are used to support operational and training requirements. 4–7: CBRN staff cell and units are able to access shared information technology resources and tools for operational requirements and training 1–3: CBRN staff cell and units possess limited access to shared information technology resources for operational requirements and training 0: CBRN staff cell and units do not possess access to information technology to support operations and training.
M2	Unit exercises are conducted under simulated CBRN/TIM conditions.	8–10: Challenging, comprehensive, and recurring unit exercises are conducted under simulated CBRN/TIM conditions and all unit activities, functions, and personnel (civilian and military) fully participate and are evaluated. Sustained operations are emphasized. 4–7: Recurring unit exercises are conducted under simulated CBRN/TIM conditions and all unit military personnel and activities, as well as critical civilian personnel and activities, fully participate and are evaluated. Sustained operations are emphasized. 1–3: Recurring unit exercises are conducted under simulated CBRN/TIM conditions and most military personnel and activities, and selected areas of critical functions manned by civilian personnel, participate and are evaluated. Requirements of routine operations may not permit the participation of all unit military personnel and activities. 0: Recurring unit exercises are not conducted under simulated CBRN/TIM conditions
M3	Adequate training tools are available.	8–10: The full range of training tools are applied to CBRND training of all personnel as applicable to their tasks. Tools include simulations, virtual reality technologies, simulants, training aids, and other means to effectively recreate a CBRN/TIM environment without the hazards. 4–7: Limited training tools are available for application to CBRND training of personnel. Applied tools partially recreate a CBRN/TIM environment (without the hazards), but not to a substantial degree. 1–3: Training tools are inadequate for CBRND training of personnel 0: Training tools are not available for CBRND training of personnel.

M4	CBRN/TIM specialists are trained to perform specific CBRND tasks.	<p>8–10: CBRN/TIM specialists are formally trained and receive recurrent training on the conduct of specific CBRND tasks. Supporting augmentation personnel are fully trained and receive recurrent refresher training on the conduct of their assigned CBRND tasks and duties.</p> <p>4–7: CBRN/TIM specialists are trained and prepared to conduct their assigned CBRND tasks and responsibilities. Augmentation personnel are not fully trained on the conduct of their assigned CBRND tasks and duties.</p> <p>1–3: CBRN/TIM specialists are trained and prepared to conduct their assigned CBRN tasks and responsibilities. Augmentation personnel are not trained to conduct their assigned CBRND tasks and duties.</p> <p>0: CBRN/TIM specialists are not trained and prepared to conduct their assigned CBRND tasks and responsibilities.</p>
M5	CBRND staff cells conduct training and rehearsals.	<p>8–10: Challenging, comprehensive, and recurring unit exercises are conducted under simulated CBRN/TIM conditions and CBRND staff cells fully participate and are evaluated. Sustained operations are emphasized.</p> <p>4–7: Unit exercises are conducted under simulated CBRN/TIM conditions and CBRND staff cells generally participate and may be evaluated.</p> <p>1–3: Unit exercises are conducted under simulated CBRN/TIM conditions and CBRND staff cells generally participate but are not evaluated.</p> <p>0: Unit exercises do not incorporate simulated CBRN/TIM conditions and CBRND staff cells are not exercised.</p>
M6	Basic CBRND training is routinely conducted for individuals.	<p>8–10: All unit personnel, civilian and military, receive mandatory introductory and recurrent refresher CBRND training supporting survival and sustained operations in a CBRN/TIM environment.</p> <p>4–7: Recurrent training is required of all military personnel and critical civilian personnel to support survival and sustained operations in a CBRN/TIM environment.</p> <p>1–3: Recurrent training is performed of military personnel and selected civilian personnel as determined needed. Requirements of routine operations may not permit the participation of all military and/or critical civilian personnel.</p> <p>0: Recurrent training is not performed for survival and operations in a CBRN/TIM environment</p>
M7	Hazards effects models and tools are adequate and available for training purposes.	<p>8–10: Standardized M&amp;S capability exists to assess and visualized adversary COAs (both CBRN and TIM) and their effects, is applied by all operating forces and staffs, is integrated into the COP, continuously refreshes as new information is drawn from interoperable sources, and is integrated into and supports training and exercising of applicable personnel.</p> <p>4–7: Operating force staffs possess M&amp;S capability and resources to perform M&amp;S visualization of adversary COAs (CBRN or TIM) and their effects, is commonly applied by operating forces and staffs, is integrated into the COP, refreshes as new information is processed, and supports the training and exercising of applicable personnel.</p> <p>1–3: Visualization of adversary COAs and their effects are inadequate to support training and exercising of personnel.</p> <p>0: Visualization of adversary COAs and their effects are nonexistent</p>
M8	Sufficient CBRN/TIM protection, detection, identification and decontamination equipment is on hand or simulation available.	<p>8–10: The full range of training tools are applied to CBRND training of all personnel as applicable to their tasks. Tools include simulations, virtual reality technologies, simulants, training aids, and other means to effectively recreate a CBRN/TIM environment without the hazards.</p> <p>4–7: Limited training tools are available for application to CBRND training of personnel. Applied tools partially recreate a CBRN/TIM environment (without the hazards), but not to a substantial degree.</p> <p>1–3: Training tools are inadequate for CBRND training of personnel.</p> <p>0: Training tools are not available for CBRND training of personnel.</p>

M9	There is effective DOTLPF in place to conduct task.	<p>8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations</p> <p>4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds.</p> <p>1–3: DOTLPF is inadequate for accomplishment of this task.</p> <p>0: DOTLPF does not exist for this task.</p>
----	---	--

<sup>1</sup> CBRN staff cell personnel and unit personnel possess access to shared information technology resources and tools. CBRN personnel do not possess dedicated information technology to perform training and operational requirements. Available resources are shared with other requiring activities and functions.

<sup>2</sup> Recurring unit exercises do not generally include the conduct of CBRND under simulated conditions by all military and critical civilian personnel and activities. Sustained operations in a CBRN/TIM environment are not emphasized and evaluated. The overall tendency is for inadequate CBRND training by regular units. The current threat situation has increased attention within this area.

<sup>3</sup> Limited training aids and tools are available to support CBRND training of personnel. Distance learning course availability and access is improving. Limited capability repositories exist supporting field reachback for contact with CBRN experts and to access and apply plans, procedures, information, and lessons learned.

<sup>4</sup> CBRN specialists are formally trained and receive recurrent training on their specialty. Augmentation personnel are trained by CBRN specialists to perform their assigned tasks.

<sup>5</sup> Most unit exercises do not generally include the conduct of CBRND under simulated conditions. However, CBRND staff cells generally participate in unit exercises and may be evaluated if the exercise includes CBRN/TIM criteria. CBRN/TIM exercises fully challenging the entire staff as a cooperative and integrated group are not generally the rule.

<sup>6</sup> Recurring CBRND training is required of all military and critical civilians tasked to potentially operate within a CBRN/TIM environment. However, nondeployable personnel and civilians within CONUS are trained as needed. Routine operations in non-HTA areas may impact scheduling of identified personnel

<sup>7</sup> Standardized hazard effects models are not deployed and manual means are the predominant means of forecasting impacts. The current ATP-45 process provides manual, broad-area assessments. The present system, however, is inadequate for complex terrain and not considered accurate. The JWARN, JOEF, and JEM suite provides hazard effects modeling and assessment tools. The suite is projected to be initially fielded in the mid term with full fielding completed early in the far term.

<sup>8</sup> Limited training aids and tools are available for the conduct of CBRND training of personnel. Generally, units and personnel train using their own equipment. Limited simulators are available at training centers to facilitate training of personnel in selected specialties. For example: CBRN specialists may be trained using a FOX simulator at Fort Leonard-Wood on CBRN reconnaissance.

<sup>9</sup> Current DOTLPF adequately addresses the conduct of CBRND training for military units and personnel. DOTLPF will need to evolve as systems, tactics, and situations change.

### 9.8.3 Functional Solution Analysis

#### 9.8.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** Access to repositories and the quality of repositories is limited.  
**Partial Non-Material Solutions:** *Doctrine:* Doctrine, policies, procedures, and TTPs are required for use of repositories. *Personnel:* Repository staffing, including subject matter expert (SME) support, is required. *Facilities:* Physical plant support is required for repositories. Integrated and interoperable connectivity within GIG Enterprise Service needed to support worldwide routine and operational needs.
- 2. Deficiency:** Absence of availability of simulants and simulations for training.  
**Partial Non-Material Solutions:** *Training:* Refined training programs are required for staffs, CBRN specialists, and general personnel.
- 3. Deficiency:** Inadequate scheduling opportunities for CBRND training, exercising, and evaluation.  
**Non-Material Solutions:** *Doctrine:* Doctrine, policies, procedures, and TTPs mandating and establishing training, exercise, and evaluation criteria are required to ensure all applicable personnel (military and civilian) are able to perform CBRND in a sustained CBRN/TIM environment. *Training:* Conduct formal and recurrent training of all applicable personnel (military and civilian) on CBRND actions, measures, and requirements. Conduct exercises and evaluations to assess readiness and to identify areas requiring additional attention. *Leadership:* Special attention is required ensuring adequate CBRND training, exercising, and evaluation occurs.
- 4. Deficiency:** Lack of standardized automated Joint Hazard Effects Modeling Tool that accurately reflects CBRN threats and provides flexibility for training, exercises, and evaluations.  
**Non-Material Solutions:** *Doctrine:* Doctrine, policies, procedures, TTPs, and criteria are required for the application of hazard effects modeling for training, exercises, and evaluations. *Training:* Conduct formal and recurrent training of all applicable personnel (military and civilian) to effectively use and apply hazard effects modeling for training, exercises, and evaluations. Integrate hazard effects modeling into exercise and evaluation criteria and assessments.
- 5. Deficiency:** Coalition partner forces may be insufficiently trained or possess insufficient experienced personnel to conduct joint operations within a CBRN environment.  
**Non-Materiel Solutions:** *Doctrine:* Doctrine, policies, procedures, and TTPs addressing the training of non-U.S. forces for CBRN operations and their integration into the force are required. *Organization:* Ensure organizational structures, organization, and resources are identified and available to train, if necessary, non-U.S. personnel and forces for CBRN

operations. *Training:* Develop criteria, standards, and course material for training of non-U.S. personnel and forces for CBRN operations. Ensure non-U.S. personnel and forces are integrated into joint exercises and evaluations in preparation for CBRN operations.

*Leadership:* Ensure awareness of criticality of integration and survivability of non-U.S. forces to joint operations success within a CBRN environment. *Personnel:* Trained and knowledgeable personnel are required, fluent in partner language and certified to instruct CBRND and CBRN operations to non-U.S. forces. *Facilities:* Supporting infrastructures (e.g., facilities, systems, equipment, etc.) are required for training of non-U.S. forces for operations within a CBRN environment and to support U.S. trainers.

### 9.8.3.2 IMA Assessment Summary

Table 9.8-4 is a list of ideas for material approaches and a corresponding description of each idea. This task brings in the need for accessing remote data sources, as well as developing new and better CBRN simulants and simulations (including accurate hazards effects models.)

Table 9.8-5 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 9.8-4. TASHA 8: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Lessons learned databases	Develop/consolidate databases for operational and training lessons learned.
Reachback capability	Develop a system providing the ability to rapidly and securely reach back and contact CBRN experts and obtain CBRND plans, procedures, information, support, and lessons learned.
Management of databases	Develop a system to link and manage the accuracy, adequacy, and availability of CBRND information databases. Includes access management, content control, and the conduct of data set management. Also includes process to identify database actions such as consolidation of similar databases, establishment of new databases, archiving of obsolete databases, etc.
Modeling and simulation	Develop a DoD-approved and standardized model for CBRN and TIM hazard prediction capabilities that incorporates physics-based functionalities. The model acquires information from databases (i.e., terrain, structures, environmental, meteorological, intelligence, unit and population) to display graphical output and map the hazard in near-real time. Develop a system including embedded training capable of simulating operational scenarios.
Simulants accurately depicting threat contaminants	Develop a system that collects and analyzes stimulant data and distinguishes it from real agents to be used in modeling and simulation.
Automated CBRN training system	Develop automated and interactive CBRN training system for individual and unit training to include training and exercise scenarios, evaluation and certification criteria, and automated tools to assist and complement individual and unit CBRN training.

Table 9.8-5. TASHA 8: IMA Assessment

<div> <div>Ideas for Material Approaches (IMA)</div> <div>Identified Gaps</div> </div>	Lessons Learned Databases	Reachback Capability	Management of Databases	Modeling and Simulation	Simulants Accurately Depicting Threat Contaminants	Automated CBRN Training System
Access to repositories and the quality of repositories is limited.	X	X	X			X
Absence of availability of simulants and simulations for training.				X	X	X
Lack of standardized automated Joint Hazard Effects Modeling Tool that accurately reflects CBRN threats and provides flexibility for training, exercises, and evaluations.		X		X		X

## **9.9 Task TASHA 9: Track the processing of CBRN/TIM casualties and exposed personnel and MWA**

### **9.9.1 Functional Area Analysis**

#### **9.9.1.1 Definition**

This task encompasses the tracking of CBRN/TIM casualties and exposed personnel and MWAs via fielded information management systems. Information from this task feeds the general casualty tracking system and supports resourcing decisions at higher levels of command.

#### **9.9.1.2 Derivation**

*UJTL (TA 5, TA 5.2.1, TA 7, TA 7.1), Protection Joint Functional Concept, Military Transformation: A Strategic Approach.*

##### **9.9.1.2.1 Supported Task: OPSHA 8**

##### **9.9.1.2.2 Lateral Task: TASENS 14**

##### **9.9.1.2.3 Supporting Task: N/A**

#### **9.9.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

##### **Military**

1. No interoperability. (C2.2.6)
2. Partially completed mission preparation. (C2.1.3)
3. Limited staff expertise. (C2.3.1.3)

**Civil.** N/A

### **9.9.2 Functional Needs Analysis**

#### **9.9.2.1 Capability and Deficiency Assessment Summary**

Table 9.9-1 discusses individual capabilities to perform this task to the designated standards. Plans and procedures exist for treatment of known CBRN agents and a manual capability exists for tracking exposed or affected personnel. The overall capability for current, near/mid, and far term are assessed “yellow.”

**Current Capability and Deficiency**

Tracking of CBRN/TIM casualties is not a specific feature of the general casualty system. All casualties, however, are tracked. There are plans and procedures in place for the treatment of known CBRN agents. Deficiencies include insufficient interface with other medical systems; lack of a current integrated/automated system; and inability to specifically track within the medical systems CBRN/TIM casualties and exposed personnel.

**Projected Near/Mid-Term Capability and Deficiency**

Tracking of CBRN/TIM casualties is not a specific feature of the general casualty system. Projected deficiencies include inadequate integration of Theater Medical Information Program (TMIP) and Defense Medical Surveillance System (DMSS) information with projected fielded JOEF, inability to specifically track within the medical systems CBRN/TIM casualties and exposed personnel, and the need for additional staff involvement necessary to track CBRN/TIM casualties.

**Projected Far-Term Capability and Deficiency**

No change is projected for this task.

**Table 9.9-1. TASHA 9: Capability and Deficiency Assessment**

<b>Capability: CBRN Casualty Tracking</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>
<b>Current Overall Capability</b>	4 <sup>1</sup>	8 <sup>2</sup>	4 <sup>1</sup>	0 <sup>3</sup>	4 <sup>4</sup>
<b>Near/Mid-Term Overall Capability</b>	4	8	4	0	4
<b>Far-Term Overall Capability</b>	4	8	4	0	4

	<b>FAA Measure</b>	<b>Scale</b>
M1	Tracking of CBRN/TIM casualties is accurate.	8–10: Tracking of CBRN/TIM casualties and exposed personnel individually and as a composite is accurate, current, and updated in near-real time from Medical Information Systems as information is entered. 4–7: Tracking of CBRN/TIM casualties and exposed personnel is performed manually on a periodic basis from information provided by Medical Services and is accurate as of the last update. 1–3: Tracking of CBRN/TIM casualties and exposed personnel contains substantial errors. 0: Tracking of CBRN/TIM casualties and exposed personnel is nonexistent.
M2	Casualties are treated in accordance with medical treatment plans for causation agent/material.	8–10: Medical Services doctrine, policies, procedures, and TTPs exist for the treatment of CBRN agents. Medical treatment plans are developed and disseminated by a central center of excellence for use by medical practitioners and personnel. 4–7: Medical Services doctrine, policies, procedures, and TTPs provide general guidance on the treatment of high-risk CBRN agents. Medical treatment plans are developed by unit-level medical practitioners and personnel based upon subject matter experts and research. 1–3: Medical treatment plans do not address causation agent/materials and/or are inadequate for the treatment of CBRN casualties. 0: Medical treatment plans do not exist.
M3	Casualties restricted by medical isolation/quarantine are identified and tracked.	8–10: Tracking of CBRN/TIM casualties and exposed personnel restricted by medical isolation/quarantine individually and as a composite is accurate, current, and updated in near-real time from Medical Information Systems as information is entered. 4–7: Tracking of CBRN/TIM casualties and exposed personnel restricted by medical isolation/quarantine is performed manually on a periodic basis from information provided by Medical Services and is accurate as of the last update. 1–3: Tracking of CBRN/TIM casualties and exposed personnel restricted by medical isolation/quarantine contains substantial errors 0: Tracking of CBRN/TIM casualties and exposed personnel restricted by medical isolation/quarantine is nonexistent.
M4	Exposed or affected personnel can be tracked over the long term.	8–10: Medical Information systems incorporate automated tracking of personnel exposed to, affected by, and/or treated for CBRN/TIM exposure from system entry until release from service. Systems incorporate ability to identify potential related issues and problems with medical treatment and care for tracked personnel. 4–7: Medical Information systems incorporate automated tracking of personnel exposed to, affected by, and/or treated for CBRN/TIM exposure from system entry until release from service. 1–3: Medical Information systems manually track personnel exposed to, affected by, and/or treated for CBRN/TIM exposure from system entry until release from service. 0: CBRN/TIM casualties and exposed personnel are not tracked through their career.

M5	There is effective DOTLPF in place to conduct task.	<p>8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations</p> <p>4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds.</p> <p>1–3: DOTLPF is inadequate for accomplishment of this task.</p> <p>0: DOTLPF does not exist for this task.</p>
----	---	--

<sup>1</sup> This should be, but is not, a feature of the general casualty tracking system. Tracking of CBRN/TIM casualties and exposed personnel, specifically, is performed manually and is generally viewed as outpatient or inpatient treatment for the results (e.g., respiratory distress, neurological impairments, etc.) and the cause (e.g., low-dose exposure to blood agent, treated exposure to GB, etc.) is usually considered informational and entered via text, if at all. Information is periodically updated and provided to the staff. The continued development of the TMIP and DMSS as interoperable and integrated systems may provide the ability to track these personnel and to provide information through JOEF for CBRND operations. JOEF is projected for initial fielding during the mid term with full fielding completed early in the far term. However, no indications currently exist for plans to include CBRN/TIM tracking capability.

<sup>2</sup> Medical Services doctrine, policies, procedures, and TTPs exist for the treatment of CBRN agents. Treatment plans are developed by SMEs at the Army Medical Department and disseminated for application by medical personnel.

<sup>3</sup> CBRN/TIM casualties and exposed personnel are not tracked in the Medical System throughout their careers. The integration and interoperability of the TMIP and DMSS medical information systems provides a foundation for tracking these personnel through their careers. However, no indications currently exist for plans to include CBRN/TIM tracking capability.

<sup>4</sup> Current DOTLPF addresses most critical aspects for completion of this task. Limitations in medical information systems require work-arounds for task completion. DOTLPF must evolve to meet current and future needs resulting from changes in systems, tactics, and situations.

### 9.9.3 Functional Solution Analysis

#### 9.9.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Insufficient interface with other medical systems. An integrated/automated system does not yet exist to track CBRN patients from the inception of medical care through the career of CBRN/TIM casualties and exposed personnel.

**Non-Material solutions:** None

#### 9.9.3.2 IMA Assessment Summary

Table 9.9-4 is a list of ideas for material approaches and a corresponding description of each idea. The approaches for this task include the need to provide real-time interfaces between the tactical and medical information systems and continue the search for new vaccines and treatments for CBRN/TIM agents.

**Table 9.9-4. TASHA 9: Materiel Approaches**

<b>Identified Deficiency</b>	<b>Idea for Materiel Approach</b>	<b>Description</b>
Insufficient interface with other medical systems. An integrated/automated system does not yet exist to track CBRN patients from the inception of medical care through the career of CBRN/TIM casualties and exposed personnel.	Modifications to medical information systems	Develop automated modifications to existing and developing medical patient tracking systems (e.g., DMSS, Medical Analysis Tool [MAT], TMIP, etc.) to specifically track the status and treatment of CBRN/TIM casualties and link this information to CBRND automated systems, particularly JOEF.

## **9.10 Task TASHA 10: Manage CBRN personnel and unit resources to ensure effective CBRND task accomplishment**

### **9.10.1 Functional Area Analysis**

#### **9.10.1.1 Definition**

Ensures mission ready personnel and units are available to effectively perform CBRND tasks. Encompasses managing the availability of CBRN specialists and specialized CBRN units.

#### **9.10.1.2 Derivation**

*UJTL (TA 5, TA 5.2.1, TA 6.5, TA 7, TA 7.1), Protection Joint Functional Concept, Military Transformation: A Strategic Approach.*

##### **9.10.1.2.1 Supported Task: OPSHA 3**

##### **9.10.1.2.2 Lateral Task: TASUST 26**

##### **9.10.1.2.3 Supporting Task: N/A**

#### **9.10.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

##### **Military**

1. Partially completed mission preparation. (C2.1.3)
2. No interoperability. (C2.2.6)
3. Limited staff expertise. (C2.3.1.3)

**Civil.** N/A

### **9.10.2 Functional Needs Analysis**

#### **9.10.2.1 Capability and Deficiency Assessment Summary**

Table 9.10-1 discusses individual capabilities to perform this task to the designated standards. Services have the overall capability to manage CBRN personnel and units. The overall capability for current, near/mid, and far term are assessed “yellow.”

##### **Current Capability and Deficiency**

The pool of trained CBRND personnel is generally adequate to meet respective Service needs. The availability of CBRND units could be limited, particularly if substantial forces are employed

in multiple regions involving CBRN threat. Individual and unit CBRN training is conducted. Deficiencies include training and provisioning of trained specialists to units requires continued attention, potential to overextend the existing units available due to the extensive operations tempo, and the perishability of skills due to personnel turnover and availability for refresher training.

**Projected Near/Mid-Term Capability and Deficiency**

No change is currently projected for this task.

**Projected Far-Term Capability and Deficiency**

No change is currently projected for this task.

**Table 9.10-1. TASHA 10: Capability and Deficiency Assessment**

<b>Capability: CBRN Personnel and Unit Resource Management</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>
<b>Current Overall Capability</b>	6 <sup>1</sup>	5 <sup>2</sup>	6 <sup>3</sup>	6 <sup>4</sup>
<b>Near/Mid-Term Overall Capability</b>	6	5	6	6
<b>Far-Term Overall Capability</b>	6	5	6	6

	<b>FAA Measure</b>	<b>Scale</b>
M1	Allocation of CBRND specialist is adequate.	8–10: Adequate numbers of trained and experienced CBRND specialists are available and allocated to support concurrent multiple operations and routine requirements. 4–7: CBRND specialists are available to support a major operation and selected routine requirements. Experience will vary from minimal to substantial. Allocations are likely to be at a reduced level with augmentation by nonprimary-duty personnel. 1–3: CBRND specialist are available to support a major operation. Experience will vary from minimal to substantial. Routine requirements are filled by nonprimary-duty personnel. 0: Quantity of CBRND specialists is insufficient to support operations.
M2	Availability of CBRND units to perform specific CBRND tasks is adequate.	8–10: Sufficient numbers and types of trained, manned, and equipped CBRND units are available to support concurrent operations and routine requirements. 4–7: CBRND units are available to support a major operation and selected routine requirements. Training, manning, and equipage will vary from unit to unit and dependent upon unit type. 1–3: Quantity and/or type of CBRND units are insufficient to support operations 0: Types of CBRND units necessary to support operations do not exist.
M3	Training and experience enable successful performance of CBRND tasks.	8–10: All personnel performing CBRND tasks are fully trained and receive recurring refresher training on the conduct of their CBRND tasks. Exercises and evaluations are routinely conducted and fully challenge capabilities to maintain and refine skills, knowledge, and capabilities. CBRND competencies and experience are high and enable the rapid, accurate, and successful completion of tasks. 4–7: Core CBRND personnel are fully trained and receive recurring refresher training on the conduct of their CBRND tasks. Exercises and evaluations do not generally fully challenge capabilities. Limited training is provided, is inconsistent, and/or is administered in preparation for operations to noncore CBRND personnel for the performance of their assigned CBRND tasks. CBRND competencies and experience will vary, but sufficient capability exists to successfully perform CBRND tasks. 1–3: Training is inadequate for the successful performance of CBRND tasks 0: Training is nonexistent for the performance of CBRND tasks.
M4	There is effective DOTLPF in place to conduct task.	8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations 4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds. 1–3: DOTLPF is inadequate for accomplishment of this task. 0: DOTLPF does not exist for this task.

<sup>1</sup> Sufficient CBRND specialists are available to support a major operation and selected routine Service requirements. Augmentation is applied to support core CBRND specialists where possible to reduce impact. Availability of trained and experienced CBRND specialists is low and strained when support is required for more than one large-scale operation involving CBRN threat. Routine requirements support reduces as demand rises to support operations.

<sup>2</sup> Sufficient CBRND units are available of the necessary types to support a major operation and selected routine Service requirements. Availability of trained, equipped, and manned CBRND units is low and strained when support is required for more than one large-scale operation involving CBRN threat. Routine support capabilities reduce as demand rises to support operations.

<sup>3</sup> Primary-duty CBRND personnel are fully trained and receive recurring refresher training on the conduct of their CBRND tasks. Core augmentation personnel receive varying degrees of training. Generally, limited training is provided, is inconsistent, and/or is administered in preparation for operations to noncore or augmentation CBRND personnel for the performance of their assigned CBRND tasks. These skills are perishable and rely on traditional training methods and practices. However, sufficient resident capability exists to successfully perform the required tasks.

<sup>4</sup> Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-around. Currently, organization and personnel are able to support a major operation and selected routine Service requirements but become strained with increased or additional demands. Augmentation is applied as a work-around to CBRN specialist availability to support core CBRND specialists where possible. Availability of trained and experienced CBRND specialists is low and strained when support is required for more than one large-scale operation involving CBRN threat. Routine requirements support reduces as demand rises to support operations. DOTLPF must continue to evolve as systems, tactics, and situations change.

### 9.10.3 Functional Solution Analysis

#### 9.10.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Concern exists for potential to overextend existing available CBRN units and personnel due to extensive operations tempo (OPTEMPO) and potential reach of threat or required support of multiple concurrent operations with threat.  
**Non-Material Solutions:** *Doctrine:* Unit readiness and deployment needs to be judiciously managed. *Organization:* Establish CBRND units and personnel position allocations sufficient to meet support requirements for defined operations and anticipated OPTEMPO considerations. *Personnel:* Ensure acquisition, training, and retention of sufficient qualified personnel to meet level supporting national multiple concurrent conflict capability requirements.
2. **Deficiency:** Perishable skills require retraining and growth in skills.  
**Non-Material Solutions:** *Training:* Continue and emphasize the importance of effective CBRND training for individuals and units. *Leadership:* Ensure personnel are current and prepared to perform CBRND tasks and responsibilities.

#### 9.10.3.2 IMA Assessment Summary

N/A

## **9.11 Task TASHA 11: Correlate observations of the indigenous population for indicators of CBRN/TIM attack or release**

### **9.11.1 Functional Area Analysis**

#### **9.11.1.1 Definition**

JTF elements can identify sick or diseased people in the conduct of their activities. As an example, patrols, convoys, and security checkpoints can identify or observe ill health in the indigenous population. The frequency and extent of ill health could be a radiological, toxic chemical, or a biological agent indicator. Liaison and information are collected from indigenous and NGO activities in the tactical operating area. Relatively rapid degradation in the indigenous populace could indicate the presence of a CBRN agent and represent a threat to JTF elements, potentially shifting the strategic and operational objectives of the JTF away from command or national intentions. This task might also include observations regarding an increase of vector populations. Daily situation reports might include these observations.

Reported observations are correlated in the operations center contributing to combat risk assessments and the management of response and mitigation, including identification of necessary medical countermeasures to protect the force. The information is included in medical surveillance, and the results and response are included in the COP situational awareness. For vector attacks and small covert attacks of communicable disease agents, the correlation and inclusion of observations of the indigenous population within medical surveillance could be the primary means of detecting an attack and implementing medical preventive countermeasures.

#### **9.11.1.2 Derivation**

##### **9.11.1.2.1 Supported Task: OPSHA 8**

##### **9.11.1.2.2 Lateral Task: TASENS 10**

##### **9.11.1.2.3 Supporting Task: N/A**

#### **9.11.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

#### **Military**

1. Partial preexisting arrangements. (C2.1.1.2)
2. Partially completed mission preparation. (C2.1.3)
3. Marginal forces assigned. (C2.2.1)

4. Fair personnel nutrition and health. (C2.2.4.1)
5. Limited personnel experience. (C2.2.4.5)
6. Limited staff expertise. (C2.3.1.3)

## Civil

1. Correct interdepartmental/interagency relationships. (C3.1.1.3)
2. Negative foreign government support. (C3.1.2.3)
3. Moderately opposed foreign public opinion. (C 3.1.2.4)
4. Poor civil health. (C3.3.1.4)
5. High health risk. (C3.3.1.5)
6. Significant TIM present in the civilian sector. (C3.3.7.5)

### 9.11.2 Functional Needs Analysis

#### 9.11.2.1 Capability and Deficiency Assessment Summary

Table 9.11-1 discusses individual capabilities to perform this task to the designated standards. The capabilities include some reports provided by non-JTF activities and limited ability to assess outbreak indicators, make accurate hazard and surveillance reports, and obtain reports of CBRN attack indicators. The overall capability for current, near/mid, and far term are rated “yellow.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

#### Current Capability and Deficiency

Correlating observations of CBRN/TIM attacks require special liaison with NGOs, international agencies, indigenous civil authorities, and aid organizations. Medical surveillance operates in isolation from the routine activities of the operational staffs. The capability is improving as a result of improvements resulting from current conflicts. Interoperability within and among Services continues to improve. Deficiencies include insufficient liaison and collaboration with non-JTF agencies and organizations in the operating area, inadequate training, insufficient interaction and coordination between medical staffs and operational staffs, lack of interactive link with COP; and insufficient communication resources.

#### Projected Near/Mid-Term Capability and Deficiency

No change is projected for this task.

#### Projected Far-Term Capability and Deficiency

No change is projected for this task.

Table 9.11-1. TASHA 11: Capability and Deficiency Assessment

Capability: Correlate Observations of the Indigenous Population for Indicators of CBRN/TIM Attack or Release	M1	M2	M3	M4	M5	M6
Current Overall Capability	4 <sup>1</sup>	5 <sup>2</sup>	5 <sup>3</sup>	5 <sup>4</sup>	5 <sup>5</sup>	6 <sup>6</sup>
Near/Mid-Term Overall Capability	4	5	5	5	5	6
Far-Term Overall Capability	4	5	5	5	5	6

	FAA Measure	Scale
M1	Reports are provided by non-JTF activities.	8–10: Secure, interoperable, and interactive processes with automated tools exist and are predominantly applied by all relevant activities of the joint force, coalition partners, and other authorized entities. Inherent capabilities support connectivity to diverse systems operated and maintained by non-JTF activities. 4–7: Special liaisons are equipped and possess connectivity for interaction and reporting of information collected by non-JTF activities and entities such as NGOs, international agencies, indigenous civil authorities, and aid organizations. In selected cases, these agencies are provided equipment and procedures specifically for this purpose. 1–3: Information is collected from non-JTF activities and entities sporadically by JTF elements in the area of responsibility (AOR). 0: The capability to collect information from non-JTF activities and entities is nonexistent.
M2	Outbreak indicators are assessed and confirmed.	8–10: Secure, interoperable, and interactive processes with automated tools exist and are predominantly applied by all echelons and elements of the joint force, coalition partners, and authorized entities. Information and data are collected, collated, confirmed, and processed using automated tools and processes on a continuous basis. 4–7: Procedures, policies, techniques, and processes exist to collect, confirm, process, and report information on outbreak indicators and are assisted by automated systems requiring manual intervention and on a periodic basis or as determined necessary. 1–3: Procedures, policies, techniques, and processes provide limited guidance for the collection, confirmation, processing, and reporting of information on outbreak indicators and are performed manually using raw information drawn from automated systems. 0: The collection, confirmation, and reporting of outbreak indicators are nonexistent.
M3	Reports on hazard are accurate.	8–10: Hazard reporting accuracy and utility is high; based on standardized automated system processing, analysis, and evaluation with trained staff review and involvement; and reliant on trained and experience observations and rapid and accurate reporting by personnel in the field. 4–7: Hazard reporting accuracy and utility exists but widely varies between units and staffs and is dependent upon manual processes reliant upon the experience, training, and availability of the performing staff/observing field personnel and the quality of reports and selected assessed information. 1–3: Hazard reporting accuracy and utility are low. 0: Hazard reporting accuracy and utility are nonexistent.
M4	Health-related surveillance reporting system is in place.	8–10: Secure, interoperable, and interactive medical surveillance systems exist and continuously interrelate with other nonmedical systems and CBRND information systems within the net-centric environment to provide ongoing health status of forces. 4–7: Procedures, policies, techniques, and processes exist to perform medical surveillance of the force and are assisted by automated systems requiring manual intervention and on a periodic basis or as determined necessary. 1–3: Medical surveillance is performed manually from raw information drawn from automated systems 0: Medical surveillance is nonexistent.

M5	Reports of observations of CBRN attack indicators are timely.	<p>8–10: Integrated, interoperable, and interactive automated systems substantially or fully detect, process, and report CBRN attack indicators in near-real time. These systems also support the collection, processing, and reporting of manually collected information and data.</p> <p>4–7: Doctrine, policies, procedures, TTPs, and formats exist and are applied and are generally performed manually for the reporting of CBRN attack indicators. Timeliness is contingent upon operational considerations and unit/personnel capabilities.</p> <p>1–3: Doctrine, policies, procedures, TTPs, and formats exist and are applied and are generally performed manually for the reporting of CBRN attack indicators. Time to perform is extended by available communications constraints and ongoing operational demands</p> <p>0: The timeliness of reporting of CBRN attack indicator observations fails to support survival and operational needs.</p>
M6	There is effective DOTLPF in place to conduct task.	<p>8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations</p> <p>4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds.</p> <p>1–3: DOTLPF is inadequate for accomplishment of this task.</p> <p>0: DOTLPF does not exist for this task.</p>

<sup>1</sup> Special liaisons may be assigned to applicable NGOs, international agencies, indigenous civil authorities, and aid organizations for coordination and information exchange.

<sup>2</sup> Procedures, policies, and processes are established for the largely manual collection, confirmation, processing, and reporting of outbreak indicators. Medical surveillance systems exist and assist for joint force personnel but are largely stovepiped and require manual intervention for transmission and interpretation. Further, these systems are not developed sufficiently to adequately incorporate information from non-JTF sources. Current systems and processes are dependent upon the experience, training, and cognizance of responsible staff.

<sup>3</sup> Accuracy and utility of hazard reporting is dependent upon the experience, training, and availability of the necessary staff, as well as the quality and accessibility of information. Field reporting accuracy and utility varies widely dependent upon unit training, individual attentiveness, and in-place observation reporting mechanisms. Current capability is achieved using doctrine and locally developed processes. Limited training is provided to staff and field personnel for the identification, reporting, and processing of hazards and related information. Consistent standardized formal and refresher training on immediate or local battlefield hazard identification and reporting is not regularly and routinely performed. Limited and often cursory training is provided and often is not until preparation or during the conduct of operations.

<sup>4</sup> Medical surveillance systems are largely stovepiped and lack integration with operations and intelligence systems. Further, these systems are not developed sufficiently to adequately incorporate information from non-JTF sources. Current systems and processes are dependent upon the experience, training, and cognizance of responsible staff.

<sup>5</sup> CBRN attack indicator observations are largely reported using standardized ATP-45 formatted messages and are prepared manually for transmission using existing and available communications systems. Timeliness is contingent upon the experience and knowledge of the reporting personnel, ongoing operational considerations, and available communications capabilities. However, dissemination to other units in the potentially affected area, especially if they do not share communications systems and frequencies, is usually delayed until retransmitted by higher authority. JWARN provides the automated capability to disseminate CBRN attack indicator information in the net-centric environment. JOEF and JEM support the collection, interpretation, and visualization of the information. This suite of systems is projected to be fielded in the near-term. JOEF and JEM are projected for initial fielding during the mid term with full fielding completed early in the far term. Concurrent with the mid-term release of JOEF and JEM will be JWARN Block II which will be initially fielded to operational units.

<sup>6</sup> Current DOTLPF include the ability to conduct this task using largely manual processes and available communications systems. However, processes and procedures for the immediate dissemination of information to neighboring units is not adequate. The retransmission of the information by higher echelon to all units potentially at risk or affected by a CBRN/TIM event is performed as a work-around and assurance of notification. CBRND training ranges from in-depth and substantial for selected functions and personnel to inadequate and haphazard for others, largely field personnel. DOTLPF will need to evolve as systems, tactics, and situations change.

### 9.11.3 Functional Solution Analysis

#### 9.11.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Insufficient liaison and collaboration with non-JTF agencies and organizations in the operating area.

**Partial Non-Material Solutions:** *Doctrine:* Doctrine and TTPs requirements are needed for liaison and collaboration with non-JTF agencies and organizations within the operating area for the purposes of coordination and information exchange. *Organization:* Establish, man, and equip specific standard units and primary-duty personnel for the conduct of liaison and collaboration with other entities, including non-JTF agencies and organizations. *Training:* Ensure ongoing training and development of experienced and qualified personnel for the conduct of successful liaison and collaboration activities. *Personnel:* Ensure selection and availability of primary-duty personnel in sufficient quantities to ensure fully mission capable status of liaison units and elements supporting operations and mission requirements.

2. **Deficiency:** Inadequate organization within the JTF to effectively assess and confirm CBRN/TIM events and outbreaks.

**Non-Material Solutions:** *Doctrine:* Doctrine and TTPs are required for assessment and confirmation of CBRN/TIM events and outbreaks. *Organization:* Staffing and organizational resources supporting the identification, assessment, confirmation, and reporting of CBRN/TIM events and outbreaks are required. *Training:* Ensure adequate formal and recurring refresher training of staff and personnel on their areas of responsibility for the identification, assessment, confirmation, and/or reporting of potential CBRN/TIM events and outbreaks.

3. **Deficiency:** Inadequate training.

**Non-Material Solutions:** *Training:* Ensure adequate formal and recurring refresher training of staff and personnel on their areas of responsibility for the identification, assessment, confirmation, and/or reporting of potential CBRN/TIM events and outbreaks.

4. **Deficiency:** Insufficient interaction and coordination between medical, operational, and intelligence staffs.

**Non-Material Solutions:** *Doctrine:* Refine doctrine, policies, procedures, processes, and TTPs to support the interactive exchange of information between medical, operational, and intelligence elements. *Organization:* Organizational resources and systems supporting the interactive and collaborative exchange of information between staffs and elements are required. *Training:* Ensure formal and recurring refresher training promoting information interchange and collaborative relationships between medical, operational, and intelligence staffs.

5. **Deficiency:** Lack of interactive link with COP.

**Partial Non-Material Solutions:** *Doctrine:* Develop doctrine, policies, procedures, and TTPs establishing local linkage processes and means with the COP.

**6. Deficiency:** Insufficient communication resources.

**Partial Non-Material Solutions:** *Organization:* Develop tables of unit authorized equipment need to ensure adequate communications resources are available to support operational needs, including CBRND.

### 9.11.3.2 IMA Assessment Summary

Table 9.11-4 is a list of ideas for material approaches and a corresponding description of each idea. Material approaches here focus on the lack of liaison and collaboration with outside organizations and agencies, the need to provide accurate information to the development of the COP, and the need for additional communications resources.

**Table 9.11-4. TASHA 11: Materiel Approaches**

Identified Deficiencies	Idea for Materiel Approach	Description
Insufficient liaison and collaboration with non-JTF agencies and organizations in the operating area.	Medical surveillance system enhancement for indigenous population surveillance	Develop automated modifications to existing and developing medical surveillance systems for the collection, correlation, processing, and reporting of CBRN event indicators within indigenous populations.
Lack of interactive link with COP.		
Insufficient communication resources.		

**9.12 Task TASHA 12: Conduct medical surveillance based on syndromic information and data across the battlespace****9.12.1 Functional Area Analysis****9.12.1.1 Definition**

Using syndromic information and data, medical surveillance across the battlespace is conducted. The results are collected and analyzed in the operations centers contributing to combat risk assessments and the management of response and mitigation, including identification of necessary medical countermeasures to protect the force. Medical surveillance results and response are included in the COP situational awareness. Medical surveillance is a critical capability to identify biological agents (vectored, communicable), nonimmediate casualty chemical exposure, and emissive radiological exposures. For vector attacks and small covert attacks of communicable disease agents, medical surveillance could be the primary means of detecting the attack and its progression through JTF elements. Liaison and information are collected from indigenous and NGO activities in the tactical operating area.

**9.12.1.2 Derivation**

*UJTL (TA 5, TA 5.2.1, TA 7, TA 7.1), Protection Joint Functional Concept, Military Transformation: A Strategic Approach.*

**9.12.1.2.1 Supported Task: OPSHA 7****9.12.1.2.2 Lateral Tasks: TASUST 5, TASUST 6, TASUST 7****9.12.1.2.3 Supporting Task: N/A****9.12.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Partial preexisting arrangements. (C2.1.1.2)
2. Partially completed mission preparation. (C2.1.3)
3. Poor personnel nutrition and health. (C2.2.4.1)
4. Limited personnel experience. (C2.2.4.5)
5. Moderate staff expertise. (C2.3.1.3)

**Civil**

1. Correct interdepartmental/interagency relationships. (C3.1.1.3)

2. Limited international organization support. (C3.1.2.5)
3. Moderate health risk. (C3.3.1.5)

## **9.12.2 Functional Need Analysis**

### **9.12.2.1 Capability and Deficiency Assessment Summary**

Table 9.12-1 discusses individual capabilities to perform this task to the designated standards. Services have a largely manual overall capability to perform medical surveillance of the battlespace. The overall capability for current, near/mid, and far term are rated “red.” Although improvements between the periods occur for specific capabilities and are reflected in the assessment of the measures, the improved capabilities are not sufficient to change the overall assessed color ratings for the measures and this task.

#### **Current Capability and Deficiency**

The current capability to conduct medical surveillance across the battlespace consists of limited automated assistive systems requiring substantial manual entry and manipulation such as USTRANSCOM Regulating and Command and Control Evacuation System (TRCCES)/Composite Health Care System II – Tactical (CHCS2T), Global Expeditionary Medical System (GEMS), plus the Army Medical Surveillance Activity’s DMSS and Joint Medical Evacuation Program (JTMEP). JTMEP does provide medical surveillance but only within the medical community. Medical surveillance operates in isolation from the routine activities of the operational staffs. Deficiencies include that there is no cohesive and integrated data interchange of medical information related to CBRN via electronic means, CBRN casualty information will require identification and supporting programming to address CBRN information issues, and there is a considerable lag between the generation of CBRN medical information and its display in the COP. Generally, non-U.S. personnel are not tracked in Service medical systems and information collected from coalition partners, NGOs, and host-nation agencies must be correlated manually by epidemiologists and command staff personnel.

#### **Projected Near/Mid-Term Capability and Deficiency**

The continuing development of medical systems and medical surveillance tools meeting interoperability standards integrating the various aspects of medical care and treatment are expected to expand the availability of surveillance information critical to effective CBRND. Development of an integrated and interoperable medical surveillance system will provide the command staff with information for correlation with other gathered information. Warning information is subsequently disseminated through JWARN.

#### **Projected Far-Term Capability and Deficiency**

Continued improvement as standardized, interoperable, and integrated systems replace legacy systems.

**Table 9.12-1. TASHA 12: Capability and Deficiency Assessment**

<b>Capability: Medical Surveillance</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>	<b>M6</b>	<b>M7</b>
<b>Current Overall Capability</b>	5 <sup>1</sup>	4 <sup>2</sup>	4 <sup>3</sup>	1 <sup>4</sup>	1 <sup>4</sup>	4 <sup>3</sup>	4 <sup>5</sup>
<b>Near/Mid-Term Overall Capability</b>	5	4	4	1	1	4	4
<b>Far-Term Overall Capability</b>	5	4	4	1	1	4	4

	<b>FAA Measure</b>	<b>Scale</b>
M1	Disseminated information is accurate.	8–10: Medical surveillance information is correlated and processed with other source information and, as a composite, is disseminated in near-real time to requiring users. The disseminated data are accurate, current, and updated as new information is received and processed. 4–7: Medical surveillance information is predominantly manually correlated and processed with other source information and, as a composite, is disseminated to requiring users. The disseminated data are accurate as of the last update. 1–3: Medical surveillance is not integrated with other source data or contains substantial errors. 0: Medical surveillance is nonexistent.
M2	Specific CBRN/TIM agent and appropriate medical countermeasures are identified.	8–10: Automated systems accurately and rapidly correlate syndromic indications from medical treatment information and other sources with CBRN/TIM agent symptomology, identify the appropriate causative agent, and specify the appropriate medical countermeasures. 4–7: Identification of the specific CBRN/TIM agent and appropriate medical countermeasures is predominantly performed manually with the use of limited assistive automated tools and resources where available. 1–3: Medical surveillance is inadequate for the identification of CBRN/TIM agent exposure and determination of appropriate medical countermeasures 0: Medical surveillance cannot identify and address CBRN/TIM agent exposure and appropriate medical countermeasures.
M3	Units affected by CBRN agents are identified and tracked.	8–10: Interoperable and integrated automated systems identify and track both potential and known exposed personnel and units. Medical systems track exposed personnel throughout their career and identify the exposure. 4–7: Units and personnel potentially and known to be exposed to CBRN agents are identified and tracked once known until exposure and contamination is confirmed and/or resolved. 1–3: Units and personnel potentially and known to be exposed to CBRN agents are inadequately identified and tracked until exposure and contamination is confirmed and/or resolved 0: Tracking of units and personnel potentially and known to be exposed to CBRN agents is not performed.
M4	Outbreak indicators are assessed and confirmed.	8–10: Automated systems accurately and rapidly correlate syndromic indications from medical treatment information and other sources with CBRN/TIM agent symptomology, identify the appropriate causative agent/disease, and specify the appropriate medical countermeasures and actions. 4–7: Identification of the specific CBRN/TIM agent or disease and appropriate medical countermeasures/activities are predominantly performed manually with the use of limited assistive automated tools and resources where available. 1–3: Medical surveillance does not adequately identify CBRN/TIM agent exposure, disease outbreaks, and the appropriate medical countermeasures. 0: Medical surveillance does not address CBRN/TIM agent exposure, disease outbreaks, and the appropriate medical countermeasures.

M5	Health-related surveillance, information epidemiology and symptomology information can be collected and analyzed.	8–10: Interoperable and integrated automated systems continually draw current information from medical systems (including treatment, surveillance, and syndromic data). These systems correlate and process the information for the identification of issues and potential solutions and/or response actions. 4–7: The collection and analysis of potential indicators are predominantly performed manually with the use of limited assistive automated tools and resources where available. 1–3: The collection and analysis of potential indicators is inadequate to prevent potential serious impact to operations 0: The collection and analysis of potential indicators is nonexistent.
M6	Battlespace health-related surveillance system is in place.	8–10: Medical surveillance of the battlespace is in place and information is correlated and processed with other source information and, as a composite, is disseminated in near-real time to requiring users. The disseminated data are accurate, current, and updated as new information is received and processed. 4–7: Medical surveillance is performed predominantly manually. Related information is generally manually correlated and processed with other source information and, as a composite, is disseminated to requiring users. The disseminated data are accurate as of the last update. 1–3: Medical surveillance is not integrated with other source data and/or contains substantial errors. 0: Medical surveillance is nonexistent.
M7	There is effective DOTLPF in place to conduct task.	8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations 4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds. 1–3: DOTLPF is inadequate for accomplishment of this task. 0: DOTLPF does not exist for this task.

<sup>1</sup> Medical surveillance is predominantly manual in performance. Limited automated medical surveillance systems exist but are generally restricted to existing medical information systems for tracking U.S. force personnel. Epidemiologists may or may not have access to information provided to command centers by field personnel, NGOs, host-nation agency contacts, and other sources. The accuracy of the derived medical surveillance information is dependent upon the experience, knowledge, and skill of the performing individual and access to relevant information. Correlation of this information with other data available to the command centers is also dependent upon the experience, knowledge, skill of the operations, intelligence, and CBRN staff and the degree to which collaboration between the command staff elements exist.

<sup>2</sup> Largely performed manually using limited assistive automated tools and resources, when available, to identify potential exposures to a CBRN/TIM agent and the affecting agent, and to outline appropriate medical countermeasures. The accuracy of this information is dependent upon the experience, knowledge, and skill of the performing medical practitioner and access to relevant information. Collaboration with CBRN and other staff members is often performed only after a definitive diagnosis is reached, increasing the time before action and does not acknowledge existing assistive expertise.

<sup>3</sup> Medical systems such as USTRANSCOM Regulating and Command and Control Evacuation System (TRCCES), Composite Health Care System II – Tactical (CHCS2T), Global Expeditionary Medical System (GEMS), and DMSS are available. However, they are not interoperable. These systems must meet DISA standards when substantial upgrades are performed or the systems are replaced. All systems must be interoperable in the far term. Information from these systems currently must be manually collected and tracked. Although these systems must be interoperable in the far term, CBRN is not possess a specific identifier in these systems and requires knowledge and skill on the part of the tracking medical and operations staff to identify and track affected personnel and units. Doctrine, policies, and procedures exist to assist the commander's staff with the identification and tracking of affected units.

<sup>4</sup> Performed manually with some limited assistive automated tools. Currently requires indication of a problem before epidemiological inquiry and medical surveillance is performed. Although limited medical surveillance tools do exist within selected stovepiped medical systems, the information must be manually interpreted and investigated generally following a deliberate implementation of the appropriate medical surveillance tool. Interoperability between medical systems may serve to support medical surveillance with preplanning for these activities and their information requirements. Epidemiologists may or may not have access to information provided to command centers by field personnel, NGOs, host-nation agency contacts, and other sources.

<sup>5</sup> Current DOTLPF addresses most critical aspects for this task using largely manual processes and focuses upon medical services activities. However, data provided to command centers by field personnel and non-force sources (e.g., NGOs, coalition partners, etc.) is not always provided to medical services for consideration and correlation. Often, when performed at all, it is conducted by the command center staff and is dependent upon the experience and knowledge of performing personnel. Observations and information within unit reports to the command center reflecting potential indicators may not be forwarded to appropriate action offices or acted upon until there a clear and present danger impresses action. DOTLPF will need to evolve as systems, tactics, and situations change.

### 9.12.3 Functional Solution Analysis

#### 9.12.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Lack of cohesive and integrated data interchange of medical information related to CBRN via electronic means to the COP.

**Partial Non-Materiel Solutions:** *Doctrine:* Adjust doctrine to address processing of information provided to the command center by field reports, coalition partners, host-nation agencies, NGOs, and other sources. *Organization:* Ensure organizational structures are in place for the assessment and integration of information from sources other than medical services into medical surveillance. *Training:* Train staffs and medical services personnel on CBRN and disease outbreak indicators. Include diverse source information in CBRN exercises and evaluations for skill development and maintenance. *Facilities:* Establish supporting infrastructure to enable data interchange and display on the COP.

2. **Deficiency:** Inadequate or lack of CBRN related casualty information.

**Partial Non-Materiel Solutions:** *Doctrine:* Adjust medical information systems doctrinal requirements to include CBRN identification and processing for medical surveillance and subsequent reporting. *Organization:* Ensure organizational structures are in place for the identification and collection of information from medical information systems for CBRN medical surveillance. *Training:* Train appropriate medical services personnel to query medical information systems and forward CBRN indicators and issues for medical surveillance review. *Facilities:* Develop supporting infrastructure to enable data collection and transfer.

3. **Deficiency:** Inadequate timeliness between generation of CBRN medical information and its display in the COP.

**Partial Non-Materiel Solutions:** *Doctrine:* Adjust doctrine to emphasize indicator identification and continuing medical surveillance in coordination with command staffs. *Facilities:* Establish supporting infrastructure to enable data collection and transfer.

#### 9.12.3.2 IMA Assessment Summary

Table 9.12-4 is a list of ideas for material approaches and a corresponding description of each idea. Approaches for this task cover the need to improve the information interchange with medical information systems, including extracting casualty data for tactical planning and improving the speed of medical input to the formation of the COP. Even though the medics are gathering patient surveillance data, the analysis of these data needs to be provided to tactical commanders to affect their decision process. Table 9.12-5 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 9.12-4. TASHA 12: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Modifications to medical information systems	Develop automated modifications to existing and developing medical patient tracking systems (e.g., DMSS, MAT, TMIP, etc.) to specifically track the status and treatment of CBRN/TIM casualties and link this information to CBRND automated systems.
Automated interface to COP	Develop automated modifications to existing and developing medical surveillance systems to specifically identify indicators of CBRN/TIM exposures and link this information to CBRND automated systems and the COP.

### **9.13 Task TASHA 13: Conduct veterinary surveillance of MWA and indigenous animal population throughout the battlespace**

#### **9.13.1 Functional Area Analysis**

##### **9.13.1.1 Definition**

This task deals with conducting veterinary surveillance of MWAs and indigenous animal population throughout the battlespace. Animal surveillance is a key part of force health protection efforts since illness or death in the animal populations may be an indication that a CBRN event has occurred.

Based on the battlespace veterinary plan, MWAs are routinely checked for potential indications of exposure to CBRN/TIM agents. Additionally, JTF elements in the area of operations can identify sick or diseased animals and birds in the conduct of their activities. As an example, patrols, convoys, and security checkpoints can identify or observe ill health in the indigenous population. The frequency and extent of ill health might be an indicator of the presence of a radiological, toxic chemical, or a biological agent. Liaison and information are collected from indigenous and NGO activities in the tactical operating area. Relatively rapid degradation in the indigenous animal and/or bird population might indicate the presence of a CBRN agent and a potential threat to JTF elements. Additionally, this task might also include observations regarding an increase of vector populations. Daily situation reports might include these observations. Information from these activities are compiled and correlated by veterinary surveillance. The results including appropriate veterinary countermeasures contribute to health and risk assessments and assist in the management of response and mitigation. Veterinary surveillance of MWA and indigenous animal and bird population is critical to the health of the force.

##### **9.13.1.2.1 Supported Task: OPSHA 7**

##### **9.13.1.2.2 Lateral Tasks: TASENS 10, TASUST 5, TASUST 6, TASUST 7**

##### **9.13.1.2.3 Supporting Task: N/A**

##### **9.13.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Partial preexisting arrangements. (C2.1.1.2)
2. Partially completed mission preparation. (C2.1.3)
3. Marginal forces assigned. (C2.2.1)
4. Poor personnel nutrition and health. (C2.2.4.1)
5. Limited personnel experience. (C2.2.4.5)
6. Limited staff expertise. (C2.3.1.3)

**Civil**

1. Correct interdepartmental/interagency relationships. (C3.1.1.3)
2. Limited foreign government support. (C3.1.2.3)
3. Moderately opposed foreign public opinion. (C 3.1.2.4)
4. Poor civil health. (C3.3.1.4)
5. High health risk. (C3.3.1.5)
6. Significant TIM present in the civilian sector. (C3.3.7.5)

**9.13.2 Functional Needs Analysis****9.13.2.1 Capability and Deficiency Assessment Summary**

Table 9.13-1 shows the current capability to track MWAs is limited and manual in nature. There is no capability to track indigenous animals. The overall capability for current, near/mid, and far term are assessed “red.”

**Current Capability and Deficiency**

Indigenous animals are currently not included in any surveillance or reporting activities and veterinary surveillance procedures must be updated to include the indigenous animal populations. Non-JTF reporting and information is not addressed for establishment and integration into veterinary surveillance activities. A need exists to develop an automated surveillance and reporting system for MWAs and indigenous animals. Veterinary information is currently processed and disseminated in text format using Lotus Notes. Information contained in this system is not interoperable or transferable to other systems by other than manual extraction and reinput.

**Projected Near/Mid-Term Capability and Deficiency**

No change is projected for this task.

**Projected Far-Term Capability and Deficiency**

No change is projected for this task.

**Table 9.13-1. TASHA 13: Capability and Deficiency Assessment**

<b>Capability: MWA/Indigenous Animal Veterinary Surveillance System</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>	<b>M6</b>	<b>M7</b>
<b>Current Overall Capability</b>	1 <sup>1</sup>	8 <sup>2</sup>	1 <sup>3</sup>	4 <sup>4</sup>	4 <sup>4</sup>	1 <sup>1</sup>	3 <sup>5</sup>
<b>Near/Mid-Term Overall Capability</b>	1	8	1	4	4	1	3
<b>Far-Term Overall Capability</b>	1	8	1	4	4	1	3

	<b>FAA Measure</b>	<b>Scale</b>
M1	Reports are provided by non-JTF activities.	8–10: Interoperable and integrated automated systems accurately and rapidly collect, correlate, validate, and process veterinary surveillance information from JTF and non-JTF sources for CBRN/TIM indications and potential cross-species outbreaks. The information is assessed and presented on the COP using automated tools and systems. 4–7: Veterinary surveillance information from JTF and non-JTF sources are accurately and rapidly collected, correlated, confirmed, and processed manually for CBRN/TIM indications and potential cross-species outbreaks. The information is assessed and presented on the COP. 1–3: Veterinary surveillance does not adequately collect, correlate, and process information from JTF and non-JTF sources for CBRN/TIM indications and potential cross-species outbreaks. 0: Veterinary surveillance does not exist.
M2	MWA restricted by veterinary isolation/quarantine are identified.	8–10: MWAs are routinely reviewed by veterinary personnel for medical issues and concerns. MWAs are isolated/quarantined when determined necessary. Identification and tracking of these animals is accurately and adequately performed by supporting veterinary services both locally, by the owning Service, and the DoD Military Working Dog Veterinary Services Center. 4–7: MWAs are reviewed by veterinary personnel upon CBRN/TIM exposure or contamination or if sick. MWAs are isolated/quarantined when determined necessary. Identification and tracking of these animals is performed manually and locally by supporting veterinary services. 1–3: Identification and tracking of veterinary ordered MWA isolation/quarantine is inadequate. 0: Identification and tracking of veterinary ordered MWA isolation/quarantine nonexistent.
M3	Outbreak indicators are assessed and confirmed.	8–10: Interoperable and integrated veterinary surveillance automated systems accurately and rapidly assess potential outbreak indicators reported by from JTF and non-JTF sources. The information is validated and presented on the COP using automated tools and systems. 4–7: Veterinary surveillance accurately and rapidly assesses and confirms outbreak indicators reported by from JTF and non-JTF sources. Veterinary surveillance is performed predominantly manually and the information is validated and presented on the COP. 1–3: Veterinary surveillance does not adequately assess and confirm outbreak indicators for CBRN/TIM indications and potential cross-species outbreaks reported by from JTF and non-JTF sources. 0: Veterinary surveillance does not exist.
M4	Reports on hazard are accurate.	8–10: Veterinary hazard report utility is high and is posted directly to the COP. 4–7: Veterinary hazard report utility exists and the information is posted on the COP after review and/or consolidation by nonveterinary activity or authority. 1–3: Veterinary hazard report utility is low and unable to support operations. 0: Veterinary hazard report utility is nonexistent.
M5	Veterinary surveillance reporting system is in place.	8–10: Interoperable and integrated veterinary surveillance reporting system exists and is in place. Reports are presented on the COP and disseminated to appropriate activities within and outside the area of operations. 4–7: Veterinary surveillance reporting system exists and is in place. Reports are performed manually and disseminated using available communications channels to selected activities within and outside the area of operations. 1–3: Veterinary surveillance reporting is inadequate to support operations. 0: Veterinary surveillance reporting does not exist.

M6	Reports of observations of CBRN attack indicators are timely.	<p>8–10: Interoperable and integrated automated systems accurately and rapidly collect, correlate, validate, and process veterinary surveillance information from JTF and non-JTF sources for CBRN/TIM indications and potential cross-species outbreaks. The information is assessed and presented on the COP using automated tools and systems.</p> <p>4–7: Veterinary surveillance information from JTF and non-JTF sources are accurately and rapidly collected, correlated, confirmed, and processed manually for CBRN/TIM indications and potential cross-species outbreaks. The information is assessed and presented on the COP.</p> <p>1–3: Veterinary surveillance does not adequately collect, correlate, and process information from JTF and non-JTF sources for CBRN/TIM indications and potential cross-species outbreaks.</p> <p>0: Veterinary surveillance does not exist.</p>
M7	There is effective DOTLPF in place to conduct task.	<p>8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations</p> <p>4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds.</p> <p>1–3: DOTLPF is inadequate for accomplishment of this task.</p> <p>0: DOTLPF does not exist for this task.</p>

<sup>1</sup> Veterinary surveillance is inadequate for the collection, correlation, and processing of information from JTF and non-JTF sources for CBRN/TIM indications and potential cross-species outbreaks. Field observations of indigenous animals and wildlife are not generally performed or forwarded for veterinary surveillance activities. Veterinary surveillance reports on MWAs are generally not provided by non-JTF activities and veterinary surveillance reports on indigenous animals and wildlife are not provided by non-JTF activities.

<sup>2</sup> MWDs are routinely restricted or isolated to reduce exposure to indigenous animals. Veterinary isolation or quarantine is imposed when determined necessary by veterinary personnel for the protection of the animal, personnel, and other MWDs. Identification and tracking is performed locally and reported to the owning Service's veterinary service and is viewed by the DoD MWD Veterinary Services Center. Reporting and identification is performed using veterinary services Lotus Notes–based system.

<sup>3</sup> Veterinary surveillance does not adequately assess and confirm potential outbreak indicators among indigenous animals and wildlife. DOTLPF does exist for the conduct of assessment and confirmation of outbreak indicators. However, field observations of indigenous animals and wildlife are not generally performed or forwarded for veterinary surveillance activities. Veterinary surveillance reports on indigenous animals and wildlife are not generally provided by non-JTF activities.

<sup>4</sup> Field veterinary services entities report on veterinary activities and identified hazards to medical services and the regional veterinary services center. The reports are generally not directly posted to the COP, although utility of identified hazards is generally high. Veterinary services do not possess automated tools to conduct veterinary surveillance. Reporting is generally performed using legacy Lotus Notes–based system or available communications systems.

<sup>5</sup> DOTLPF is inadequate for the conduct of this task. Veterinary services DOTLPF does address most critical aspects of the conduct of veterinary surveillance within the JTF. However, JTF functions and activities outside of the veterinary services do not possess adequate DOTLPF to support veterinary surveillance. Non-JTF sources of information are not adequately addressed in veterinary surveillance activities and processes.

### 9.13.3 Functional Solution Analysis

#### 9.13.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Lack of established reporting and integration into veterinary surveillance activities of indigenous animal reports from non-JTF activities and routine MWA veterinary activities.  
**Partial Non-Material Solutions:** *Doctrine:* Develop doctrine to establish procedures and guidance for MWA and indigenous animal reports from non-JTF entities. *Training:* Train non-JTF personnel to properly collect MWA and indigenous animal surveillance information and forward it to JTF activities. *Leadership:* Have leadership at non-JTF activities support and enable the collection and reporting of MWA and indigenous animal surveillance information to the JTF.
2. **Deficiency:** Inability to directly place veterinary surveillance information into the COP.  
**Non-Material Solutions:** *Doctrine:* Require the direct posting of veterinary surveillance information in the COP.
3. **Deficiency:** Lack of SOPs to assess or confirm outbreak indicators in MWAs and indigenous animals.  
**Non-Material Solutions:** *Doctrine:* Develop doctrine to require these types of SOPs.
4. **Deficiency:** Inadequate routing of observations of indigenous animal/wildlife population within daily SITREPs to the veterinary services.  
**Non-Material Solutions:** *Training:* Train personnel to routinely disseminate information on indigenous animals to veterinary services as it is placed in the situation report (SITREP). Veterinary services personnel should review SITREP.
5. **Deficiency:** Lack of inclusion of indigenous animals in hazard reporting.  
**Non-Material Solutions:** *Doctrine:* Develop doctrine to include indigenous animals in hazard reports.

#### 9.13.3.2 IMA Assessment Summary

Table 9.13-4 is a list of ideas for material approaches and a corresponding description of each idea. The recommended approach to ensure completion of this task is to improve the information exchange process between the tactical and the veterinary units so the MWA treatment information is included in the COP.

**Table 9.13-4. TASHA 13 Materiel Approaches**

<b>Identified Deficiency</b>	<b>Idea for Materiel Approach</b>	<b>Description</b>
Lack of established reporting and integration into veterinary surveillance activities of indigenous animal reports from non-JTF activities and routine MWA veterinary activities.	Modifications to veterinary information system	Develop automated modifications to existing and developing veterinary tracking systems to collect and disseminate food and water testing information, collect/collate and process veterinary CBRN information, track the status of MWA isolation and quarantine operations, and link this information to interoperable medical automated systems and the COP.

**9.14 Task TASHA 14: Conduct surveillance of food and water supplies throughout the battlespace****9.14.1 Functional Area Analysis****9.14.1.1 Definition**

Based on the battlespace preventive health plan, all food and water supplies are checked for contamination upon entering the supply chain, at key points in the supply chain, and before being prepared and consumed. This task is performed by veterinary, preventive medicine, engineer, and food service personnel. Information from these activities are collected and analyzed by preventive health surveillance. The results including appropriate preventive activities and medical countermeasures contribute to health and risk assessments and assist in the management of response and mitigation. Surveillance of food and water supplies is critical to the health of the force.

**9.14.1.2 Derivation**

*UJTL (TA 5, TA 5.2.1, TA 7, TA 7.1), Protection Joint Functional Concept, Military Transformation: A Strategic Approach.*

**9.14.1.2.1 Supported Task: OPSHA 7****9.14.1.2.2 Lateral Tasks: TASENS 7, TASENS 8, TASENS 9****9.14.1.2.3 Supporting Task: N/A****9.14.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Partial preexisting arrangements. (C2.1.1.2)
2. Partially completed mission preparation. (C2.1.3)
3. Poor personnel nutrition and health. (C2.2.4.1)
4. Limited personnel experience. (C2.2.4.5)
5. Limited staff expertise. (C2.3.1.3)

**Civil**

1. Correct interdepartmental/interagency relationships. (C3.1.1.3)
2. Limited international organization support. (C3.1.2.5)
3. Moderate health risk. (C3.3.1.5)

**9.14.2 Functional Needs Analysis****9.14.2.1 Capability and Deficiency Assessment Summary**

Table 9.14-1 discusses individual capabilities to perform this task to the designated standards. Current capabilities are based on old, manual systems and surveillance data on food and water and preventative health are not always integrated into the COP. The overall capability for current, near/mid, and far term are assessed “yellow.”

**Current Capability and Deficiency**

Testing of food is performed when there is confirmed or suspected contamination. Water testing is done by a number of groups (e.g., preventative medicine and veterinarians) based on location. There is little capability to conduct routine surveillance of food and water supplies. Any collected data are not always shared nor included in the COP. Current deficiencies include the facts that reports may not be available, preventive medicine and veterinarians are not tied together to share data, testing is performed only when there is confirmed or suspected contamination, and the Veterinary Corps relies on e-mail to obtain and pass information.

**Projected Near/Mid-Term Capability and Deficiency**

No change is projected for this task.

**Projected Far-Term Capability and Deficiency**

No change is projected for this task.

Table 9.14-1. TASHA 14: Capability and Deficiency Assessment

Capability: Veterinary Food and Water Surveillance	M1	M2	M3	M4	M5	M6	M7
Current Overall Capability	1 <sup>1</sup>	5 <sup>2</sup>	5 <sup>3</sup>	6 <sup>4</sup>	3 <sup>1</sup>	2 <sup>5</sup>	4 <sup>6</sup>
Near/Mid-Term Overall Capability	1	5	5	6	3	2	4
Far-Term Overall Capability	1	5	5	6	3	2	4

	FAA Measure	Scale
M1	Food and water surveillance information in the COP is accurate and useful.	8–10: Consumable food and water surveillance information utility is high and is accurately and rapidly presented on the COP using automated tools and systems. 4–7: Consumable food and water surveillance information utility exists; information is current and accurate and is directly posted to the COP using manual means. 1–3: Consumable food and water surveillance information utility is low, delayed, inaccurate, or not generally posted directly to the COP. 0: Consumable food and water surveillance information utility is nonexistent.
M2	Preventative health surveillance information is correlated.	8–10: Veterinary and preventative health surveillance automated systems are interoperable and integrated. Correlation of information is performed by the systems and is timely and accurate. 4–7: Correlation of veterinary and preventative health surveillance information is predominantly performed manually. 1–3: Correlation of veterinary and preventative health surveillance information is inadequate for support of operations 0: Correlation of veterinary and preventative health surveillance information is nonexistent.
M3	Reports on hazard are accurate.	8–10: Consumable food and water surveillance hazard report utility is high and is posted directly to the COP. 4–7: Consumable food and water surveillance hazard report utility exists and the information is posted on the COP after review and/or consolidation by nonveterinary activity or authority. 1–3: Consumable food and water surveillance hazard report utility is low and does not support operations. 0: Consumable food and water surveillance hazard report utility is nonexistent.
M4	Food and water surveillance information reporting system is in place.	8–10: Interoperable and integrated consumable food and water surveillance reporting system exists and is in place. Reports are presented on the COP and disseminated to appropriate activities within and outside the area of operations. 4–7: Consumable food and water surveillance reporting system exists and is in place. Reports are performed manually and disseminated using available communications channels to selected activities within and outside area of operations. 1–3: Consumable food and water surveillance reporting is inadequate for support of operations. 0: Consumable food and water surveillance reporting does not exist.

M5	Reports of contamination indications of food and water supplies are timely.	<p>8–10: Interoperable and integrated automated systems accurately and rapidly collect, correlate, and surveillance information of food and water supplies. The information is assessed and presented directly on the COP by veterinary and/or preventative health services activities using automated tools and systems.</p> <p>4–7: Surveillance information on food and water supplies is accurately and rapidly collected, correlated, and processed manually. The information is assessed and directly presented on the COP by veterinary and/or preventative health services activities.</p> <p>1–3: Food and water surveillance inadequately collects, correlates, and processes information for presentation on the COP by veterinary and/or preventative health services activities.</p> <p>0: Food and water surveillance does not exist.</p>
M6	Preventative activities and medical countermeasures are fully implemented.	<p>8–10: Veterinary and/or preventative health surveillance automated systems are interoperable and integrated. Correlation of information is performed by the systems and identifies appropriate medical services COAs that are timely and accurate. Implementation of appropriate preventative activities and medical countermeasures adequately address situation.</p> <p>4–7: Correlation of veterinary and/or preventative health surveillance information and identification of the appropriate medical services COA is predominantly performed manually and is timely and accurate. Implementation and conduct of the selected COA adequately addresses situation.</p> <p>1–3: Correlation of veterinary/or and preventative health surveillance information, identification of appropriate medical services COA, and/or implementation and conduct of the selected COA are inadequate for support of operations.</p> <p>0: Correlation of veterinary and/or preventative health surveillance information, identification of appropriate medical services COA, and/or implementation and conduct of the selected COA are nonexistent.</p>
M7	There is effective DOTLPF in place to conduct task.	<p>8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations</p> <p>4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds.</p> <p>1–3: DOTLPF is inadequate for accomplishment of this task.</p> <p>0: DOTLPF does not exist for this task.</p>

<sup>1</sup> Consumable surveillance information is generally not posted to the COP. Information collected by veterinary and/or preventative health services activities is generally posted, when performed, to the COP by medical services authorities after review. Process is predominantly manual, time- and labor-intensive, and delays display of potentially critical information on the COP with concurrent risk to health and well-being of the force.

<sup>2</sup> Veterinary and/or preventative health surveillance information is correlated. However, the process is predominantly manual and time- and labor-intensive.

<sup>3</sup> Consumable food and water surveillance hazard reporting on food and water supplies is posted on the COP by medical services authorities after review. Process is predominantly manual and time- and labor-intensive. Reporting is performed only on supplies tested. Generally, testing of food and water supplies by veterinary and/or preventative health surveillance are performed when indications exist of a potential safety issue.

<sup>4</sup> Consumable food and water surveillance information reporting processes and procedures exist and is in place. Reporting is performed manually and disseminated using available C4ISR systems.

<sup>5</sup> Cooperative relationships between veterinary, preventative health, and medical services activities in the field are largely dependent upon establishment of personal interactions, OPTEMPO, leadership interest, and the circumstances. Medical, preventative health, and veterinary services activities often operate and perform distinctly separate with generally inadequate coordination and cooperation.

<sup>6</sup> DOTLPF provides for the performance of most critical aspects of this task. In-place barriers and work-arounds, however, impede accomplishment. DOTLPF must evolve as systems, tactics, and situations change and to promote net-centric operations.

### 9.14.3 Functional Solution Analysis

#### 9.14.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Lack of common sharing of automated data between preventive medicine and veterinary services.  
**Partial Non-Materiel Solutions:** *Doctrine:* Adjust doctrine to include address and remove impediments to veterinary information processing and dissemination. *Organization:* Adjust medical and veterinary organizations to foster sharing and exchange of data. *Leadership:* Promote and maintain close cooperative and mutually participating relationships between field medical and veterinary services activities. *Training:* Provide initial and recurrent training to preventative medicine, veterinary services, and unit command staff of medical services activities facilitating and emphasizing the appropriate sharing of information.
2. **Deficiency:** Inadequate doctrine supporting veterinary performance of testing unless there is confirmed or suspected contamination.  
**Partial Non-Materiel Solutions:** *Doctrine:* Include threat-based guidance under which veterinary services activities perform sampling tests on animals for presymptomatic infections.
3. **Deficiency:** Inadequate automated data collection and exchange for consumable food and potable water surveillance.  
**Partial Non-Materiel Solutions:** *Doctrine:* Adjust joint and Service doctrine to require automated, interoperable data collection, analysis, and exchange systems for all units and forces tasked with conducting consumable food and potable water surveillance.
4. **Deficiency:** Inadequate veterinary capability for response unless there exists a known problem or suspected situation.  
**Non-Materiel Solutions:** *Doctrine:* Include threat-based guidance under which veterinary services activities perform sampling tests on animals for presymptomatic infections.  
*Personnel:* Adjust veterinary staffing for additional workload involved in testing.

#### 9.14.3.2 IMA Assessment Summary

Table 9.14-4 is a list of ideas for material approaches and a corresponding description of each idea. Approaches focus on the need for medical/veterinary data exchange process, connecting the veterinarians to the tactical network, and providing the needed automated tools to improve the speed and accuracy of veterinary testing and reporting to the COP. Table 9.14-5 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 9.14-4. TASHA 14: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Modifications to veterinary information system	Develop automated modifications to existing and developing veterinary tracking systems to collect and disseminate food and water testing information, collect/collate and process veterinary CBRN information, track the status of MWA isolation and quarantine operations, and link this information to medical automated systems and the COP.
Veterinary automated tools	Develop automated tools that, on a systematic (routine) basis, automatically trigger testing of food and water supplies.

Table 9.14-5. TASHA 14: IMA Assessment

<div>Identified Gaps</div> <div>Ideas for Material Approaches (IMA)</div>	Modifications to Veterinary Information System	Veterinary Automated Tools
Lack of common sharing of automated data between preventive medicine and veterinary services.	X	
Inadequate doctrine supporting veterinary performance of testing unless there is confirmed or suspected contamination.	X	X
Inadequate Veterinary Corps automated data collection and exchange.	X	X

**9.15 Task TASHA 15: Conduct CBRND preparations****9.15.1 Functional Area Analysis****9.15.1.1 Definition**

Includes collaborative preparation for joint and coalition forces CBRND operations within the local or immediate battlespace. Includes collecting and analyzing data from assessments within CBRND functional areas (Shape, Sense, Shield, and Sustain) to support CBRND preparations based on plans, commander's intent, and operational context and situation. Includes preparatory activities with affected forces, coalition partners, and appropriate NGO and indigenous agencies. Also includes integration of CBRN resources provided by other nations and agencies. Includes the tracking, status, and allocation of CBRND resources and activities to assure CBRND readiness and preparedness for sustained effective performance of CBRND tasks within a CBRN/TIM environment. Includes the development and dissemination of taskings to achieve defined end states. Maintains visibility and awareness in the COP of CBRND preparatory activities and resource status.

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Partial preexisting arrangements. (C2.1.1.2)
2. Limited military commitments from other nations. (C2.1.1.7)
3. Marginal forces assigned. (C2.2.1)
4. Limited modern military systems. (C2.2.5)
5. Some interoperability. (C2.2.6)
6. Full joint staff integration. (C2.3.1.1)
7. Partial multinational integration. (C2.3.1.2)

8. Moderate staff expertise. (C2.3.1.3)
9. Limited deployed supplies. (C2.8.2)
10. Limited prepositioned materiel. (C2.8.4)
11. No host-nation support. (C2.8.5)

### **Civil**

1. Limited major power involvement. (C3.1.2.1)
2. Negative foreign government support. (C3.1.2.3)
3. Uncertain international organization support. (C3.1.2.5)
4. Restrictive National Command Authority decisions. (C3.1.3)

## **9.15.2 Functional Needs Analysis**

### **9.15.2.1 Capability and Deficiency Assessment Summary**

Table 9.15-1 discusses individual capabilities to plan and prepare for CBRND operations and activities to the designated standards. Currently fielded capabilities are adequate, but need automating, for most operational situations. Capability includes processes and methodologies to plan, coordinate, and conduct preparations for CBRND operations and activities. The overall capability for current, near/mid, and far term are rated “yellow.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

### **Current Capability and Deficiency**

Processes exist to coordinate allocation of CBRND units, personnel, systems, and equipment. Plans have been prepared for operations in a CBRN/TIM environment. Training of U.S. forces for operations involving a CBRN threat is generally performed in preparation of tasked forces to conduct operations not of a sustained nature within a CBRN environment. U.S. forces are not trained and equipped to perform sustained operations within a CBRN environment. Although negotiations and discussions with coalition partners and other participants establish requirements and activities for non-U.S. forces in preparation for CBRN operations, not all potential partner nations possess CBRND capabilities. The participation of such nations in CBRN operations will be dependent upon the ability and willingness of the United States and/or other allies to provide the necessary training and materiel. Deficiencies include inadequate automated processing and assessment tools; training of coalition forces; and inadequately trained CBRND personnel.

### **Projected Near/Mid-Term Capability and Deficiency**

The initial fielding of programmed Joint CBRND systems (e.g., Joint Expeditionary Collective Protection [JECF], Joint Service Lightweight Integrated Suit Technology[JSLIST], Joint Service General Purpose Mask [JSGPM], etc.) provides additional capabilities for consideration and application in operations planning. These systems will gradually replace Service-specific legacy systems throughout the mid term and into the early far term. The CBRN staff cell must consider

the diversity of CBRND assets and their associated capabilities when conducting CBRND operations. The programmed initial fielding of JEM and JOEF will provide tools to assist the CBRN staff cell in the performance of their tasks and responsibilities. However, the processes applied by the cell personnel will largely remain unchanged.

**Projected Far-Term Capability and Deficiency**

Joint CBRND systems will fully replace legacy Service-specific systems within the early far term. Additional protective systems will likely be fielded throughout the far term to address emerging and new threats. JEM and JOEF will be fully fielded in the early far term.

Table 9.15-1. TASHA 15: Capability and Deficiency Assessment

Capability: Conduct CBRND Preparations	M1	M2	M3	M4	M5	M6	M7	M8	M9
Current Overall Capability	6 <sup>1</sup>	6 <sup>2</sup>	6 <sup>3</sup>	4 <sup>4</sup>	6 <sup>5</sup>	7 <sup>6</sup>	5 <sup>7</sup>	5 <sup>8</sup>	6 <sup>9</sup>
Near/Mid-Term Overall Capability	6	7	7	5	6	7	5	5	6
Far-Term Overall Capability	6	8	8	5	6	7	5	5	6

	FAA Measure	Scale
M1	Process exists to coordinate the allocation of CBRND units and personnel.	8–10: Automated tools, processes, and systems track and display on the COP the status of CBRND units and personnel. Includes unit equipment and supplies status, unit capabilities, and other relevant information for review. Assists with the allocation of these units and personnel to meet identified needs and operational requirements. 4–7: The identification, tracking, and allocation of CBRND units and personnel is performed by predominantly manual means. Process effectiveness is dependent upon the training, knowledge, skill, and experience of performing personnel and the currency and accuracy of applied information. 1–3: Processes for the identification, tracking, and/or allocation of CBRND units and personnel is inadequate for effective support of operations 0: Processes for the identification, tracking, and/or allocation of CBRND units and personnel is nonexistent.
M2	Allocation of CBRND systems and equipment.	8–10: Adequate quantities and types of CBRND equipment, systems, and material are available, allocated, ready, and match JTF operations (e.g., Expeditionary, High Maneuver, etc.) and environments (e.g., jungle, extreme cold terrain, desert, etc.). Includes support of sustained operations in a CBRN/TIM environment. 4–7: Sufficient quantities and types of CBRND equipment, systems, and material are allocated and ready for support of JTF operations in a CBRN/TIM environment. Adjustments to planned quantities are performed when necessary for availability. Alternatives are identified, supporting material availability determined, and appropriate allocation actions are taken. 1–3: CBRND systems and equipment allocation is inadequate to support operations. 0: CBRND systems and equipment allocation processes do not exist.
M3	Process exists to coordinate the pertinent Sense, Shape, Shield, and Sustain factors.	8–10: Automated processes, templates, and collaborative spaces ensure all relevant issues and needs are addressed. Planners and CBRN specialist are highly trained, knowledgeable, and possess access to needed reference material and impacting information. 4–7: Manual processes are predominantly applied to address pertinent CBRND issues and are dependent upon the training, skill, experience, and knowledge of planning participants. 1–3: Process are inadequate for the effective identification and planning of pertinent CBRND issues, and/or planning participants do not possess adequate training, skill, experience, and knowledge to perform the task. 0: Processes and training do not exist for the identification and planning of pertinent CBRND issues.
M4	CBRND staff cell and units have access to dedicated information technology resources to perform tasks and responsibilities.	8–10: CBRN staff cell and units possess dedicated information technology resources and tools for the accomplishment and performance of their duties and responsibilities. These are used to support operational and training requirements. 4–7: CBRN staff cell and units are able to access shared information technology resources and tools for operational requirements and training. 1–3: CBRN staff cell and units possess limited access to shared information technology resources for operational requirements and training.

		0: CBRN staff cell and units do not possess access to information technology to support operations and training.
M5	Plans exist for operations within a CBRN/TIM environment.	8–10: Operational plans for sustained operations within a CBRN/TIM environment are developed and disseminated to all tasked elements. Plans adequately address the four CBRND areas and enable maintenance of OPTEMPO and successful attainment of planned end states. 4–7: Operational plans for operations within a CBRN/TIM environment are developed and disseminated to all tasked elements. Plans adequately address the four CBRND areas and enable resumption of OPTEMPO and successful attainment of planned end states. 1–3: Plans are inadequate for support of operations within a CBRN/TIM environment. 0: Plans are nonexistent for operations within a CBRN/TIM environment.
M6	Non-DoD CBRND resources integrated when available.	8–10: Available CBRND resources of coalition partners and pertinent non-DoD entities are integrated into CBRND planning and preparations. Secure, interoperable, and interactive processes between participants track identified CBRND resources and display information that is current and accurate on the COP. 4–7: Available CBRND resources of coalition partners and pertinent non-DoD entities are integrated into CBRND planning and preparations. Tracking and readiness information is performed by the owning nation/entity and status updates are provided to the JTF staff. Tracking of CBRND resources supplied to the JTF for application is predominantly performed manually and not integrated with existing JTF automated logistics and CBRND asset tracking systems. 1–3: Identification and tracking of available CBRND resources of coalition partners and non-DoD entities is inadequate to support operations 0: Identification and tracking of available CBRND resources of coalition partners and non-DoD entities is nonexistent.
M7	Forces prepared to operate in a CBRN/TIM environment.	8–10: Forces are equipped, trained, and ready to perform sustained operations within a CBRN/TIM environment. 4–7: Forces are equipped, trained, and ready to perform operations within a CBRN/TIM environment. 1–3: Forces are inadequately equipped, trained, or ready to perform operations within a CBRN/TIM environment 0: Forces are not equipped, trained, or prepared for operations within a CBRN/TIM environment.
M8	CBRN staff cells have the training an experience to make effective preparations.	8–10: All CBRN staff cell personnel are formally trained, receive recurring refresher training, and are experienced in the determination of appropriate CBRND needs, planning, and the conduct of preparations. 4–7: Limited training is provided, is inconsistent, and/or is administered as needed of CBRN staff cell personnel on the determination of appropriate CBRND needs, planning, and the conduct of preparations. Experience will vary between CBRN staff cells among the performing units. 1–3: CBRN staff cell personnel training and experience is inadequate to support operations 0: CBRN staff cell personnel training and experience is nonexistent.
M9	There is effective DOTLPF in place to conduct task.	8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations 4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds. 1–3: DOTLPF is inadequate for accomplishment of this task. 0: DOTLPF does not exist for this task.

<sup>1</sup> Allocation of CBRND units and personnel is performed using predominantly manual processes and means. Currency and accuracy of information applied in the process is dependent upon routine reports and inquiries. Effective allocation is dependent upon the experience, skill, knowledge, and training of the staff and varies between staffs. The

programmed fielding of JOEF and JEM in the mid term provides the staff with tools to identify and assess COAs supporting the effective allocation of CBRND units and personnel. However, the process will remain largely unchanged.

<sup>2</sup> CBRND equipment, systems, and types are available in sufficient quantities to support JTF operations in a CBRN environment, provided there does not exist conflicting demands to support multiple concurrent operations with CBRN threat. Protection from high-risk TIMs is minimal in current CBRND equipment, systems, and material. Further, the majority of the types of systems do not adequately support sustained operations and require infusion of increased CBRND resources to maintain OPTEMPO. Collective protection (COLPRO) systems, for example, are generally large-scale systems and do not adequately support expeditionary and high-maneuver operations, particularly in austere environments at the extremes of the lines of communication. JECF is programmed to field in the mid term and will provide COLPRO flexibility to support most operations and situations. The JSLIST is programmed to field during the mid term and is undergoing certification to meet Occupational Safety and Health Administration (OSHA) Level “C” requirements for TIMs. The JSGPM filtration system will provide a level of protection against selected TIMs and is programmed to field during the mid term. The programmed initial fielding of JOEF and JEM in the mid term provides the staff with tools to identify and assess COAs supporting the effective allocation of CBRND resources. Full fielding of JOEF and JEM will be completed in the early far term. However, the process will remain largely unchanged.

<sup>3</sup> Processes to consider, coordinate, and plan for pertinent CBRND Sense, Shape, Shield, and Sustain factors, needs, and limitations are predominantly manually performed. The effective application of these processes is dependent upon the experience, skill, knowledge, and training of the staff and varies between staffs. The programmed initial fielding of JOEF and JEM in the mid term provides the staff with tools to identify and assess COAs supporting the planning of CBRND. JOEF and JEM will complete fielding in the early far term.

<sup>4</sup> CBRN staff cell personnel and unit personnel possess access to shared information technology resources and tools. CBRN personnel do not possess dedicated information technology to perform training and operational requirements. Available resources are shared with other requiring activities and functions. The programmed fielding of JOEF and JEM, although CBRND-supporting technologies, will likely reside upon resident C4ISR hardware and not dedicated CBRND hardware resources.

<sup>5</sup> Operational plans do not generally address sustained operations within a CBRN/TIM environment. However, plans are developed addressing operations not of a sustained nature within a CBRN environment. Operations within a TIM environment are generally not planned or considered. Resumption and/or maintenance of OPTEMPO is a primary consideration of operational planning. Processes to consider coordinate, and plan for pertinent CBRND Sense, Shape, Shield, and Sustain factors, needs, and limitations are performed for CBRN threat in the development of plans.

<sup>6</sup> In coordination with coalition partner staff and pertinent non-DoD entities, the JTF staff develops a comprehensive operations plan for successful achievement of the desired end states. Discussions and negotiations between partners determine the capabilities of each partner within the full spectrum of support. Specific tasks are assigned to elements of the coalition force and non-DoD entities most capable of completing the task. Although the provision of CBRND equipment to national forces ultimately resides with their nations, mutual logistics support among coalition partners is planned to complement partners’ capabilities and to minimize weaknesses. For example: U.S. Marine Corps forces were equipped with lightweight CBRN/TIM individual protective equipment by the United Kingdom during Operation Desert Storm. The United States installed COLPRO capabilities in Saudi critical command and control facilities for the same operation. CBRND resources availability and readiness is addressed throughout the process for CBRND. The allocation, placement, and reallocation of protective assets is a function of the planning and operational control of the JTF, JTF staff, and combined staff. Acquisition cross-Service agreements between coalition partners enable acquisition and cross-servicing support between the partners. The implementing arrangement, a more specific arrangement, provides for a wide range of support exchange including consumables, sheltering, medical care, and other support activities. The allocation, operation, manning, management, and resupply of non-U.S. force CBRND assets are generally the responsibility of the owning nation. The tracking of these assets are internal to those forces and nations. Integration of U.S. and non-U.S. logistics systems is not currently required. Tracking of non-U.S. equipment supplied for U.S. force application is largely performed manually and not integrated with existing component Service systems.

<sup>7</sup> Planning and preparation of U.S. forces for operations involving a CBRN threat provide for the equipping, training, and preparation of tasked forces to conduct operations not of a sustained nature within a CBRN environment. Negotiations and discussions with coalition partners and other participants establish similar requirements and activities for non-U.S. forces. However, not all potential partner nations possess CBRND capabilities and would rely upon the United States and other allies for equipment and training.

<sup>8</sup> Training in CBRN staff cell operations and processes is generally conducted by the unit. Standardized training is virtually nonexistent, although standard requirements for the responsibilities and duties of the cell do exist. The effectiveness of the cell is dependent upon the experience, skill, knowledge, and training of the assigned staff personnel and varies between staffs.

<sup>9</sup> DOTLPF adequately addresses most of the critical aspects of this task. However, DOTLPF requires improvement to sufficiently address areas increasingly important for the transformed force and the changing operational environment. DOTLPF will continue to need to evolve as systems, tactics, and situations change.

### 9.15.3 Functional Solution Analysis

#### 9.15.2.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Inadequate automated processing and assessment tools for the NBC staff cells.  
**Partial Non-Material Solutions:** *Doctrine:* Develop doctrine commensurate with advanced information technology application.
2. **Deficiency:** Insufficient access to automated processing tools.  
**Partial Non-Material Solutions:** *Doctrine:* Ensure TTPs and local procedures ensure access to automated processing tools.
3. **Deficiency:** Inadequate integration and tracking of non-JTF resources applied by the JTF.  
**Partial Non-Material Solutions:** *Doctrine:* Ensure TTPs and local procedures account for the integration of local resources in preparations. Also include the potential impact of chemical/biological contamination of airlift aircraft on the intertheater airlift flow and the passive defense measures available to mitigate the threat. *Organization:* Ensure coordination and collaboration with indigenous authorities. *Facilities:* Modification of supporting logistical infrastructure to track “loaned” non-U.S. CBRND resources and report status.
4. **Deficiency:** Inadequate recognition and support of non-NATO capable forces in coalitions operating in a CBRN Threat environment.  
**Partial Non-Material Solutions:** *Organization:* Ensure adequacy of coalitions to operate in a CBRND environment. *Training:* Ensure training programs are available for coalition partners who lack CBRND skills.
5. **Deficiency:** Insufficient trained personnel for CBRN staff cells.  
**Partial Non-Material Solutions:** *Training:* Ensure training programs maintained to provide a continuous pool of capable CBRN staff cells. *Personnel:* Take steps to adequately provide trained personnel to CBRN staff cells.

#### 9.15.3.2 IMA Assessment Summary

Table 9.15-4 is a list of ideas for material approaches and a corresponding description of each idea. The material approaches to help accomplish this task cover developing new, more accurate models and simulations for CBRND planning, providing reach back capability to use information from previous lessons learned, the need for linkages to other data systems and the need for additional C4ISR assets. Table 9.15-5 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 9.15-4. TASHA 15: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Simulations and models	Develop a system enabling operational commanders to efficiently execute “what if” scenarios and facilitate the evaluation of plausible adversary and friendly COAs, CBRN employment, and TIM ROTA.
Database	Develop a system for obtaining information, archiving data, accessing databases, performing information/data queries, and exchanging data files in support of CBRN functions and activities.
Reachback capability	Develop a system providing the ability to rapidly and securely reach back and contact CBRN experts and obtain CBRND plans, procedures, information, and lessons learned.
Link to GIS	Develop a system resident in standard C4ISR systems with interface to GIS to provide input to the COP.
Risk factor template	Develop a system merging CBRN, intelligence, and operational data and plans into standardized automated formats for application to effectively and rapidly accomplish CBRN/TIM functions and activities.

Table 9.15-5. TASHA 15: IMA Assessment

Identified Gaps	Ideas for Material Approaches (IMA)	Simulations and Models	Database	Reachback Capability	Link to GIS	Risk Factor Templates
Inadequate automated processing and assessment tools for the NBC staff cells.		X	X	X	X	X
Insufficient access to automated processing tools.		X	X	X	X	X
Inadequate integration and tracking of non-JTF resources applied by the JTF.		X	X		X	
Inadequate recognition and support of non-NATO capable forces in coalitions operating in a CBRN Threat environment.		X	X			X
Insufficient trained personnel for CBRN staff cells.		X	X			X

**9.16 Task TASHA 16: Conduct CBRN hazard prediction and effects modeling****9.16.1 Functional Area Analysis****9.16.1.1 Definition**

This task encompasses hazard prediction and effects modeling for situational awareness, response management, preparation, and planning within the immediate battlespace. Agent fate data aid in predicting persistency and impact over the length of the operation or campaign. Effects modeling extend to casualty prediction, effects on unit and mission capability, and expected degradation. All of these are required for COA (adversary and joint force) evaluations, preparations, and management. As the contaminated area matures, hazard levels fluctuate over time, based on the specific agent, winds, terrain, vegetation, waterways, etc. Terrain data, local or micrometeorology, and surface texture are accounted for in atmospheric modeling. Detection data and hazard characterization data are the input for the model-based predictions for atmospheric-driven hazards. Observations and data from the IDN are used to update the hazard prediction.

Biological agents, which are contagious, communicable, or propagated by vectors, are modeled to assist in locating the source, extent of population exposure, persistency in human and animal populations, and impact on military and indigenous populations.

Results are displayed to force commanders via the COP. Computations are performed in either stand-alone or network mode.

**9.16.1.2 Derivation**

*UJTL (TA 2.4, TA 7, TA 7.1), Joint Enabling Concept for CBRN Operations, Protection Joint Functional Concept, An Operational Concept for Biological Defense, Military Transformation: A Strategic Approach.*

**9.16.1.2.1 Supported Task: OPSHA 1****9.16.1.2.2 Lateral Tasks: TASENS 1, TASENS 2, TASENS 3****9.16.1.2.3 Supporting Task: N/A****9.16.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Moderately developed land. (C1.1)
2. Temperate climate. (C1.3.1)
3. Moderate atmospheric effects. (C1.3.3)

**Military**

1. Partial preexisting arrangements. (C2.1.1.2)
2. Low military systems reliability. (C2.2.5.3)
3. Some interoperability. (C2.2.6)
4. Partial joint staff integration. (C2.3.1.1)
5. Limited staff expertise. (C2.3.1.3)
6. High information volume. (C2.3.1.9)

**Civil**

1. Limited international organization support. (C3.1.2.5)

**9.16.2 Functional Needs Analysis****9.16.2.1 Capability and Deficiency Assessment Summary**

Table 9.16-1 discusses individual capabilities to perform this task to the designated standards. Staffs and units have limited capability to perform CBRN hazard prediction and effects modeling. ATP-45 provides broad-area assessments. Capability is manual and limited to the mesolevel. Even future capabilities do not provide sufficient information technology resources to CBRN staffs. The overall capability for current, near/mid, and far term are rated “yellow.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

**Current Capability and Deficiency**

There is no existing DoD approved methodology to provide common representation of WMD or TIM hazards. The current hazard prediction models have not been tested to DoD standards. These models lack validation, verification, and accreditation. Staffs and units currently possess limited capabilities to perform CBRN hazard prediction and effects modeling. ATP-45 provides broad-area assessments. Current deficiencies include lack of ability to work with urban terrain at the micro level, limited information provided by ATP-45 reports, absence of ability to accurately and rapidly characterize the hazard, coordination collaboration procedures required for medical and NBC staff cells, and no common joint hazard prediction capability. JEM will address some of these shortfalls. However, limitations remain with respect to quality control of meteorological and oceanographic inputs to JEM, as well as assessing the accuracy of JEM plume against ground truth. The absence of this supporting data has a significant impact during Concept of Operations (CONOPS) development process for high-resolution hazard prediction.

**Projected Near/Mid-Term Capability and Deficiency**

The programmed initial fielding of JWARN, JOEF, and JEM during the mid term is projected to improve the ability to perform hazard prediction and effects modeling. Overall capabilities of the JTF will gradually increase as operational units are equipped with the systems throughout the

mid term and into the early far term. However, this enhanced capability retains many of the current deficiencies. Micromodeling necessary for urban and complex terrain modeling is inadequate, a common accurate and detailed common joint hazard prediction capability is not determined, and future capabilities do not provide sufficient information technology resources to CBRN staffs. Although the systems do provide a level of support for an aerosolized biological release, they are inadequate for predicting communicable disease transmission, progression, and persistency within populations. Capabilities to detect and identify agents, including standoff detection, are fielded sporadically and as determined operationally ready. The fielding of JEM in the near term will markedly improve high-resolution hazard prediction throughout the battlespace. As JEM matures through the acquisition process, difficult challenges will be undertaken, such as urban and water dispersion. One notable shortfall with JEM is the absence of operating concepts that highlight the most effective employment of JEM across the Joint Service.

### **Projected Far-Term Capability and Deficiency**

Interoperable medical surveillance prediction and modeling tools are reasonably expected to be fielded in this period and should address communicable disease transmission, progression, and persistency within populations. Agent detect and identify capabilities continue to improve as sensor systems are determined operationally ready and fielded. Fielding of JWARN, JEM, and JOEF is projected to be completed early in the far term.

Table 9.16-1. TASHA 16: Capability and Deficiency Assessment

Capability: Hazard Prediction and Effects Modeling		M1	M2	M3	M4	M5	M6	M7	M8	M9	M10
Chemical	Current	8 <sup>1</sup>	4 <sup>2</sup>	4 <sup>3</sup>	4 <sup>4</sup>	4 <sup>5</sup>	5 <sup>6</sup>	5 <sup>6</sup>	5 <sup>6</sup>	4 <sup>7</sup>	4 <sup>8</sup>

Current Overall Capability		5	4	4	4	4	5	5	5	4	5
Near/Mid Term Overall Capability		5	5	5	5	5	6	6	6	5	5
Far Term Overall Capability		7	6	6	8	5	7	7	7	7	6

	FAA Measure	Scale
M1	There is sufficient access to the hazard prediction models.	8–10: CBRN staff cell and unit personnel possess unrestricted access to common and standardized hazard prediction models. 4–7: CBRN staff cell and unit personnel possess limited access to common hazard prediction models. 1–3: CBRN staff cell and unit personnel have difficulty accessing hazard prediction models. 0: CBRN staff cell and unit personnel do not have access to hazard prediction models.
M2	Terrain data input is adequate.	8–10: Microterrain data are available with required fidelity (e.g., accuracy, resolution, time latency, periodicity) and applied to microlevel hazard prediction. 4–7: Meso-/macroterrain data are available, accurate, and applied to meso-/macrolevel hazard prediction. 1–3: Meso-/macroterrain data are available and applied to meso-/macrolevel hazard prediction and may contain errors. 0: Terrain data are not available and/or applied to hazard prediction.
M3	Meteorological data are adequate.	8–10: Micrometeorological, as well as high-altitude-weather, data are available with required fidelity (e.g., accurate, timely, of the required resolution) and applied for microlevel hazard prediction. 4–7: Meso-/macrometeorological data are available, accurate, and applied to meso-/macrolevel hazard prediction. 1–3: Meso-/macrometeorological data are available and applied to meso-/macrolevel hazard prediction and may contain errors. 0: Meteorological data are not available and/or applied to hazard prediction.

M4	Agent detection and identification data are adequate.	<p>8–10: Automated agent detection systems are integrated and interoperable with automated CBRND systems. Sensor systems include point, standoff, detect-to-alert, detect-and-identify, and identification sensors providing adequate detection capability and coverage of operations. Sensor data are correlated and processed to identify and characterize the hazard and the results are posted on the COP in near-real time.</p> <p>4–7: Agent detection systems vary between manual to automated detection systems and are predominantly point detection, and the sensor data must be manually correlated and processed to characterize the hazard. Input to the COP is usually performed manually.</p> <p>1–3: Agent detection and identification systems and data are inadequate to support operations.</p> <p>0: Agent detection and identification systems and data are nonexistent.</p>
M5	CBRN staff cell and units have access to dedicated information technology resources to perform tasks and responsibilities.	<p>8–10: CBRN staff cell and units possess dedicated information technology resources and tools for the accomplishment and performance of their duties and responsibilities. These are used to support operational and training requirements.</p> <p>4–7: CBRN staff cell and units are able to access shared information technology resources and tools for operational requirements and training.</p> <p>1–3: CBRN staff cell and units possess limited access to shared information technology resources for operational requirements and training.</p> <p>0: CBRN staff cell and units do not possess access to information technology to support operations and training.</p>
M6	Commanders and staffs have the training to effectively use hazard prediction tools.	<p>8–10: All commanders and staff personnel are formally trained and received recurring refresher training on the effective use of hazard prediction tools to include their application, interpretation, and weak and strong points.</p> <p>4–7: Selected staff personnel are trained on the effective use of hazard prediction models and processes. Commanders are cognizant of the proper application of these tools.</p> <p>1–3: Training on the effective use of hazard prediction tools and models is inadequate to effectively support operations</p> <p>0: Training on the effective use of hazard prediction tools and models is nonexistent.</p>
M7	CBRND specialists have the training to effectively apply hazard prediction models.	<p>8–10: CBRND specialist are formally trained and received recurring refresher training on the effective use of hazard prediction tools to include their application, interpretation, and weak and strong points. Exercises and evaluations include requirements for hazard prediction modeling and interpretation to maintain competencies.</p> <p>4–7: CBRND specialists are formally trained to perform hazard prediction using prediction models. Exercises and evaluations periodically include requirements for hazard prediction modeling and interpretation to maintain basic competencies.</p> <p>1–3: Training of CBRND specialists on the effective use of hazard prediction tools and models is inadequate to effectively support operations</p> <p>0: Training of CBRND specialists on the effective use of hazard prediction tools and models is nonexistent.</p>
M8	Hazard prediction useful for assessment and decision making.	<p>8–10: Hazard prediction utility is high for hazard assessment and decision-making. Prediction is based upon standardized automated microlevel hazard prediction tools continual drawing upon various applicable sources and updating predictions.</p> <p>4–7: Hazard prediction utility exists for assessment and decision making. Prediction is based upon common hazard prediction tools and is dependent upon manual processes, possibly with limited automated support, and is reliant upon the experience, training and knowledge of performing staff and the scope and quality of influencing information.</p> <p>1–3: Hazard prediction utility is low for assessment and decision making and is inadequate to effectively support operations.</p> <p>0: Hazard prediction utility is nonexistent.</p>

M9	Hazards effects models are useful for assessment and decision making.	8–10: Hazard effects modeling utility is high for hazard assessment and decision making. Modeling is based upon standardized automated microlevel hazard effects modeling tools continual drawing upon various applicable sources and updating hazard effects presentations. 4–7: Hazard effects modeling utility exists for assessment and decision making. Modeling is based upon predominantly manual modeling tools and is dependent upon manual processes, possibly with limited automated support, and is reliant upon the experience, training, and knowledge of performing staff and the scope and quality of influencing information. 1–3: Hazard effects modeling utility is low for assessment and decision making and is inadequate to effectively support operations. 0: Hazard effects modeling utility is nonexistent.
M10	There is effective DOTLPF in place to conduct task.	8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations 4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds. 1–3: DOTLPF is inadequate for accomplishment of this task. 0: DOTLPF does not exist for this task.

<sup>1</sup> CBRND staff cell personnel and unit personnel are trained in the application of and possess access to ATP-45 hazard prediction model, a NATO standard. This is a manual process and is dependent upon the experience, skill, and knowledge of the performing individual(s). Although other prediction models, both GOTS and COTS, exist, these are not standardized and common to the force. The mid-term programmed fielding of JEM will provide CBRN specialists with a standardized and common hazard prediction tool. However, JEM will likely reside upon resident C4ISR systems and not dedicated CBRND hardware resources. CBRN specialists will possess shared access to these systems.

<sup>2</sup> Current hazard prediction modeling is performed at the meso-/macrolevel. Microterrain data, when available, are at greater depth of detail than required by the model. Modeling currently uses ATP-45, which provides broad-area assessments. ATP-45 was designed for application using standard maps. Digital Terrain Elevation Data (DTED) Level 1 terrain data adequately supports current modeling processes. The advent of computerized modeling using ATP-45 provides visualization, but generally requires terrain data to be resident. The mid-term and far-term fielding of JOEF and JEM will expand hazard modeling capabilities. Terrain data may be accessed as needed and retained from GIS, mapping, or other applicable and approved sources. JEM will provide a standardized and common hazard prediction tool.

<sup>3</sup> Current hazard prediction modeling is performed at the meso-/macrolevel. Micrometeorological data, when available, are at greater depth of detail than required by the model. Modeling currently uses ATP-45 which provides broad-area assessments. ATP-45 was designed for application using standard maps. The mid-term and far-term fielding of JOEF and JEM will expand hazard modeling capabilities. Meteorological data from applicable and approved sources is accessed on a continuing basis and applied to the model. JEM will provide a standardized and common hazard prediction tool.

<sup>4</sup> Agent detection and identification is currently performed using predominantly point detection systems and manual reporting. Characterization of the hazard is currently time-consuming and labor-intensive. Current sensor capabilities are limited. However, ongoing efforts are proceeding for development of enhanced sensor capabilities, including stand-off sensors. Fielding of these systems will occur throughout the mid- and far-term. The mid-term and far-term fielding of JWARN to operational units will provide the capability to integrate sensor data for alerting and warning. Agent identification may be achieved by sensor detection parameters, emplaced identification sensors, and/or manual identification processes. Characterization of the hazard can be performed rapidly and accurately through an adequate sensor mix tied to the automated system.

<sup>5</sup> CBRN staff cell personnel and unit personnel possess access to shared information technology resources and tools. CBRN personnel do not possess dedicated information technology to perform training and operational requirements. Available resources are shared with other requiring activities and functions. The programmed fielding of JOEF and JEM, although CBRND supporting technologies, will likely reside upon resident C4ISR hardware and not dedicated CBRND hardware resources.

<sup>6</sup> CBRN specialists received formal training on the use and application of the ATP-45 process. Commanders are cognizant of the implications of the results and factor the information into their decisions. CBRN specialists in operational units are periodically exercised and evaluated on the conduct of hazard prediction. However, most local evaluators are unable to adequately assess the performance of this task.

<sup>7</sup> Current hazard prediction capability is based upon ATP-45, which provides broad-area assessments and is reliant upon the training, knowledge, and experience of the performing individual(s). ATP-45 is not designed for predictions involving urban or complex terrain. Other prediction processes exist, both GOTS and COTS, but are not common and standard to the force. The mid-term fielding of JOEF and JEM will expand hazard prediction capabilities and their utility to operations involving other than open terrain.

---

<sup>8</sup> Current DOTLPF address the performance of this task using predominantly manual processes and at a meso-/macrolevel. Operations, however, are not restricted to open terrain, and the ATP-45 methodology is inadequate for these circumstances. DOTLPF must evolve and consider changes in technology, tactics, systems, and situations.

<sup>9</sup> CBRND staff cell personnel and unit personnel are trained in the application of and possess access to ATP-45 hazard prediction model, a NATO standard. This is a manual process and is dependent upon the experience, skill, and knowledge of the performing individual(s). Although other prediction models exist, both GOTS and COTS, exist, these are not standardized and common to the force. However, although the ATP-45 and other prediction models do provide a level of support for an aerosolized biological release, they are inadequate for predicting communicable disease transmission, progression, and persistency within populations. The mid-term and far-term programmed fielding of JEM will provide CBRN specialists with a standardized and common hazard prediction tool. However, JEM will likely reside upon resident C4ISR systems and not dedicated CBRND hardware resources. CBRN specialists will possess shared access to these systems. Further, JEM will not incorporate tools to predict disease transmission, progression, and persistency. Future medical surveillance tool development is said to include these capabilities which will be interoperable.

<sup>10</sup> Agent detection and identification is currently performed using predominantly point detection systems and manual reporting. Characterization of the hazard is currently time-consuming and labor-intensive. Current sensor capabilities are limited. However, ongoing efforts are proceeding for development of enhanced sensor capabilities, including standoff sensors. Fielding of these systems will occur throughout the mid and far term. The mid-term and far-term fielding of JWARN (Increment 1 – IOC) to operational units will provide the capability to integrate sensor data for alerting and warning. Agent identification may be achieved by sensor detection parameters, emplaced identification sensors, and/or manual identification processes. Characterization of the hazard can be performed rapidly and accurately through an adequate sensor mix tied to the automated system. JEM, programmed to initially field in the mid term and complete fielding in the early far term, will not incorporate tools to predict disease transmission, progression, and persistency. Future medical surveillance tool development is said to include these capabilities which will be interoperable.

<sup>11</sup> CBRN specialists received formal training on the use and application of the ATP-45 process. Commanders are cognizant of the implications of the results and factor the information into their decisions. CBRN specialists in operational units are periodically exercised and evaluated on the conduct of hazard prediction. However, most local evaluators are unable to adequately assess the performance of this task. However, ATP-45 is not appropriate for a nonaerosolized release of a biological agent. Close coordination and collaboration between medical services and CBRN staff cell personnel is essential for situations involving a communicable biological hazard.

### 9.16.3 Functional Needs Analysis

#### 9.16.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Absence of ability to accurately and rapidly characterize the hazard.  
**Partial Non-Material Solutions:** *Doctrine:* Improved TTPs required for hazard characterization.
2. **Deficiency:** Access is limited to information technology (IT) resources.  
**Partial Non-Material Solutions:** *Doctrine:* Ensure TTPs and local procedures access/availability to IT resources. *Organization:* Ensure adequate IT resources are available.
3. **Deficiency:** Insufficient continuing training requirement to maintain proficiency.  
**Partial Non-Material Solutions:** *Training:* Establish continued training requirements, recurring refresher courses, and training tools.
4. **Deficiency:** Inadequate ability for communicable disease transmission and persistency in populations.  
**Partial Non-Material Solutions:** *Doctrine:* Ensure doctrine addresses improved communicable disease prediction of transmission and persistency.
5. **Deficiency:** Inadequate coordination and collaboration procedures for medical and CBRN staff cells.  
**Partial Non-Material Solutions:** *Doctrine:* Establish doctrinal requirements for close collaboration of medical and CBRN staffs. *Training:* Ensure joint training programs for CBRN and medical staff cells.
6. **Deficiency:** Inadequate communicable biological hazard prediction.  
**Partial Non-Material Solutions:** *Doctrine:* Improve doctrine for communicable biological hazard prediction. *Training:* Ensure training programs for communicable biological hazard prediction.

#### 9.16.3.2 IMA Assessment Summary

Table 9.16-4 is a list of ideas for material approaches and a corresponding description of each idea. Approaches here again include the development of faster, more accurate CBRN models and simulations; improved detection capabilities; and medical tools for predicting casualties and collaborating with tactical units. Table 9.16-5 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 9.16-4. TASHA 16: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Simulations and models	Develop a system enabling operational commanders to efficiently execute “what if” scenarios and facilitate the evaluation of plausible adversary and friendly COAs, CBRN employment, and TIM ROTA
Medical prediction/collaboration tools	Develop automated tools to model the spread and persistency of communicable diseases that interface with the COP to provide collaboration and accurate information for decision making.
CBRN staff collaboration tools	Develop automated system among and between CBRND specialists and other functions (e.g., operations, logistics) to allow collaboration between these functional areas and link to the COP.
Hazard status templates	Develop a system that merges collected data and predictions of agent travel to provide hazard status.

**Table 9.16-5. TASHA 16: IMA Assessment**

Insufficient continuing training requirement to maintain proficiency.	X	X	X	X
Inadequate ability for communicable transmission and persistency in populations.	X	X	X	X
Coordination collaboration procedures required for medical and CBRN staff cells.		X	X	
Inadequate communicable biological prediction.	X	X	X	X

**9.17 Task TASHA 17: Operate an IDN to “detect to warn” and provide continuous hazard status****9.17.1 Functional Area Analysis****9.17.1.1 Definition**

This task encompasses deploying and establishing an IDN array of detectors and sensors to provide synergy to the system and compensate for the technological weaknesses of any single sensor. Includes the ability to continuously monitor the CBRN situation through the use of an IDN. An IDN likely consists of smart standoff and point detectors as a means to “detect to warn” and receive continuous updates. Compiled IDN data update hazard predictions and projected impacts to achieve an understanding of the hazard. Survey and reconnaissance activities can be directed based on the results of the IDN data. Additional IDN assets aid in monitoring persistent CBRN hazards. Data from the IDN are displayed via the COP. Areas not covered by the IDN need to be managed. Ideally, the IDN archives event histories. Additionally, the IDN links to the JTF intelligence system, theater missile defense system, and other theater collection assets. CBRN data are correlated with data from other assets at a processing node within the operations center.

**9.17.1.2 Derivation**

*UJTL (TA 2.4, TA 5, TA 5.2.1, TA 6.5, TA 7, TA 7.1), Joint Enabling Concept for CBRN Operations, Protection Joint Functional Concept, Military Transformation: A Strategic Approach.*

**9.17.1.2.1 Supported Task: OPSHA 5****9.17.1.2.2 Lateral Task: N/A****9.17.1.2.3 Supporting Task: N/A****9.17.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Moderately developed land. (C1.1)
2. Temperate climate. (C1.3.1)

**Military**

1. Limited personnel experience. (C2.2.4.5)
2. Limited modern military systems. (C2.2.5)
3. Low military systems reliability. (C2.2.5.3)

## **9.17.2 Functional Needs Analysis**

### **9.17.2.1 Capability and Deficiency Assessment Summary**

Table 9.17-1 discusses individual capabilities to perform this task to the designated standards. There is no current capability to operate an IDN to “detect to warn” and provide continuous hazard status. JWARN, when fielded, will provide improvement in the ability to warn units. The overall capability for current and near/mid term are “red.” Although improvements between the periods occur for specific supporting capabilities and are reflected in the assessment, the improved capabilities are not sufficient to change the overall assessed color ratings for the assessed measures. Improvement in task capabilities achieve an assessed “yellow” rating for the far term.

#### **Current Capability and Deficiency**

Joint forces have extremely limited capability to “detect to warn” and provide continuous status. Deficiencies include lack of sensor capability, inadequate networking of sensors, immature technology, and lack of ability to differentiate between multiple releases. Doctrine and training must mature along with the evolving systems.

#### **Projected Near/Mid-Term Capability and Deficiency**

JWARN (Increment 1 – IOC), programmed for initial fielding during the mid term, will provide a substantial improvement in the ability to notify and warn units of a hazard.

#### **Projected Far-Term Capability and Deficiency**

JWARN (Increment 1 – IOC) is projected to complete fielding in the early far term. Sensors and IDN capabilities are in development with stated fielding sometime in the far term. This effort is dependent upon the progression of sensor technologies necessary for an IDN.

Table 9.17-1. TASHA 17: Capability and Deficiency Assessment

<b>Capability: Operate an IDN to “Detect to Warn” and Provide Continuous Hazard Status</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>	<b>M6</b>	<b>M7</b>	<b>M8</b>	<b>M9</b>
<b>Current Capability</b>	0 <sup>1</sup>	0 <sup>2</sup>	0 <sup>3</sup>	0 <sup>4</sup>	0 <sup>5</sup>	0 <sup>6</sup>	0 <sup>7</sup>	0 <sup>8</sup>	0 <sup>9</sup>
<b>Near/Mid-Term Capability</b>	1	2	2	0	0	0	3	2	0
<b>Far-Term Capability</b>	3	4	4	6	4	4	4	7	3

	<b>FAA Measure</b>	<b>Scale</b>
M1	Tactical area is adequately covered by the IDN.	8–10: IDN systems exist and provide full coverage of the tactical area for all CBRN and high-threat TIMs. IDN data are integrated and interoperable with CBRN and C4ISR systems. CBRN and C4ISR systems are continuously updated with IDN information. 4–7: IDN systems exist and provide coverage of critical areas of the area of operations for all CBRN and high-threat TIMs. IDN data are integrated and interoperable with CBRN and C4ISR systems. CBRN and C4ISR systems are updated with IDN information. 1–3: IDN systems provide inadequate coverage of operations for all CBRN and high-threat TIMs. 0: IDN systems are nonexistent.
M2	There is confidence in the IDN ability to detect and provide characterization data.	8–10: IDN detection and characterization data utility is high and supports decision making, operations, and the safety and well-being of the force. 4–7: IDN detection and characterization data utility exists for decision making, operations, and assists activities providing for the safety and well-being of the force. 1–3: IDN detection and characterization data are low and unable to support decision making and operations positively affecting the safety and well-being of the force. 0: IDN detection and characterization data are nonexistent.
M3	Sensors are managed at all echelons networked to the IDN.	8–10: All echelons networked to the IDN are able to remotely manage sensors using automated tools and C4ISR connectivity. 4–7: Selected entities networked to the IDN are able to remotely manage sensors using automated tools and C4ISR connectivity. 1–3: IDN sensors are remotely managed by a single control point. 0: IDN sensors cannot be managed remotely.
M4	There are sufficient doctrine and TTPs for effective IDN operation.	8–10: Doctrine and TTPs provide clear and concise guidance, requirements, and procedures for the effective operation of an IDN. 4–7: Doctrine and TTPs provide general guidance, requirements, and procedures for the operation of an IDN. 1–3: Doctrine and TTPs do not adequately address the operation of an IDN. 0: Doctrine and TTPs are nonexistent for the operation of an IDN.

M5	Units are adequately trained to effectively operate the IDN.	<p>8–10: All personnel performing IDN operations tasks are fully trained and receive recurring refresher training on the conduct of their tasks. Exercises and evaluations are routinely conducted and fully challenge capabilities to maintain and refine skills, knowledge, and capabilities. IDN operations competences and experience are high and enable the rapid, accurate, and successful completion of tasks.</p> <p>4–7: Core personnel performing IDN operations tasks are fully trained and receive recurring refresher training on the conduct of their tasks. Exercises and evaluations do not generally fully challenge capabilities. Limited training is provided, is inconsistent, and/or is administered in preparation for operations to noncore personnel for the performance of their assigned tasks. IDN operations competencies and experience will vary, but sufficient capability exists to successfully perform tasks.</p> <p>1–3: Training is inadequate for the successful performance of IDN operations.</p> <p>0: Training is inadequate or nonexistent for the successful performance of IDN operations.</p>
M6	CBRND specialists have the training to effectively operate the IDN.	<p>8–10: All CBRND personnel are fully trained and receive recurring refresher training on the conduct of IDN operations. Exercises and evaluations are routinely conducted and fully challenge capabilities to maintain and refine skills, knowledge, and capabilities. IDN operations competences and experience are high and enable the rapid, accurate, and successful completion of tasks.</p> <p>4–7: Core CBRND specialists performing IDN operations tasks are fully trained and receive recurring refresher training on the conduct of their tasks. Exercises and evaluations do not generally fully challenge capabilities. Limited training is provided, is inconsistent, and/or is administered in preparation for operations to noncore CBRND specialists for the performance of their assigned tasks. IDN operations competencies and experience will vary, but sufficient capability exists to successfully perform tasks.</p> <p>1–3: Training is inadequate for the successful performance of IDN operations.</p> <p>0: Training is nonexistent for the successful performance of IDN operations.</p>
M7	All operation centers networked to IDN.	<p>8–10: All operations centers are networked to the IDN.</p> <p>4–7: Selected operations centers are networked to the IDN.</p> <p>1–3: Selected operations centers possess limited access to the IDN.</p> <p>0: Operations centers are not networked to the IDN.</p>
M8	IDN can successfully track and monitor the hazard throughout its persistency.	<p>8–10: The IDN maintains its ability to monitor the hazard, clear sensors between readings, and reset sensors throughout the full presence of the hazard without manual intervention.</p> <p>4–7: The IDN requires manual intervention to maintain the ability to monitor the hazard, clear sensors between readings, and reset sensors through the hazard's presence.</p> <p>1–3: The IDN requires manual intervention and possesses limited capability to monitor the hazard, clear sensors between readings, and resetting of sensors through the hazard's presence.</p> <p>0: The IDN is unable to monitor and track a hazard throughout its persistency.</p>
M9	There is effective DOTLPF in place to conduct task.	<p>8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations.</p> <p>4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds.</p> <p>1–3: DOTLPF is inadequate for accomplishment of this task.</p> <p>0: DOTLPF does not exist for this task.</p>

<sup>1</sup> Fielded IDN systems for CBRN/TIM do not currently exist. Systems are in development and fielding is expected in the far term but are contingent upon sensor technology progression. JWARN, to be initially fielded to operational units in the mid term with fielding projected to be completed in the early far term, includes IDN data capabilities.

<sup>2</sup> Confidence is low as IDN systems have yet to be fielded. Expectation is the systems will increase the accuracy of decision making, sustain OPTEMPO, and further promote the safety and well-being of the force.

<sup>3</sup> Current fielded detection systems are inadequately networked and many require manual reporting. Management of current systems is performed locally and adjustments are often made individually. Systems are in development and fielding is expected in the far-term but are contingent upon sensor technology progression. Remote management capabilities is an expectation for these future fielded systems.

<sup>4</sup> Lack of IDN maturity prohibits doctrine and TTP development.

<sup>5</sup> Units are currently trained in the operation of current non-IDN sensor systems. Training to support future fielded IDNs awaits development of associated DOTLPF and IDN technology maturity.

<sup>6</sup> CBRND specialists are currently trained in the operation of current non-IDN sensor systems. Training to support future fielded IDNs awaits development of associated DOTLPF and IDN technology maturity.

<sup>7</sup> IDN is not fielded; therefore, operations centers are not networked to the IDN. However, operations centers are increasingly evolving to handle network sensors for other battlespace threats. Connectivity to future fielded IDNs awaits development of associated DOTLPF and IDN technology maturity.

<sup>8</sup> IDN technology is currently too immature to perform this function

<sup>9</sup> Lack of IDN maturity prohibits development of supporting and associated DOTLPF.

### 9.17.3 Functional Solution Analysis

#### 9.17.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

**1. Deficiency:** Lack of sensor capability.

**Partial Non-Material Solutions:** *Doctrine:* Develop doctrine supporting IDN as sensor and IDN capability matures.

**2. Deficiency:** Lack of mature IDN and evolving operation center technologies/systems.

**Partial Non-Material Solutions:** *Doctrine:* Doctrine needs to mature as IDN and sensor capability matures. *Training:* Operations center training will have to adjust to maturing IDN capability.

**3. Deficiency:** Lack of mature doctrine.

**Non-Material Solutions:** *Doctrine:* Develop doctrine supporting IDN as sensor and IDN capability matures.

**4. Deficiency:** Absence of training standards.

**Non-Material Solutions:** *Training:* Develop training standards supporting IDN as sensor and IDN capability matures.

#### 9.17.3.2 IMA Assessment Summary

Table 9.17-4 is a list of ideas for material approaches and a corresponding description of each idea. Approaches needed to accomplish this task include the development and fielding of IDN interfaces for detectors, collecting and processing detector data, querying detectors for status and associated data processing and modeling. Table 9.17-5 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 9.17-4. TASHA 17: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
IDN interface for sensors	Ensure developmental CBRN sensors include ability to interface with an IDN. Develop adaptors to interface existing CBRN sensors to the IDN.
Collect, exchange, and disseminate information	Develop a system that collects and analyzes CBRN information and sensor input, generates, edits, and disseminates NBC reports, including downwind-hazard plots, and overlays and verify receipt of reports and plots. Transmission of data uses existing communication nets.
Query sensor status	Develop a system capable of automatically requesting sensor status (health) of networked sensors.
Simulation and models	Develop a system enabling operational commanders to display current operational picture and to efficiently execute “what if” scenarios and facilitate the evaluation of plausible adversary and friendly COAs, CBRN employment, and TIM ROTA.
Database	Develop a system for obtaining information, archiving data, accessing databases, performing information/data queries, and exchanging data files in support of CBRN functions and activities.
Field CBRN information resource	Develop a field resource system that will provide and search archived information for CBRN/TIM agents, effects, treatments, etc.
Reachback capability	Develop a system providing the ability to rapidly and securely reach back and contact CBRN experts and obtain CBRND plans, procedures, information, and lessons learned.

**Table 15.17-5. TASHA 17: IMA Assessment**

Identified Gaps	Ideas for Material Approaches (IMA)						
	IDN Interface for Sensors	Sensor Data	Query Sensors for Status	Simulation and Models	Database	Field CBRN Information Resource	Reachback Capability
Lack of sensor capability.	X	X	X				
Lack of mature IDN and evolving operation center technologies/systems.	X			X	X	X	X

**9.18 Task TASHA 18: Provide CBRN tactical situational awareness throughout the battlespace via the COP****9.18.1 Functional Area Analysis****9.18.1.1 Definition**

Establishes tactical battlespace situational awareness, via the COP, to ensure units immediately affected by the hazards are able to effectively respond, including warning units projected to be affected by the hazard based on hazard prediction results as displayed in the COP. An NBC Warning and Reporting System provides essential information for local staff action and command decisions. Data from the local IDN accompanied by hazard characterizations are the input for situational awareness. The overall operational objective is for situational awareness to mature into shared awareness, and then shared understanding. Shared awareness and understanding promotes synchronized response on the part of affected units.

## **9.18.2 Functional Needs Analysis**

### **9.18.2.1 Capability and Deficiency Assessment Summary**

Table 9.18-1 discusses individual capabilities to perform this task to the designated standards. Current capability to provide CBRN tactical situational awareness is based on ATP-45 information. The mid- to far-term fielding of JWARN and JEM will provide the future capability. The overall capability for current, near/mid, and far term are rated “yellow.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

#### **Current Capability and Deficiency**

Joint forces currently have limited capability to provide CBRN tactical situational awareness via the COP; basic ATP-45 information is currently available, and the assessment process remains predominantly manual. Current deficiencies include the lack of visibility of CBRN information in the COP, potential for errors and omissions related to predominant manual systems of assessment, and inadequacy of ATP-45 information to provide detailed and specific information; and the perishable nature of attained staff skills. Continuous training is required to update perishable skills.

#### **Projected Near/Mid-Term Capability and Deficiency**

The projected initial fielding in the mid term of JWARN, JOEF, and JEM systems will enhance the collection, processing, availability, timeliness, and accuracy of CBRN information for display in the COP. Emerging C4ISR capabilities will enhance the CBRN threat intelligence process. However, projected deficiencies include the impact of retained legacy systems upon the ability to process and disseminate information; lack of operational assessment tools for CBRN impact; and the inadequacy of ATP-45 information to provide detailed, accurate, and specific information on the hazard. New DoD systems are expected to be in compliance with DISA standards and net-centric capable, as appropriate during the current and near term for interoperability and net-centric operations. Substantial upgrades to legacy systems are required to include DISA standards and net-centric capabilities. Further, the mix of legacy and compliant systems will continue to require the attentiveness and awareness of staffs to ensure effective collection and integration of information until the legacy systems are either replaced or modified for compliance. Doctrine must evolve to maximize the utility of the new systems for all phases of operations from planning to post-operations.

#### **Projected Far-Term Capability and Deficiency**

The fielding of JWARN, JOEF, and JEM are projected to be completed during the early far term. All legacy systems are projected to either be replaced by, or be in compliance with, DISA standards and fully support net-centric operations in the far term.

Table 9.18-1. TASHA 18: Capability and Deficiency Assessment

Capability: CBRN Tactical Situational Awareness	M1	M2	M3	M4	M5	M6	M7	M8	M9
Current Overall Capability	8 <sup>1</sup>	5 <sup>2</sup>	3 <sup>2</sup>	1 <sup>3</sup>	4 <sup>4</sup>	7 <sup>5</sup>	2 <sup>6</sup>	1 <sup>2</sup>	4 <sup>7</sup>
Near/Mid-Term Overall Capability	8	6	4	2	4	8	2	3	4
Far-Term Overall Capability	9	7	8	5	5	9	3	7	5

	FAA Measure	Scale
M1	Mechanism is in place to disseminate routine, essential, and critical CBRN/TIM threat intelligence rapidly.	8–10: Means exist and are employed to rapidly disseminate routine, essential, and critical CBRN/TIM threat intelligence to all need-to-know centers. 4–7: Limited means exist and are employed for dissemination of CBRN threat intelligence to most need-to-know centers. 1–3: Means employment is inadequate for dissemination of CBRN threat intelligence to requiring need-to-know centers. 0: Means do not exist for the dissemination of CBRN threat intelligence to requiring need-to-know centers.
M2	Means exist to compile and display information on CBRN/TIM events that occurs throughout the operating area.	8–10: Automated systems substantially or fully perform collection, compilation, and processing of CBRN/TIM events occurring throughout the area of operations, incorporate display of the information, and provide the information to the COP. 4–7: Collection, compilation, and processing of CBRN/TIM events occurring throughout the area of operations is performed predominantly using manual means, is limited to available trained resources, and the quality of the selected assessed data. 1–3: Inadequate capability to collect, compile, and process information on CBRN/TIM events throughout the area of operations. 0: Nonexistent capability to collect, compile, and process information on CBRN/TIM events throughout the area of operations.
M3	Means exist to present information on the operational impact of the CBRN/TIM event.	8–10: Automated systems substantially or fully present operational impact information and plausible COAs for CBRN/TIM events occurring and provide visualization of the information. 4–7: Determination of the operational impact of CBRN/TIM events is performed predominantly using manual means, is limited to available trained resources, and the quality of the selected assessed data. Visualization is minimal. 1–3: Inadequate capability to assess and present the operational impacts of CBRN/TIM events. Automated visualization is absent. 0: Nonexistent capability to assess and visually present the operational impacts of CBRN/TIM events.
M4	There is confidence in the CBRN information available within the COP.	8–10: Confidence in accuracy, timeliness, trustworthiness, and relevancy of CBRN information on the COP is high. CBRN information is collected, correlated, and processed in high fidelity from multiple sources and source automated information systems are interoperable. 4–7: Limited confidence in accuracy, timeliness, trustworthiness, and relevancy of CBRN information on the COP. Predominantly manual processes collect, correlated, and process CBRN information from sources and may be restricted in the number of sources assessed. 1–3: Low confidence in accuracy, timeliness, trustworthiness, and relevancy of CBRN information on the COP. 0: No confidence in accuracy, timeliness, trustworthiness, and relevancy of CBRN information on the COP.

M5	There are sufficient doctrine and TTPs to effectively acquire and maintain situation awareness.	<p>8–10: Doctrine, policies, procedures, and TTPs are adequate for the establishment and maintenance of situation awareness and integrate CBRN information on the COP.</p> <p>4–7: Doctrine, policies, procedures, and TTPs supporting the establishment and maintenance of situation awareness exist and address CBRN.</p> <p>1–3: Doctrine, policies, procedures, and TTPs are inadequate for the establishment and maintenance of situation awareness.</p> <p>0: Doctrine, policies, procedures, and TTPs are nonexistent for the establishment and maintenance of situation awareness.</p>
M6	Units are adequately trained to effectively acquire and maintain situational awareness.	<p>8–10: All unit commanders and staff are formally trained and receive recurring refresher training including the effective acquisition and maintenance of situation awareness and emphasize CBRN as a critical component.</p> <p>4–7: Limited training is provided, is inconsistent, and/or is administered to staffs in preparation for operations with a CBRN threat for CBRN as an important factor when acquiring and maintaining situation awareness.</p> <p>1–3: Training on the inclusion of CBRN in the acquisition and maintenance of situation awareness is inadequate for support of operations.</p> <p>0: Training on the inclusion of CBRN in the acquisition and maintenance of situation awareness is nonexistent.</p>
M7	CBRND specialist units, teams, cells have access to the COP.	<p>8–10: CBRN specialist units, teams, and cells possess dedicated information technology resources and tools with unrestricted (as applicable) access to the COP for the accomplishment and performance of their duties and responsibilities. These are used to support operational and training requirements.</p> <p>4–7: CBRN specialist units, teams, and cells are able to access the COP using shared information technology resources and tools for operational requirements and training.</p> <p>1–3: CBRN specialist units, teams, and cells possess inadequate access to the COP to support operations and training requirements.</p> <p>0: CBRN specialist units, teams, and cells do not possess access to the COP to support operations and training requirements.</p>
M8	Potentially affected or indirectly affected units are made aware by the COP across echelons of command.	<p>8–10: All CBRN potentially or indirectly affected units are identified and notified in a timely manner by automated systems and across echelons of command on the COP. Timely, accurate, and relevant information is posted on the COP and readily accessible.</p> <p>4–7: Limited means exist and are employed over the COP across echelons of command for the dissemination of CBRN hazard information to known potentially affected units.</p> <p>1–3: Means are inadequate to notify potentially and indirectly affected units of CBRN hazard using the COP across echelons of command.</p> <p>0: Means are nonexistent to notify potentially and indirectly affected units of CBRN hazard using the COP across echelons of command.</p>
M9	There is effective DOTLPF in place to conduct task.	<p>8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations.</p> <p>4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds.</p> <p>1–3: DOTLPF is inadequate for accomplishment of this task.</p> <p>0: DOTLPF does not exist for this task.</p>

<sup>1</sup> Existing DoD communication infrastructure systems and JWARN, where available, are used to disseminate CBRN intelligence and warnings. Manual ATP-45 format messages are created when automated warning systems are unavailable. However, existing communications systems are not fully interoperable and are dependent upon systems available to elements of the JTF. Attentiveness is required to ensure the effectiveness of the intelligence and operations centers in this mixed communications environment. Net-centric operations and mandatory DISA standards address interoperability and the interchange of information among elements. All DoD systems are expected to be in compliance with DISA standards and net-centric capable, as appropriate, during the mid term.

<sup>2</sup> Current processes are predominantly manual with limited automation. Process is labor- and time-consuming and dependent upon the training, experience, and availability of performing personnel as well as the quality of the collected information. The current capability is achieved using doctrine and locally devised checklists. The process is slow and prone to human error and omissions. TIM processes are currently nonexistent for operational forces and data are limited to civilian HAZMAT and ITF-40 sources. Information currently flows vertically through the command structure and not horizontally to adjacent and nearby forces. Although limited visualization tools are available for CBRN, these are not generally in use by operating forces. JOEF and JEM are envisioned as providing forces with the tools to assess and display CBRN information and plausible COAs. JWARN will provide the means for collection and dissemination of CBRN information both vertically and horizontally. JWARN, JOEF, and JEM are projected for initial fielding during the mid term. The efficiency and utility of JWARN, JOEF, and JEM will be influenced by emerging C4ISR systems and processes residing on and using GIG Enterprise Services. Legacy systems will continue to require significant manual extraction, review, and reinput of information for application by JWARN, JOEF, and JEM. The continuing requirement for DoD systems to become and be in compliance with DISA standards will gradually provide interoperability of the systems with JOEF and JEM with projected full interoperability of systems in the far term. JOEF and JEM are programmed to link with the COP via the GIG Enterprise Service. Access needed for automated systems to post all relevant data to the COP, as well as access to needed information from the COP.

<sup>3</sup> Specificity of current ATP-45 processes is inadequate. ATP-45-based data are broad-based and general without the degree of detail necessary for effective decisioning. ATP-45 information does not provide fidelity of data essential for operations in complex and urban terrain. JWARN uses ATP-45 format. JEM is currently projected as macrolevel capable. JWARN, JOEF, and JEM are projected for initial fielding in the mid term with fielding completed in the early far term. Visualization and COA determinations are supported by these systems.

<sup>4</sup> Doctrine, policies, procedures, and TTPs supporting the establishment and maintenance of situation awareness exist and are sufficient for ATP-45-based processes. JWARN, JOEF, and JEM are projected for initial fielding in the mid term with fielding completed in the early far term and have capabilities for connectivity with the COP. Doctrine, policies, procedures, and TTP is not sufficient for providing CBRN information into the COP.

<sup>5</sup> Limited training is provided to unit staffs on CBRN as an integral part of situational awareness. Consistent formal and refresher training including CBRN in situation awareness attainment and maintenance is not regularly and routinely performed. Limited routine training is provided and often is not focused upon preparation for operations with a CBRN threat. The fielding of JWARN, JEM, and JOEF provide the capability to refine staff skills as part of local training and exercising/evaluations. JWARN, JOEF, and JEM are programmed for initial fielding during the mid term with fielding completed in the early far term. However, supporting and requiring DOTLPF is necessary to ensure attainment and maintenance of the capability that includes CBRN.

<sup>6</sup> CBRN specialist units, teams, and cells possess access to shared information technology resources and tools. CBRN personnel do not possess dedicated information technology to perform training and operational requirements. Available resources are shared with other requiring activities and functions, which may conflict with CBRN entity connectivity to the COP until a known threat is identified and command influence is exerted. JWARN, JOEF, and JEM are programmed for initial fielding during the mid term with fielding completed in the early far term and possess capabilities to link with the COP via the GIG Enterprise Service.

<sup>7</sup> Current DOTLPF adequately address tactical situation awareness. CBRN is discussed but is not considered critical without threat and does not currently possess a direct interface to COP. DOTLPF will need to evolve as systems, tactics, and situations change.

### 9.18.3 Functional Solution Analysis

#### 9.18.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

- 1. Deficiency:** Inadequate DOTLPF ensuring emergent JWARN, JOEF, and JEM capabilities provide accurate and timely information into the COP.  
**Partial Non-Material Solutions:** *Doctrine:* Develop doctrine and TTPs for JWARN, JOEF, and JEM and account for COP integration. *Organization:* Develop organization structures and processes for the accurate, timely, and effective application of JWARN, JOEF, and JEM in operations. *Training:* Incorporate into initial and recurring training the effective and timely operation and application of JWARN, JOEF, JEM and the dissemination of information on the COP. Incorporate into exercise and evaluation criteria requirements challenging force application and use of JWARN, JOEF, and JEM, including posted COP information. *Leadership:* Ensure awareness of criticality to operations with threat of accurate and timely CBRND information posted on the COP. *Facilities:* Establish supporting infrastructure necessary for the effective, accurate, and timely application of JWARN, JOEF, and JEM as well as the posting and availability of resulting information on the COP.
- 2. Deficiency:** Inadequate doctrine for predictions and status information being made available by JEM, JOEF, and JWARN.  
**Non-Material Solutions:** *Doctrine:* Develop doctrine for application of capabilities provided by JEM, JOEF, and JWARN.
- 3. Deficiency:** Inadequate basic skill training and refresher training to ensure a cadre of trained personnel.  
**Non-Material Solutions:** *Training:* Ensure training programs for CBRN Information Systems and COP.
- 4. Deficiency:** Inadequate access to IT resources and the COP.  
**Partial Non-Material Solutions:** *Training:* Ensure access to IT systems for CBRN staff cells and units.

#### 9.18.3.2 IMA Assessment Summary

Table 9.18-4 is a list of ideas for material approaches and a corresponding description of each idea. This task—key to the ability to shape the battlespace—will require extensive materiel improvements. These improvements include improvements in transmitting accurate information, using existing and forthcoming C4ISR assets to their full capabilities, and automated planning and assessment tools. Table 9.18-5 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 9.18-4. TASHA 18: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Information assurance	Develop a CBRND system that processes and transmits information in accordance with Information Assurance Defense in Depth standards including certification and accreditation in accordance with DoD and CJCS guidance.
Collect, exchange, and disseminate information	Develop a system that collects and analyzes CBRN information and sensor input, generates, edits, and disseminates NBC reports, including downwind-hazard plots, and overlays and verify receipt of reports and plots. Transmission of data uses existing communication nets.
Link to GIS	Develop a system resident in standard C4ISR systems with interface to GIS to provide input to the COP.
Simulations and models	Develop a system enabling operational commanders to efficiently execute “what if” scenarios and facilitate the evaluation of plausible adversary and friendly COAs, CBRN employment, and TIM ROTA.
Database	Develop a system for obtaining information, archiving data, accessing databases, performing information/data queries, and exchanging data files in support of CBRN functions and activities.
Reachback capability	Develop a system providing the ability to rapidly and securely reach back and contact CBRN experts and obtain CBRND plans, procedures, information, and lessons learned.
Risk factor template	Develop a system merging CBRN, intelligence, and operational data and plans into standardized automated formats for application to effectively and rapidly accomplish CBRN/TIM functions and activities.
Hazard status template	Develop a system that merges collected data and predictions of agent travel to provide hazard status.
Hazard prediction tool	Develop a DoD-approved model for CBRN and TIM hazard prediction capabilities, incorporating physics-based functionalities. The model acquires and integrates information from appropriate databases (i.e., terrain, structures, environmental, meteorological, intelligence, unit, population, etc.) to accurately predict, map, and graphically portray the hazard in near-real time.
Data fusion	Develop a capability to automatically perform data fusion. “Data fusion” is combining automatically correlated information with data that refines the information or presents it in an intuitive format. Fused data in many cases will arrive later than real- or near-real-time data.

Inadequate access to IT resources and the COP.		X	X			X				

**9.19 Task TASHA 19: Provide CBRN warning, reporting, and alarming throughout the local or immediate battlespace****9.19.1 Functional Area Analysis****9.19.1.1 Definition**

Includes warning, reporting, and alarming to disseminate CBRN information across the tactical area of operations. This task encompasses the warning, reporting and alarming of units and personnel potentially affected by the hazard in time to assume protective posture. Within the local or immediate battlespace, CBRN warning and reporting may occur multiple times, perhaps concurrently. The various elements of command monitor the CBRN/TIM situation over their respective areas of interest. For atmospheric and surface hazards, models portray the probable downwind hazard and likely downwind contour pattern for each event. The fidelity of the prediction or tracking of actual contamination depends on IDN performance. The ability to actually detect and characterize the hazard is essential to effective warning, reporting, and alarming. Interoperability of warning, reporting, and alarming systems is critical across Services and between nations.

**9.19.1.2 Derivation**

*UJTL (TA 2.4, TA 5, TA 5.2.1, TA 7, TA 7.1), Joint Enabling Concept for CBRN Operations, Protection Joint Functional Concept, Military Transformation: A Strategic Approach.*

**9.19.1.2.1 Supported Task: OPSHA 8****9.19.1.2.2 Lateral Task: N/A****9.19.1.2.3 Supporting Task: N/A****9.19.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Limited modern military systems. (C2.2.5)
2. Low military systems reliability. (C2.2.5.3)
3. Some interoperability. (C2.2.6)
4. Partial joint staff integration. (C2.3.1.1)
5. Limited staff expertise. (C2.3.1.3)
6. Intelligence dissemination and receipt partially exists. (C2.4.7)

**Civil.** N/A

## **9.19.2 Functional Needs Analysis**

### **9.19.2.1 Capability and Deficiency Assessment Summary**

Table 9.19-1 discusses individual capabilities to perform this task to the designated standards. The overall capability for current, near/mid, and far term are rated “yellow.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

#### **Current Capability and Deficiency**

Most CBRN warning, reporting, and alarming are performed using manual processes; little automation exists. Current deficiencies include lack of automated detection and warning, insufficient information for risk assessment; and stand-alone CBRND systems not integrated with C4ISR capabilities. The ATP-45 information and related processes fail to take full advantage of automated systems and processes to increase rapidity and accuracy.

#### **Projected Near/Mid-Term Capability and Deficiency**

The projected initial fielding in the mid term of JWARN will provide substantial improvement in this capability. Emerging C4ISR capabilities will enhance the dissemination of CBRN information to requiring force elements, both vertically and horizontally. New DoD systems are expected to be in compliance with DISA standards and net-centric capable, as appropriate during the current and near term for interoperability and net-centric operations. Substantial upgrades to legacy systems are required to include DISA standards and net-centric capabilities. Further, the mix of legacy and compliant systems will continue to require the attentiveness and awareness of staffs to ensure effective collection, integration, and dissemination of information until the legacy systems are either replaced or modified for compliance. Doctrine and TTPs must be revised to accommodate new C4ISR systems as well as JWARN.

#### **Projected Far-Term Capability and Deficiency**

The fielding of JWARN is projected to be completed early in the mid term. All legacy systems are projected to either be replaced by, or be in compliance with, DISA standards and fully support net-centric operations in the far term.

Table 9.19-1. TASHA 19: Capability and Deficiency Assessment

Capability: Provide CBRN Tactical and CBRN Warning, Reporting, and Alarming Throughout the Local or Immediate Battlespace	M1	M2	M3	M4	M5	M6	M7	M8
Current Overall Capability	5 <sup>1</sup>	8 <sup>2</sup>	6 <sup>2</sup>	6 <sup>2</sup>	7 <sup>3</sup>	5 <sup>4</sup>	2 <sup>5</sup>	5 <sup>6</sup>
Near/Mid-Term Overall Capability	8	9	7	6	8	5	5	5
Far-Term Overall Capability	9	9	7	7	9	5	8	5

	FAA Measure	Scale
M1	Tactical area CBRN/TIM IDN provides automated warning and reporting.	<p>8–10: Tactical area CBRN/TIM IDN systems substantially or fully perform automated warning and reporting of CBRN/TIM to local JTF elements (including coalition partners and other authorized entities) and all appropriate organizations and echelons of command and control in sufficient detail to enable effective, adequate, and rapid response specific to the incident and involved elements. CBRN information is immediately and prominently posted on the COP.</p> <p>4–7: Tactical area CBRN/TIM IDN systems are not integrated with automated warning and reporting systems and are managed and controlled by local centers. The local unit centers perform the required warning and reporting of CBRN/TIM hazards using existing and primarily manual means.</p> <p>1–3: Inadequate tactical CBRN/TIM IDN and/or warning and reporting capability exists.</p> <p>0: Tactical CBRN/TIM IDN and/or warning and reporting capability is nonexistent.</p>
M2	CBRND specialists have the training to effectively warn and make reports.	<p>8–10: All CBRND personnel are fully trained and receive recurring refresher training on CBRN warning and reporting. Exercises and evaluations are routinely conducted and fully challenge capabilities to conduct effective CBRN warning and reporting and to refine skills, knowledge, and competencies. CBRN warning and reporting competencies are high and enable the rapid, accurate, and successful notification of hazards.</p> <p>4–7: Core CBRND specialists performing CBRN warning and reporting are fully trained and receive recurring refresher training on the conduct of CBRN warning and reporting. Exercises and evaluations do not generally fully challenge capabilities. Limited training is provided, is inconsistent, and/or is administered in preparation for operations to noncore CBRND specialists for CBRN warning and reporting. CBRN warning and reporting competencies and experience will vary, but sufficient capability exists to successfully perform tasks.</p> <p>1–3: Training is inadequate for the successful performance of CBRN warning and reporting.</p> <p>0: Training is nonexistent for the successful performance of CBRN warning and reporting.</p>
M3	Commanders and staffs have the training to effectively use warnings and reports.	<p>8–10: All commanders and staff personnel are formally trained and receive recurring refresher training on the effective use of CBRN warnings and reports to include their application, interpretation, and weak and strong points.</p> <p>4–7: Selected staff personnel are trained on the effective use of CBRN warnings and reports. Commanders are cognizant of the proper application of CBRN warnings and reports.</p> <p>1–3: Training on the effective use of CBRN warnings and reports is inadequate for support of operations.</p> <p>0: Training on the effective use of CBRN warnings and reports is nonexistent.</p>

M4	Units are sufficiently trained for CBRN/TIM hazard alarm, warning, and reporting.	<p>8–10: All personnel are formally trained and receive recurring refresher training on policies, procedures, and processes for CBRN/TIM hazard alarm, warning, and reporting. Training is tailored to the functions, activities, and tasks of the individuals. Exercises and evaluations are routinely conducted and fully challenge capabilities to conduct effective CBRN hazard alarm, warning, and reporting and to refine and maintain skills, knowledge, and competencies. CBRN hazard alerting, warning, and reporting competencies are high and enable the rapid, accurate, and successful dissemination of presence of hazards.</p> <p>4–7: All unit personnel are fully trained on CBRN hazard alerting. Selected personnel are fully trained and receive recurring refresher training on the conduct of CBRN warning and reporting. Exercises and evaluations do not generally fully challenge unit capabilities. Limited training is provided, is inconsistent, and/or is administered in preparation for operations to other personnel for CBRN warning and reporting. CBRN hazard alerting, warning, and reporting competencies and experience will vary, but sufficient capability exists to successfully perform tasks.</p> <p>1–3: Training is inadequate for the successful performance of CBRN hazard alerting, warning, and reporting.</p> <p>0: Training is nonexistent for the successful performance of CBRN hazard alerting, warning, and reporting.</p> <p><b>NOTE:</b> Alerting, warning, and reporting do not strictly refer to formal ATP-45 and similar systems of information dissemination. Immediate dissemination such as yelling, radio, etc. (e.g., “Gas! Gas! Gas!”, notifying company commander, relaying to adjacent element by field phone, etc.) of an imminent hazard to local personnel is an essential element of alerting, warning, and reporting.</p>
M5	Units transmit and receive CBRN/TIM hazard alarm, warning, and reporting effectively.	<p>8–10: All units are linked to the COP and possess interoperable and integrated automated systems and tools to rapidly and accurately formulate and transmit, and receive and integrate CBRN/TIM hazard alarm, warning, and report information. Potentially or indirectly affected subordinate units are simultaneously identified and notified in a timely manner by automated systems and the COP. Related information is posted on the COP and readily accessible.</p> <p>4–7: Limited means exist, are predominantly manual, and are employed to formulate and transmit, and receive and integrate CBRN/TIM hazard alarm, warning, and report information. The parent unit disseminates the information to potentially or indirectly affected subordinate units using existing communications means.</p> <p>1–3: Means are inadequate enabling units to formulate and transmit, and receive and integrate CBRN/TIM hazard alarm, warning, and report information; and/or disseminate the information to potentially or indirectly affected subordinate units.</p> <p>0: Means are nonexistent enabling units to formulate and transmit, and receive and integrate CBRN/TIM hazard alarm, warning, and report information; and/or disseminate the information to potentially or indirectly affected subordinate units.</p>
M6	There are sufficient doctrine and TTPs for effective response and the restoration of operations.	<p>8–10: Doctrine, policies, procedures, and TTPs are adequate for effective response to, and restoration of operations following, a CBRN event and integrate CBRN information on the COP.</p> <p>4–7: Doctrine, policies, procedures, and TTPs supporting response to, and restoration of operations following, an event exist and address CBRN.</p> <p>1–3: Doctrine, policies, procedures, and TTPs are inadequate for response to, and restoration of operations following, a CBRN event.</p> <p>0: Doctrine, policies, procedures, and TTPs are nonexistent for response to, and restoration of operations following, a CBRN event.</p>

M7	Units warned to take effective countermeasures.	<p>8–10: All CBRN potentially or indirectly affected units are identified and notified in a timely manner by automated systems and the COP. Related information is posted on the COP and readily accessible.</p> <p>4–7: Limited means exist and is employed over the COP for the dissemination of CBRN hazard and countermeasure information to known potentially affected units.</p> <p>1–3: Means are inadequate to notify potentially and indirectly affected units of CBRN hazard and required countermeasures using the COP.</p> <p>0: Means are nonexistent to notify potentially and indirectly affected units of CBRN hazard and required countermeasures using the COP.</p>
M8	There is effective DOTLPF in place to conduct task.	<p>8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations</p> <p>4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds.</p> <p>1–3: DOTLPF is inadequate for accomplishment of this task.</p> <p>0: DOTLPF does not exist for this task.</p>

<sup>1</sup> Current detection systems are primarily point detection systems and require manual oversight, control, signal interpretation, validation, and reporting. The initial fielding of JWARN to operational units during the mid term provides the means to manage, integrate, and report IDN information. Fielding of JWARN is projected for completion during the early far term. JWARN enables the dissemination of CBRN information on the COP to all units in an area (horizontal flow) as well as higher authority and subordinate units (vertical flow, the current practice). However, full tactical IDN capabilities are dependent upon sensor technology progression and fielding.

<sup>2</sup> All personnel are trained during military basic training and periodic CBRND training on alerting nearby personnel, warning those in their area, and reporting the event as outlined in their unit procedures. This training is reinforced during deployment preparation for operations with a threat. CBRND specialists are fully trained and receive recurring training on the conduct of performing CBRN warning and reporting. Units not possessing primary duty CBRND specialists do assign selected staff personnel with CBRN responsibilities and provide access to the necessary training. CBRN warning and reporting competencies of these latter personnel will vary, but sufficient capability generally exists. Selected staff personnel are also trained using these warnings and reports to assess and recommended COAs to the commander for maintenance of OPTEMPO while providing for the safety and well-being of the force. Exercises and evaluations do not generally challenge all areas of unit capabilities for alerting, warning, and reporting. Adjacent units, particularly non-U.S. and often other U.S. Service, may not receive alerts, warnings, and reports until after these have been processed up through channels and then disseminated back down channels. This procedure creates unnecessary delays with potential serious ramifications for OPTEMPO and unit survivability. Fielding of JWARN is projected for completion during the early far term. JWARN enables the dissemination of CBRN information on the COP to all units in an area (horizontal flow) as well as higher authority and subordinate units (vertical flow, the current practice).

<sup>3</sup> Currently, the transmission and reception of CBRN/TIM hazard alarm, warning, and report information is performed manually predominantly using ATP-45 formats and processes by the CBRN staff cell. Each unit is responsible for ensuring potentially or indirectly affected subordinate units are notified of the hazard. This is generally performed using nondedicated existing and available communications systems. The mid-term initial fielding of JWARN, and its continued deployment into the early far term, to operational units will reduce the labor and manual steps required for effective alarming, warning, and reporting of CBRN hazards. Further, JWARN supports the horizontal and vertical dissemination of information. JWARN applies ATP-45 formats and processes for reporting and warning.

<sup>4</sup> Doctrine, policies, procedures, and TTPs outline requirements for the warning and reporting of CBRN hazards. The response to and subsequent restoration of operations following an event are generally addressed in supporting DOTLPF.

<sup>5</sup> CBRN information is not integral to the COP. DOTLPF and operational plans provide guidance and instructions for the conduct of CBRND to protect against the effects of CBRN/TIM hazards. Units plan and prepare to perform CBRND measures during preparations to ensure required actions are performed rapidly and effectively when necessary and required. MOPP 4 provides maximum protection and is implemented immediately upon notification of a hazard until the hazard is characterized and the risks are determined. However, notification is not generally performed over the COP. ATP-45 format messages and other sources are usually the means of notification to take CBRND actions. Fielding of JWARN is projected for completion during the early far term. JWARN enables the dissemination of CBRN information on the COP to all units in an area (horizontal flow) as well as higher authority and subordinate units (vertical flow, the current practice).

<sup>6</sup> Current DOTLPF includes the ability to conduct this task using largely manual processes and available communications systems. However, processes and procedures for the dissemination of information to neighboring units is not adequate. The retransmission of the information by higher echelon to all units potentially at risk or affected by a CBRN/TIM event is performed as a work-around and assurance of notification. CBRND training ranges from indepth and substantial for selected functions and personnel to inadequate. DOTLPF will need to evolve as systems, tactics, and situations change.

### 9.19.3 Functional Solution Analysis

#### 9.19.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Absence of ability to automate detection and warning reports.  
**Partial Non-Material Solutions:** *Doctrine:* Develop doctrine and adjust TTPs to address emergent capabilities. *Training:* Adapt training to account for emergent IDN, JWARN, and COP capabilities
2. **Deficiency:** Inadequate integration of emerging capabilities.  
**Partial Non-Material Solutions:** *Doctrine:* Develop doctrine and adjust TTPs to address emergent capabilities.
3. **Deficiency:** Inadequate training and maintenance of proficiency of commanders and staffs.  
**Non-Material Solutions:** *Training:* Advanced training capabilities are required.
4. **Deficiency:** Insufficient training and refresher training of units and personnel assigned to units.  
**Non-Material Solutions:** *Training:* Advanced training capabilities are required.
5. **Deficiency:** Inadequate integration of emergent C4ISR capabilities.  
**Partial Non-Material Solutions:** *Doctrine:* Develop doctrine and adjust TTPs to address emergent capabilities. *Training:* Advanced training capabilities required.
6. **Deficiency:** Doctrine and TTPs are inadequate to fully implement JWARN and COP capabilities.  
**Non-Material Solutions:** *Doctrine:* Ensure doctrine and TTPs keep pace with emergent capabilities.
7. **Deficiency:** Inadequate process of continuing adjustment for emergent C4ISR, IDN, and organizational changes.
8. **Non-Material Solutions:** *Doctrine:* Ensure doctrine and TTPs keep pace with emergent capabilities. *Organization:* Ensure organizational structures and operations adapt to emergent capabilities and maximize operational capabilities.

#### 9.19.3.2 IMA Assessment Summary

Table 9.19-4 is a list of ideas for material approaches and a corresponding description of each idea. Material approaches here focus on focus on the dissemination of the warning and reporting information using better automated tools and reach back to historical databases. Table 9.19-5 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 9.19-4. TASHA 19: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Collect, exchange, and disseminate information	Develop a system that collects and analyzes CBRN information and sensor input, generates, edits, and disseminates NBC reports, including downwind-hazard plots, and overlays and verify receipt of reports and plots. Transmission of data uses existing communications nets.
Simulations and models	Develop a system enabling operational commanders to efficiently execute “what if” scenarios and facilitate the evaluation of plausible adversary and friendly COAs, CBRN employment, and TIM ROTA.
Database	Develop a system for obtaining information, archiving data, accessing databases, performing information/data queries, and exchanging data files in support of CBRN functions and activities.
Reachback capability	Develop a system providing the ability to rapidly and securely reach back and contact CBRN experts and obtain CBRND plans, procedures, information, and lessons learned.
Risk factor templates	Develop a system merging CBRN, intelligence, and operational data and plans into standardized formats for application to effectively and rapidly accomplish CBRN/TIM functions and activities.
Link to GIS	Develop a system resident in standard C4ISR systems and interface to GIS to provide input to the COP.

**9.20 Task TASHA 20: Manage CBRN material resources to ensure effective CBRND task accomplishment****9.20.1 Functional Area Analysis****9.20.1.1 Definition**

This task encompasses the ability to ensure resources are available to effectively perform CBRND tasks across command echelons and units, as well as in support of coalition units, NGOs, and indigenous civil authorities. Resources managed include CBRN systems, items of equipment, consumables, and supplies. Involves resource tracking to ensure the effective allocation of CBRND systems equipment, supplies, and consumables throughout the operating area. Also manages demand for transportation and maintenance support for CBRND systems.

**9.20.1.2 Derivation**

*UJTL (TA 5, TA 5.2.1, TA 6.5, TA 7, TA 7.1), Protection Joint Functional Concept, Military Transformation: A Strategic Approach, Sense and Respond Logistics: Co-Evolution of an Adaptive Capability Document Concept, Sense and Respond CONOPs.*

**Military**

1. Partial preexisting arrangements. (C2.1.1.2)
2. Limited personnel experience. (C2.2.4.5)
3. Low military systems reliability. (C2.2.5.3)
4. Some interoperability. (C2.2.6)
5. Partial joint staff integration. (C2.3.1.1)
6. Partial multinational integration. (C2.3.1.2)
7. Limited staff expertise. (C2.3.1.3)
8. Restricted information exchange. (C2.3.1.8)
9. High information volume. (C2.3.1.9)
10. Limited deployed supplies. (C2.8.2)
11. Limited CONUS resupply. (C2.8.3)

**Civil.** N/A

## **9.20.2 Functional Needs Analysis**

### **9.20.2.1 Capability and Deficiency Assessment Summary**

Table 9.20-1 discusses individual capabilities to perform this task to the designated standards. U.S. forces have the capability to manage and maintain CBRND materiel resources (for U.S. forces only) for short-term, moderate-intensity CBRND operation; they do not have the current (or future) capability to ensure effective task accomplishment in high-intensity CBRND operations or for coalition partners. The overall capability for current, near/mid, and far term are rated “yellow.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

### **9.20.2.2 Overall Capability and Deficiency Assessment Summary**

Table 9.20-2 shows the overall capabilities and deficiencies for this task.

#### **Current Capability and Deficiency**

The joint forces have limited capacity to provide and manage CBRN resources in a sustained CBRND operation. Defense logistics processes and systems do exist to manage assets and Service-specific processes and systems are incorporated. Current deficiencies include lack of access to maintenance information; lack of supplies, equipment, and consumables to equip joint forces for sustained high-intensity CBRND operations; lack of effective tools to determine COA; insufficient and stove-piped systems track CBRND logistics items; and lack of integration of CBRND logistics in the COP.

#### **Projected Near/Mid-Term Capability and Deficiency**

The DoD effort to standardize data structures and promote integration/interoperability will provide increased opportunities for improvements in CBRND logistics management processes. New DoD systems are expected to be in compliance with DISA standards and net-centric capable, as appropriate during the current and near term for interoperability and net-centric operations. Substantial upgrades to legacy systems are required to include DISA standards and net-centric capabilities. Further, the mix of legacy and compliant systems will continue to require the attentiveness and awareness of staffs to ensure effective collection, integration, and dissemination of information until the legacy systems are either replaced or modified for compliance. However, the current deficiencies remain and the potential opportunities afforded by the DoD initiative and enhanced automation capabilities are not fully realized for CBRND.

#### **Projected Far-Term Capability and Deficiency**

All legacy systems are projected to either be in compliance with, or replaced by new systems that are compliant with, DISA standards and fully support net-centric operations in the far term. Otherwise, no change is projected for this task.

Table 9.20-1. TASHA 20: Capability and Deficiency Assessment

Capability: Manage CBRN Resources	M1	M2	M3	M4	M5	M6	M7	M8	M9
Current Overall Capability	4 <sup>1</sup>	4 <sup>1</sup>	4 <sup>1</sup>	5 <sup>2</sup>	4 <sup>1</sup>	7 <sup>1</sup>	5 <sup>3</sup>	5 <sup>4</sup>	5 <sup>5</sup>
Near/Mid-Term Overall Capability	4	4	4	5	4	8	5	5	5
Far-Term Overall Capability	5	5	5	5	5	9	5	5	5

	FAA Measure	Scale
M1	There is access to CBRND information for maintenance.	8–10: Queriable, interoperable, and integrated logistics automated systems substantially or fully track and report availability and operational status of all CBRND assets—end items, consumables, and components—including maintenance, location, condition, and manufacturer lot status data. 4–7: CBRND assets are tracked and reported using predominantly manual means, generally limited to aggregate information (except possibly for selected end items). 1–3: CBRND asset information inadequate for determination of availability and status of material for support of operations. 0: CBRND asset information is not available for determination of availability and status of material for support of operations.
M2	Tools and processes are available to manage CBRND material resources.	8–10: CBRND logistics management doctrine, policies, procedures, TTPs and supporting interoperable and integrated automated systems and tools exist, are in place, provide current and accurate information to the COP, and support effective management of CBRND material. 4–7: General logistics doctrine, policies, procedures, TTPs, and supporting automated systems and manual processes exist, are in place, support predominantly manual management of material, and can provide selected information on CBRND material. 1–3: Logistics management processes are inadequate for CBRND material. 0: Logistics management processes are nonexistent for CBRND material.
M3	CBRND logistic tracking system is sufficient.	8–10: CBRND logistics management doctrine, policies, procedures, TTPs, and supporting interoperable and integrated automated systems exist, are in place, and provide current and accurate information to the COP for CBRND material. 4–7: General logistics doctrine, policies, procedures, TTPs, and supporting automated systems and manual processes exist, are in place, and can provide selected information on CBRND material. 1–3: Logistics management processes are inadequate for monitoring CBRND material. 0: Logistics management processes are nonexistent for CBRND material.
M4	Sufficient replacement systems are available.	8–10: Adequate replacements end items, components, and consumables are available to rapidly support operations. Replenishment is sufficient to maintain stocks and support routine and operational requirements. 4–7: Replacement end items, components, and consumables are available to support operations. Systems may be drawn from noncommitted operational units and stocks to meet operational needs. Replenishment is sufficient to meet operational requirements. 1–3: Replacement systems, components, and/or consumables are available in inadequate numbers exist to support operations, and/or replenishment is inadequate to effectively support operational requirements. 0: Replacement systems, components, and/or consumables are not available and/or replenishment cannot support operational requirements.

M5	Appropriate CBRND logistics management processes are in place.	8–10: CBRND logistics management doctrine, policies, procedures, TTPs, and supporting interoperable and integrated automated systems exist, are in place, and provide current and accurate information to the COP for CBRND material. 4–7: General logistics doctrine, policies, procedures, TTPs, and supporting automated systems and manual processes exist, are in place, and can provide selected information on CBRND material. 1–3: Logistics management processes are inadequate for CBRND material. 0: Logistics management processes are nonexistent for CBRND material.
M6	Analytical tools are used to assess logistics demand for COA results.	8–10: Automated logistics systems substantially or fully perform analytical processing of CBRND material data to assess logistical demands for plausible COAs. 4–7: Analytical process for the assessment of plausible CBRND material impacts upon COAs is performed predominantly using manual means, is limited to available trained resources, and the quality and currency of the assessed data. 1–3: Inadequate capability to perform CBRND material assessments for the evaluation of plausible COAs. 0: Nonexistent capability to perform CBRND material assessments for the evaluation of plausible COAs.
M7	Units are fully equipped for CBRND operations.	8–10: Units are equipped with necessary CBRND materials and assets in the quantities and types to effectively conduct sustained operations and maintain OPTEMPO within a CBRN/TIM hazard environment. 4–7: Units are equipped with necessary CBRND material and assets in adequate quantities to conduct operations within a CBRN/TIM hazard environment. 1–3: Units are inadequately equipped with sufficient types or quantities of CBRND material and assets to conduct operations within a CBRN/TIM hazard environment. 0: Units are not equipped with types or quantities of CBRND material and assets for operations within a CBRN/TIM hazard environment.
M8	CBRND resources are limited or not employed due to insufficient/lack of supporting consumables	8–10: Adequate replacements end items, components, and consumables are available to rapidly support operations. Replenishment is sufficient to maintain stocks and support routine and operational requirements. 4–7: Replacement end items, components, and consumables are available to support operations. Systems may be drawn from noncommitted operational units and stocks to meet operational needs. Replenishment is sufficient to meet operational requirements. 1–3: Replacement systems, components, and/or consumables are inadequate in numbers to support operations, and/or replenishment is inadequate to support operational requirements. 0: Replacement systems, components, and/or consumables are not available and/or replenishment cannot support operational requirements.
M9	There is effective DOTLPF in place to conduct task.	8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations 4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds. 1–3: DOTLPF is inadequate for accomplishment of this task. 0: DOTLPF does not exist for this task.

<sup>1</sup> Stovepiped Service logistics systems exist for maintenance, stocks, transport, and requisitioning. However, these systems are not interoperable and integrated. Predominantly manual means are applied to obtain and aggregate information, generally using manual reporting processes. General logistics DOTLPF are in place and support manual processes. However, the information is not integrated into the COP for awareness and for rapid or immediate COA decisioning support. Assessment processes and integration into COA development is generally performed manually. The effectiveness of CBRND logistics management is dependent upon the experience, skill, knowledge, and training of the assigned

staff personnel and the quality and accuracy of the base information and varies between staffs. Net-centric operations and DISA data standards address interoperability and the interchange of information among DoD systems and elements. DoD systems are expected to be increasingly in compliance with the DISA standards and net-centric capable, as appropriate, during the mid term. New DoD systems are currently required to be in compliance with DISA standards and net-centric capable when fielded. All remaining legacy systems are projected to either be replaced by, or be fully compliant with, DISA standards and net-centric capable in the far term. Interoperability with coalition partners, especially non-NATO partners, may be a continuing issue requiring maintenance of attentiveness and awareness by the responsible centers. The programmed initial fielding of JOEF and JEM in the mid term, with fielding completed early in the far-term, provides the staff with tools to identify and assess COAs supporting the effective allocation of CBRND resources. However, the process will remain unchanged.

<sup>2</sup> CBRND equipment, systems, and types are available in sufficient quantities to support JTF operations in a CBRN environment, provided there do not exist conflicting demands to support multiple concurrent operations with CBRN threat. A number of CBRND assets are low-density items and may require transfer from nonparticipating units to meet JTF requirements. Further, the majority of the types of systems do not adequately support sustained operations and require infusion of increased CBRND resources to maintain OPTEMPO. For example, COLPRO systems are generally large-scale systems, limited in number, and do not adequately support expeditionary and high-maneuver operations, particularly in austere environments at the extremes of the lines of communication. Currently, replacement must be drawn from other deployable, but untasked, units. JECIP is programmed to field in the mid term and will provide COLPRO flexibility to support most operations and situations. Replenishment of depot supporting stocks of systems, components, and consumables are largely dependent upon manufacturer production surge capacities and available production line capacities. Often, assets are manufactured under sole source contracts, may contain proprietary materials/processes, and the asset or critical components may be produced outside of the United States. Further, asset replacement/replenishment is dependent upon planning, available logistical transport resources, assigned priority in relation to other mission-critical assets, and the location and status of the needed asset. DOTLPP provides for the acquisition and maintenance of war reserve materiel (WRM) stocks to meet projected operational requirements. However, funding of WRM acquisitions and levels maintenance are performed by the Services and generally addressed after other operational requirements are satisfied. Funding of WRM stocks of CBRND assets are not forecasted by the Services due to changing operational requirements and is performed on annually based upon available funds. Availability of systems is further complicated in circumstances involving non-CBRND equipped partner forces, increasing demand upon available systems for initial and replacement support. Other CBRND-capable partners may offset initial CBRND system requirements, but replacement and support of partner-provided assets requires close coordination and cooperation between the JTF and the providing partner.

<sup>3</sup> Limited availability of selected types and specific systems does not permit the allocation of these resources to all units possessing planned operational taskings. A number of CBRND assets are low density and inadequate to support multiple operations involving a threat. Planners consider the availability of CBRND resources, threat, risks, and projected operational requirements to identify CBRND requirements. Determination of the mix of systems is performed by the planners based upon this logistical information. Adjustments are accomplished upon implementation of plans and as needed during operations to provide adequate quantities and types of CBRND materials for support of CBRN operations. However, planning and CBRND assets do not adequately support sustained operations within a CBRN/TIM operations.

<sup>4</sup> CBRND equipment, systems, and types are available in sufficient quantities to support JTF operations in a CBRN environment, provided there do not exist conflicting demands to support multiple concurrent operations with CBRN threat. A number of CBRND assets are low-density items and may require transfer from nonparticipating units to meet JTF requirements. Further, the majority of the types of systems do not adequately support sustained operations and require infusion of increased CBRND resources to maintain OPTEMPO. For example, COLPRO systems are generally large-scale systems, limited in number, and do not adequately support expeditionary and high-maneuver operations, particularly in austere environments at the extremes of the lines of communication. Currently, replacement must be drawn from other deployable, but untasked, units. JECIP is programmed to field in the mid term and will provide COLPRO flexibility to support most operations and situations. Replenishment of depot supporting stocks of systems, components, and consumables are largely dependent upon manufacturer production surge capacities and available production line capacities. Often, assets are manufactured under sole source contracts and may contain proprietary materials/processes and the asset or critical components may be produced outside of the United States. Further, asset replacement/replenishment is dependent upon planning, available logistical transport resources, assigned priority in relation to other mission-critical assets, and the location and status of the needed asset. DOTLPP provides for the acquisition and maintenance of WRM stocks to meet projected operational requirements. However, funding of WRM acquisitions and levels maintenance are performed by the Services and generally addressed after other operational requirements are satisfied. Funding of WRM stocks of CBRND assets are not forecasted by the Services due to changing operational requirements and is performed on an annually based upon available funds. Availability of systems is further complicated in circumstances involving non-CBRND equipped partner forces, increasing demand upon available systems for initial and replacement support. Other CBRND-capable partners may offset initial CBRND system requirements, but replacement and support of partner-provided assets requires close coordination and cooperation between the JTF and the providing partner.

<sup>5</sup> Existing DOTLPP adequately addresses the performance of this task although predominantly using manual means. DOTLPP requires improvement to sufficiently address areas increasingly important for the transformed force and the changing operational environment. DOTLPP will continue to need to evolve as systems, tactics, and situations change.

### 9.20.3 Functional Solution Analysis

#### 9.20.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Inadequate access to maintenance information.  
**Partial Non-Material Solutions:** *Doctrine:* Doctrine and TTPs are required for emergent access to maintenance information. *Training:* Training programs are required to ensure personnel know-how to access information.
2. **Deficiency:** Inadequate ability to query and apply automated logistics information for CBRND.  
**Partial Non-Material Solutions:** *Doctrine:* Develop doctrine, policy, and TTPs incorporating CBRND into logistics information processes. *Training:* Ensure CBRN staff cell receive initial and recurring training on accessing automated logistics information systems and processing information.
3. **Deficiency:** Inadequate integration of emergent capabilities and systems.  
**Partial Non-Material Solutions:** *Doctrine:* Doctrine and TTPs need to evolve relevant to emerging capability. *Training:* Ensure training programs are available for the effective use of emergent resource management systems.

#### 9.20.3.2 IMA Assessment Summary

Table 9.20-4 is a list of ideas for material approaches and a corresponding description of each idea. In addition to the material approaches involving data access, modeling and automated tools, this task also brings in the need for interfacing with logistical data to determine the current status of CBRND equipment down to unit level. Table 9.20-5 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 9.20-4. TASHA 20: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Database	Develop a system for obtaining information, archiving data, accessing databases, performing information/data queries, and exchanging data files in support of CBRN functions and activities.
Reachback capability	Develop a system providing the ability to rapidly and securely reach back and contact CBRN experts and obtain CBRND plans, procedures, information, and lessons learned.
Management of databases	Develop a system to link and manage the accuracy, adequacy, and availability of CBRND information databases. Includes access management, content control, and the conduct of data set management. Also includes process to identify database actions such as consolidation of similar databases, establishment of new databases, archiving of obsolete databases, etc.
Link to GIS	Develop a system resident in standard C4ISR systems and interface with GIS to provide input to the COP.
Link to logistics systems	Develop an automated interface that tracks CBRND supplies and equipment and their status and condition through existing DoD logistics systems.
Simulations and models	Develop a system enabling operational commanders to efficiently execute “what if” scenarios and facilitate the evaluation of plausible adversary and friendly COAs, CBRN employment, and TIM ROTA.
Risk factor templates	Develop a system merging CBRN, intelligence, and operational data and plans into standardized automated formats for application to effectively and rapidly accomplish CBRN/TIM functions and activities.

Table 9.20-5. TASHA 20: IMA Assessment

Identified Gaps	Ideas for Material Approaches (IMA)						
	Database	Reachback Capability	Management of Databases	Link to GIS	Link to Logistics Systems	Simulations and Models	Risk Factor Templates
Inadequate access to maintenance information	X	X	X	X	X		
Inadequate ability to query and apply automated logistics information for CBRND	X	X		X	X	X	
Inadequate integration of emergent capabilities and systems					X	X	X

**9.21 Task TASHA 21: Conduct immediate or local battlespace CBRN/TIM incident COA assessment for maneuvering forces****9.21.1 Functional Area Analysis****9.21.1.1 Definition**

Includes immediate or local CBRN/TIM incident COA assessment for maneuvering forces. Also includes evaluating adversary COAs against maneuver force vulnerabilities and COAs for maneuvering forces response. This considers all aspects of Shield, Shape, Sense, and Sustain operational elements. As part of the process, tactical end states are envisioned for sustained operation while enduring CBRN attacks.

**9.21.1.2 Derivation**

*UJTL (TA 2.4, TA 5, TA 5.2.1, TA 6.5, TA 7, TA 7.1), Protection Joint Functional Concept, Military Transformation: A Strategic Approach.*

**9.21.1.2.1 Supported Task: OPSHA 6****9.21.1.2.2 Lateral Task: N/A****9.21.1.2.3 Supporting Task: N/A****9.21.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Moderately developed land. (C1.1)
2. Major storm weather systems. (C1.3.1.2)
3. Precipitating weather. (C1.3.1.3)
4. Strong atmospheric weapons effects. (C1.3.3)

**Military**

1. Limited modern military systems. (C2.2.5)
2. Partial joint staff integration. (C 2.3.1.1)
3. Limited staff expertise. (C2.3.1.3)
4. Restricted information exchange. (C2.3.1.8)
5. High information volume. (C2.3.1.9)
6. Low certitude of data. (C2.4.6)

**Civil.** N/A

## **9.21.2 Functional Needs Analysis**

### **9.21.2.1 Capability and Deficiency Assessment Summary**

Table 9.21-1 discusses individual capabilities to perform this task to the designated standards. The current capability to conduct CBRN/TIM incident COA assessment for maneuvering forces is a manual process (essentially ATP-45 and map overlays), augmented with limited automated tools that work in isolation and are not part of the COP. The overall capability for current, near/mid, and far term are rated “yellow.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

#### **Current Capability and Deficiency**

Staffs and units have the capability to account for all Sense, Shape, Shield, and Sustain factors in manual and mental processes. CBRND resource information is not included in the COP, and there is a limited capability to share local information between adjacent units. Current deficiencies include limited decision and assessment tools, lack of automated processes, lack of capability to account for resources, lack of collaborative capability, the inability for agent/release characterization at lower unit levels, and lack of CBRN resource visibility in the COP.

#### **Projected Near/Mid-Term Capability and Deficiency**

The programmed initial deployment of JWARN, JOEF, and JEM during the mid term provides enhanced staff capability to effectively and rapidly assess CBRN events and to conduct COA assessment. The DoD effort to standardize data structures and promote integration/ interoperability will provide increased opportunities for improvements in CBRND logistics management processes. Developmental “born joint” DoD information systems will be compliant with the four elements of the NR-KPP, ensuring interoperability, information assurance, integration to the appropriate community of interest, as well as GIG architecture. Substantial upgrades to legacy systems are required to include DISA standards and net-centric capabilities. Further, the mix of legacy and compliant systems will continue to require the attentiveness and awareness of staffs to ensure effective collection, integration, and dissemination of information until the legacy systems are either replaced or modified for compliance. However, the current deficiencies remain and the potential opportunities afforded by the DoD initiative and enhanced automation capabilities are not fully realized for CBRND.

#### **Projected Far-Term Capability and Deficiency**

The completion of deployment of JWARN, JOEF, and JEM is expected during the early far term. All legacy systems are projected to either be in compliance with, or replaced by new systems that are compliant with, DISA standards and fully support net-centric operations in the far term. Otherwise, no change projected for this task.

**Table 9.21-1. TASHA 21: Capability and Deficiency Assessment**

<b>Capability: Immediate or Local Battlespace CBRN/TIM Incident COA Assessment for Maneuvering Forces</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>	<b>M6</b>	<b>M7</b>
<b>Current Overall Capability</b>	6 <sup>1</sup>	5 <sup>2</sup>	5 <sup>3</sup>	6 <sup>4</sup>	4 <sup>5</sup>	3 <sup>6</sup>	5 <sup>7</sup>
<b>Near/Mid-Term Overall Capability</b>	6	5	5	7	4	4	5
<b>Far-Term Overall Capability</b>	7	5	5	8	5	7	5

	<b>FAA Measure</b>	<b>Scale</b>
M1	Assessment is conducted collaboratively.	8–10: Electronic collaborative workspaces with automated tools exist and are predominantly applied for evaluation, assessment, planning, and decisioning processes. 4–7: Manual collaborative processes are predominantly applied for the evaluation, assessment, planning, and decisioning processes. 1–3: Collaborative processes are inadequate for the conduct of evaluation, assessment, planning, and decisioning processes. 0: Collaborative processes do not exist for the conduct of evaluation, assessment, planning, and decisioning processes.
M2	Operational and analytical/planning staffs have the training and experience to effectively assess CBRN event response COAs.	8–10: All intelligence, operations, and CBRN staff personnel are formally trained and receive recurring refresher training on the conduct of CBRN COA assessment for event response. 4–7: Limited training is provided, is inconsistent, and/or is administered in preparation for operations to intelligence, operations, and CBRN cell specialists for the processing and conduct of CBRN event response COA assessment. 1–3: Adversary CBRN event response COA assessment training is inadequate to support operations. 0: Adversary CBRN event response COA assessment training is nonexistent.
M3	There are sufficient doctrine and TTPs for effective assessments.	8–10: Doctrine, policies, procedures, and TTPs are adequate for effective assessments and are actively revised to exploit current, emerging, and projected technologies and changes to tactics, systems, capabilities, and situations. 4–7: Doctrine, policies, procedures, and TTPs for assessment exist but are predominantly manual and are periodically revised to exploit technologies and operational changes. 1–3: Doctrine, policies, procedures, and TTPs are inadequate for effective assessments. 0: Doctrine, policies, procedures, and TTPs are nonexistent for effective assessments.
M4	All pertinent Sense, Shape, Shield, and Sustain factors are considered.	8–10: Automated processes, templates, and collaborative spaces ensure all relevant issues and needs are addressed. Staff and CBRN specialists are highly trained, knowledgeable, and possess access to needed reference material and impacting information. 4–7: Manual processes are predominantly applied to address pertinent CBRND issues and are dependent upon the training, skill, experience, and knowledge of staff participants. 1–3: Processes are inadequate for the identification and planning of pertinent CBRND issues, and/or staff and/or CBRN specialist participants do not possess adequate training, skill, experience, and knowledge to adequately perform the task. 0: Processes do not exist for the identification and planning of pertinent CBRND issues, and/or staff and/or CBRN specialist participants do not possess training, skill, experience, and knowledge to perform the task.

M5	CBRND resources location, status, and availability displayed by COP.	<p>8–10: CBRND logistics management doctrine, policies, procedures, TTPs, and supporting interoperable and integrated automated systems and tools exist, are in place, provide current and accurate information to the COP, and support effective management of CBRND material.</p> <p>4–7: General logistics doctrine, policies, procedures, TTPs and supporting automated systems and manual processes exist, are in place, support predominantly manual management of material, and can provide selected information on CBRND material. Placement on the COP, when performed, is by manual entry.</p> <p>1–3: Logistics management processes are inadequate for CBRND material.</p> <p>0: Logistics management processes are nonexistent for CBRND material.</p>
M6	Accurate local data are available.	<p>8–10: Micrometeorology, microterrain, unit element locations, and CBRN detection and characterization data are available, accurate, and effectively applied to microlevel hazard prediction using automated systems and tools. Data are correlated and processed to identify and characterize the hazard and the results are posted on the COP in near-real time.</p> <p>4–7: Meso-/macrometeorological and terrain, unit locations, and CBRN detection and characterization data are available, accurate, and adequately applied to meso-/macrolevel hazard prediction. Data is correlated and processed predominantly using manual means to identify and characterize the hazard. Input to the COP is usually performed manually.</p> <p>1–3: Meteorology, terrain, unit location, and/or CBRN detection and characterization data are inadequate to support operations.</p> <p>0: Meteorology, terrain, unit location, and/or CBRN detection and characterization data are nonexistent.</p>
M7	There is effective DOTLPF in place to conduct task.	<p>8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations.</p> <p>4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds.</p> <p>1–3: DOTLPF is inadequate for accomplishment of this task.</p> <p>0: DOTLPF does not exist for this task.</p>

<sup>1</sup> Assessments currently require collaboration using traditional means such as telephone calls, personal visits, mail routing, e-mail, and other similar means. There is an absence of electronic collaborative workspaces within which differing functions and activities are able to cooperatively assist the evaluation, assessment, planning, and decisioning process without time delay and the need for physical presence. Automated tools could effectively enhance and be enhanced by these electronic rooms. Collaborative workspaces support net-centric operations. These workspaces are inevitable and a natural progression with the increasing utility of automation and information sharing.

<sup>2</sup> Limited training is provided to intelligence, operations, and CBRN cell specialists for the processing and conduct of CBRN incident COA development and assessment. Consistent formal and refresher training on immediate or local battlefield CBRN incident COA development and assessment is not regularly and routinely performed. Limited routine training is provided and often is not focused until preparation for operations. The fielding of JEM and JOEF provide capability to refine cell specialist skills as part of local training and exercising/evaluations. Initial fielding of JEM and JOEF is projected for mid term with completion of fielding in the early far term. However, supporting and requiring DOTLPF is necessary to ensure attainment and maintenance of capability.

<sup>3</sup> Doctrine, policies, procedures, and TTPs exist and are sufficient for the manual performance of effective CBRN incident assessment. This is not true for current, emerging, and projected automated and simulated based assessment tools. Doctrine, policies, procedures, and TTPs must evolve to accommodate changes in tactics, systems, capabilities, and situations.

<sup>4</sup> Manual processes exist and are applied by staff and NBC specialists. However, the breadth and depth of planning and consideration of CBRND issues is dependent upon the knowledge, skills, and experience of the participants in the process. The projected initial fielding of JEM and JOEF, with fielding completed in the early far term, provides enhanced automated capabilities to conduct COA development and determination of supporting resource allocations for CBRND.

<sup>5</sup> Stovepiped Service logistics systems exist for maintenance, stocks, transport, and requisitioning. However, these systems are not interoperable and integrated. Predominantly manual means are applied to obtain and aggregate information, generally using manual reporting processes. General logistics DOTLPF are in place and support manual processes. However, the information is not integrated into the COP for awareness and for rapid or immediate COA decisioning support. CBRN units are identified and tracked at the unit

level. The specific status of the unit, to include available resources, is current as of the last report by the unit. Assessment processes and integration into COA development is generally performed manually. The effectiveness of CBRND logistics management is dependent upon the experience, skill, knowledge, and training of the assigned staff personnel, quality and accuracy of the base information, and varies between staffs. Net-centric operations and DISA data standards address interoperability and the interchange of information among DoD systems and elements. DoD systems are expected to be increasingly in compliance with the DISA standards and net-centric capable, as appropriate, during the mid term. New DoD systems are currently required to be in compliance with DISA standards and net-centric capable when fielded. All remaining legacy systems are projected to either be replaced by, or be fully compliant with, DISA standards and net-centric capable in the far term. Interoperability with coalition partners, especially non-NATO partners, may be a continuing issue requiring maintenance of attentiveness and awareness by the responsible centers. The programmed initial fielding of JOEF and JEM in the mid term provides the staff with tools to identify and assess COAs supporting the effective allocation of CBRND resources. However, the process will remain unchanged. Completed fielding of JEM and JOEF is expected in the early far term.

<sup>6</sup> Current DOTLPF and available limited automated systems fielded with operational units is inadequate to perform micro-level data assimilation and display. Micro-level data, when available, is at greater depth of detail than required by the current standard ATP process. Hazard identification, characterization, and hazard impacts are conducted at the meso-/macrolevel and are consistent with ATP-45 processes. The ATP-45 process broadly applies the information without consideration of changes in terrain and meteorology at dispersed unit locations. The ATP-45 process is inadequate to meet needs in urban or complex terrain. The initial mid-term fielding of JWARN, JOEF, and JEM will expand data collection, assessment, and display capabilities. Data will be accessed on a continuing basis and processed information updated. Completion of the fielding of JWARN, JOEF, and JEM is expected in the early far term.

<sup>7</sup> Existing DOTLPF adequately addresses the performance of this task although predominantly using manual means. DOTLPF requires improvement to sufficiently address areas increasingly important for the transformed force and the changing operational environment. DOTLPF will continue to need to evolve as systems, tactics, and situations change.

### 9.21.3 Functional Solution Analysis

#### 9.21.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Absence of COA tool for CBRN incident impact.  
**Partial Non-Material Solutions:** *Training:* Develop training programs that encompass and support operational application of emergent assessment tools.
2. **Deficiency:** Lack of collaborative capability available to CBRND staff cells and specialists.  
**Partial Non-Material Solutions:** *Doctrine:* Enhance doctrine and TTPs to support active collaboration among the joint forces and coalition partners. *Training:* Develop training, exercises, and evaluations supporting and challenging collaborative processes among involved forces.
3. **Deficiency:** Lack of advanced training programs for automated tools  
**Non-Material Solutions:** *Training:* Implement training programs for staff members on collaborative assessment processes.
4. **Deficiency:** Inadequate doctrine and TTPs accounting for emergent JWARN and JEM capability.  
**Non-Material Solutions:** *Doctrine:* Expand doctrine and TTPs to address the application of advanced assessment tools.
5. **Deficiency:** Lack of characterization capability at the unit level.  
**Partial Non-Material Solutions:** *Organization:* Make provision for sensors at the unit level. *Training:* Establish training programs for the effective local level use of sensors.

#### 9.21.3.2 IMA Assessment Summary

Table 9.21-4 is a list of ideas for material approaches and a corresponding description of each idea. Simulations and models, data reachback capability, links to GIS, improved sensors and tables and templates are all material approaches to accomplish this task. Table 9.21-5 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 9.21-4. TASHA 21: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Simulations and models	Develop a system enabling operational commanders to efficiently execute “what if” scenarios and facilitate the evaluation of plausible adversary and friendly COAs, CBRN employment, and TIM ROTA.
Database	Develop a system for obtaining information, archiving data, accessing databases, performing information/data queries, and exchanging data files in support of CBRN functions and activities.
Reachback capability	Develop a system providing the ability to rapidly and securely reach back and contact CBRN experts and obtain CBRND plans, procedures, information, and lessons learned.
Risk factor templates	Develop a system merging CBRN, intelligence, and operational data and plans into standardized automated formats for application to effectively and rapidly accomplish CBRN/TIM functions and activities.
Link to GIS	Develop a system resident in standard C4ISR systems and interface with GIS to provide input to the COP.
Improved CBRN detectors	Ensure current and future detector programs quickly identify, quantify and disseminate detected CBR/TIM agent events.
CBRN staff collaboration tools	Develop automated system among and between CBRND specialists and other functions (e.g., operations, logistics) to allow collaboration between these functional areas and link to the COP.
Field CBRN information resource	Develop a field resource system that will provide and search archived information for CBRN/TIM agents, effects, treatments, etc.
Link to logistics systems	Develop an automated interface that tracks CBRND supplies and equipment and their status and condition through existing DoD logistics systems.

Lack of characterization capability at the unit level.	X					X		X	

**9.22 Task TASHA 22: Provide CBRN attack or TIM release impact assessment throughout the local or immediate battlespace****9.22.1 Functional Area Analysis****9.22.1.1 Definition**

The impact assessments are made by unit and command staffs as rapidly as possible. Access to local meteorology data and environmental conditions are essential to the assessment process. Assessments are time-phased over the predicted hazards fate. Addresses impacts to personnel, casualties, operations, terrain, equipment, and fixed, as well as, mobile forces. This assessment of the CBRN/TIM hazard impact is combined with other assessments of the situation to enable a complete combat risk assessment by the commander. As part of the process, tactical end states are envisioned for sustained operations, while enduring CBRN attacks.

**9.22.1.2 Derivation**

*UJTL (TA 5, TA 5.2.1, TA 6.5, TA 7, TA 7.1), Protection Joint Functional Concept, Military Transformation: A Strategic Approach.*

**9.22.1.2.1 Supported Task: OPSHA 12****9.22.1.2.2 Lateral Task: N/A****9.22.1.2.3 Supporting Task: N/A****9.22.1.3 Condition**

Perform this task under conditions of:

**Physical**

1. Moderately developed land. (C1.1)
2. Induced air. (C1.3)
3. Temperate climate. (C1.3.1)
4. Strong atmospheric weapons effects. (C1.3.3)

**Military**

1. Limited modern military systems. (C2.2.5)
2. Partial joint staff integration. (C2.3.1.1)
3. Limited staff expertise. (C2.3.1.3)
4. Restricted information exchange. (C2.3.1.8)
5. High information volume. (C2.3.1.9)
6. Low certitude of data. (C2.4.6)

## **9.22.2 Functional Needs Analysis**

### **9.22.2.1 Capability and Deficiency Assessment Summary**

Table 9.22-1 discusses individual capabilities to perform this task to the designated standards. The capability includes the current manual method of preparing and distributing impact assessments in the present and the mid- to far-term fielding of JWARN, JEM, and JOEF to meet the identified standards. The overall capability for current, near/mid, and far term are rated “yellow.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

#### **Current Capability and Deficiency**

Limited manual, nonnetworked capability exists to assess impacts of CBRN attack or TIM release. Current deficiencies include limited automation, constrained archival capabilities, and lack of sophisticated assessment tools.

#### **Projected Near/Mid-Term Capability and Deficiency**

JWARN, in conjunction with JEM and JOEF, will provide substantial improvement in the area. JWARN, JEM, and JOEF are projected for initial deployment during the mid term. However, the limitation to ATP-45 information and processes restricts the systems to the meso-/macrolevel of assessment and modeling. Coalition partners are not certain to possess sufficient automated capabilities to exchange, integrate, and process CBRND information.

#### **Projected Far-Term Capability and Deficiency**

Completion of deployment of JWARN, JOEF, and JEM is expected in the early far term. Otherwise, no change is projected for this task.

Table 9.22-1. TASHA 22: Capability and Deficiency Assessment

Capability: Impact Assessment of the Local Immediate Battlespace	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10	M11
Current Overall Capability	6 <sup>1</sup>	4 <sup>2</sup>	1 <sup>3</sup>	5 <sup>4</sup>	5 <sup>4</sup>	5 <sup>5</sup>	5 <sup>6</sup>	5 <sup>7</sup>	6 <sup>8</sup>	4 <sup>9</sup>	5 <sup>10</sup>
Near/Mid-Term Overall Capability	6	5	4	5	5	5	5	5	6	5	5
Far-Term Overall Capability	8	5	6	7	7	6	5	5	6	6	5

	FAA Measure	Scale
M1	CBRN/TIM information is accessible.	8–10: CBRN staff cell, unit staff, and automated systems possess unrestricted access to stored data on CBRN and TIM agents. Data sets are integrated and interoperable with CBRN systems. Additional information support is available using electronic Reachback and connectivity to information sources located outside the AO. Reachback is transparent to the user. 4–7: CBRN staff cell and unit personnel predominantly depend upon doctrine, policies, procedures, TTPs, reference material, and acquired training and knowledge for evaluation and assessment of CBRN and TIM agents. 1–3: Access to CBRN and/or TIM information is inadequate to support operations. 0: Access to CBRN and/or TIM information is nonexistent.
M2	CBRN staff cell and units have access to dedicated information technology resources to perform tasks and responsibilities.	8–10: CBRN staff cell and units possess dedicated information technology resources and tools for the accomplishment and performance of their duties and responsibilities. These are used to support operational and training requirements. 4–7: CBRN staff cell and units are able to access shared information technology resources and tools for operational requirements and training 1–3: CBRN staff cell and units possess limited access to shared information technology resources for operational requirements and training 0: CBRN staff cell and units do not possess access to information technology.
M3	Plausible end states envisioned are based on the response COAs.	8–10: Standardized M&S capability exists to assess and visualize potential end-states based upon assessed COAs (both CBRN and TIM) and is applied by all operating forces and staffs, is reviewed and assessed against other COAs, and the selected COA is placed into the COP. M&S continuously refreshes as new information drawn from interoperable sources and selections are made. 4–7: Operating force staff possess M&S capability and resources to perform M&S visualization of potential end-states based upon assessed COAs (CBRN or TIM) and is commonly applied by operating forces and staffs. Selected COA is placed into the COP and refreshes as new information is processed. 1–3: Visualization of potential COA end-states are inadequate for minimal support of operations. 0: Visualization of potential COA end-states are nonexistent.
M4	An automated assessment process is in place.	8–10: Secure, interoperable, and interactive electronic processes and workspaces with automated tools exist and are predominantly applied by all relevant echelons of the joint force, coalition partners, and other authorized entities. 4–7: Collaborative and interoperable manual processes are predominantly applied by most planning staffs of the joint force, coalition partners, and other authorized entities. 1–3: Process is inadequate or collaboration and interoperability is limited within or between elements of the joint force, coalition partners, and other authorized entities. 0: Process is nonexistent, or are not collaborative and interoperable within or between elements of the joint force, coalition partners, and other authorized entities.

M5	Assessment is conducted in a time responsive manner.	8–10: Integrated, interoperable, and interactive automated systems substantially collect, validate, compile, process, and evaluate CBRN information in near-real time for assessment and COA determination. Information is posted on the COP. 4–7: Doctrine, policies, procedures, TTPs, and formats exist and are applied and are generally performed manually for assessment. Timeliness is contingent upon operational considerations and unit/personnel capabilities. 1–3: The timeliness of assessment is not adequate to minimally support survival and operational needs. 0: The timeliness of assessment fails to support survival and operational needs.
M6	The assessment is conducted collaboratively.	8–10: Electronic collaborative workspaces with automated tools exist and are predominantly applied for evaluation, assessment, planning, and decisioning processes. 4–7: Manual collaborative processes are predominantly applied for evaluation, assessment, planning, and decisioning processes. 1–3: Collaborative processes are inadequate for the conduct of evaluation, assessment, planning, and decisioning processes. 0: Collaborative processes do not exist for the conduct of evaluation, assessment, planning, and decisioning processes.
M7	Analytical/planning staffs have the training and experience to effectively assess adversary and CBRN/TIM event response COAs.	8–10: All intelligence, operations, and CBRN staff personnel are formally trained and receive recurring refresher training on the conduct of CBRN COA assessment for event response. 4–7: Limited training is provided, is inconsistent, and/or is administered in preparation for operations to intelligence, operations, and CBRN cell specialists for the processing and conduct of CBRN event response COA assessment. 1–3: Adversary CBRN event response COA assessment training is inadequate to support operations. 0: Adversary CBRN event response COA assessment training is nonexistent.
M8	Analytical/planning staffs have the training and experience to effectively assess the CBRN/TIM event situation and its impacts.	8–10: All intelligence, operations, and CBRN staff personnel are formally trained, receive recurring refresher training, and are routinely exercised and evaluated on the use of automated tools and processes for assessment of CBRN COA events and their potential impacts upon forces and operations. 4–7: Limited training is provided, is inconsistent, and/or is administered in preparation for operations to intelligence, operations, and CBRN cell specialists for the predominantly manual conduct of assessments of CBRN events and their potential impacts upon forces and operations. 1–3: CBRN event situation and impact assessment training is inadequate to support operations. 0: CBRN event situation and impact assessment training is nonexistent.
M9	There are sufficient doctrine and TTPs for effective assessments.	8–10: Doctrine, policies, procedures, and TTPs are adequate for effective assessments and are actively revised to exploit current, emerging, and projected technologies and changes to tactics, systems, capabilities, and situations. 4–7: Doctrine, policies, procedures, and TTPs for assessment exist but are predominantly manual and are periodically revised to exploit technologies and operational changes. 1–3: Doctrine, policies, procedures, and TTPs are inadequate for assessments. 0: Doctrine, policies, procedures, and TTPs are nonexistent for effective assessments.
M10	Accurate meteorological data are available.	8–10: Micrometeorology is available, accurate, and effectively applied to microlevel hazard prediction using automated systems and tools. Data is correlated and processed to characterize CBRN hazards as impacted by weather, and the results are posted on the COP in near-real time. 4–7: Meso-/macrometeorological data are available, accurate, and adequately applied to meso-/macrolevel hazard prediction. Data are correlated and processed predominantly using manual means to characterize CBRN hazards as impacted by weather. Input to the COP is usually performed manually. 1–3: Meteorology data are inadequate to support operations. 0: Meteorology data are nonexistent.

M11	There is effective DOTLPF in place to conduct task.	8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations. 4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds. 1–3: DOTLPF is inadequate for accomplishment of this task. 0: DOTLPF does not exist for this task.
-----	---	--

<sup>1</sup> CBRN staff cell and unit personnel deploy with hard and electronic copies of doctrine and reference material for the performance of their duties and responsibilities. However, training and acquired knowledge provide the basis for decisioning and the effective application of the manually accessed information sources.

<sup>2</sup> CBRN staff cell personnel and unit personnel possess access to shared information technology resources and tools. CBRN personnel do not possess dedicated information technology to perform training and operational requirements. Available resources are shared with other requiring activities and functions. The projected initial fielding of JWARN, JOEF, and JEM provide using CBRN personnel to more efficiently perform their tasks and responsibilities. The fielding of JWARN, JOEF, and JEM is projected to be completed during the early far term.

<sup>3</sup> Insufficient simulation capability in available automated assessment tools or completely unavailable for manual vulnerability assessment. Currently available modeling and simulation tools are limited to HPAC- and VLSTRACK-based systems designed for graphics-enhanced systems. COTS M&S tools, such as ADASHI, provide limited capabilities but are not DISA certified. Current M&S tools, additionally, are not interoperable and are not linked within the COP. They must be manually data entered and manipulated. JOEF and JEM are envisioned as providing forces with the tools to assess and simulate plausible adversary COAs. Additionally, they may be also used to assess actual events and for training. JOEF and JEM will be initially fielded in the mid term with fielding completion expected in early far-term. However, the extent to which JOEF and JEM will address TIM (and the specific agents to be included) is not as yet determined. JOEF is projected to include analytical tools for the evaluation of COAs and will draw information from diverse sources operating using GIG Enterprise Services. Visualization through modeling and simulation is projected to be accomplished using JEM. JOEF and JEM are programmed to link with the COP via GIG Enterprise Service. However, not all coalition partners are certain to possess sufficient automated capabilities for the integration and application of generated and displayed CBRND information.

<sup>4</sup> The assessment process is performed manually by most planning staffs. Automated tools, systems, and processes are not in place at this time. Timeliness is a factor of operational considerations, available communications capabilities, and skilled personnel. The fielding of JWARN, JOEF, and JEM to operational units in the mid term will provide automated assessment tools for application in planning and response to CBRN/TIM events. However, not all coalition partners are certain to possess sufficient automated capabilities for the exchange, integration, and application of automated CBRND information and processes.

<sup>5</sup> Assessments currently require collaboration using traditional means such as telephone calls, personal visits, mail routing, e-mail, and other similar means. There is an absence of electronic collaborative workspaces within which differing functions and activities are able to cooperatively assist the evaluation, assessment, planning, and decisioning process without time delay and the need for physical presence. Automated tools could effectively enhance and be enhanced by these electronic rooms. Collaborative workspaces support net-centric operations. These workspaces are inevitable with the increasing utility of automation and information sharing. The initial fielding during the mid term of JWARN, JOEF, and JEM provide the CBRN staff cell with tools for conducting assessments and developing COAs. The fielding of JWARN, JOEF, and JEM is expected to be completed during the early far term. However, not all coalition partners are certain to possess sufficient automated capabilities for the integration and application of automated CBRND information.

<sup>6</sup> Limited training is provided to intelligence, operations, and CBRN cell specialists for the processing and conduct of CBRN incident COA development and assessment. Consistent formal and refresher training on immediate or local battlefield CBRN incident COA development and assessment is not regularly and routinely performed. Limited routine training is provided and often is not focused until preparation for operations. Collaborative processes for planning, evaluation, assessment, and decisioning are manual in nature and time-consuming. The fielding of JEM and JOEF provide capability to refine cell specialist skills as part of local training and exercising/evaluations. JEM and JOEF are projected for initial fielding during the mid term and completion of fielding expected during the early far term. However, supporting and requiring DOTLPF is necessary to ensure attainment and maintenance of capability.

<sup>7</sup> Limited training is provided to intelligence, operations, and CBRN cell specialists for the processing and conduct of CBRN incident COA development and assessment. Consistent formal and refresher training on immediate or local battlefield CBRN incident COA development and assessment is not regularly and routinely performed. Limited routine training is provided and often is not focused until preparation for operations. The fielding of JEM and JOEF provide capability to refine cell specialist skills as part of local training and exercising/evaluations. JEM and JOEF are projected for initial fielding during the mid term and completion of fielding expected during the early far term. However, supporting and requiring DOTLPF is necessary to ensure attainment and maintenance of capability.

<sup>8</sup> Doctrine, policies, procedures, and TTPs exist are sufficient for the manual performance of effective CBRN incident assessment. This statement is not true for current, emerging, and projected automated and simulated based assessment tools. Doctrine, policies, procedures, and TTPs must evolve to accommodate changes in tactics, systems, capabilities, and situations.

<sup>9</sup> Current DOTLPF and available limited automated systems fielded with operational units is inadequate to perform microlevel data assimilation and display. Microlevel data, when available, is at greater depth of detail than required by the current standard ATP process. Hazard identification, characterization, and hazard impacts are conducted at the meso-/macrolevel and are consistent with ATP-45 processes. The ATP-45 process broadly applies the information without consideration of changes in terrain and meteorology at dispersed unit locations. The ATP-45 process is inadequate to meet needs in urban or complex terrain. The projected fielding of JWARN, JOEF, and JEM will expand data collection, assessment, and display capabilities. JWARN, JOEF, and JEM are projected to be initially fielded in the mid term with fielding expected to be completed in the early far term. Data will be accessed on a continuing basis and processed information updated. However, these systems are based upon the ATP-45 process and formats. Further, the modeling and simulation software is meso-/macrolevel.

<sup>10</sup> Existing DOTLPF adequately addresses the performance of this task although predominantly using manual means. DOTLPF requires improvement to sufficiently address areas increasingly important for the transformed force and the changing operational environment. DOTLPF will continue to need to evolve as systems, tactics, and situations change.

### 9.22.3 Functional Solution Analysis

#### 9.22.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Inadequate access to information and archived data.  
**Partial Non-Material Solutions:** *Doctrine:* Improve doctrine, policies, procedures, and TTPs required enhancing information archival and access. *Training:* Improve training for use of archives.
2. **Deficiency:** Lack of advanced impact assessment tools.  
**Partial Non-Material Solutions:** *Doctrine:* Improve doctrine, procedures, policies, and TTPs for advanced assessment tools as fielded. *Training:* Training programs are required for effective application of advanced assessment tools.
3. **Deficiency:** Insufficient training, due to staff turnover.  
**Non-Material Solutions:** *Training:* Training programs are required for effective application of advanced assessment tools.

#### 9.22.3.2 IMA Assessment Analysis

Table 9.22-4 is a list of ideas for material approaches and a corresponding description of each idea. Approaches for this task include reachback capability to lessons learned databases and the management and maintenance of those databases. Table 9.22-5 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 9.22-4. TASHA 22: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Lessons learned databases	Develop/consolidate databases for operational and training lessons learned.
Reachback capability	Develop a system providing the ability to rapidly and securely reach back and contact CBRN experts and obtain CBRND plans, procedures, information, and lessons learned
Management of databases	Develop a system to link and manage the accuracy, adequacy, and availability of CBRND information databases. Includes access management, content control, and the conduct of data set management. Also includes process to identify database actions such as consolidation of similar databases, establishment of new databases, archiving of obsolete databases, etc.

Table 9.22-5. TASHA 22: IMA Assessment

Identified Gaps	Ideas for Material Approaches (IMA)		
	Lessons Learned Databases	Reachback capability	Management of Databases
Inadequate access to information and archived data.	X	X	X
Lack of advanced impact assessment tools.	X	X	

**9.23 Task TASHA 23: Conduct immediate or local battlespace CBRN/TIM incident COA assessment for fixed and mobile sites****9.23.1 Functional Area Analysis****9.23.1.1 Definition**

Includes local or immediate CBRN/TIM incident COA assessment for specific fixed sites. Includes evaluating local adversary attack COAs and local responses for accurate response and mitigation of COAs. Sense, Shape, Shield, and Sustain factors are thoroughly addressed. During the process tactical end states are envisioned for sustained operations, while enduring CBRN attacks. The assessments impact fixed-site planning and preparations.

**9.23.1.2 Derivation**

*UJTL (TA 5, TA 5.2.1, TA 6.5, TA 7, TA 7.1), Protection Joint Functional Concept, Military Transformation: A Strategic Approach.*

**Civil.** N/A

## **9.23.2 Functional Needs Analysis**

### **9.23.2.1 Capability and Deficiency Assessment Summary**

Table 9.23-1 discusses individual capabilities to perform this task to the designated standards. The capabilities include the current manual method of preparing incident assessments and the mid- to far-term fielding of JWARN, JEM and JOEF to meet the identified standards. The overall capability for current, near/mid, and far term are rated “yellow.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

#### **Current Capability and Deficiency**

Joint forces have limited capability to conduct CBRN/TIM incident COA assessment for fixed and mobile sites. Manual, subjective, processes are currently used. Visibility of CBRND resources on the COP is not currently available. Hazard information transfer is limited to ATP-45 format, a manual (preautomation) system.

#### **Projected Near/Mid-Term Capability and Deficiency**

When fielded, JWARN (with JOEF and JEM) will help with COA assessment and increase the potential for collaborative assessments. JWARN (with JOEF and JEM) are projected for initial fielding in the mid term. DOTLPF must be prepared to support emerging systems. JWARN will provide the joint forces with a comprehensive analysis and response capability to minimize the effects of hostile NBC attacks as well as accidents and incidents. JOEF and JEM will interface through and with JWARN. It will provide the operational capability to employ NBC warning technology which will collect, analyze, identify, locate, report and disseminate NBC warnings. JWARN will be compatible and integrated with joint and Service Common Operating Environment–based operational and non–Common Operating Environment–based tactical C4ISR systems. However, the limitation to ATP-45 information and process restricts the system to the meso-/macrolevel. The DoD effort to standardize data structures and promote integration/interoperability will provide increased opportunities for improvements in CBRND logistics management processes. New DoD systems are expected to be in compliance with DISA standards and net-centric capable, as appropriate during the current and near term for interoperability and net-centric operations. Substantial upgrades to legacy systems are required to include DISA standards and net-centric capabilities. Further, the mix of legacy and compliant systems will continue to require the attentiveness and awareness of staffs to ensure effective collection, integration, and dissemination of information until the legacy systems are either replaced or modified for compliance. However, the current deficiencies remain and the potential opportunities afforded by the DoD initiative and enhanced automation capabilities are not fully realized for CBRND.

### **Projected Far-Term Capability and Deficiency**

Fielding of JWARN (with JOEF and JEM) is expected to be completed in the early far term. All legacy systems are projected to either be in compliance with, or replaced by new systems that are compliant with, DISA standards and fully support net-centric operations in the far term. Otherwise, no change is projected for this task.

Table 9.23-1. TASHA 23: Capability and Deficiency Assessment

<b>Capability: Conduct Immediate or Local Battlespace CBRN/TIM Incident COA Assessment for Fixed and Mobile Sites</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>	<b>M6</b>	<b>M7</b>

Data is correlated and processed predominantly using manual means to characterize CBRN hazards as impacted by weather. Input to the COP is usually performed manually.</p> <p>1–3: Meteorology data are inadequate to support operations. Dedicated CBRN/TIM information processing mechanisms are inadequate to support CBRN/TIM processing for decisioning.</p> <p>0: Dedicated CBRN/TIM information processing mechanisms do not exist.</p>
M7	There is effective DOTLPF in place to conduct task.	<p>8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations</p> <p>4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds.</p> <p>1–3: DOTLPF is inadequate for accomplishment of this task.</p> <p>0: DOTLPF does not exist for this task.</p>

<sup>1</sup> Assessments currently require collaboration using traditional means such as telephone calls, personal visits, mail routing, e-mail, and other similar means. There is an absence of electronic collaborative workspaces within which differing functions and activities are able to cooperatively assist the evaluation, assessment, planning, and decisioning process without time delay and the need for physical presence. Automated tools could effectively enhance and be enhanced by these electronic rooms. Collaborative workspaces support net-centric operations. These workspaces are inevitable with the increasing utility of automation and information sharing.

<sup>2</sup> Limited training is provided to intelligence, operations, and CBRN cell specialists for the processing and conduct of CBRN incident COA development and assessment. Consistent formal and refresher training on immediate or local battlefield CBRN incident COA development and assessment is not regularly and routinely performed. Limited routine training is provided and often is not focused until preparation for operations. The fielding of JWARN, JEM and JOEF provide capability to refine cell specialist skills as part of local training and exercising/evaluations. These systems are projected for initial fielding within the mid term, and fielding is expected to be completed in the early far term. However, supporting and requiring DOTLPF is necessary to ensure attainment and maintenance of capability.

<sup>3</sup> Doctrine, policies, procedures, and TTPs exist are sufficient for the manual performance of effective CBRN incident assessment. This statement is not true for current, emerging, and projected automated and simulated-based assessment tools. Doctrine, policies, procedures, and TTPs must evolve to accommodate changes in tactics, systems, capabilities, and situations.

<sup>4</sup> Manual processes exist and are applied by staff and NBC specialists. However, the breadth and depth of planning and consideration of CBRND issues is dependent upon the knowledge, skills, and experience of the participants in the process. The projected initial fielding of JWARN, JEM and JOEF, with fielding completed in the early far term, provide enhanced automated capabilities for CBRND.

<sup>5</sup> Stovepiped Service logistics systems exist for maintenance, stocks, transport, and requisitioning. However, these systems are not interoperable and integrated. Predominantly manual means are applied to obtain and aggregate information, generally using manual reporting processes. General logistics DOTLPF are in place and support manual processes. However, the information is not integrated into the COP for awareness and for rapid or immediate COA decisioning support. CBRN units are identified and tracked at the unit

level. The specific status of the unit, to include available resources, is current as of the last report by the unit. Assessment processes and integration into COA development is generally performed manually. The effectiveness of CBRND logistics management is dependent upon the experience, skill, knowledge, and training of the assigned staff personnel, quality and accuracy of the base information, and varies between staffs. Net-centric operations and DISA data standards address interoperability and the interchange of information among DoD systems and elements. DoD systems are expected to be increasingly in compliance with the DISA standards and net-centric capable, as appropriate, during the mid term. New DoD systems are currently required to be in compliance with DISA standards and net-centric capable when fielded. All remaining legacy systems are projected to either be replaced by, or be fully compliant with, DISA standards and net-centric capable in the far term. Interoperability with coalition partners, especially non-NATO partners, may be a continuing issue requiring maintenance of attentiveness and awareness by the responsible centers. The programmed initial fielding of JOEF and JEM in the mid term provides the staff with tools to identify and assess COAs supporting the effective allocation of CBRND resources. However, the process will remain unchanged. Completed fielding of JEM and JOEF is expected in the early far term.

6 Current DOTLPF and available limited automated systems fielded with operational units is inadequate to perform microlevel meteorological data assimilation and display. Microlevel meteorological data, when available, is at greater depth of detail than required by the current standard ATP process. Hazard identification, characterization, and hazard impacts are conducted at the meso-/macrolevel and are consistent with ATP-45 processes. The ATP-45 process broadly applies the information without consideration of changes in terrain and meteorology at dispersed unit locations. The ATP-45 process is inadequate to meet needs in urban or complex terrain. The initial mid-term fielding of JWARN, JOEF, and JEM will expand data collection, assessment, and display capabilities. Data will be accessed on a continuing basis and processed information updated. Completion of the fielding of JWARN, JOEF, and JEM is expected in the early far term. However, the ATP-45 process and formats are applied by JWARN, JOEF, and JEM.

<sup>7</sup> Existing DOTLPF adequately addresses the performance of this task, although predominantly using manual means. DOTLPF requires improvement to sufficiently address areas increasingly important for the transformed force and the changing operational environment. DOTLPF will continue to need to evolve as systems, tactics, and situations change

### 9.23.3 Functional Solution Analysis

#### 9.23.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Inadequate doctrine covering the mechanism and requirement for collaborative development of fixed site CBRN/TIM incident assessments.

**Non-Material Solutions:** *Doctrine:* Ensure doctrine, policies, procedures, and TTPs enabling effective CBRN assessments collaboration are in place and adequate to meet operational needs. *Training:* Integrate into formal and informal training and challenging exercise and evaluation criterion for CBRN assessments collaboration applying emerging technologies and processes.

2. **Deficiency:** Insufficient doctrine and training to ensure staff personnel can effectively respond to a CBRN/TIM event.

**Non-Material Solutions:** *Doctrine:* Enhance doctrine, policies, procedures, and TTPs enabling effective the production and maintenance of effective staff personnel for CBRN/TIM event response. *Training:* Integrate into formal and informal training challenging exercise and evaluation criteria to produce and sustain sufficient and effective staff personnel to respond to CBRN/TIM events.

3. **Deficiency:** Lack of specific doctrine for the effective use of JWARN, JOEF and JEM assessments.

**Non-Material Solutions:** *Doctrine:* As the development of JWARN, JOEF and JEM progresses, the full range of doctrine should be developed for their effective use and application for CBRN/TIM response.

#### 9.23.3.2 IMA Assessment Analysis

N/A

**9.24 Task TASHA 24: Manage the CBRND response and mitigation efforts****9.24.1 Functional Area Analysis****9.24.1.1 Definition**

Response and event mitigation management are executed dynamically and collaboratively across the affected and responding commands. All Shape, Sense, Shield, and Sustain factors are considered. Includes coordination with coalition partners, NGOs, and indigenous authorities and organizations. Ensure plans, TTPs, and standard operating procedures exist and drills are conducted. Manage resources including personnel, supplies (consumables), and equipment. Actions involve resource allocation, reallocation, tracking and taskings. Includes managing survey, reconnaissance, and decontamination actions. Encompasses the management of CBRN casualty processing throughout the JOA. Restoration operations may be required as a distinct operation independent of joint participation after a CBRN incident.

3. Partially completed mission preparation. (C2.1.3)
4. Partial personnel capability. (C2.2.4)
5. Limited modern military systems. (C2.2.5)
6. Partial joint staff integration. (C2.3.1.1)
7. Partial multinational integration. (C2.3.1.2)
8. Limited staff expertise. (C2.3.1.3)

### Civil

1. Limited foreign government support. (C3.1.2.3)
2. Significant TIM present in the civilian sector. (C3.3.7.5)

## 9.24.2 Functional Needs Analysis

### 9.24.2.1 Capability and Deficiency Assessment Summary

Table 9.24-1 discusses individual capabilities to perform this task to the designated standards. The capabilities include the current manual method of preparing incident assessments and the mid- to far-term fielding of JWARN, JEM and JOEF to meet the identified standards. The overall capability for current, near/mid, and far term are rated “yellow.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

### Current Capability and Deficiency

Existing doctrine and training provide manual mechanisms to manage CBRND response and WMD/TIM hazard mitigation. Deficiencies include lack of ability to collect CBRND information across echelons; lack of ability to assess unit, personnel, and equipment adequacy; lack of means to use M&S to evaluate COAs; and absence of effective decision support tools.

### Projected Near/Mid-Term Capability and Deficiency

The projected initial fielding of the JWARN, JOEF, and JEM during the mid term enhances and provides visibility of CBRND information and processes. However, adequate DOTLPF to capitalize upon the potential benefits of these systems does not currently exist. Additionally, these systems are based upon the preautomation ATP-45 information reporting formats and processes. The DoD effort to standardize data structures and promote integration/interoperability will provide increased opportunities for improvements in CBRND logistics management processes. New DoD systems are expected to be in compliance with DISA standards and net-centric capable, as appropriate during the current and near term for interoperability and net-centric operations. Substantial upgrades to legacy systems are required to include DISA standards and net-centric capabilities. Further, the mix of legacy and compliant systems will continue to require the attentiveness and awareness of staffs to ensure effective collection, integration, and dissemination of information until the legacy systems are either replaced or

modified for compliance. However, the current deficiencies remain and the potential opportunities afforded by the DoD initiative and enhanced automation capabilities are not fully realized for CBRND.

**Projected Far-Term Capability and Deficiency**

Fielding of JWARN (with JOEF and JEM) is expected to be completed in the early far term. All legacy systems are projected to either be in compliance with, or replaced by new systems that are compliant with, DISA standards and fully support net-centric operations in the far term. Otherwise, no change is projected for this task.

Table 9.24-1. TASHA 24: Capability and Deficiency Assessment

Capability: Manage the CBRND Response and Mitigation Efforts	M1	M2	M3	M4	M5	M6	M7	M8	M9	M10
Current Overall Capability	5 <sup>1</sup>	5 <sup>2</sup>	6 <sup>3</sup>	6 <sup>4</sup>	4 <sup>5</sup>	6 <sup>6</sup>	5 <sup>7</sup>	5 <sup>8</sup>	6 <sup>9</sup>	5 <sup>10</sup>
Near/Mid-Term Overall Capability	6	5	7	7	4	7	5	6	6	5
Far-Term Overall Capability	7	5	8	8	5	8	5	5	7	6

	FAA Measure	Scale
M1	Compiled and correlated theater CBRN Information available.	8–10: Interoperable and integrated automated systems, processes, and tools collect, compile, correlate, and process CBRN/TIM information for decisioning and planning. Standardized automated templates and M&S tools provide visualization and rapid attainment of situational awareness. Information is continuously processed and updated. 4–7: Manual processes are predominantly applied for the collection, compilation, correlation, and processing of CBRN/TIM information. The process may be restricted in the number of sources compiled and correlated and is dependent upon the knowledge, training, and experience of performing personnel. 1–3: Compilation and correlation of CBRN information is inadequate to support operations 0: Compilation and correlation of CBRN information is nonexistent
M2	Allocation of CBRN units and personnel is adequate.	8–10: Sufficient numbers and types of trained, manned, and equipped CBRND units and CBRN specialists are available to support concurrent operations and routine requirements. 4–7: CBRN units and specialists are available to support a major operation and selected routine requirements. Training, manning, and equipment will vary from unit to unit and dependent upon unit type. Specialist experience will vary from minimal to substantial. Allocations are likely to be at a reduced level with augmentation by nonprimary-duty personnel. 1–3: CBRND specialists and units are available to support a major operation. Experience will vary from minimal to substantial. Routine requirements are filled by nonprimary-duty personnel. 0: Quantity and/or type of CBRND units and specialists are insufficient to support operations.
M3	Allocation of CBRND systems and equipment is adequate.	8–10: Adequate quantities and types of CBRND equipment, systems, and material are available, allocated, ready, and match JTF operations (e.g., Expeditionary, High Maneuver, etc.) and environments (e.g., jungle, extreme cold terrain, desert, etc.). Includes support of sustained operations in a CBRN/TIM environment. 4–7: Sufficient quantities and types of CBRND equipment, systems, and material are allocated and ready for support of JTF operations in a CBRN/TIM environment. Adjustments to planned quantities are performed when necessary for availability. Alternatives are identified, supporting material availability determined, and appropriate allocation actions are taken. 1–3: CBRND systems and equipment allocation is inadequate to support operations. 0: CBRND systems and equipment allocation processes do not exist.

M4	All pertinent Sense, Shape, Shield, and Sustain information is available.	<p>8–10: Automated processes, templates, and collaborative spaces ensure all relevant issues and needs are addressed. Staff and CBRN specialists are highly trained, knowledgeable, and possess access to needed reference material and impacting information.</p> <p>4–7: Manual processes are predominantly applied to address pertinent CBRND issues and are dependent upon the training, skill, experience, and knowledge of staff participants.</p> <p>1–3: Processes are inadequate for the identification and planning of pertinent CBRND issues, and/or staff and/or CBRN specialist participants do not possess adequate training, skill, experience, and knowledge to adequately perform the task.</p> <p>0: Processes do not exist for the identification and planning of pertinent CBRND issues, and/or staff and/or CBRN specialist participants are not trained, experienced, and knowledgeable in the task.</p>
M5	CBRND resources location, status and availability displayed by COP.	<p>8–10: CBRND logistics management doctrine, policies, procedures, TTPs, and supporting interoperable and integrated automated systems and tools exist, are in place, provide current and accurate information to the COP, and support effective management of CBRND material.</p> <p>4–7: General logistics doctrine, policies, procedures, TTPs and supporting automated systems and manual processes exist, are in place, support predominantly manual management of material, and can provide selected information on CBRND material. Placement on the COP, when performed, is by manual entry.</p> <p>1–3: Logistics management processes are inadequate for CBRND material.</p> <p>0: Logistics management processes are nonexistent for CBRND material.</p>
M6	Mechanism in place to process CBRN/TIM information rapidly to meet decision needs.	<p>8–10: Highly interoperable, integrated, and dedicated system and tools collect, compile, correlate, process, report, and provide visualization of CBRN/TIM information for decisioning in near-real time.</p> <p>4–7: Dedicated mechanisms are in place to process CBRN/TIM information for decisioning.</p> <p>0: Dedicated CBRN/TIM information processing mechanisms are inadequate or do not exist.</p>
M7	There is means to track unit level mission degradation and restoration status.	<p>10: Highly integrated dedicated system provides accurate, timely, and current unit-level mission capability status, including existing degradation and mitigation/restoration activities and status.</p> <p>4–7: Dedicated mechanisms are in place to process and provide critical data elements on unit mission capability status. Tracking mechanisms provide minimal information.</p> <p>1–3: Dedicated unit-level mission capability status tracking mechanisms are inadequate to support operations</p> <p>0: Dedicated unit-level mission capability status tracking mechanisms do not exist.</p>
M8	Staff sufficiently trained or experienced to coordinate response and mitigation.	<p>8–10: Staff personnel are experience, formally trained, receive recurring refresher training, and are fully challenged in exercises and evaluations on effective incident response and mitigation COA development and decisioning. Interoperable and integrated automated systems, tools, and processes support efficient and accurate incident response actions and the minimal application of resources necessary for successful mitigation activities.</p> <p>4–7: Selected staff personnel are trained to perform effective incident response and mitigation COA development and decisioning. Processes are predominantly manual, although some units may possess limited automated capabilities. Staff incident response and mitigation management competencies and experience will vary within and between units, but sufficient capability exists to successfully perform the essential tasks.</p> <p>1–3: Staff training, experience, and/or competencies are inadequate for successful CBRN/TIM incident response and/or mitigation.</p> <p>0: Staff training, experience, and/or competencies are nonexistent for successful CBRN/TIM incident response and/or mitigation.</p>

M9	Plans, TTPs, and SOPs have been developed, trained and exercised.	<p>8–10: Doctrine, policies, procedures, and TTPs are adequate for effective response to an event and mitigation. Unit plans and SOPs are developed applying these documents, automated tools and systems, and training—both formal and recurring refresher training—of performing personnel. Unit-level training is performed to ensure personnel are ready, capable, and prepared to perform their taskings. Routine and recurring exercises and evaluations fully challenge unit and individual capabilities to effectively and rapidly respond to an event and perform necessary mitigation efforts. Doctrine, policies, procedures, TTPs, and SOPs are actively revised to exploit current, emerging, and projected technologies and changes to tactics, systems, capabilities, and situations.</p> <p>4–7: Doctrine, policies, procedures, and TTPs for assessment exist but processes are predominantly manual. Unit plans and SOPs apply these documents and the knowledge, experience, and training of the performing personnel. Response and mitigation training is inconsistent and/or is administered to unit personnel in preparation for operations with CBRN threat. Exercises and evaluations do not generally fully challenge capabilities. Doctrine, policies, procedures, TTPs, and SOPs are periodically revised to exploit technologies and operational changes.</p> <p>1–3: Doctrine, policies, procedures, TTPs, SOPs, training, and/or exercises and evaluations are inadequate for incident response and mitigation</p> <p>0: Doctrine, policies, procedures, TTPs, SOPs, training, and/or exercises and evaluations are nonexistent for effective incident response and mitigation.</p>
M10	There is effective DOTLPF in place to conduct task.	<p>8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations.</p> <p>4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds.</p> <p>1–3: DOTLPF is inadequate for accomplishment of this task.</p> <p>0: DOTLPF does not exist for this task.</p>

<sup>1</sup> Manual process exists and is applied by staff and NBC specialists. The process is dependent upon the knowledge, skills, and experience of the performing personnel. These factors will vary within and between staffs ranging from minimal to substantial capabilities. The projected mid-term initial fielding of JWARN, JOEF, and JEM (with fielding expected to be completed in the early far term) to operational units will provide some capabilities to compile and correlate CBRN information and to post to the COP. However, current processes remain and require NBC specialist and staff action.

<sup>2</sup> Sufficient CBRND specialists are available to support a major operation and selected routine Service requirements. Augmentation is applied to support core CBRND specialists where possible to reduce impact. Availability of trained and experienced CBRND specialists is low and strained when support is required for more than one large-scale operation involving CBRN threat. Routine requirements support reduces as demand rises to support operations. Sufficient CBRND units are available of the necessary types to support a major operation and selected routine Service requirements. Availability of trained, equipped, and manned CBRND units is low and strained when support is required for more than one large-scale operation involving CBRN threat. Routine support capabilities reduce as demand rises to support operations.

<sup>3</sup> CBRND equipment, systems, and types are available in sufficient quantities to support JTF operations in a CBRN environment, provided there does not exist conflicting demands to support multiple concurrent operations with CBRN threat. Protection from high-risk TIMs is minimal in current CBRND equipment, systems, and material. Further, the majority of the types of systems do not adequately support sustained operations and require infusion of increased CBRND resources to maintain OPTEMPO. COLPRO systems, for example, are generally large-scale systems and do not adequately support expeditionary and high maneuver operations, particularly in austere environments at the extremes of the lines of communication. JECF is programmed to field in the mid term and will provide COLPRO flexibility to support most operations and situations. The JSLIST is programmed to field during the mid term and is undergoing certification to meet OSHA Level “C” requirements for TIMs. The JSGPM filtration system will provide a level of protection against selected TIMs and is programmed to field during the mid term. The fielding of these protective systems will be gradual and planners will be required to consider remaining legacy systems as well as the newer joint systems in planning and support. However, as the number of elements possessing joint systems increases, the diverse support requirements will lessen and improvements in operational support are expected. The programmed initial fielding of JOEF and JEM in the mid term provides the staff with tools to identify and assess COAs supporting the effective allocation of CBRND resources. However, the process will remain largely unchanged. Completion of the deployment of JOEF and JEM is projected during the early far term.

<sup>4</sup> Manual processes exist and are applied by staff and NBC specialists. However, the breadth and depth of planning and consideration of CBRND issues is dependent upon the knowledge, skills, and experience of the participants in the process. The projected initial fielding of JEM and JOEF, with fielding completed in the early far term, provide enhanced automated capabilities for CBRND.

<sup>5</sup> Stovepiped Service logistics systems exist for maintenance, stocks, transport, and requisitioning. However, these systems are not interoperable and integrated. Predominantly manual means are applied to obtain and aggregate information, generally using manual reporting processes. General logistics DOTLPF are in place and support manual processes. However, the information is not integrated into the COP for awareness and for rapid or immediate COA decisioning support. CBRN units are identified and tracked at the unit level. The specific status of the unit, to include available resources, is current as of the last report by the unit. Assessment processes and integration into COA development is generally performed manually. The effectiveness of CBRND logistics management is dependent upon the experience, skill, knowledge, and training of the assigned staff personnel, quality and accuracy of the base information, and varies between staffs. Net-centric operations and DISA data standards address interoperability and the interchange of information among DoD systems and elements. DoD systems are expected to be increasingly in compliance with the DISA standards and net-centric capable, as appropriate, during the mid term. New DoD systems are currently required to be in compliance with DISA standards and net-centric capable when fielded. All remaining legacy systems are projected to either be replaced by, or be fully compliant with, DISA standards and net-centric capable in the far term. Interoperability with coalition partners, especially non-NATO partners, may be a continuing issue requiring maintenance of attentiveness and awareness by the responsible centers. The programmed initial fielding of JOEF and JEM in the mid term provides the staff with tools to identify and assess COAs supporting the effective allocation of CBRND resources. However, the process will remain unchanged. Completed fielding of JEM and JOEF is expected in the early far term.

<sup>6</sup> Doctrinal mechanisms are in place for processing CBRN/TIM information and subsequent decisioning. Process is predominantly manual, time-consuming, and labor-intensive. Information sources are either not interoperable or possess limited interoperability. CBRN information must compete for resources with other priority operational information processes. Processing and decisioning may be delayed due to lack of dedicated C4ISR capabilities for CBRN information collection, processing, interpretation, and dissemination. The projected mid-term initial fielding of JWARN, JOEF, and JEM, with fielding expected to be completed during the early far term, to operational units provides the staff with tools and capabilities to perform aspects of the process; however, the largely manual nature of the process will remain.

<sup>7</sup> Doctrinal processes are applied to track unit mission capability status, critical issues, and projected/estimated corrective dates. This is a predominantly manual, time-consuming, labor-intensive, and information-minimizing process. Continued advances in automated technologies, systems, and tools, coupled with net-centric operations and DISA data standardization, may cause the gradual movement to automated processes and systems that are interoperable, integrate information from a variety of sources, and reduce manpower requirements.

<sup>8</sup> Limited training is provided to staff personnel for the conduct of CBRN/TIM response and mitigation management. Consistent formal and refresher training on immediate or local battlefield CBRN incident response and mitigation COA development and implementation is not regularly and routinely performed. Limited routine training is provided and often is not focused until preparation for operations with threat. The fielding of JEM and JOEF provide capability to refine skills as part of local training and exercising/evaluations. However, supporting and requiring DOTLPF is necessary to ensure attainment and maintenance of capability.

<sup>9</sup> Doctrine, policies, procedures, and TTPs exist are sufficient for the manual performance of effective CBRN incident assessment. This statement is not true for current, emerging, and projected automated and simulated-based assessment tools. Doctrine, policies, procedures, and TTPs must evolve to accommodate changes in tactics, systems, capabilities, and situations.

<sup>10</sup> Existing DOTLPF adequately addresses the performance of critical aspects of this task, although predominantly using manual means. DOTLPF requires improvement to sufficiently address areas increasingly important for the transformed force and the changing operational environment. DOTLPF will continue to need to evolve as systems, tactics, and situations change.

### 9.24.3 Functional Solution Analysis

#### 9.24.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Inadequate ability to process CBRN/TIM information rapidly to meet decision needs.  
**Partial Non-Materiel Solutions:** *Doctrine:* Reinforce in doctrine the need for rapid analysis and response to CBRN/TIM events. *Training:* Enhance training reinforcing rapid analysis and response to CBRN/TIM events.
2. **Deficiency:** Inadequate staff training programs.  
**Non-Materiel Solutions:** *Training:* Enhance training of staff personnel to ensure adequate acquisition and maintenance of ability to effectively handle CBRN mitigation and response.
3. **Deficiency:** Inadequate timeliness in the warning process affecting timely protective measure implementation.  
**Partial Non-Materiel Solutions:** *Doctrine:* Expand doctrine including the range of “Man in the Loop” in the warning process.
4. **Deficiency:** Lack of ability to assess equipment adequacy.  
**Partial Non-Materiel Solutions:** *Organization:* Review table of organization and equipment standards against actual organization and personnel to ensure adequate to support CBRN assessments. *Personnel:* Acquire and maintain adequate and sufficient CBRN personnel to support CBRN requirements.
5. **Deficiency:** Interoperability barriers exist that limit force collaboration with interagencies and coalition partners.  
**Non-Materiel Solutions:** *Doctrine:* Develop doctrine, policies, procedures, and processes addressing the establishment and maintenance of collaborative arrangements with interagencies and coalition partners. *Training:* Integrate into initial and recurrent training of unit command staff personnel the application of means and processes for the establishment and maintenance of effective collaboration with interagencies and coalition partners. Incorporate into exercise and evaluation criteria requirements challenging unit command staff establishment and application of collaborative arrangements. *Leadership:* Ensure recognition of criticality to operations of effective collaboration with interagencies and coalition partners.

#### 9.24.3.2 IMA Assessment Summary

Table 9.24-4 is a list of ideas for material approaches and a corresponding description of each idea. Material approaches to accomplish this task identify the automation and management of historical, technical and sensor data, as well as analytical tools and linkages to the COP. Table

9.24-5 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 9.24-4. TASHA 24: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Lessons learned databases	Develop/consolidate databases for operational and training lessons learned.
Reachback capability	Develop a system providing the ability to rapidly and securely reach back and contact CBRN experts and obtain CBRND plans, procedures, information, and lessons learned.
Management of databases	Develop a system to link and manage the accuracy, adequacy, and availability of CBRND information databases. Includes access management, content control, and the conduct of data set management. Also includes process to identify database actions such as consolidation of similar databases, establishment of new databases, archiving of obsolete databases, etc.
Simulations and models	Develop a system enabling operational commanders to efficiently execute “what if” scenarios and facilitate the evaluation of plausible adversary and friendly COAs, CBRN employment, and TIM ROTA.
Database	Develop a system for obtaining information, archiving data, accessing databases, performing information/data queries, and exchanging data files in support of CBRN functions and activities.
Risk factor templates	Develop a system merging CBRN, intelligence, and operational data and plans into standardized automated formats for application to effectively and rapidly accomplish CBRN/TIM functions and activities.
Collect, exchange, and disseminate information	Develop a system that collects and analyzes CBRN information and sensor input, generates, edits, and disseminates NBC reports, including downwind-hazard plots, and overlays and verify receipt of reports and plots. Transmission of data uses existing communications nets.
Link to GIS	Develop a system resident in standard C4ISR systems with interface to GIS to provide input to COP

**9.25 Task TASHA 25: Provide tactical CBRN/TIM weapons information to the combatant commander****9.25.1 Functional Area Analysis****9.25.1.1 Definition**

To obtain information and data from all sources that provide information about the CBRN/TIM weapons situation on the battlefield and in the JOA. These data are provided to the combatant commander.

**9.25.1.2 Derivation**

*OPSENS 1.*

**9.25.1.2.1 Supported Task: OPSHA 10****9.25.1.2.2 Lateral Task: N/A****9.25.1.2.3 Supporting Task: N/A****9.25.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Minimal time available. (C2.1.5)
2. Negligible to marginal intelligence database. (C2.4.4)
3. Negligible to difficult theater intelligence access. (C2.4.4)
4. Little or no certitude of data. (C2.4.6)
5. Nuclear, chemical and biological threat form. (C2.9.2)

**Civil**

1. Negative foreign government support. (C3.1.2.3)
2. Aggressively opposed foreign public opinion. (C3.1.2.4)
3. No international organization support. (C3.1.2.5)

**9.25.2 Functional Needs Analysis****9.25.2.1 Capability and Deficiency Assessment Summary**

Table 9.25-1 discusses individual capabilities to perform this task to the designated standards. The capabilities include the current manual method of preparing incident assessments and the

mid- to far-term fielding of JWARN, JEM and JOEF initial fielding to meet the identified standards. The overall capability for current, near/mid, and far term are rated “yellow.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

**Current Capability and Deficiency**

Existing doctrine and training provide manual mechanisms to manage CBRND information for the combatant commander. Deficiencies include the lack of automated warning and reporting system for CBRN attacks and the lack of reachback capability to CBRND databases.

**Projected Near/Mid-Term Capability and Deficiency**

The projected fielding of the JWARN, JOEF, and JEM suite enhances and provides visibility of CBRND information and processes. JWARN, JOEF, and JEM are projected for initial fielding in the mid term. However, adequate DOTLPF to capitalize upon the potential benefits of these systems does not currently exist. Further, integration of disparate sensor systems must be realized.

**Projected Far-Term Capability and Deficiency**

JWARN, JOEF, and JEM are expected to complete fielding in the early far term. Sensors and IDN capabilities are in development with stated fielding sometime in the far term. This achievement is dependent upon the progression of sensor technologies necessary for an IDN.

**Table 9.25-1. TASHA 25: Capability and Deficiency Assessment**

<b>Capability: Provide Tactical CBRN/TIM Weapons Information To The Combatant Commander</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>	<b>M6</b>
<b>Current Overall Capability</b>	2 <sup>1</sup>	5 <sup>2</sup>	2 <sup>1,2</sup>	4 <sup>2</sup>	6 <sup>3</sup>	5 <sup>4</sup>
<b>Near/Mid-Term Overall Capability</b>	4	5	4	5	8	5
<b>Far-Term Overall Capability</b>	6	8	6	8	9	5

	<b>FAA Measure</b>	<b>Scale</b>
M1	CBRN/TIM weapon capabilities on the battlefield can be detected.	<p>8–10: Integrated, interoperable, and interactive battlefield automated systems and sensor networks collect, validate, correlate, compile, and process weapons data with known weapons characteristics to detect and identify CBRN/TIM weapon capabilities in near-real time for dissemination to forces of alerting and warning of hazards. CBRN/C4ISR, and COP systems are continuously updated with information.</p> <p>4–7: Battlefield systems and sensor networks exist. Information and data are predominantly manually processed by CBRN and unit personnel against known weapons characteristics to detect and identify CBRN/TIM weapons capabilities. Doctrine, policies, procedures, TTPs, reference material, and acquired training and knowledge are the foundation for this action and will vary between staffs based upon experience and acquired capabilities. CBRN, C4ISR, and COP systems are updated with information.</p> <p>1–3: Battlefield systems and sensor networks and/or CBRN and unit staff personnel knowledge and capabilities are inadequate to support survival and operational requirements for the identification and detection of CBRN/TIM weapons capabilities.</p> <p>0: Battlefield systems and sensor networks are nonexistent or CBRN and unit staff personnel are trained to detect and identify CBRN/TIM weapons capabilities.</p>
M2	CBRN/TIM weapon capabilities on the battlefield can be identified.	<p>8–10: Integrated, interoperable, and interactive battlefield automated systems collect, validate, process, and correlate weapons data with known weapons characteristics to identify CBRN/TIM weapons capabilities in near-real time for situation assessment and COA determination. Information is posted on the COP.</p> <p>4–7: CBRN and unit personnel predominantly depend upon manual processes for identification of CBRN/TIM weapon capabilities. Doctrine, policies, procedures, TTPs, reference material, and acquired training and knowledge are the foundation for this action and will vary between in experience and capabilities between staff.</p> <p>1–3: Battlefield identification of CBRN/TIM weapon capabilities is inadequate to support operational requirements.</p> <p>0: Battlefield identification of CBRN/TIM weapon capabilities is nonexistent.</p>

M3	Time to detect CBRN/TIM weapon capabilities is adequate.	<p>8–10: Integrated and interoperable battlefield automated systems and sensor networks exist and are in place. Information from these systems are collected, correlated, validated, compiled and processed in near-real time for input to integrated, interoperable, and interactive automated systems that process and correlate weapons data with known weapons characteristics to identify CBRN/TIM weapons capabilities in near-real time for dissemination to forces of alerting and warning of hazards. CBRN, C4ISR, and COP systems are continuously updated with information.</p> <p>4–7: Battlefield systems and sensor networks exist. Information and data are manually compiled and processed for dissemination to Forces of altering and warning of hazards. CBRN staff cell and unit personnel predominantly depend upon manual processes for identification of CBRN/TIM weapon capabilities. Doctrine, policies, procedures, TTPs, reference material, and acquired training and knowledge are the foundation for this action and will vary between in experience and capabilities between staff. CBRN, C4ISR, and COP systems are updated with information.</p> <p>1–3: Battlefield systems and sensor networks are inadequately or not integrated and/or interoperable, and/or are inadequate to support survival and operational requirements; or identification of CBRN/TIM weapon capabilities is inadequate to effectively support operational requirements.</p> <p>0: Battlefield systems and sensor networks are nonexistent or identification of CBRN/TIM weapon capabilities nonexistent.</p>
M4	Time to identify CBRN/TIM weapon capabilities is adequate.	<p>8–10: Integrated, interoperable, and interactive automated systems collect, validate, process, and correlate weapons data with known weapons characteristics to identify CBRN/TIM weapons capabilities in near-real time for situation assessment and COA determination. Information is posted on the COP.</p> <p>4–7: CBRN staff cell and unit personnel predominantly depend upon manual processes for identification of CBRN/TIM weapon capabilities. Doctrine, policies, procedures, TTPs, reference material, and acquired training and knowledge are the foundation for this action and will vary between in experience and capabilities between staff. The time period taken to identify weapon capabilities is adequate to meet operational requirements.</p> <p>1–3: Timeliness for identification is inadequate to support operational requirements or identification capabilities are inadequate to meet operational requirements.</p> <p>0: Timeliness for identification does not support operational requirements or identification cannot be performed.</p>
M5	Time to provide CBRN/TIM weapon information to the combatant commander is adequate.	<p>8–10: Integrated, interoperable, and interactive automated systems substantially collect, validate, compile, process, and evaluate CBRN/TIM weapon information in near-real time for assessment and COA determination. Information is posted on the COP.</p> <p>4–7: Doctrine, policies, procedures, TTPs, and formats exist and are applied and are generally performed manually for collection and determination of CBRN/TIM weapon information. Timeliness is contingent upon receipt of data/information, operational considerations, and unit/personnel capabilities.</p> <p>1–3: The timeliness of CBRN/TIM weapon information is inadequate to support survival and operational needs.</p> <p>0: The timeliness of CBRN/TIM weapon information fails to support survival and operational needs.</p>
M6	There is effective DOTLPF in place to conduct task.	<p>8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations</p> <p>4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds.</p> <p>1–3: DOTLPF is inadequate for accomplishment of this task.</p> <p>0: DOTLPF does not exist for this task.</p>

<sup>1</sup> Limited battlefield systems and local sensor networks exist for the purpose of detecting a release or, as with missile tracking systems, weapons. However, these systems and networks are not interoperable and integrated. Manual processes using largely manual resources are the predominant means of performing this task and are generally reliant upon

the knowledge and experience of the CBRN and unit staff personnel. Networking battlefield systems and sensors using JWARN will permit the ability to reach back to CBRND databases to improve identification and detection accuracy and speed. JWARN is projected for initial fielding in the mid term with completion of fielding expected in the far term. The concurrent fielding of JEM and JOEF with JWARN will automate functions and provide interface to the COP to update and disseminate information.

<sup>2</sup> Current processes are predominantly manual, time-consuming, and labor-intensive. Determinations are dependent upon the experience, knowledge, and training of the performing personnel as well as available reference material. Networking CBRN sensors using JWARN will permit the ability to reach back to CBRND databases to improve identification accuracy and speed. JWARN is projected for initial fielding in the mid term with completion of fielding expected in the far term.

<sup>3</sup> Current processes are predominantly manual, time-consuming, and labor-intensive. Determinations are dependent upon the experience, knowledge, and training of the performing personnel. The current manual method of providing alarm and warning to units/warfighters as well as situational awareness information to combatant commanders is slow and prone to errors. The projected initial mid-term fielding to operational units of JWARN, JEM, and JOEF will automate functions and provide interface to the COP to keep operational commanders informed. Fielding is projected for completion in the early far term.

<sup>4</sup> Current DOTLPF include the ability to conduct this task using largely manual processes and available communications systems. However, processes and procedures for the dissemination of information to neighboring units is not adequate. The retransmission of the information by higher echelon to all units potentially at risk or affected by a CBRN/TIM event is performed as a work-around and assurance of notification. The fielding of JWARN, JOEF, and JEM initially performed during the mid term provides the capability to perform horizontal notification and information dissemination in addition to existing vertical capabilities. JWARN, JOEF, and JEM are projected for completion of fielding in the early far term. Lack of IDN and disparate sensor maturity prohibits development of supporting and associated DOTLPF. DOTLPF will need to evolve as systems, tactics, and situations change.

### 9.25.3 Functional Solution Analysis

#### 9.25.3.1 DOTLPF Assessment Summary.

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Lack of automated warning and reporting system for CBRN attacks.  
**Partial Non-Material Solutions:** *Doctrine:* Update and enhance doctrine, policies, procedures, TTPs, and SOPs to support and integrate disparate sensors, JWARN, JEM, and JOEF for effective CBRND. *Training:* Incorporate standards and criteria into formal and informal training, exercises, and evaluation for the integration of disparate sensors and the application of JWARN for effective CBRN warning and reporting.
2. **Deficiency:** Lack of reachback capability to CBRND databases and SMEs.  
**Partial Non-Material Solutions:** *Doctrine:* Establish in doctrine, policies, procedures, and TTPs requirements, guidelines, and processes for the rapid, secure, and accurate capability to reach back to CBRN/TIM information essential to rapid and accurate field analysis and response. *Organization:* Establish SME centers of excellence and structures to support reachback activities. *Training:* Institute formal and informal training on reachback processes and acquire and maintain SME capabilities. *Personnel:* Identify, acquire, and maintain SME expertise to support CBRND Reachback. *Facilities:* Institute necessary infrastructure to support reachback activities.

#### 9.25.3.2 IMA Assessment Analysis

Table 9.25-4 is a list of ideas for material approaches and a corresponding description of each idea. The ability to reach back to any CBRN/TIM information data locations is critical to the effective accomplishment of this task and cannot be overemphasized. Table 9.25-5 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 9.25-4. TASHA 25: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Collect, exchange, and disseminate information	Develop a system that collects and analyzes CBRN information and sensor input, generates, edits, and disseminates NBC reports, including downwind-hazard plots, and overlays and verify receipt of reports and plots. Transmission of data uses existing communications nets.
Simulations and models	Develop a system enabling operational commanders to efficiently execute “what if” scenarios and facilitate the evaluation of plausible adversary and friendly COAs, CBRN employment, and TIM ROTA.
Databases	Develop a system for obtaining information, archiving data, accessing databases, performing information/data queries, and exchanging data files in support of CBRN functions and activities.
Reachback capability	Develop a system providing the ability to rapidly and securely reach back and contact CBRN experts and obtain CBRND plans, procedures, information, and lessons learned.
Link to GIS	Develop a system resident in standard C4ISR systems with interface to GIS to provide input to the COP.

Table 9.25-5. TASHA 25: IMA Assessment

Identified Gaps	Ideas for Material Approaches (IMA)	Collect, Exchange, and Disseminate Information	Simulations and Models	Database	Reachback Capability	Link to GIS
Lack of automated warning and reporting system for CBRN attacks.		X				X
Lack of reachback capability to CBRND databases and SMEs.			X	X	X	X

**9.26 Task TASHA 26: Establish battlespace CBRND information integration and connectivity****9.26.1 Functional Area Analysis****9.26.1.1 Definition**

Ensures the smooth integration and rapid dissemination of CBRN information across the GIG within the immediate battlespace. Interoperability is a key component of the integration and connectivity. The integration plan addresses CBRN system and software interoperability and accreditation issues to facilitate the effective movement of essential CBRND information across the defense information infrastructure and common operating environment. Operation center, cell, or hub connectivity and interoperability support CBRND information activities and tasks. Connectivity and inoperability with coalition partners and appropriate indigenous agencies and NGOs are critical components. Operations centers of all echelons receive and transmit essential and routine CBRND information. Connectivity to the IDN supports situational awareness.

## **9.26.2 Functional Needs Analysis**

### **9.26.2.1 Capability and Deficiency Assessment Summary**

Table 9.26-1 discusses individual capabilities to perform this task to the designated standards. There are one current and three expected near-future capabilities used to accomplish this task. The capabilities include the current manual method of preparing incident assessments and the mid- to far-term fielding of JWARN, JEM and JOEF to meet the identified standards. The overall capability currently is rated “red.” Improvements in the near/mid term raise the assessment to “yellow” and continue into the far term. Although improvements between the near/mid-term and far-term periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to further change the overall assessed color rating for this task in the far term.

#### **Current Capability and Deficiency**

Current methods for exchanging CBRND information are cumbersome and slow, consisting of manual calculations and oral or written communication. Deficiencies include lack of automated capability to process and disseminate CBRN information, lack of compatibility among CBRND systems, and lack of information surety controls for CBRND.

#### **Projected Near/Mid-Term Capability and Deficiency**

Improvements in capabilities are envisioned with the fielding of the programmed JWARN, JOEF, and JEM systems. JWARN, JOEF, and JEM are projected for initial fielding in the mid term. Enhancements of existing information systems provide for potential integration of various systems to provide current and detailed information for decisioning and action. However, interoperability and integration is a DoD specific goal and is not mandatory upon other involved agencies. New DoD systems are expected to be in compliance with DISA standards and net-centric capable, as appropriate during the current and near term for interoperability and net-centric operations. Substantial upgrades to legacy systems are required to include DISA standards and net-centric capabilities. Further, the mix of legacy and compliant systems will continue to require the attentiveness and awareness of staffs to ensure effective collection, integration, and dissemination of information until the legacy systems are either replaced or modified for compliance. However, the current deficiencies remain and the potential opportunities afforded by the DoD initiative and enhanced automation capabilities are not fully realized for CBRND. Interoperability and integration will be a gradual process.

#### **Projected Far-Term Capability and Deficiency**

The fielding of JWARN, JOEF, and JEM is expected to be completed in the early far term. All legacy systems are projected to either be in compliance with, or replaced by new systems that are compliant with, DISA standards and fully support net-centric operations in the far term. Otherwise, no change is projected for this task.

Table 9.26-1. TASHA 26: Capability and Deficiency Assessment

Capability: Battlespace CBRND Information Integration and Connectivity	M1	M2	M3	M4	M5	M6	M7	M8
Current Overall Capability	3 <sup>1</sup>	6 <sup>2</sup>	2 <sup>3</sup>	5 <sup>4</sup>	2 <sup>3</sup>	4 <sup>5</sup>	1 <sup>3</sup>	4 <sup>6</sup>
Near/Mid-Term Overall Capability	5	6	5	5	5	5	2	4
Far-Term Overall Capability	8	7	7	7	7	5	3	5

	FAA Measure	Scale
M1	CBRND information is easily disseminated onto the GIG.	<p>8–10: Interoperable and integrated automated systems, processes, and tools collect, compile, correlate, and process CBRN/TIM information for decisioning, planning, warning, reporting, and visualization. Information is continuously processed and updated over the GIG and posted on the COP in near-real time.</p> <p>4–7: Manual processes are predominantly applied to the collection, compilation, correlation, and processing of CBRN/TIM information for decisioning, planning, warning, and reporting. Information is updated periodically and posted on the COP.</p> <p>1–3: Processes are inadequate for the collection, compilation, correlation, processing, and/or dissemination of CBRN/TIM information; or information dissemination is performed manually using existing communications systems.</p> <p>0: Processes are nonexistent for the collection, compilation, correlation, processing, and/or dissemination of CBRN/TIM information; or information dissemination cannot be accomplished using existing communications systems.</p>
M2	CBRND data and information formats are interoperable across the coalition.	<p>8–10: Processes and formats exist generating detailed CBRND data and information. The data elements and formats are standardized and interoperable among all coalition partners.</p> <p>4–7: Manual processes and broad-based, and general formats exist and are employed for the dissemination of selected CBRND data and information to most need-to-know centers. Data elements and format are standardized and recognized.</p> <p>1–3: Data format and information interoperability are inadequate to support operational needs and requirements.</p> <p>0: Data format and information interoperability are nonexistent.</p>
M3	Operation center systems are interoperable with force systems.	<p>8–10: Automated operation center systems are interoperable with all force systems, and data elements and formats are standardized and interoperable and integrated between all coalition partners, participating agencies, and force components. Information is disseminated using the GIG and displayed on the COP.</p> <p>4–7: A combination of manual and automated processes are applied within the operation center to process and disseminate information to all need-to-know centers. Information is updated periodically and posted on the COP. Manual processes and broad-based, and general formats exist and are employed for the dissemination of selected CBRND data and information. Data elements and format are standardized and recognized.</p> <p>1–3: Operation center systems are not adequately interoperable with force, coalition, and/or participating agency systems; and/or data elements and/or formats are inadequately interoperable and integratable across participating entities.</p> <p>0: Operation center systems are not interoperable with force, coalition, and/or participating agency systems; or data elements and/or formats are not interoperable and integratable across participating entities.</p>

M4	Operation center systems possess connectivity with force systems.	<p>8–10: Automated operation center systems possess secure and uninterrupted connectivity with all force, coalition, and participating agency systems with sufficient bandwidth to support the exchange of electronic information and data at a rate commensurate with intense operational activities.</p> <p>4–7: Existing C4ISR systems provide connectivity to force, coalition, and participating agency systems on a priority and as-available need basis. Connectivity and bandwidth is adequate to support most operations.</p> <p>1–3: Operation center systems possess inadequate connectivity with similar force, coalition partner, and/or participating agency systems; and/or necessary bandwidth.</p> <p>0: Operation center systems possess inadequate or do not possess connectivity with similar force, coalition partner, and/or participating agency systems; and/or bandwidth.</p>
M5	Operation center software is interoperable with force software and formats.	<p>8–10: Automated operation center systems are interoperable with all force systems and data elements and formats are standardized and interoperable and integrated between all coalition partners, participating agencies, and force components. Information is disseminated using the GIG and displayed on the COP.</p> <p>4–7: A combination of manual and automated processes are applied within the operation center to process and disseminate information to all need-to-know centers. Information is updated periodically and posted on the COP. Manual processes and broad-based and general formats exist and are employed for the dissemination of selected CBRND data and information. Data elements and format are standardized and recognized.</p> <p>1–3: Operation center systems are not adequately interoperable with force, coalition, and/or participating agency systems; or data elements and/or formats are inadequately interoperable and integratable across participating entities.</p> <p>0: Operation center systems are not interoperable with force, coalition, and/or participating agency systems; or data elements and/or formats are not interoperable and integratable across participating entities.</p>
M6	Information surety controls are active.	<p>8–10: Active and in-depth automated information surety controls and processes correlate and validate received information for authenticated originator, authorized coding sequence, data format, verification with other sources, and indicators of tampering, secondary transport, or other information assurance surveillance requirements.</p> <p>4–7: Manual and automated controls and processes are applied to validate and verify received information for potential indications of adversary origination, tampering, and to ensure information is verified with other sources for accuracy and completeness.</p> <p>1–3: Information surety controls are inadequate to assure received and applied information is not affected by adversary information warfare activities.</p> <p>0: Information surety controls are nonexistent to assure received and applied information is not affected by adversary information warfare activities.</p>
M7	CBRND data and information are interoperable across other agencies.	<p>8–10: Processes and formats exist generating detailed CBRND data and information. The data elements and formats are standardized and interoperable among all participating agencies.</p> <p>4–7: Manual processes and broad-based and general formats exist and are employed for the dissemination of selected CBRND data and information to most need-to-know centers. Data elements and format are standardized and recognized.</p> <p>1–3: Data format and information interoperability is inadequate to support operational needs and requirements.</p> <p>0: Data format and information interoperability is nonexistent.</p>

M8	There is effective DOTLPF in place to conduct task.	<p>8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations</p> <p>4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds.</p> <p>1–3: DOTLPF is inadequate for accomplishment of this task.</p> <p>0: DOTLPF does not exist for this task.</p>
----	---	--

<sup>1</sup> CBRND information is not generally disseminated through the GIG. Information is disseminated using manually prepared formats and textual messages using existing C4ISR communications systems. Posting on the COP, when accomplished, is performed manually. The projected mid-term initial fielding of JWARN, JEM, and JOEF will provide the ability to disseminate CBRND information over the GIG enterprise service using C4ISR information systems and the COP. Completed fielding is expected in the early far term. Net-centric operations and DISA data standards address interoperability and the interchange of information among DoD systems and elements. DoD systems are expected to be increasingly in compliance with the DISA standards and net-centric capable, as appropriate, during the mid term. New DoD systems are currently required to be in compliance with DISA standards and net-centric capable when fielded. All remaining legacy systems are projected to either be replaced by, or be fully compliant with, DISA standards and net-centric capable in the far term.

<sup>2</sup> The ATP-45 process, data elements, and formats are standardized throughout all NATO partners. ATP-45 is standard to all U.S. Forces and is generally recognized by most coalition partners. ATP-45 is currently a manual process providing broad-based CBRND data and information. The mid-term initial fielding of JWARN, JEM, and JOEF will automate many of the current manual processes. Completion of fielding of these systems is expected in the early far term. However, JWARN will continue to apply the ATP-45 data elements and processes. Current processes will remain. Net-centric operations and DISA data standards address interoperability and the interchange of information among DoD systems and elements. DoD systems are expected to be increasingly in compliance with the DISA standards and net-centric capable, as appropriate, during the mid term. New DoD systems are currently required to be in compliance with DISA standards and net-centric capable when fielded. All remaining legacy systems are projected to either be replaced by, or be fully compliant with, DISA standards and net-centric capable in the far term. Interoperability with coalition partners, especially non-NATO partners, and other agencies may be a continuing issue requiring maintenance of attentiveness and awareness by the responsible centers.

<sup>3</sup> Operations center systems are not interoperable with most force, coalition, and participating agency systems. Other than the ATP-45 data elements and formats, most data elements and formats are not interoperable with and between these systems. The mid-term initial fielding of JWARN, JEM, and JOEF does not resolve data interoperability and integration issues. Net-centric operations and DISA data standards address interoperability and the interchange of information among DoD systems and elements. DoD systems are expected to be increasingly in compliance with the DISA standards and net-centric capable, as appropriate, during the mid term. New DoD systems are currently required to be in compliance with DISA standards and net-centric capable when fielded. All remaining legacy systems are projected to either be replaced by, or be fully compliant with, DISA standards and net-centric capable in the far term. Interoperability with coalition partners, especially non-NATO partners, and other agencies may be a continuing issue requiring maintenance of attentiveness and awareness by the responsible centers. Fielding of JWARN, JOEF, and JEM is expected to be completed early in the far term.

<sup>4</sup> Current C4ISR systems in operation centers are generally stovepipe systems. Connectivity with other force, coalition partner, and participating agency systems is on a priority, as-available basis and manually performed, provided connectivity and data exchange is not otherwise negated by data structures and transmission protocols. Net-centric operations and DISA data standards address interoperability and the interchange of information among DoD systems and elements. DoD systems are expected to be increasingly in compliance with the DISA standards and net-centric capable, as appropriate, during the mid term. New DoD systems are currently required to be in compliance with DISA standards and net-centric capable when fielded. All remaining legacy systems are projected to either be replaced by, or be fully compliant with, DISA standards and net-centric capable in the far term. Interoperability with coalition partners, especially non-NATO partners, and other agencies may be a continuing issue requiring maintenance of attentiveness and awareness by the responsible centers. Bandwidth is adequate to support most operational requirements. However, the increasing demand for bandwidth to support net-centric operations and to support interoperability and near-real-time data exchange in the mid to far term is likely to exceed available bandwidth, to the potential detriment of operations.

<sup>5</sup> A combination of manual and automated information surety controls and processes are currently applied to ensure information is complete, verified, authenticated, and untampered. The process is time-consuming and the potential exists for errors to occur during periods of high OPTEMPO. JWARN, JEM, and JOEF—projected for initial fielding in the mid term—include automated information surety controls and processes. These will assist in the process; however, these systems will require manual oversight and operation. Fielding of these systems is expected to be completed in the early far term. Net-centric operations and DISA data standards address interoperability and the interchange of information among DoD systems and elements. DoD systems are expected to be increasingly in compliance with the DISA standards and net-centric capable, as appropriate, during the mid term. New DoD systems are currently required to be in compliance with DISA standards and net-centric capable when fielded. All remaining legacy systems are

projected to either be replaced by, or be fully compliant with, DISA standards and net-centric capable in the far term. Interoperability with coalition partners, especially non-NATO partners, and other agencies may be a continuing issue requiring maintenance of attentiveness and awareness by the responsible centers. Net-centric requirements and DISA standards will, over the course of the mid and far term through updates to legacy systems and software or their replacement, increase integration of automated information surety controls and processes. But information surety issues will remain with coalition partner and participating agency system information and data.

<sup>6</sup> Current DOTLPF addresses the critical aspects of this task, although applying predominantly manual means for attainment. DOTLPF requires improvement to sufficiently address information surety integration into force software and systems. This is especially critical with the increasing application of information systems on the battlefield within net-centric operations. DOTLPF must continue to evolve as systems, tactics, and situations change.

### 9.26.3 Functional Solution Analysis

#### 9.26.3.1 DOTMLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** DOTMLPF is inadequate to support and effectively apply joint systems and standards, and emerging technologies.

**Partial Non-Material Solutions:** *Doctrine:* Doctrine, policies, procedures, and TTPs must ensure the integration of information assurance capabilities into legacy, evolving, and emerging battlefield information technologies. Continued emphasis upon standardization of data elements, formats, and the interoperability and connectivity of Force systems is required. *Organization:* Ensure that organizational structures, processes, and capabilities support implementation and the effective application of joint systems and emerging technologies/systems. *Training:* Incorporate lessons learned and emerging technologies and systems into initial, recurring and advanced training. Formulate standards and criteria for challenging exercises and evaluations. *Leadership:* Ensure interoperability, connectivity, and integration of deploying systems and standardization of data elements and formats are pursued and accomplished. *Facilities:* Supporting necessary infrastructure.

2. **Deficiency:** Insufficient emphasis upon compatibility and interoperability of CBRND systems.

**Partial Non-Material Solutions:** *Doctrine:* Doctrine, policies, procedures, and TTPs must ensure the interoperability of deploying systems and standardization of data elements and formats.

3. **Deficiency:** Inadequate doctrine and training of the force.

**Non-Material Solutions:** *Doctrine:* Doctrine, policies, procedures, and TTPs require ongoing update and enhancement to maintain currency with materiel developments and operational needs. *Training:* Formal and recurring training, as well as challenging exercises and evaluations, are essential to maintaining force capabilities and currency with materiel developments and operational requirements.

#### 9.26.3.2 IMA Assessment Analysis

Table 9.26-4 is a list of ideas for material approaches and a corresponding description of each idea. The ability to obtain and process sensor data and tools to allow collaboration and information exchange while maintaining the integrity of that information is essential to this task. Table 9.26-5 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 9.26-4. TASHA 26: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Collect, exchange, and disseminate information	Develop a system that collects and analyzes CBRN information and sensor input, generates, edits, and disseminates NBC reports, including downwind-hazard plots and overlays, and verify receipt of reports and plots. Transmission of data uses existing communications nets.
CBRN staff collaboration tools	Develop automated system among and between CBRND specialists and other functions (e.g., operations, logistics) to allow collaboration between these functional areas and link to the COP.
Information assurance	Develop a CBRND system that processes and transmits information in accordance with Information Assurance Defense in Depth Standards, including certification and accreditation in accordance with DoD and CJCS guidance.

**Table 9.26-5. TASHA 26: IMA Assessment**

<div style="text-align: center;"> <b>Identified Gaps</b> </div> <div style="text-align: center;"> <b>Ideas for Material Approaches (IMA)</b> </div>	Collect, Exchange, and Disseminate Information	CBRN Staff Collaboration Tools	Information Assurance
DOTMLPF is inadequate to support and effectively apply Joint systems and standards, and emerging technologies.	<b>X</b>	<b>X</b>	<b>X</b>
Insufficient emphasis upon compatibility and interoperability of CBRND systems	<b>X</b>	<b>X</b>	<b>X</b>

**9.27 Task TASHA 27: Ensure the means to collaboratively plan, assess, and manage****9.27.1 Functional Area Analysis****9.27.1.1 Definition**

Ensures planners and staffs possess the appropriate means to collaboratively assess, plan, and manage. Encompasses access to automated collaborative workspace tools that are integrated and interoperable with existing C4ISR systems. Also encompasses movement of essential CBRN information across networks and the GIG. Includes interactive access to information repositories and expert advice. This task applies to all levels of command across the joint forces. This task enables situational awareness, situational understanding, and effective decision making.

**9.27.1.2 Derivation**

## **9.27.2 Functional Needs Analysis**

### **9.27.2.1 Capability and Deficiency Assessment Summary**

Table 9.27-1 discusses individual capabilities to perform this task to the designated standards. The capabilities include the current manual method of preparing incident assessments and the mid- to far-term fielding of JWARN, JEM and JOEF to meet the identified standards. The overall capability for current, near/mid, and far term are rated “yellow.” Although improvements between the periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to change the overall assessed color ratings for this task.

#### **Current Capability and Deficiency**

Collaborative planning and management of CBRND activities is a manual and time-intensive process. Some limited access is available to archived CBRN data. Current deficiencies include absence of advanced tools for planning and assessment management; no robust capability for remote situations; and absence of compliance with emerging network centric capability.

#### **Projected Near/Mid-Term Capability and Deficiency**

The fielding of the JWARN, JOEF, and JEM suite will significantly improve the capability of the staff to plan, assess, and manage CBRND activities. Initial fielding is projected for the mid term. However, improvements to this programmed capability are necessary. These include the ability to access out-of-network experts, improved bandwidth, and expanded supporting DOTLPF.

#### **Projected Far-Term Capability and Deficiency**

Fielding of JWARN, JOEF, and JEM is expected in the early far term.

Table 9.27-1. TASHA 27: Capability and Deficiency Assessment

Capability: Means of Collaboratively Planning, Assessing, and Managing	M1	M2	M3	M4	M5	M6
Current Overall Capability	5 <sup>1</sup>	5 <sup>1</sup>	3 <sup>2</sup>	3 <sup>2</sup>	4 <sup>3</sup>	3 <sup>4</sup>
Near/Mid-Term Overall Capability	5	5	3	3	5	4
Far-Term Overall Capability	6	6	3	3	7	5

	FAA Measure	Scale
M1	Participants are able to exchange information.	8–10: Secure, interoperable, and interactive electronic processes and workspaces with automated tools exist and are predominantly applied by all relevant echelons of the joint force, coalition partners, and other authorized entities. 4–7: Collaborative and interoperable manual processes are predominantly applied by most planning staffs of the joint force, coalition partners, and other authorized entities. Collaboration is performed via formal and informal review and comments of drafted material, on-site representation, and/or voice discussions. 1–3: Collaborative processes are inadequate or are not adequately collaborative or interoperable within or between elements of the joint force, coalition partners, and other authorized entities. 0: Collaborative processes do not exist or are not collaborative or interoperable within or between elements of the joint force, coalition partners, and other authorized entities.
M2	Planning, assessment, and management tools are interoperable.	8–10: Secure, interoperable, and interactive electronic processes, workspaces, and automated tools exist and are predominantly applied by all relevant echelons of the joint force, coalition partners, and other authorized entities. 4–7: Collaborative and interoperable manual processes and tools are predominantly applied by most staffs of the joint force, coalition partners, and other authorized entities. 1–3: Tools and process are inadequate or are not adequately collaborative and interoperable within or between elements of the joint force, coalition partners, and other authorized entities. 0: Tools and processes are nonexistent or are not collaborative and interoperable within or between elements of the joint force, coalition partners, and other authorized entities.
M3	CBRND information repositories are routinely accessible.	8–10: CBRN staff cell, unit staff, and automated systems possess unrestricted access to stored data and SMEs for CBRN/TIM agents and CBRND actions. CBRN/TIM agents and CBRND data sets are integrated and interoperable with CBRN systems. Additional information support is available using electronic reachback and connectivity to information sources and SMEs located outside the area of operations. Reachback is transparent to the user. 4–7: CBRN staff cell and unit personnel predominantly depend upon doctrine, policies, procedures, TTPs, reference material, and acquired training and knowledge for evaluation and assessment of CBRN/TIM agents and determination of CBRND actions as well as operational considerations. Reachback is routinely performed manually, although dependent upon availability of communications resources. 1–3: Access to CBRN, TIM, and/or CBRND information repositories and/or SMEs is inadequate to support operations. 0: Access to CBRN, TIM, and/or CBRND information repositories and/or SMEs is nonexistent for support of operations.

M4	Expert advice is routinely accessible.	<p>8–10: CBRN staff cell, unit staff, and automated systems possess unrestricted access to stored data and SMEs for CBRN/TIM agents and CBRND actions. CBRN/TIM agents and CBRND data sets are integrated and interoperable with CBRN systems. Additional information support is available using electronic reachback and connectivity to information sources and SMEs located outside the area of operations. Reachback is transparent to the user.</p> <p>4–7: CBRN staff cell and unit personnel predominantly depend upon doctrine, policies, procedures, TTPs, reference material, and acquired training and knowledge for evaluation and assessment of CBRN/TIM agents and determination of CBRND actions as well as operational considerations. Reachback is routinely performed manually, although dependent upon availability of communications resources.</p> <p>1–3: Access to CBRN, TIM, and/or CBRND information repositories and/or SMEs is inadequate to support operations.</p> <p>0: Access to CBRN, TIM, and/or CBRND information repositories and/or SMEs is nonexistent for support of operations.</p>
M5	CBRN information is processed using existing C4ISR assets.	<p>8–10: Interoperable and integrated automated systems, processes, and tools collect, compile, correlate, and process CBRN/TIM information from systems and resources on the GIG for decisioning, information/action dissemination, warning and reporting, and situational awareness. Information is continuously processed, updated, and posted on the COP.</p> <p>4–7: Manual processes are predominantly applied for the collection, compilation, correlation, and processing of CBRN/TIM information. The process may be restricted as C4ISR systems access by CBRN personnel is shared with other staff personnel and there may exist conflicting operational demands.</p> <p>1–3: CBRN information processing is inadequate to support operations.</p> <p>0: CBRN information processing is nonexistent for support of operations.</p>
M6	There is effective DOTLPF in place to conduct task.	<p>8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations</p> <p>4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds.</p> <p>1–3: DOTLPF is inadequate for accomplishment of this task.</p> <p>0: DOTLPF does not exist for this task.</p>

<sup>1</sup> CBRN/TIM and CBRND planning, assessments, and management currently require collaboration using traditional means such as telephone calls, personal visits, mail routing, e-mail, and other similar means. There is an absence of electronic collaborative workspaces and tools that are interoperable and integrated through which differing functions and activities are able to cooperatively assist and participate in the evaluation, assessment, planning, and decisioning process without time delay and the need for physical presence. Automated tools could effectively enhance and be enhanced by collaborative workspaces. Collaborative workspaces and tools support net-centric operations. The mid-term initial fielding of JWARN and its siting on existing C4ISR systems permits the reception and dissemination of CBRN/TIM event information. JWARN fielding is expected to be completed in the early far term. However, the largely manual nature of current processes remains.

<sup>2</sup> Predominantly manual access to CBRND information and guidance is performed to selected support entities and higher echelon of command. CBRN/TIM and CBRND repositories do exist but are fragmented and generally not accessible by field units. SMEs and knowledge centers do exist for various aspects of CBRND but are generally not known or accessible to deployed units. Reachback is performed in selected circumstances and is dependent upon operational considerations, available communications resources, and personal knowledge of contacts for information. CBRN staff cell and unit personnel essentially rely upon electronic and hardcopy reference material taken by the staff and the training and experience of the performing personnel.

<sup>3</sup> Current processes are predominantly manual with limited automation. Process is labor- and time-consuming, and dependent upon the training, experience, and availability of performing personnel as well as the quality of the collected information. The current capability is achieved using doctrine. CBRN staff cell and unit personnel possess access to shared information technology resources and tools. CBRN personnel do not possess dedicated information technologies to perform training and operational requirements. Available resources are shared with other requiring activities and functions. The communication of CBRN information is performed using existing and available C4ISR resources but is not otherwise processed by these assets. The programmed mid-term initial fielding of JWARN, JOEF, and JEM, although CBRND-supporting technologies, will likely reside

upon resident C4ISR hardware and not dedicated CBRND hardware resources. However, these systems are expected to reduce the time required to perform tasks and the dissemination of information. JWARN, JOEF, and JEM are expected to be fully fielded in the early far term. These systems provide CBRN information processing capabilities.

<sup>4</sup> -DOTLPF does address the collaborative assessment, planning, and management of CBRN/TIM incidents and CBRND. However, DOTLPF does not adequately address dedicated CBRND staff cell information technology resources, information repositories, SMEs and SME centers, and automated tools and workspaces within the net-centric environment. DOTLPF does not effectively support CBRND operations in a net-centric environment. DOTLPF must evolve to meet current and future needs resulting from changes in systems, tactics, and situations.

### 9.27.3 Functional Solution Analysis

#### 9.27.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Lack of CBRND information, data, and support systems meeting standards.  
**Partial Non-Materiel Solutions:** *Doctrine:* Enhance doctrine, policies, procedures, and TTPs to address the full scope of activities involving CBRN/TIM and CBRND information. Include format, access, availability, transmission, processing, dissemination, and other activities and functions critical to timely and accurate decisioning and response activities. *Training:* Emphasis in formal and recurring training, as well as challenging criteria for exercises and evaluations, upon means and methods ensuring timely, accurate, and effective CBRN/TIM and CBRND planning, assessment, management, decisioning, and response.
2. **Deficiency:** Absence of advanced tools for planning and assessment management.  
**Partial Non-Materiel Solutions:** *Training:* Expand formal and recurring training, and exercise and evaluation criteria, to include CBRN/TIM planning and assessment tools as they are fielded.
3. **Deficiency:** Lack of robust capability for very remote situations requiring high capacity and competitiveness for bandwidth.  
**Partial Non-Materiel Solutions:** *Doctrine:* Include mechanisms in doctrine, policy, procedures, and TTPs for means and processes enabling remote locations to obtain needed CBRND information. *Training:* Include mechanisms in formal and recurring training, and their implementation and use in exercises and evaluations, for means and processes addressing the ability of remote locations to obtain needed CBRND information.
4. **Deficiency:** Absence of compliance with emerging network-centric capability.  
**Partial Non-Materiel Solutions:** *Doctrine:* Ensure doctrine, policies, procedures, and TTPs address the exchange CBRN/TIM and CBRND data and information across the network and posting on the COP. *Training:* Ensure formal and recurring training, as well as exercise and evaluation criteria, address the exchange of CBRN/TIM and CBRND data information across the network and posting on the COP.

#### 9.27.3.2 IMA Assessment Summary

Table 9.27-4 is a list of ideas for material approaches and a corresponding description of each idea. Approaches here span the spectrum of approaches in previous paragraphs, including sensor data acquisition and processing, modeling and simulation for planning and warning and, of course, the ability to actively collaborate between units, commands, services, other agencies and coalition partners. Table 9.27-5 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 9.27-4. TASHA 27: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Information assurance	Develop a CBRND system that processes and transmits information in accordance with Information Assurance Defense in Depth Standards, including certification and accreditation in accordance with DoD and CJCS guidance.
Collect, exchange, and disseminate information	Develop a system that collects and analyzes CBRN information and sensor input; generates, edits, and disseminates NBC reports, including downwind-hazard plots and overlays; and verify receipt of reports and plots. Transmission of data uses existing communication nets.
Link to GIS	Develop a system resident in standard C4ISR systems with interface with GIS to provide input to the COP.
Simulations and models	Develop a system that will enable operational commanders to efficiently execute “what if” scenarios and facilitate the evaluation of COAs.
Database	Develop a system enabling operational commanders to efficiently execute “what if” scenarios and facilitate the evaluation of plausible adversary and friendly COAs, CBRN employment, and TIM ROTA.
Reachback capability	Develop a system providing the ability to rapidly and securely reach back and contact CBRN experts and obtain CBRND plans, procedures, information, and lessons learned.
Risk factor templates	Develop a system merging CBRN, intelligence, and operational data and plans into standardized automated formats for application to effectively and rapidly accomplish CBRN/TIM functions and activities.
Link to COP	Develop a CBRND information system resident in standard C4ISR systems with interface with GIS to provide input to the COP.

Table 9.27-5. TASHA 27: IMA Assessment

Identified Gaps	Ideas for Material Approaches (IMA)							
	Information Assurance	Collect, Exchange, and Disseminate Information	Link to GIS	Simulations and Models	Database	Reachback Capability	Risk Factor Templates	Link to Common Operating Picture
Lack of CBRND information, data, and support systems meeting standards	X	X	X	X	X	X	X	X
Absence of advanced tools for planning and assessment management.			X	X	X	X	X	X
Lack of robust capability for very remote situations requiring high capacity and competitiveness for bandwidth.		X	X					X
Absence of compliance with emerging network centric capability.	X	X	X					X

**9.28 Task TASHA 28: Ensure CBRND information and data****9.28.1 Functional Area Analysis****9.28.1.1 Definition**

Ensures adherence to the appropriate information security procedures and protocols. The ability to gain and maintain information superiority enables speed of command and self-synchronization. This task provides the warfighter the ability to make risk-based decisions in a timely manner. Ensure that an appropriate level of information confidentiality, integrity, authentication, nonrepudiation, and availability is maintained. Deny the enemy comparable advantages and exploit weaknesses. Information must be in accordance with protocols. Ensures quality, timeliness, and utility of information processes.

**9.28.1.2 Derivation**

3. Intelligence dissemination and receipt partially exists. (C2.4.7)

**Civil.** N/A

**9.28.2 Functional Needs Analysis****9.28.2.1 Capability and Deficiency Assessment Summary**

Table 9.28-1 discusses individual capabilities to perform this task to the designated standards. The capabilities include the current manual method (ATP-45) of preparing incident assessments and the mid- to far-term fielding of JWARN, JEM and JOEF to meet the identified standards.

The overall capability currently is rated “red.” Improvements in the near/mid term raise the assessment to “yellow” and continue into the far term. Although improvements between the near/mid-term and far-term periods occur for specific capabilities and are reflected in the associated identified values, the improved capabilities are not sufficient to further change the overall assessed color rating for this task in the far term.

### **Current Capability and Deficiency**

The accuracy and assurance of disseminated CBRND information are dependent on the individual ability of the person performing the analysis and assessment. Current deficiencies include absence of automated tools, (which impacts accuracy of produced information); lack of access to communication and data processing tools; and challengeable information assurance.

### **Projected Near/Mid-Term Capability and Deficiency**

The fielding of the programmed JWARN, JOEF, and JEM systems significantly improves assurance of information. JWARN, JOEF, and JEM are projected for initial fielding in the mid term. The systems are designed to comply with Information Assurance Defense In-Depth Standards and to be certified and accredited under the DoD Information Technology Security Certification and Accreditation Process (DITSCAP) process. However, improvements to supporting DOTLPF are necessary to effectively implement and apply the new systems, as well as other evolving technologies. The mechanism for information assurance requires improvement to maintain pace with these new technologies and systems. Increased information processing and transfer capabilities place a high demand upon available bandwidth and will exceed current allocations. Increased bandwidth is needed to accommodate this demand. Increased processing and transmission/reception speeds may help mitigate the demand. However, interoperability and integration is a DoD-specific goal and is not mandatory upon other involved agencies. New DoD systems are expected to be in compliance with DISA standards and net-centric capable, as appropriate during the current and near term for interoperability and net-centric operations. Substantial upgrades to legacy systems are required to include DISA standards and net-centric capabilities. Further, the mix of legacy and compliant systems will continue to require the attentiveness and awareness of staffs to ensure effective collection, integration, and dissemination of information until the legacy systems are either replaced or modified for compliance. However, the current deficiencies remain and the potential opportunities afforded by the DoD initiative and enhanced automation capabilities are not fully realized for CBRND. Interoperability and integration will be a gradual process.

### **Projected Far-Term Capability and Deficiency**

The fielding of JWARN, JOEF, and JEM is expected to be completed in the early far term. All legacy systems are projected to either be replaced by, or be in compliance with, Information Assurance Defense in Depth Standards (IADDS)/DISA standards and fully support net-centric operations in the far term. Otherwise, no change is projected for this task.

Table 9.28-3. TASHA 28: Capability and Deficiency Assessment

Capability: CBRND Information and Data Assurance	M1	M2	M3	M4	M5
Current Overall Capability	2 <sup>1</sup>	5 <sup>2</sup>	5 <sup>3</sup>	3 <sup>4</sup>	2 <sup>5</sup>
Near/Mid-Term Overall Capability	4	6	6	5	5
Far-Term Overall Capability	8	8	7	6	8

	FAA Measure	Scale
M1	Information assurance is in accordance with current doctrine.	8–10: All CBRN information processes and systems strictly adhere to IADDS including certification and accreditation of automated processes and systems in accordance with DoD and CJCS guidance. 4–7: Automated CBRN information and standards generally conform to IADDS. Critical automated CBRN systems and processes possess certification and accreditation outlined in DoD and CJCS guidelines. 1–3: CBRN information processes and systems generally do not adhere to IADDS or are not certified or accredited as specified in DoD and CJCS guidance. 0: CBRN information processes and systems do not adhere to IADDS and are not certified and accredited as specified in DoD and CJCS guidance.
M2	Information assurance controls are challenge free.	8–10: Information assurance processes and controls preclude the dissemination and application of erroneous, unsubstantiated, and/or tampered information. No impact. 4–7: Information assurance processes and controls generally preclude the dissemination and application of erroneous, unsubstantiated, and/or tampered information. However, impact is minor and does not adversely impact mission success. 1–3: Information assurance process and controls are inadequate to preclude dissemination and application of erroneous, unsubstantiated, and/or tampered information and possess the potential to seriously impact mission success. 0: Information assurance process and controls do not exist to preclude dissemination and application of erroneous, unsubstantiated, and/or tampered information and possess the potential to prevent mission success.
M3	Disseminated information is accurate.	8–10: CBRN information is correlated and processed with other source information and, as a composite, is disseminated in near-real time to requiring users. The disseminated data are accurate, current, and updated as new information is received and processed. 4–7: CBRN information is predominantly manually correlated and processed with other source information and, as a composite, disseminated to requiring users. The disseminated data are accurate as of the last update. 1–3: Disseminated CBRN information contains inaccuracies, not adequately integrated with other source data, or is based upon incomplete/unverified data. 0: Disseminated CBRN information is inaccurate, not integrated with other source data, or is based upon erroneous data.

M4	Processed information reaches requiring units/ action personnel in a timely manner.	<p>8–10: Means exist and are employed for the near-real-time dissemination of processed CBRND information to all need-to-know centers and activities.</p> <p>4–7: Limited means exist and are employed for the dissemination of CBRND information to all need-to-know centers and activities prior to potential serious affect by agent(s) upon unit operational capabilities.</p> <p>1–3: Means employment and/or timeliness is inadequate for the dissemination of CBRND information to requiring need-to-know centers to preclude serious impact upon unit and/or activity operational capabilities.</p> <p>0: Means do not exist or employment and/or timeliness is unable to support the dissemination of CBRND information to requiring need-to-know centers to preclude loss of unit and/or activity operational capabilities with significant potential for non-success of mission/operations.</p>
M5	There is effective DOTLPF in place to conduct task.	<p>8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations</p> <p>4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds.</p> <p>1–3: DOTLPF is inadequate for accomplishment of this task.</p> <p>0: DOTLPF does not exist for this task.</p>

<sup>1</sup> Current CBRN information processes and systems are not in compliance with IADDS including certification and accreditation in accordance with DITSCAP. JWARN, JOEF, and JEM, projected to be initially fielded during the mid term, are to comply with IADDS and DITSCAP. JWARN, JOEF, and JEM are expected to complete fielding in the early far term. The standards incorporate and provide for information assurance. However, these systems will be resident on existing C4ISR systems. These systems are expected to comply with these requirements during the mid term. Net-centric operations, DISA, and IADDS data standards address interoperability, information assurance, and the interchange of information among DoD systems and elements. DoD systems are expected to be increasingly in compliance with the IADDS and DISA standards and net-centric capable, as appropriate, during the mid term. New DoD systems are currently required to be in compliance with IADDS/DISA standards and net-centric capable when fielded. All remaining legacy systems are projected to either be replaced by, or be fully compliant with, IADDS/DISA standards and net-centric capable in the far term.

<sup>2</sup> Information assurity measures for CBRN information and data are a mix of manual and automated measures (predominantly manual). The potential for the application and/or dissemination of erroneous, unsubstantiated, and/or tampered information exists. The impact is dependent upon the information and operations. Generally, however, flawed information is rapidly identified and rectified. JWARN, JOEF, and JEM, projected to be initially fielded during the mid term, are to comply with IADDS and DITSCAP. JWARN, JOEF, and JEM are expected to complete fielding in the early far term. The standards incorporate and provide for information assurance. However, these systems will be resident on existing C4ISR systems. These systems are expected to comply with these requirements during the mid term. Net-centric operations, DISA, and IADDS data standards address interoperability, information assurance, and the interchange of information among DoD systems and elements. DoD systems are expected to be increasingly in compliance with the IADDS and DISA standards and net-centric capable, as appropriate, during the mid term. New DoD systems are currently required to be in compliance with IADDS/DISA standards and net-centric capable when fielded. All remaining legacy systems are projected to either be replaced by, or be fully compliant with, IADDS/DISA standards and net-centric capable in the far term. Oversight and review will continue to be necessary until standards and controls are adequate across all involved systems.

<sup>3</sup> CBRN/TIM incident, agent characterization, and CBRND information and data correlation, validation, processing, and dissemination are predominantly manual and time- and labor-intensive. Reporting is performed using the ATP-45 process and formats. Accuracy of disseminated data and information is contingent upon availability of information and the training, experience, and knowledge of the performing individuals. Updates are disseminated as additional information is received, validated, and processed. The projected mid-term initial fielding of JWARN, JOEF, and JEM will improve the process and reduce the potential for dissemination of flawed information and data. JWARN, JOEF, and JEM are expected to complete fielding in the early far term.

<sup>4</sup> Limited means exist for the rapid and timely dissemination of CBRN data and information to requiring units and/or action personnel. Existing ATP-45 processes and reports generally flow upward within a unit's command structure. The higher echelon then disseminates the information downward in the structure to other units and upward to the next higher echelon of command of a Service. The echelon commanding or supporting differing Service elements initiates the cross notification and downward dissemination of the data. Notification of adjacent units is often delayed, especially if the adjacent units are not of the same immediate command structure. The projected mid-term initial deployment of JWARN provides for warning and reporting of CBRN information and data to all requiring units and applies the NATO standard ATP-45 reporting formats. JWARN is expected to be fully fielded in the early far term. Net-centric operations and DISA data standards address interoperability, information assurance, and the interchange of information among

DoD systems and elements. DoD systems are expected to be increasingly in compliance with the DISA standards and net-centric capable, as appropriate, during the mid term. New DoD systems are currently required to be in compliance with DISA standards and net-centric capable when fielded. All remaining legacy systems are projected to either be replaced by, or be fully compliant with, DISA standards and net-centric capable in the far term. However, not all potential partners and participating agencies will be interoperable and integrated with the C4ISR system or trained to rapid interpret ATP-45 data and information.

<sup>5</sup> Current DOTLPF address the performance of this task. Work-arounds enabling the cross-notification between adjacent units of hazards are often established locally by the units. However, DOTLPF remains inadequate for the rapid and timely lateral notification of units within a hazard area. DOTLPF must ensure readiness to fully implement and apply JWARN, JOEF, and JEM when these systems are fielded. DOTLPF must evolve as systems, tactics, and situations change for survival and successful mission accomplishment.

### 9.28.3 Functional Solution Analysis

#### 9.28.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

**1. Deficiency:** Absence of automated tools impacts accuracy.

**Partial Non-Material Solutions:** *Doctrine:* Expand and enhance doctrine, policies, procedures, and TTPs provide in-depth guidance and requirements supporting the collection, movement, application, and dissemination of information, using automated tools where appropriate, that is accurate and timely. Include requirement for CBRN/TIM and CBRND data and information be posted and maintained on the COP. *Training:* Emphasize formal and recurring training and exercise and evaluation criteria that support the vertical and lateral movement of CBRN/TIM and CBRND data and information and the application of automated tools to increase accuracy and timeliness.

**2. Deficiency:** Lack of or limited access to communication and data processing tools.

**Partial Non-Material Solutions:** *Doctrine:* Emphasize and enable within doctrine, policies, procedures, and TTPs the essential nature of CBRN information exchange and promoting the allocation of necessary resources essential for IDN and automated CBRND tools effectiveness. *Training:* Implement attainment and maintenance of task skills through formal and recurring training and challenging exercises and evaluations stressing the effective allocation of necessary resources and conduct of CBRN/TIM information exchange, processing, and dissemination that is accurate and timely. *Leadership:* Emphasize criticality of effective and timely processing of CBRN/TIM and CBRND data and information upon force survival and successful mission accomplishment. Ensure necessary resources are allocated and applied to support this task.

#### 9.28.3.2 IMA Assessment Summary

Table 9.28-4 is a list of ideas for material approaches and a corresponding description of each idea. Approaches to this task center around an automated system to obtain, process, and disseminate CBRND/TIM information while maintaining the integrity and validity of that information. Table 9.28-5 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 9.28-4. TASHA 28: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Information assurance	Develop a CBRND system that processes and transmits information in accordance with IADDS, including certification and accreditation in accordance with DoD and CJCS guidance.
Simulations and models	Develop a system that will enable operational commanders to efficiently execute “what if” scenarios and facilitate the evaluation of COAs.
Database	Develop a system enabling operational commanders to efficiently execute “what if” scenarios and facilitate the evaluation of plausible adversary and friendly COAs, CBRN employment, and TIM ROTA.
Reachback capability	Develop a system providing the ability to rapidly and securely reach back and contact CBRN experts and obtain CBRND plans, procedures, information, and lessons learned.
Risk factor templates	Develop a system merging CBRN, intelligence, and operational data and plans into standardized automated formats for application to effectively and rapidly accomplish CBRN/TIM functions and activities.
Link to GIS	Develop a system resident in standard C4ISR systems with interface with GIS to provide input to the COP.

**9.29 Task TASHA 29: Coordinate the allocation and access to C4ISR assets to support battlespace CBRND operating requirements****9.29.1 Functional Area Analysis****9.29.1.1 Definition**

Ensures access to or availability of the appropriate C4ISR and CBRND information systems throughout the theater to include small units on independent operations. Sufficient C4ISR assets are required for effective performance of CBRND tasks by units and staff cells. Stand-alone processing capability enhances performance in austere, expeditionary, and widely dispersed force positions. Network access to higher-capacity C4ISR systems and information technology enhances performance.

**9.29.1.2 Derivation**

*UJTL (TA 5, TA 5.2.1, TA 7, TA 7.1), Protection Joint Functional Concept, Military Transformation: A Strategic Approach, Transformation Planning Guidance, An Operational Concept for Biological Defense.*

**9.29.1.2.1 Supported Task: OPSHA 5****9.29.1.2.2 Lateral Task: N/A****9.29.1.2.3 Supporting Task: N/A****9.29.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Limited modern military systems. (C2.2.5)
2. Intermittent communications connectivity. (C2.3.1.6)

**Civil**

1. Fair information management. (C3.3.7.4)

**9.29.2 Functional Needs Analysis****9.29.2.1 Capability and Deficiency Assessment Summary**

Table 9.29-1 discusses individual capabilities to perform this task to the designated standards. The capabilities include the current manual method of preparing incident assessments and the

mid- to far-term fielding of JWARN, JEM and JOEF to meet the identified standards. The overall capability for current, near/mid, and far term are assessed “yellow.”

**Current Capability and Deficiency**

NBC staff must share access to C4ISR terminals with other staff functions. This limits their ability to keep the COP updated with accurate CBRN situational awareness and their ability to stay informed of other units’ status. Current deficiencies include the need for CBRND units and staffs to be properly equipped and have sufficient access to C4ISR assets to accomplish their missions.

**Projected Near/Mid-Term Capability and Deficiency**

The programmed JWARN, JOEF, and JEM systems will provide the CBRN staff with current information and visibility in the COP. JWARN, JOEF, and JEM are projected for initial fielding in the mid term. The importance of and reliance upon increasingly networked systems means additional connective nodes will be required for information access.

**Projected Far-Term Capability and Deficiency**

Completion of fielding of JWARN, JOEF, and JEM is expected in the early far term. Additional connective nodes will be required to support the increasingly networked systems and to support operational requirements.

**Table 9.29-1. TASHA 29: Capability and Deficiency Assessment**

<b>Capability: C4ISR Asset Allocation and Access Coordination Supporting Battlespace CBRND Operating Requirements</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>
<b>Current Overall Capability</b>	4 <sup>1</sup>	4 <sup>2</sup>	5 <sup>3</sup>	5 <sup>4</sup>
<b>Near/Mid-Term Overall Capability</b>	5	5	6	5
<b>Far-Term Overall Capability</b>	7	5	7	5

	<b>FAA Measure</b>	<b>Scale</b>
M1	CBRN Information is processed using existing C4ISR assets.	8–10: Interoperable and integrated automated systems, processes, and tools collect, compile, correlate, and process CBRN/TIM information from systems and resources on the GIG for decisioning, information/action dissemination, warning and reporting, and situational awareness. Information is continuously processed, updated, and posted on the COP. 4–7: Manual processes are predominantly applied for the collection, compilation, correlation, and processing of CBRN/TIM information. The process may be restricted as C4ISR systems access by CBRN personnel is shared with other staff personnel and there may exist conflicting operational demands. 1–3: CBRN information processing is inadequate to support operations. 0: CBRN information processing is nonexistent for support of operations.
M2	CBRND units and staff cells can access C4ISR assets.	8–10: CBRND units and staff cells possess dedicated information technology resources and tools with unrestricted (as applicable) access to C4ISR systems for the accomplishment and performance of their duties and responsibilities. These are used to support operational and training requirements. 4–7: CBRND units and staff cell personnel are able to access C4ISR systems using shared information technology resources and tools for operational requirements and training. 1–3: CBRND units and staff cell personnel possess inadequate access to C4ISR systems to support operations and training requirements. 0: CBRND units and staff cell personnel do not possess access to C4ISR systems to support operations and training requirements.
M3	CBRN information processing available when network is no longer available.	8–10: Local CBRN systems possess sufficient resident capability and alternative connectivities to maintain data collection, correlation, validation, processing, and dissemination of CBRN/TIM information to support ongoing OPTEMPO in the event network connectivity is interrupted for any length of time. 4–7: Manual CBRN processes with limited automated tools and capabilities provide CBRN information processing support of operations should network connectivity be temporarily interrupted. 1–3: CBRN information processing is inadequate for effective support of operations if network connectivity is interrupted. 0: CBRN information processing cannot support operations, and/or nonexistent if network connectivity is interrupted.
M4	There is effective DOTLPF in place to conduct task.	8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations. 4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds. 1–3: DOTLPF is inadequate for accomplishment of this task. 0: DOTLPF does not exist for this task.

<sup>1</sup> Current processes are predominantly manual with limited automation. Process is labor- and time-consuming and dependent upon the training, experience, and availability of performing personnel as well as the quality of the collected information. The current capability is achieved using doctrine. CBRN staff cell and unit personnel possess access to shared information technology resources and tools. CBRN personnel do not possess dedicated information technologies to perform training and operational requirements. Available resources are shared with other requiring activities and functions. The communication of CBRN information is performed using existing and available C4ISR resources but is not otherwise processed by these assets. The programmed mid-term initial fielding of JWARN, JOEF, and JEM, although CBRND-supporting technologies, will likely reside upon resident C4ISR hardware and not dedicated CBRND hardware resources. JWARN, JOEF, and JEM are expected to complete fielding in the early far term. These systems provide CBRN information processing capabilities.

<sup>2</sup> CBRN staff cell personnel and unit personnel possess access to shared information technology resources and tools. CBRN personnel do not possess dedicated information technology to perform training and operational requirements. Available resources are shared with other requiring activities and functions. The programmed mid-term initial fielding of JWARN, JOEF, and JEM, although sited upon resident C4ISR hardware, are expected to reduce the time required for CBRN staff cell personnel to perform their tasks and responsibilities. JWARN, JOEF, and JEM are expected to complete fielding in the early far term.

<sup>3</sup> Current processes are predominantly manual with limited automated tools and capabilities. Capability currently exists to perform CBRN information processing without access to automated network resources. The project mid-term initial fielding of JWARN, JOEF, and JEM and increasing reliance upon networked automated systems requires possession of resident capabilities and alternative connectivities within local CBRN systems to maintain support of operations through a period of interruption. JWARN, JOEF, and JEM are expected to complete fielding in the early far term. JWARN, JOEF, and JEM do possess the capability to work off-network with manual interface and support when the circumstances require.

<sup>4</sup> Current DOTLPF supports the manual processing of CBRN information and data. However, the projected fielding of JWARN, JOEF, and JEM in the mid term and the increasing application and dependence upon networked automated systems dictates the investigation and determination of alternative connectivities and processes to accomplish this task during periods of network interruption. DOTLPF must address short-term and long-term interruptions of primary connectivity due to natural, system-based, or adversary-imposed situations. DOTLPF must evolve as systems, tactics, and situations change and to promote and maintain net-centric operations.

### 9.29.3 Functional Solution Analysis

#### 9.29.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

**1. Deficiency:** Lack of dedicated C4ISR assets for CBRND units and staffs.

**Partial Non-Material Solutions:** *Doctrine:* Adjust doctrine to establish either CBRN staff priority access to C4ISR terminals during CBRN threat/incident situations or dedicated CBRN staff C4ISR access and terminals. *Organization:* Structure operations center to afford and support CBRN staff priority access to C4ISR systems. *Training:* Include doctrinal adjustments in staff training. *Leadership:* Provide specific leadership development training and exercises to reinforce the essential nature of CBRND information.

#### 9.29.3.2 IMA Assessment Summary

Table 9.29-4 is a list of ideas for material approaches and a corresponding description of each idea. The need for additional C4ISR assets is identified in this analysis along with the material approach of developing an automated CBRND system that will reside on current and future C4ISR systems.

**Table 9.29-4. TASHA 29: Materiel Approaches**

<b>Identified Deficiency</b>	<b>Idea for Materiel Approach</b>	<b>Description</b>
Lack of dedicated C4ISR assets for CBRND units and staffs	CBRN staff cell C4ISR equipment	Procure and field dedicate C4ISR equipment to CBRN staff cells enabling connectivity with the COP and the performance of their responsibilities and tasks.
	Enhanced C4ISR systems	Expand existing and programmed C4ISR systems capabilities to support increasing demands upon resources.

**9.30 Task TASHA 30: Initiate CBRN/TIM event history archiving****9.30.1 Functional Area Analysis****9.30.1.1 Definition**

Encompasses the collecting, compiling, and archiving of CBRN/TIM event data, information, and related decision and response actions. Includes such things as event time history, response actions, hazard prediction and effects modeling, along with the dynamic and deliberate staff actions and management tools utilization. IDN nodes archive sensor and characterization data. The archived data are used in studies and analyses to assess what occurred and contribute to improving future responses. Includes information assurance considerations.

**9.30.1.2 Derivation**

*UJTL (TA 5.2.1, TA 7, TA 7.1), Protection Joint Functional Concept, Military Transformation: A Strategic Approach.*

**9.30.1.2.1 Supported Task: OPSHA 5****9.30.1.2.2 Lateral Task: N/A****9.30.1.2.3 Supporting Task: N/A****9.30.1.3 Condition**

Perform this task under conditions of:

**Physical.** N/A

**Military**

1. Limited modern military systems. (C2.2.5)
2. Low military systems reliability. (C2.2.5.3)
3. Restricted information exchange. (C2.3.1.8)
4. High information volume. (C2.3.1.9)
5. Intelligence dissemination and receipt partially exists. (C2.4.7)

**Civil.** N/A

**9.30.2 Functional Needs Analysis****9.30.2.1 Capability and Deficiency Assessment Summary**

Table 9.30-1 discusses individual capabilities to perform this task to the designated standards. The capabilities include the current manual method of preparing incident assessments and the mid- to far-term fielding of JWARN, JEM and JOEF to meet the identified standards. The

current overall capability is rated “red,” and the near/mid and far-term overall capabilities are rated “yellow.”

**Current Capability and Deficiency**

Current capability is extremely limited. Event histories are compiled from operations center logs as current IDN systems are restricted to real-time information transmission and do not possess internal archiving.

**Projected Near/Mid-Term Capability and Deficiency**

When fielded, JWARN, as an integral part of the IDN, will be capable of storing, modifying, retrieving, displaying, archiving and transferring data including location of attacks and sources of attack. JWARN is projected for initial fielding in the mid term. New DoD systems are expected to be in compliance with DISA standards and net-centric capable, as appropriate during the current and near term for interoperability and net-centric operations. Substantial upgrades to legacy systems are required to include DISA standards and net-centric capabilities. Further, the mix of legacy and compliant systems will continue to require the attentiveness and awareness of staffs to ensure effective collection, integration, and dissemination of information until the legacy systems are either replaced or modified for compliance. However, the current deficiencies remain and the potential opportunities afforded by the DoD initiative and enhanced automation capabilities are not fully realized for CBRND. Interoperability and integration will be a gradual process.

**Projected Far-Term Capability and Deficiency**

Fielding of JWARN is expected to be completed in the early far term. All legacy systems are projected to either be replaced by, or in compliance with, DISA standards and full support net-centric operations in the far term. Sensors and IDN capabilities are in development with stated fielding sometime in the far term. This is dependent upon the progression of sensor technologies necessary for an IDN. Otherwise, no change is projected for this task.

**Table 9.30-1. TASHA 30: Capability and Deficiency Assessment**

<b>Capability: CBRN/TIM Event History Archival</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>
<b>Current Overall Capability</b>	0 <sup>1</sup>	4 <sup>2</sup>	4 <sup>3</sup>
<b>Near/Mid-Term Overall Capability</b>	2	5	4
<b>Far-Term Overall Capability</b>	5	5	4

	<b>FAA Measure</b>	<b>Scale</b>
M1	IDN able to archive and make available sensor track data over time.	8–10: IDN nodes and sensors possess resident automated data-retention capabilities for sensor-reading information and data, as well as node activities such as adjustments, corrections, etc. Each node registers, records, and disseminates information on lower-level node and sensor readings and node activities. Node-retained data are accessible and supports extended periods of operation. 4–7: IDN system possesses resident automated data-retention capabilities for subordinate nodes and sensors. Node-retained data are accessible and entries are cleared on a routine basis. 1–3: IDN system possesses inadequate resident automated data-retention capabilities for subordinate nodes and sensors. Nodes do not possess data-retention capabilities. 0: IDN does not possess resident automated data-retention capabilities, data are not accessible, and/or data memory retention is inadequate.
M2	Operations centers compile event histories.	8–10: Integrated and interoperable systems collect and compile event information from all systems within operations centers. Data entries are identified to source, date/time, performing activity, etc., and retained in time sequence blocks. Information is accessible by time and/or system. The automated event history permits manual notations and entries and provides a detailed and in-depth history of an event. 4–7: Manual event histories are compiled following an event, or as time permits, through the use of logs, documentation, system information, and other sources. The compiled event history provides a detailed history of an event. 1–3: Event histories are inadequate. 0: Event histories are nonexistent.
M3	There is effective DOTLPF in place to conduct task.	8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations. 4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds. 1–3: DOTLPF is inadequate for accomplishment of this task. 0: DOTLPF does not exist for this task.

<sup>1</sup> Fielded IDN systems for CBRN/TIM do not currently exist. Systems are in development and fielding is expected in the far term but are contingent upon sensor technology progression. JWARN, to be initially fielded to operational units in the mid term and into the early far term, includes IDN data repository capabilities.

<sup>2</sup> Current event histories are compiled generally after-the-fact based upon manual logs, documentation, extracted system information, interviews, and other sources of information. The compilation is manual and time- and labor-intensive. The event histories do provide a detailed chronological history of an event and are usually divided into functional segments with an overall summary. The projected mid-term fielding of JWARN provides an additional source of information. However, an overall system that collects from the various systems within the center to compile a comprehensive event history does not exist and is not programmed. The lack of interoperability and integration of existing systems impede the potential for a collection and compilation program for event histories. New DoD systems are required to meet DISA standards and be net-centric capable. Legacy systems, however, are not required to be in meet these standards and requirements until they are replaced or undergo substantial upgrades. However, all DoD systems are to meet

the standards and requirements in the far term. The mix of legacy and compliant systems will continue to require staff intervention for the compilation of event histories until the legacy systems are either replaced or modified for compliance.

<sup>3</sup> Current DOTLPF does address the compilation and performance of event histories and their application as lessons learned for adjustments to existing DOTLPF and the application of material. However, the process is predominantly manual and is time- and labor-intensive. Information and the exact chronology of events are often lost since much of the data and information is not documented and the performance of this task is performed after-the-fact, sometimes at some length following the event. DOTLPF must evolve as systems, tactics, and situations change and to promote and draw-upon the inherent capabilities of net-centric operations.

### 9.30.3 Functional Solution Analysis

#### 9.30.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Absence of automatic means to record and compile event histories.

**Partial Non-Material Solutions:** *Doctrine:* Expand doctrine, policies, procedures, and TTPs to address automated collection, compilation, and processing of ongoing information for event histories. *Training:* Incorporate automated event history training into formal and recurring training of operations center staff personnel.

#### 9.30.3.2 IMA Assessment Summary

Table 9.30-4 is a list of ideas for material approaches and a corresponding description of each idea. The approaches to this task include an automatic system to obtain and process sensor data and archive CBRN/TIM event histories; the key is the automation of the process.

**Table 9.30-4. TASHA 30: Materiel Approaches**

Identified Deficiency	Idea for Materiel Approach	Description
Absence of automatic means to record and compile event histories	IDN interface for sensors	Ensure developmental CBRN sensors include the ability to interface with an IDN. Develop adaptors to interface existing CBRN sensors to the IDN. Develop history logging capability for IDN sensors.
	Collect, exchange, and disseminate information	Develop a system that will collect and analyze CBRN sensor inputs, generate, edit, and disseminate NBC reports, including downwind-hazard plots and overlays, and verify receipt of reports and plots.
	Event history archival	Develop a system accepting manual and automatic CBRN/TIM event data input then modifies, retrieves, displays, archives, and transfers data (e.g., intelligence, location of attack, source and sensor information) to repositories.

**9.31 Task TASHA 31: Provide CBRN lessons learned and attack/release information****9.31.1 Functional Area Analysis****9.31.1.1 Definition**

The deliberate collecting and compiling of lessons learned support post-event operational assessments and studies. Includes the archiving of relevant information regarding analytical efforts and training improvements. Immediate lessons learned access by the joint force supports immediate post-event assessments and continued operational evaluations to enhance current and future operations preparations and planning. Also supports revisions to TTPs, operational plans, and training plans. Includes information assurance considerations.

**9.31.1.2 Derivation**

4. Intelligence dissemination and receipt partially exists. (C2.4.7)

**Civil.** N/A

**9.31.2 Functional Needs Analysis****9.31.2.1 Capability and Deficiency Assessment Summary**

Table 9.31-1 discusses individual capabilities to perform this task to the designated standards. The capabilities include preparing lessons learned and attack/release information and the mid- to far-term fielding of JWARN, JEM and JOEF to meet the identified standards. The overall capability for current, near/mid, and far term are assessed “yellow.”

**Current Capability and Deficiency**

The services have their own CBRND information repositories. The center for Army lessons learned includes information gleaned from CBRN events as well as other lessons. Deficiencies include lack of emphasis on collecting and preserving CBRN data; insufficient repository access; absence of automated archiving capability; and lack of Joint access to information.

**Projected Near/Mid-Term Capability and Deficiency**

The JWARN capability for archiving event history provides a basis for common CBRND event history archiving. JWARN will be initially fielded to operational units in the mid term. New DoD systems are expected to be in compliance with DISA standards and net-centric capable, as appropriate during the current and near term for interoperability and net-centric operations. Substantial upgrades to legacy systems are required to include DISA standards and net-centric capabilities. Further, the mix of legacy and compliant systems will continue to require the attentiveness and awareness of staffs to ensure effective collection, integration, and dissemination of information until the legacy systems are either replaced or modified for compliance. However, the current deficiencies remain and the potential opportunities afforded by the DoD initiative and enhanced automation capabilities are not fully realized for CBRND. Interoperability and integration will be a gradual process.

**Projected Far-Term Capability and Deficiency**

Fielding of JWARN is expected to be completed in the early far term. All legacy systems are projected to either be replaced by, or in compliance with, DISA standards and full support net-centric operations in the far term. Sensors and IDN capabilities are in development with stated fielding sometime in the far term. This achievement is dependent upon the progression of sensor technologies necessary for an IDN. Otherwise, no change is projected for this task.

**Table 9.31-1. TASHA 31: Capability and Deficiency Assessment**

<b>Capability: CBRN Lessons Learned and Attack/Release Information</b>	<b>M1</b>	<b>M2</b>	<b>M3</b>	<b>M4</b>	<b>M5</b>	<b>M6</b>	<b>M7</b>
<b>Current Overall Capability</b>	5 <sup>1</sup>	5 <sup>2</sup>	5 <sup>3</sup>	5 <sup>4</sup>	5 <sup>3</sup>	5 <sup>5</sup>	5 <sup>6</sup>
<b>Near/Mid-Term Overall Capability</b>	5	5	5	5	5	5	5
<b>Far-Term Overall Capability</b>	6	6	5	6	5	5	5

	<b>FAA Measure</b>	<b>Scale</b>
M1	All units submit assessments and lessons learned.	<p>8–10: Integrated and interoperable systems collect and compile event information from all systems within operations centers. The automated event history permits manual notations and entries and provides a detailed and in-depth history of an event. Assessments of the events are performed and lessons learned are identified and entered. The event history, assessment, and lessons learned are submitted to a central center for review, archival, and recommendations for change to DOTMLPF.</p> <p>4–7: Manual event histories are compiled following an event, or as time permits, through the use of logs, documentation, system information, and other sources. The compiled event history provides a detailed history of an event. Assessments of the events are performed and lessons learned are identified. The event history, assessment, and lessons learned are submitted for review, archival, and recommendations for change to DOTMLPF.</p> <p>1–3: Event histories, assessments, and/or lessons learned are inadequate, not submitted by a number of units, not centralized and archived, or are inadequately reviewed and applied to recommendations for DOTMLPF changes.</p> <p>0: Event histories, assessments, and/or lessons learned are nonexistent, not submitted, not centralized, not archived, and not applied to recommendations for DOTMLPF changes.</p>
M2	Affected units can record and compile lessons learned.	<p>8–10: Integrated and interoperable systems collect and compile event information from all systems within operations centers. The automated event history permits manual notations and entries and provides a detailed and in-depth history of an event. Assessments of the events are performed and lessons learned are identified and entered. The event history, assessment, and lessons learned are submitted to a central center for review, archival, and recommendations for change to DOTMLPF.</p> <p>4–7: Manual event histories are compiled following an event, or as time permits, through the use of logs, documentation, system information, and other sources. The compiled event history provides a detailed history of an event. Assessments of the events are performed and lessons learned are identified. The event history, assessment, and lessons learned are submitted for review, archival, and recommendations for change to DOTMLPF.</p> <p>1–3: Event histories, assessments, and/or lessons learned are inadequate, not submitted by a number of units, not centralized and archived, or are inadequately reviewed and applied to recommendations for DOTMLPF changes.</p> <p>0: Event histories, assessments, and/or lessons learned are nonexistent, not submitted, not centralized, not archived, and not applied to recommendations for DOTMLPF changes.</p>

M3	Information repository is available to all users.	<p>8–10: Central common repository maintains secure, interoperable, and integrated automated systems hosting databases and data sets possessing CBRN/TIM and/or CBRND information and data. This includes event histories, assessments, lessons learned, plans, policies, technical data, and other necessary information. Internal and external links enable movement by users to relevant information. The systems and information structures comply with DISA, IADDS, and DITSCAP requirements. Authorized users are able to access the repository easily and without regard to their location or mode of connection.</p> <p>4–7: Repositories exist and maintain a mix of electronic and hard-copy CBRN/TIM and/or CBRND information and data. Authorized users may possess limited access to electronic information. Hard copies must be requested.</p> <p>1–3: Repositories are not designated, do not as a group fully cover CBRN/TIM and CBRND requirements, do not possess adequate connectivity, do not comply with DISA/IADDS and/or DITSCAP requirements, and/or do not possess adequate data and information to support operations and/or requirements.</p> <p>0: Repositories do not exist for CBRN/TIM and CBRND.</p>
M4	An archiving process exists to record event history.	<p>8–10: Integrated and interoperable systems collect and compile event information from all systems within operations centers. Data entries are identified to source, date/time, performing activity, etc., and retained in time sequence blocks. Information is accessible by time and/or system. The automated event history permits manual notations and entries and provides a detailed and in-depth history of an event.</p> <p>4–7: Manual event histories are compiled following an event, or as time permits, through the use of logs, documentation, system information, and other sources. The compiled event history provides a detailed history of an event.</p> <p>1–3: Event histories are inadequate.</p> <p>0: Event histories are nonexistent.</p>
M5	Routine access is available to CBRN/TIM lessons learned information.	<p>8–10: Central common repository maintains secure, interoperable, and integrated automated systems hosting databases and data sets possessing CBRN/TIM and/or CBRND information and data, including event histories, assessments, lessons learned, plans, policies, technical data, and other necessary information. Internal and external links enable movement by users to relevant information. The systems and information structures comply with DISA, IADDS, and DITSCAP requirements. Authorized users are able to access the repository easily and without regard to their location or mode of connection.</p> <p>4–7: Repositories exist and maintain a mix of electronic and hard-copy CBRN/TIM and/or CBRND information and data. Authorized users may possess limited access to designated electronic information. Hard copies must be requested.</p> <p>1–3: Repositories are not designated, do not as a group fully cover CBRN/TIM and CBRND requirements, do not possess adequate connectivity, do not comply with DISA/IADDS and/or DITSCAP requirements, and/or do not possess adequate data and information to support operations and/or requirements.</p> <p>0: Repositories do not exist for CBRN/TIM and CBRND.</p>
M6	Provides ability to track action items, including responsible command, point of contact, and resolution.	<p>8–10: Central common repository center automated systems track action items to include action item identifying information, suspending information, action command and point of contact, status, and resolution information. Detailed progress reports are electronically entered by the point of contact directly to the action item record. Center staff possess the ability to query system on status of action items individually or collectively.</p> <p>4–7: Repository centers apply both manual and automated systems to track action items and the responsible action agency actions. Determinations are provided by hard copy to the center by the point of contact.</p> <p>1–3: Repository centers do not possess adequate capability or any capability to track action items from initiation to completion.</p> <p>0: Repository centers do not exist.</p>

M7	There is effective DOTLPF in place to conduct task.	8–10: DOTLPF exists and is adequate for this task. Task can be effectively performed with little or no direct impact upon operations. 4–7: Most critical aspects of DOTLPF for this task are addressed. Task can be performed with limitations requiring work-arounds. 1–3: DOTLPF is inadequate for accomplishment of this task. 0: DOTLPF does not exist for this task.
----	---	--

<sup>1</sup> DOTLPF exists for the conduct of event histories, assessments, and lessons learned. These are generally manually performed after the fact by the unit and are time- and labor-intensive. Each Service maintains repositories and centers for lessons learned (for example, the U.S. Army's Center for Army Lessons Learned). The repositories/centers are tasked to review submitted reports for concepts, shortfalls, and other potentials for DOTMLPF changes and to make recommendations for review and action. While the services attempt to collect all lessons learned information, inevitably some units will not submit the data, so enforcement is needed. A joint repository and center for lessons learned does not exist.

<sup>2</sup> Current event histories, assessments, and lessons learned are generally performed after the fact based upon manual logs, documentation, extracted system information, interviews, and other sources of information. The process is manual and time- and labor-intensive. Doctrine provides guidelines for the performance of this process. However, an overall system that collects from the various systems within the center to compile a comprehensive log of events does not exist and is not automated. The lack of interoperability and integration of existing systems impede the potential for a collection and compilation program for event histories, lessons learned, and assessments. New DoD systems are required to meet DISA standards and be net-centric capable. Legacy systems, however, are not required to be in meet these standards and requirements until they are replaced or undergo substantial upgrades. However, all DoD systems are to meet the standards and requirements in the far term. The mix of legacy and compliant systems will continue to require staff intervention for the collection and preparation of assessments, lessons learned, and histories until the legacy systems are either replaced or modified for compliance.

<sup>3</sup> Each Service maintains repositories and centers for lessons learned (for example, the U.S. Army's Center for Army Lessons Learned). A single common joint repository and center for lessons learned does not exist. Access to the repositories is established by the individual Service and restrictions exist for access and data set content review and retrieval. Some repositories and centers require the user to submit requests for the information to be reviewed and do not permit direct access. Much of the information is in hard copy and must be requested. Many of the repositories are not known to potential users.

<sup>4</sup> Current event histories are compiled generally after the fact based upon manual logs, documentation, extracted system information, interviews, and other sources of information. The compilation is manual and time- and labor-intensive. The event histories do provide a detailed chronological history of an event and are usually divided into functional segments with an overall summary. The projected mid-term initial fielding of JWARN provides an additional source of information. JWARN is expected to complete fielding in the early far term. However, an overall system that collects from the various systems within the center to compile a comprehensive event history does not exist and is not automated. The lack of interoperability and integration of existing systems impede the potential for a collection and compilation program for event histories, lessons learned, and assessments. New DoD systems are required to meet DISA standards and be net-centric capable. Legacy systems, however, are not required to be in meet these standards and requirements until they are replaced or undergo substantial upgrades. However, all DoD systems are to meet the standards and requirements in the far term. The mix of legacy and compliant systems will continue to require staff intervention for the collection and preparation of assessments, lessons learned, and histories until the legacy systems are either replaced or modified for compliance.

<sup>5</sup> Service repository and lesson learned centers apply automated and manual tracking systems for disseminated action items. These systems generally are administrative suspense control in nature, and entries are usually removed upon completion. Status reporting and final determinations are submitted by the action office in hard copy.

<sup>6</sup> Current DOTLPF does address the compilation and performance of event histories and their assessment and application as lessons learned for adjustments to existing DOTLPF and the application of material. However, the process is predominantly manual and is time- and labor-intensive. Information and the exact chronology of events are often lost since much of the data and information is not document and the performance of this task is performed after the fact, sometimes at some length following the event. Often, lessons learned from prior actions and activities are not researched and compared to recent events. Further, the Service-based lessons learned centers do not interrelate and correlate information on a routine basis. The joint community and the transformation of forces for joint Concept of Operations require a centralized center with oversight and connectivity to Service lessons-learned centers and systems. DOTLPF must evolve as systems, tactics, and situations change and to promote and draw upon the inherent capabilities of net-centric operations and joint interoperability and operations.

### 9.31.3 Functional Solution Analysis

#### 9.31.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies and suggests potential non-materiel solutions. If there are no non-materiel solutions or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section.

1. **Deficiency:** Lack of emphasis upon importance of collecting and preserving data and information about CBRN events.  
**Non-Material Solutions:** *Doctrine:* Highlight the importance of collecting and preserving data and info about CBRN event. *Training:* Modify training to amplify the need to collect and preserve data and info on CBRN events. *Leadership:* Modify training programs to amplify the need to collect and preserve data and info on CBRN events.
2. **Deficiency:** Insufficient repository access.  
**Partial Non-Material Solutions:** *Doctrine:* Establish standardized joint doctrine, policy, and procedures for establishing, maintaining, and operating repositories to include access procedures and processes. *Organization:* Establish organizational structures, processes, and procedures to support repositories and accessibility. *Training:* Include repository identification and accessing processes to all appropriate personnel. *Leadership:* Maintain emphasis upon availability and application of repository information for planning, training, and operations. *Facilities:* Establish supporting infrastructure enabling repository operations and accessibility.
3. **Deficiency:** Lack of central joint repository.  
**Partial Non-Material Solutions:** *Doctrine:* Establish standardized joint doctrine, policy, and procedures for establishing, maintaining, and operating central joint repository to include access procedures and processes. *Organization:* Establish organizational structures, processes, and procedures to support repository and accessibility. *Training:* Include repository identification and accessing processes to all appropriate personnel. *Leadership:* Maintain emphasis upon availability and application of repository information for planning, training, and operations. *Facilities:* Establish supporting infrastructure enabling repository operations and accessibility.
4. **Deficiency:** Inadequate means to timely record and compile lessons learned.  
**Partial Non-Material Solutions:** *Doctrine:* Establish standardized joint doctrine, policy, and procedures for the automated collection and compilation of information for development of lessons learned. *Training:* Conduct advanced training of staff on the automated collection and compilation of information; and the preparation of lessons learned and event histories. *Leadership:* Maintain emphasis upon availability and application of lessons learned information for planning, training, and operations.

**9.31-3.2 IMA Assessment Summary**

Table 9.31-4 is a list of ideas for material approaches and a corresponding description of each idea. Once CBRN/TIM event histories are automatically archived in lessons learned databases, the approaches to accomplish this task will also include the ability to reach back into those databases and extract pertinent information to aid in future CBRND missions. Table 9.31-5 identifies which of the material approaches might address specific materiel deficiencies identified in the DOTMLPF assessment.

**Table 9.31-4. TASHA 31: Materiel Approaches**

<b>Idea for Materiel Approach</b>	<b>Description</b>
Lessons learned databases	Develop/consolidate databases for operational and training lessons learned.
Reachback capability	Develop a system providing the ability to rapidly and securely reach back and contact CBRN experts and obtain CBRND plans, procedures, information, and lessons learned.
Management of Databases	Develop a system to link and manage the accuracy, adequacy, and availability of CBRND information databases. Includes access management, content control, and the conduct of data set management. Also includes process to identify database actions such as consolidation of similar databases, establishment of new databases, archiving of obsolete databases, etc.
Collect, exchange, and disseminate information	Develop a system that collects and analyzes CBRN information and sensor input; generates, edits, and disseminates NBC reports, including downwind-hazard plots and overlays; and verify receipt of reports and plots. Transmission of data uses existing communication nets.
Event history archival	Develop a system accepting manual and automatic CBRN/TIM event data input then modifies, retrieves, displays, archives, and transfers data (e.g., intelligence, location of attack, source and sensor information) to repositories.

## 10.0 Strategic National Shield

### 10.0.1 Introduction

Strategic level of war is divided into two sublevels: strategic national (SN) and strategic theater (ST). This chapter focuses upon the SN level of war at the national (U.S. Department of Defense [DoD]/Service/interagency) level of task development and implementation. At this level, national authorities, often in cooperation with other nations, establish national or multinational (alliance or coalition) security objectives and guidance and develop and apply national resources to accomplish these objectives. Decisions and activities at the SN level establish national and multinational military objectives, specify the sequencing of activities and actions, develop global plans and means to attain these objectives, delineate limits and assess risks for the application of military and other tools of national power, and provide military forces and other capabilities as outlined in strategic plans.<sup>1</sup>

This chapter, detailing the Strategic National Shield (SHLD) area, estates relevant information from the chemical, biological, radiological, and nuclear defense (CBRND) Functional Area Analysis (FAA), including a description of each of the 12 SNSHLD tasks, derivation of the task, an indication of other linked tasks, and the pertinent conditions. The Functional Needs Analysis (FNA) section addresses the capability and deficiency analysis and a brief description of potential near-term changes. Once all the capabilities are considered, the assessment concludes with a separate, overarching look at the entire capability spectrum to identify remaining gaps and/or synergies. The Functional Solutions Analysis (FSA) section addresses possible solutions for the deficiencies identified in the FNA section. Solutions for SNSHLD are non-materiel and are reflected in one or more of the six areas of DOTLPP: doctrine, organization, training, leadership, personnel, and facilities. Annotations under “Materiel” are non-materiel in nature but do not align in one of the six non-materiel aspects of DOTLPP. These annotations include research, analysis, and other actions to address and establish solutions for the deficiencies.

Most of the SNSHLD tasks involve doctrine, policies, and procedures providing parameters for planning, decisioning, and actions or activities to accomplish the tasks. These range from the establishment of foundational standards, criteria, and metrics for Shield systems and measures to equipping and training of forces (national and multinational) for sustained CBRND operations encompassing both chemical, biological, radiological, and nuclear (CBRN) and toxic industrial material (TIM) agents.

Tasks associated with forces includes constituent elements of the transforming force, such as civilians, military working animals (MWAs), coalition/alliance forces, and third-party nationals. Increasing reliance upon nonmilitary personnel (such as government employees and contractors) as operational enablers dictated their inclusion as force members.

### 10.0.2 FNA Summary

The below table summaries the overall current and proejcted capability to perform the SNSHLD tasks identified in the CBRND FAA. The overall capability to conduct these tasks in the current

---

<sup>1</sup> Appendix A to Enclosure B, para. 3a, CJCMS 3500.04C, *Universal Joint Task List*, July 2002, CJCS.

time frame is assessed as “red.” There are key deficiencies in DoD’s ability to protect populations other than military members as well as support concurrent CBRND operations, especially those associated with sustained and expeditionary operations within a CBRN/TIM environment. It is projected that the overall status will improve to “Yellow” in the near/mid term with some improvements in specific measures within specific tasks.

**Table 10.0-1. Strategic National Shield Summary FNA Findings**

CBRN Strategic National Shield Task Number	CBRN Strategic National Shield Task Title	Capability		
		Current	Near/Mid	Far
SNSHLD 1	Establish interoperability and protection standards and criteria for protective equipment and supplies	●	●	●

### 10.0.3 FSA Summary

The paragraphs below summarize the assessment of all potential DOTLPF solutions for the capability gaps identified in the FNA section. The summaries also address the non-materiel solutions annotated under “Materiel” as discussed earlier. SNSHLD addresses non-materiel actions and activities. Therefore, materiel solutions are not applicable to this level of war.

#### 10.0.3.1 DOTLPF

The DOTLPF solutions identified in this chapter are associated primarily with the the level of protection afforded by CBRND systems and measures and the readiness of force populations for CBRND activities and actions. Non-materiel solutions are identified. These solutions include such actions as the establishment of baseline CBRND standards, criteria, and metrics adequately addressing the needs of the force and its constituent populations; doctrine encompassing those populations; applicable training programs, infrastructures and organizational structures supporting CBRND operations within sustained CBRN/TIM environments for the transformed force; leadership CBRND awareness and decisioning enablers; and criteria for civilian personnel performing mission-related activities within a CBRN/TIM environment.

#### 10.0.3.2 IMA

All solutions identified for the Strategic National level of war within Shield are non-materiel approaches. Since materiel solutions are not applicable to this Shield level of war, assessments of Ideas for Materiel Solutions (IMAs) are not applicable.

## **10.1 Task SNSHLD 1: Establish interoperability and protection standards and criteria for protective equipment and supplies**

### **10.1.1 Functional Area Analysis**

#### **10.1.1.1 Definition**

To reduce the impact of CBRN/TIM releases on U.S., allied, friendly, or nonaligned military forces and eligible civilians, MWAs, and equipment, supplies, and facilities. This task includes interoperability,<sup>2</sup> protection standards, and baseline requirements for protective equipment and supplies required for survival and operations within a CBRN/TIM environment. The criteria establish requisite metrics. The standards specify characteristics for protective equipment and supplies required for survival and operations within a CBRN/TIM environment. The standards establish and define “clean,” “safe,” and “dirty” hazard levels for the application and performance of protective equipment and supplies. The supporting criteria stipulate baseline requirements for CBRN/TIM protective equipment and supplies. The criteria establish requisite metrics that optimize protection, function/task accomplishment, and mission capabilities for operations within CBRN/TIM environments while minimizing hazards, encumbrances, limitations, and adverse impacts.

NOTE: Interoperability, as defined in JP 0-2, includes “the development and fielding process that provides materiel that is fully compatible to systems of all Services.” North Atlantic Treaty Organization (NATO) and other alliance standards are negotiated separately and assimilated into the requirements and acquisition process as necessary.

#### **10.1.1.2 Derivation**

*Joint Enabling Concept for CBRN Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (SN 3.4.4, SN 4.3.4, SN 5.1.1, SN 6.1, SN 7.5, SN 9, SN 9.1.3, SN 9.2.1).*

##### **10.1.1.2.1 Supported Task: N/A**

##### **10.1.1.2.2 Lateral Task: SNSHA 3**

##### **10.1.1.2.3 Supporting Task: N/A**

#### **10.1.1.3 Condition**

Perform this task under conditions of:

---

<sup>2</sup> Interoperability includes “the development and fielding process that provides material that is fully compatible to systems of all Services.” (JP 02, *Unified Action Armed Forces*) NATO and other alliance standards are negotiated separately and assimilated into the requirements and acquisition process as necessary.

**Physical**

1. Immediate to delayed danger, and potential long-term health hazard of atmospheric weapons effects. (C1.3.3)

**Military**

1. Partial joint staff integration. (C2.3.1.1)
2. Partial multinational integration. (C2.3.1.2)
3. Some interoperability. (C2.2.6)

**Civil**

1. Correct interdepartmental/interagency relationships. (C3.1.1.3)

**10.1.2 Functional Needs Analysis****10.1.2.1 Capability and Deficiency Assessment Summary**

Table 10.1-1 discusses the only capability that currently exists to perform the task to the designated standard. The Chairman of the Joint Chiefs of Staff (CJCS)/joint staff promulgates and establishes joint Service baseline standards, criteria, and metrics for the development and fielding of CBRND protective equipment and supplies.

**Current Capability and Deficiency**

Interoperability and protection standards, measures, and criteria for CBRND protective equipment and supplies exist for specific assets and are established during the development, acquisition, and fielding process. Doctrine, policy, procedures, and tactics, techniques, and procedures (TTPs) are currently available for employment of CBRND protective equipment and measures; however, task performance within a contaminated environment by individual protective equipment (IPE)-encumbered personnel is not generally addressed. Deficiencies include the lack of a single set of overarching CBRND standards, measures, criteria, and metrics for CBRND assets. The overall current assessment is “yellow.”

**Projected Near/Mid-Term Capability and Deficiency**

No change projected for this task.

**Projected Far-Term Capability and Deficiency**

No change projected for this task.

Table 10.1-1. SNSHLD 1: Capability and Deficiency Assessment

	FAA Measure	Scale
M1	“Clean” hazard levels are specifically defined in terms of route of entry, exposed area, exposure rate and duration, material concentration and physical state, accumulated dose, and impact on life, health, and the environment.	<b>G:</b> An overarching single set of specific measures defining “Clean” hazard levels exist for application to all systems, equipment, and assets that address the full range of protected resources. <b>Y:</b> Specific “Clean” hazard levels and measures are defined for specific systems, equipment, and assets. <b>R:</b> “Clean” hazard levels are not defined.
M2	“Safe” hazard levels are specifically defined in terms of route of entry, exposed area, exposure rate and duration, material concentration and physical state, accumulated dose, and impact on life, health, and the environment.	<b>G:</b> An overarching single set of specific measures defining “Safe” hazard levels exist for application to all systems, equipment, and assets that address the full range of protected resources. <b>Y:</b> Specific “Safe” hazard levels and measures are defined for specific systems, equipment, and assets. <b>R:</b> “Safe” hazard levels are not defined.
M3	“Dirty” hazard levels are specifically defined in terms of route of entry, exposed area, exposure rate and duration, material concentration and physical state, accumulated dose, and impact on life, health, and the environment.	<b>G:</b> An overarching single set of specific measures defining “Dirty” hazard levels exist for application to all systems, equipment, and assets that address the full range of protected resources. <b>Y:</b> Specific “Dirty” hazard levels and measures are defined for specific systems, equipment, and assets. <b>R:</b> “Dirty” hazard levels are not defined.
M4	Criteria for employing CBRN/TIM protective equipment and measures have been adequately described to include timing and level of protection required.	<b>G:</b> Doctrine, policy, procedures, and TTPs adequately address the employment of protective equipment and measures across the full range of protected resources and eligible personnel, including non-U.S. <b>Y:</b> Doctrine, policy, procedures, and TTPs adequately address the employment of protective equipment and measures for U.S. forces. <b>R:</b> Doctrine, policy, procedures, and TTPs do not or inadequately address the employment of protective equipment and measures for U.S. forces.

M5	Measures identify the quantity of CBRN/TIM material released into the environment that requires donning IPE, activation of collective protection system (CPS), or initiating other protective measures.	<p><b>G:</b> Specific measures identify the quantity of CBRN/TIM material released into the environment requiring the implementation of protective measures and are applied.</p> <p><b>Y:</b> General measures or alternative processes exist address the detection of CBRN material in the environment and the employment of protective measures.</p> <p><b>R:</b> Measures and processes do not exist or are inadequate for the detection of CBRN material in the environment and the employment of protective measures.</p>
M6	Measures identify the quantity of CBRN/TIM material against which protective equipment must be tested for each agent.	<p><b>G:</b> An overarching single set of specific measures for CBRN agent testing, by agent, exist for application to all systems, equipment, and assets that address the full range of protected resources.</p> <p><b>Y:</b> Specific CBRN measures are defined for specific systems, equipment, and assets.</p> <p><b>R:</b> CBRN measures are not defined.</p>
M7	Measures specify the minimum period of time required for test quantities of CBRN/TIM material to permeate the protective material.	<p><b>G:</b> An overarching single set of specific measures for CBRN agent testing exist for application to all systems, equipment, and assets that address the full range of protected resources.</p> <p><b>Y:</b> Specific CBRN measures are defined for specific systems, equipment, and assets.</p> <p><b>R:</b> CBRN measures are not defined.</p>
M8	Metrics specify the minimum period of time required for test quantities of CBRN/TIM material to penetrate the protective material.	<p><b>G:</b> An overarching single set of specific metrics for CBRN agent testing exist for application to all systems, equipment, and assets that address the full range of protected resources.</p> <p><b>Y:</b> Specific CBRN metrics are defined for specific systems, equipment, and assets.</p> <p><b>R:</b> CBRN metrics are not defined.</p>
M9	Metrics specify the minimum period of time required for test quantities of CBRN/TIM material to saturate the protective material.	<p><b>G:</b> An overarching single set of specific metrics for CBRN agent testing exist for application to all systems, equipment, and assets that address the full range of protected resources.</p> <p><b>Y:</b> Specific CBRN metrics are defined for specific systems, equipment, and assets.</p> <p><b>R:</b> CBRN metrics are not defined.</p>
M10	Metrics specify the maximum period of time required to don or activate protective equipment or initiate other protective measures.	<p><b>G:</b> Specific metrics identify the maximum period of time for donning or activation of protective equipment or the implementation of protective measures and are applied.</p> <p><b>Y:</b> General metrics or alternative processes exist address the detection of CBRN material in the environment and the employment of protective equipment and measures.</p> <p><b>R:</b> Metrics and processes do not exist or are inadequate for the detection of CBRN material in the environment and the employment of protective equipment and measures.</p>
M11	Standards adequately address sustained survival and operational requirements within a CBRN/TIM environment.	<p><b>G:</b> Doctrine, policy, procedures, and TTPs incorporate standards that adequately address sustained survival and operational requirements within a CBRN/TIM environment across the full range of protected resources and eligible personnel, including non-U.S.</p> <p><b>Y:</b> Doctrine, policy, procedures, and TTPs incorporate standards that address survival and operational requirements within a CBRN/TIM environment for U.S. forces.</p> <p><b>R:</b> Doctrine, policy, procedures, and TTPs do not incorporate standards for, or inadequately address, sustained survival and operational requirements within a CBRN/TIM environment for U.S. forces.</p>

M12	Standards and criteria support interoperability.	<p><b>G:</b> An overarching single set of specific standards and criteria supporting CBRND interoperability exist and are applied to all systems, equipment, and assets across the Services addressing the full range of protected resources and personnel, including non-U.S.</p> <p><b>Y:</b> Specific CBRN interoperability standards and criteria are defined for specific U.S. systems, equipment, assets, and forces.</p> <p><b>R:</b> CBRN interoperability standards and criteria are not defined for U.S. systems, equipment, assets, and forces.</p>
M13	Standards identify the period of time for test quantities of CBRN/TIM material to penetrate and defeat filtration.	<p><b>G:</b> An overarching single set of specific standards for CBRN agent testing exist for application to all systems, equipment, and assets that address the full range of protected resources.</p> <p><b>Y:</b> Specific CBRN standards are defined for specific systems, equipment, and assets.</p> <p><b>R:</b> CBRN standards are not defined.</p>
M14	Criteria and metrics optimize sustained task and function performance within a contaminated environment and in high-stress circumstances.	<p><b>G:</b> An overarching single set of specific criteria and metrics for optimization of sustained task and function performance within a contaminated environment and in high-stress circumstances exist for application to all systems, equipment, and assets that address the full range of protected resources and personnel, including non-U.S.</p> <p><b>Y:</b> Specific CBRN criteria and metrics for task and function performance within a contaminated environment and in high-stress circumstances are defined for specific U.S. systems, equipment, assets, and forces.</p> <p><b>R:</b> CBRN metrics are not defined for sustained task and function performance within a contaminated environment and in high-stress circumstances.</p>
M15	Criteria and metrics minimize encumbrances, hazards, limitations, and restrictions of CBRN/TIM protective equipment and supplies.	<p><b>G:</b> An overarching single set of specific criteria and metrics addressing the minimization of encumbrances, hazards, limitations, and restrictions of CBRN/TIM protective equipment and supplies exist and are applied.</p> <p><b>Y:</b> Specific criteria and metrics addressing the reductions of encumbrances, hazards, limitations, and restrictions of CBRN/TIM protective equipment and supplies are defined for specific systems, equipment, and assets.</p> <p><b>R:</b> Criteria and metrics addressing the minimization of encumbrances, hazards, limitations, and restrictions of CBRN/TIM protective equipment and supplies are not defined.</p>
M16	Criteria and metrics optimize safety and well-being of forces operating within a contaminated environment.	<p><b>G:</b> An overarching single set of specific criteria and metrics addressing the optimization of the safety and well-being of forces (including eligible civilians and non-U.S. forces) operating within a CBRN/TIM environment exist and are applied.</p> <p><b>Y:</b> Specific criteria and metrics addressing the safety and well-being of U.S. forces operating within a CBRN/TIM environment are defined for specific systems, equipment, and assets.</p> <p><b>R:</b> Criteria and metrics addressing the optimization of the safety and well-being of U.S. forces within a CBRN/TIM environment are not defined.</p>

M17	Criteria and metrics minimize logistic support costs and user Total Ownership Cost.	<p><b>G:</b> An overarching single set of specific criteria and metrics addressing the minimization of logistical support costs and Total Ownership Cost exist and are applied.</p> <p><b>Y:</b> Specific criteria and metrics addressing reductions in logistical support costs and Total Ownership Cost are defined for specific systems, equipment, and assets.</p> <p><b>R:</b> Criteria and metrics addressing the minimization of logistical support costs and Total Ownership Cost are not defined.</p>
M18	Criteria and metrics maximize compatibility and integration with individual combat equipment and systems.	<p><b>G:</b> An overarching single set of specific criteria and metrics addressing the maximization of compatibility and integration of CBRND assets with individual combat equipment and systems exist and are applied.</p> <p><b>Y:</b> Specific criteria and metrics addressing compatibility and/or integration of CBRND assets with individual combat equipment and systems are defined for specific systems, equipment, and assets.</p> <p><b>R:</b> Criteria and metrics addressing the maximization of compatibility and integration of CBRND assets with individual combat equipment and systems are not defined.</p>
M19	Criteria and metrics maximize compatibility and integration with combat weapons and support systems.	<p><b>G:</b> An overarching single set of specific criteria and metrics addressing the maximization of compatibility and integration of CBRND assets with combat equipment and support systems exist and are applied.</p> <p><b>Y:</b> Specific criteria and metrics addressing compatibility and/or integration of CBRND assets with combat equipment and support systems are defined for specific systems, equipment, and assets.</p> <p><b>R:</b> Criteria and metrics addressing the maximization of compatibility and integration of CBRND assets with combat equipment and support systems are not defined.</p>
M20	Criteria and metrics optimize worldwide application in the expected combat and climatic conditions.	<p><b>G:</b> An overarching single set of specific criteria and metrics addressing the optimization of worldwide application of CBRND assets in the expected combat and climatic conditions by forces (including eligible civilians and non-U.S. forces) exist and are applied.</p> <p><b>Y:</b> Specific criteria and metrics addressing application of CBRND assets in the expected combat and climatic conditions by U.S. forces are defined for specific systems, equipment, and assets.</p> <p><b>R:</b> Criteria and metrics addressing the optimization of the worldwide application of CBRND assets in the expected combat and climatic conditions by U.S. forces are not defined.</p>
M21	Criteria and metrics minimize training and maintenance resources.	<p><b>G:</b> An overarching single set of specific criteria and metrics addressing the minimization of CBRND training and maintenance resources by forces (including eligible civilians and non-U.S. forces) exist and are applied.</p> <p><b>Y:</b> Specific criteria and metrics addressing the reduced levels of required CBRND training and maintenance resources by U.S. forces are defined for specific systems, equipment, and assets.</p> <p><b>R:</b> Criteria and metrics addressing the minimization of CBRND training and maintenance resources by U.S. forces are not defined.</p>
M22	Criteria and metrics optimize shelf life in prolonged storage under any climatic condition.	<p><b>G:</b> An overarching single set of specific criteria and metrics addressing the optimization of CBRND asset shelf life in prolonged storage under any climatic condition exist and are applied.</p> <p><b>Y:</b> Specific criteria and metrics addressing CBRND asset shelf life in prolonged storage under any climatic condition are defined for specific systems, equipment, and assets.</p> <p><b>R:</b> Criteria and metrics addressing the optimization of CBRND asset shelf life in prolonged storage under any climatic condition are not defined.</p>

M23	Criteria and metrics minimize impact upon warfighter load.	<p><b>G:</b> An overarching single set of specific criteria and metrics addressing the minimization of CBRND asset impact upon the warfighter load exist and are applied.</p> <p><b>Y:</b> Specific criteria and metrics addressing CBRND asset impact upon the warfighter load are defined for specific systems, equipment, and assets.</p> <p><b>R:</b> Criteria and metrics addressing the minimization of CBRND asset impact upon the warfighter are not defined.</p>
M24	Criteria and metrics minimize transport requirements.	<p><b>G:</b> An overarching single set of specific criteria and metrics addressing the minimization of CBRND asset transport requirements exist and are applied.</p> <p><b>Y:</b> Specific criteria and metrics addressing CBRND asset transport requirements are defined for specific systems, equipment, and assets.</p> <p><b>R:</b> Criteria and metrics addressing the minimization of CBRND asset transport requirements are not defined.</p>
M25	Criteria and metrics optimize serviceable life of protective equipment and supplies.	<p><b>G:</b> An overarching single set of specific criteria and metrics addressing the optimization of CBRND asset service life exist and are applied.</p> <p><b>Y:</b> Specific criteria and metrics addressing CBRND asset service life are defined for specific systems, equipment, and assets.</p> <p><b>R:</b> Criteria and metrics addressing the optimization of CBRND asset service life are not defined.</p>
M26	Criteria and metrics optimize decontaminability of protective equipment and supplies.	<p><b>G:</b> An overarching single set of specific criteria and metrics addressing the optimizing the decontaminability of CBRND assets exist and are applied.</p> <p><b>Y:</b> Specific criteria and metrics addressing CBRND asset decontaminability are defined for specific systems, equipment, and assets.</p> <p><b>R:</b> Criteria and metrics addressing the optimization of CBRND asset decontaminability are not defined.</p>
M27	Criteria and metrics minimize storage footprint, packaging size, and weight.	<p><b>G:</b> An overarching single set of specific criteria and metrics addressing the minimizing CBRND asset storage footprint, packaging, size, and weight exist and are applied.</p> <p><b>Y:</b> Specific criteria and metrics addressing minimizing CBRND asset storage footprint, packaging, size, and weight are defined for specific systems, equipment, and assets.</p> <p><b>R:</b> Criteria and metrics addressing minimizing CBRND asset storage footprint, packaging, size, and weight are not defined.</p>
M28	Criteria and metrics minimize infrared (IR)/electronic emissions.	<p><b>G:</b> DOTLPF provides common guidance across all Services, ensures the safety and well-being of forces (including eligible civilians and non-U.S. members), and enables sustained operations within a CBRN/TIM environment.</p> <p><b>Y:</b> DOTLPF is common across all Services, ensures the safety and well-being of U.S. forces (including eligible civilians), and supports sustained operations within a CBRN/TIM environment.</p> <p><b>R:</b> DOTLPF is not common across services, inadequate, or nonexistent for the safety and well-being of U.S. forces (including eligible civilians and non-U.S. members) and does not enable or is inadequate for sustained operations within a CBRN/TIM environment.</p>

<sup>1</sup> DOTLPF for task performance within a CBRN/TIM hazard environment is inadequate and insufficient. DOTLPF generally does not discuss task performance within a contaminated environment by personnel encumbered with IPE. DOTLPF considering MWAss, civilians, and non-U.S. forces (forces not part of a treaty organization such as NATO) is inadequate.

<sup>2</sup> “Clean” hazard levels currently are not specifically defined.

<sup>3</sup> “Safe” hazard levels are currently not specifically defined.

<sup>4</sup> “Dirty” hazard levels are currently not specifically defined.

<sup>5</sup> Sufficient doctrine, policy, procedures, and TTPs are currently available for the employment of protective equipment and measures by U.S. forces. However, criteria applicable to MWAs, civilians, and non-U.S. forces are not promulgated.

<sup>6</sup> Quantities of CBRN/TIM material within the environment for implementation of protective measures are not identified. However, detection of the presence of CBRN/TIM within the environment by sensors (manual and/or automated) is linked to the implementation of associated protective measures. MWAs, civilians, and non-U.S. forces are not adequately addressed.

<sup>7</sup> Measures are established for specific systems, equipment, and assets, when determined applicable, during the acquisition and development process, including protective material incorporated into the end item. Additionally, no single set of measures exists as an overarching basis for testing. Measures considering MWAs, civilians, and non-U.S. forces are not adequately addressed.

<sup>8</sup> Metrics maybe established for specific systems, equipment, and assets, when determined applicable, during the acquisition and development process. Doctrine, policies, procedures, and TTPs identify time periods for the donning of protective equipment and the initiation of other protective measures. However, detection of the presence of CBRN/TIM within the environment by sensors (manual and/or automated) is linked to the implementation of associated protective measures. Metrics considering MWAs, civilians, and non-U.S. forces are not adequately addressed.

<sup>9</sup> Sufficient doctrine, policy, procedures, and TTPs are currently available for the employment of protective equipment and measures. Standards considering MWAs, civilians, and non-U.S. forces are not adequately addressed.

<sup>10</sup> Standards and criteria are established for specific systems, equipment, and assets (when determined applicable) during the acquisition and development process. However, interoperability may not be a factor in some Service specific programs. Standards considering MWAs, civilians, and non-U.S. forces (forces not part of a treaty organization such as NATO) are not adequately addressed.

<sup>11</sup> Standards are established during the acquisition and development process. No single set of standards exist as an overarching basis.

<sup>12</sup> Criteria and metrics are established for specific systems, equipment, and assets, when determined applicable, during the acquisition and development process. No single set of criteria and metrics exists as an overarching basis. Criteria and metrics considering MWAs, civilians, and non-U.S. forces (forces not part of a treaty organization such as NATO) are not adequately addressed.

<sup>13</sup> Criteria and metrics are established for specific systems, equipment, and assets, when determined applicable, during the acquisition and development process. No single set of criteria and metrics exists as an overarching basis.

### 10.1.3 Functional Solution Analysis

#### 10.1.3.1 DOTLPF Assessment Summary

This section addresses the deficiencies associated with interoperability and protection standards, measures, criteria, and metrics for CBRND protective equipment and supplies. The deficiencies can be addressed with non-materiel solutions. If there are no non-materiel solutions, or they are only partial solutions, the remaining non-materiel need is then stated. Materiel needs are assessed in the IMA section. Non-materiel solutions include research, development, and engineering (RD&E) to define “Clean,” “Safe,” and “Dirty” and their associated hazard levels for CBRN/TIM, as well as determining minimal CBRN/TIM quantities in the environment for implementation of CBRND protection. This foundational information provides the basis for development of overarching standards, measures, criteria, and metrics for the development, acquisition, fielding and employment of CBRND protective equipment and supplies. The derived joint standards, measures, criteria, and metrics should address other protected populations such as MWAs, eligible civilians, and non-U.S. forces and be integrated into doctrine, policy, procedures, TTPs, and training. These non-materiel requirements should also establish minimal qualifications for eligible civilians supporting the mission to ensure their safe application of CBRND protective measures and materiel for survival.

1. **Deficiency:** “Clean” hazard levels currently are not specifically defined.  
**Non-Materiel Solutions:** *Doctrine:* Define “Clean” and identify threshold hazard levels for CBRN/TIM agents within the environment and include in doctrine, policy, procedures, and TTPs.
2. **Deficiency:** “Safe” hazard levels are currently not specifically defined.  
**Non-Materiel Solutions:** *Doctrine:* Define “Safe” and identify threshold hazard levels for CBRN/TIM agents within the environment and include in doctrine, policy, procedures, and TTPs.
3. **Deficiency:** “Dirty” hazard levels are currently not specifically defined.  
**Non-Materiel Solutions:** *Doctrine:* Define “Dirty” and identify threshold hazard levels for CBRN/TIM agents within the environment and include in doctrine, policy, procedures, and TTPs.
4. **Deficiency:** Quantities of CBRN/TIM material within the environment for implementation of protective measures are not identified.  
**Non-Materiel Solutions:** *Doctrine:* Identify and link ranges of quantities of CBRN/TIM material to Mission-Oriented Protective Posture (MOPP) levels and protective measures and include in doctrine, policy, procedures, and TTPs.
5. **Deficiency:** MWAs, civilians, and non-U.S. forces (forces not part of a treaty organization such as NATO) are not adequately addressed.  
**Non-Materiel Solutions:** *Doctrine:* Address application of MOPP levels and protective measures for MWAs, civilians, and non-U.S. forces and include in doctrine, policy, procedures, and TTPs.

- 6. Deficiency:** No single set of measures, standards, metrics, and criteria exists as an overarching basis CBRND.  
**Non-Materiel Solutions:** *Doctrine:* Promulgate, establish, and enforce the application of an overarching CBRND set of measures, standards, and metrics for CBRND equipment and supplies.
- 7. Deficiency:** Interoperability may not be a factor in some Service-specific programs.  
**Non-Materiel Solutions:** *Doctrine:* Enforce DoD mandate for single CBRND program and interoperability. *Leadership:* Leadership of Service Components support and enforce DoD mandate.
- 8. Deficiency:** DOTLPF generally does not discuss task performance within a contaminated environment by personnel encumbered with IP.  
**Non-Materiel Solutions:** *Doctrine:* Consider implications of IP encumbrances upon task performance within a CBRN/TIM environment for training and task development.  
*Organization:* Consider limitations of IP encumbered personnel within a CBRN/TIM environment for task structuring. *Training:* Include task performance within a CBRN/TIM environment during formal and unit training and as an essential requirement element.  
*Leadership:* Leadership training and awareness of limitations and restrictions associated with task performance within a CBRN/TIM environment. *Personnel:* Ensure personnel are both psychologically and physiologically matched with specialty for task completion requirements within a CBRN/TIM environment.
- 9. Deficiency:** DOTLPF considering MWAs, civilians, and non-U.S. forces (forces not part of a treaty organization such as NATO) is inadequate.  
**Non-Materiel Solutions:** *Doctrine:* Address the provision of CBRN/TIM protection to MWAs, eligible civilians, and non-U.S. forces in doctrine, policy, procedures, and TTPs.  
*Organization:* Address organizational issues (e.g., who provides the equipment, support forces to train and equip, etc.) related to the provision of CBRN/TIM protection to MWAs, eligible civilians, and non-U.S. forces. *Training:* Include MWAs and eligible civilians in CBRND training, exercises, and evaluations. Identify training requirements and responsibilities for non-U.S. forces. *Leadership:* Leadership awareness of criticality of MWD resources and increased dependence of military operations upon civilians. *Personnel:* Require eligible civilians supporting the mission meet minimum standards for safe use of CBRND resources.

#### 10.1.3.1.2 IMA Assessment Summary

N/A

## **10.2 Task SNSHLD 2: Establish protection policy, standards, and criteria for medical CBRN/TIM protective countermeasures**

### **10.2.1 Functional Area Analysis**

#### **10.2.1.1 Definition**

To reduce the impact of CBRN/TIM releases on U.S., allied, friendly, or nonaligned military forces and eligible civilians and MWAs. Policy provides guidance on the management, eligibility, and administration of medical CBRN/TIM protective countermeasures. The standards specify medical CBRN/TIM protective countermeasures for acquired immunity or preventive mitigation of the effects of CBRN/TIM hazards. These countermeasures may include vaccines, pretreatments, prophylaxes, surfactant, or other medical pre- and postexposure (presymptomatic) measures for entity survival. The supporting criteria stipulate baseline requirements for the standard. Depending upon the standard, the criteria may address efficacy, level of afforded protection, duration of effectiveness, maximum number of administrations to achieve specified protection level, method(s) of administration, potential for adverse reactions and long-term effects, and ability to tailor to performed function. The criteria establish requisite metrics that optimize protection for operations within CBRN/TIM environments while minimizing hazards, limitations, and adverse impacts.

#### **10.2.1.2 Derivation**

*Joint Enabling Concept for CBRN Operations, An Operational Concept for Biological Defense, Protection Joint Functional Concept, UJTL (SN 3.4.4, SN 4.3.4, SN 5.1.1, SN 6.1, SN 7.5, SN 9, SN 9.1.3, SN 9.2.1).*
